would be made by land; but as soon as he learned that the enemy had embarked at Ravenshire in Holderness, he turned his course northwards, to be ready for the assailants at whatever point they might land in the Forth. But on reaching Musselburgh his last march was ended. For some time past he had been afflicted with that excruciating disease the stone, and he suddenly died on the 20th of July, 1332, in the midst of his political anxieties and warlike preparations. Never, indeed, has Scotland—so often harassed with minority and interregnum—possessed, either before or afterwards, such a deputy-sovereign, with the single exception of his noble namesake of after centuries, that Earl of Moray who was called the "Good Regent." Randolph's death was the commencement of heavy woes for Scotland. From the suddenness of his departure, and its disastrous consequences, it was suspected that the invaders, who had no hope of success as long as he lived, had caused him to be removed by poison; but the incurable nature of the malady under which he died sufficiently accounts for his decease.

REID, JOHN, M.D., Chandos professor of anatomy and medicine in the university of St. Andrews. This talented anatomist and physiologist, who was so unexpectedly removed from us when his value was just beginning to be estimated by the world, was born at Bathgate, Linlithgowshire, on the 9th of April, 1809. He was the sixth child of Henry Reid, a thriving farmer and cattle-dealer. The commencement of his education was rather unpropitious; for before he knew the grammar of his own language he was sent to learn that of Latin, under one of those frowzy village pedagogues who were so plentiful in Scotland, as well as England, when normal schools were as yet unknown. Under, or rather, we should say, in spite of such a preceptor, John Reid made a respectable proficiency in classical learning; and at the age of fourteen he was sent to the university of Edinburgh, where, for the first two or three years, he chiefly devoted himself to the study of Latin, Greek, and mathematics. But a love of literature for its own sake was not his characteristic: it was merely the means to an end, and not the end itself, and he valued it chiefly as the exponent of thought in those scientific pursuits to which his life was devoted. The same love of science induced him to direct his studies to the medical profession, instead of the church, which had been originally selected for his career. In the many departments of the healing art, those of anatomy and physiology exclusively attracted his attention, and upon these, while a student, he laid the secure foundation of his future distinction. After five years spent as a medical student, he obtained, in 1830, the diploma of surgeon and physician. On receiving the last and most honourable of these appointments there were not less than 106 candidates who obtained the diploma of M.D. on the same day. On this occasion a velvet cap is placed for a moment upon each head successively—resembling the now almost forgotten process in Scotland of extinguishing a chandelier of candles. This useful and wonder-working cap, that converts raw lads into learned doctors by a single touch, was supposed to have been originally the head-gear of George Buchanan. At the university of St. Andrews the case is better still, as their graduating cap is supposed to have been made out of a part of the velvet dress of John Knox.

On becoming a physician Dr. Reid's first wish was to receive a medical appointment in the navy for two or three years, in the hope of seeing the world and establishing himself in his profession.

But as no opportunity of this kind occurred, he accepted the office of clerk or assistant physician in the clinical wards of the Edinburgh infirmary. After discharging its duties for a twelvemonth with great ability, he repaired to Paris in the autumn of 1831, for the purpose of improving himself in its medical schools. His enthusiastic application in the French capital was well requited by the lessons of Louis and Andral, two of the most distinguished physicians, and Dupuytren and Listrane, the most skilful surgeons in Paris, whose lectures he attended. His description of the daily routine while thus employed, although so brief, gives a full idea of his diligence:—"I go to one of the hospitals for three hours in the morning, before breakfast; immediately after breakfast I go to the dissecting-rooms for three or four hours, then attend a lecture or two, return to dinner, and pass the evening at home." On his return to Scotland in 1832, uncertain where to commence his labours, he soon found that a choice had been made for him, by a stern necessity over which he had no control. The cholera had entered the country, and was making fearful havoc in Dumfries; and as the regular physicians of the district were too few to withstand the sudden and overwhelming visitation, four medical men were sent to their aid from Edinburgh, of whom Dr. Reid was one. He had seen the worst of this terrible calamity in Paris, and learned its mode of treatment: he was also aware of the danger which it entailed upon the physician as well as the patient. Undismayed, however, by his full knowledge of the peril, he set off with this "forlorn hope," and remained a whole month in the midst of infection, until the plague was stayed; and this, too, in spite of an alarming attack of peritonitis, that threatened every moment while it lasted to involve him in the fate of the sufferers, by increasing his liability to infection. The duties which he had to undergo in Dumfries during his short sojourn there, were such as required the utmost of moral heroism. "It was terrible work," he thus wrote, "for the first few days. It was truly the city of the plague. Such dreadful scenes I should never wish to be again obliged to witness; and what aggravated in no small degree the miseries and horrors inseparable from the agonies and dying groans of so many sufferers was, that the dread of contagion seemed to have torn asunder the social bonds of society, and the wretched victim had too often occasion to upbraid, with his last breath, the selfish fear of friends, and even of his nearest relations."

On the cessation of this most fearful of plagues, Dr. Reid, after a short interval, and while he was yearning for active employment, received two offers. The one was to settle in a medical vacancy near his native Bathgate, where he might have secured the quiet, easy, and respectable life of a country doctor, and talked politics with the parish minister, or general gossip with the laird's family. The other offer was to become a partner in the school of anatomy in Old Surgeons' Hall, Edinburgh, where the growing crowd of students required an addition to the usual staff of instructors. Here, as demonstrator, his duty would be a revolting one. He would have to wait all day, like a ghoul, in the dissecting-room, amidst mangled human subjects, and expound, from morning till night, the construction of these revolting masses, and trace in them the sources of those various maladies which flesh is heir to. He felt that he must thus dwell among the dead to benefit the living. He knew, also, that in this way alone he could prosecute those anatomical researches in reference to physiology, to which his whole heart was so devoted. On this account he did not hesitate to accept the

office, notwithstanding the horror of his family at the idea of one of their number being a mangler of the dead—a very henchman of the common executioner! From 1833 to 1836 he continued to be the demonstrator of Old Surgeons' Hall, and his labours in this capacity have elicited the most enthusiastic encomiums from those distinguished successors who were originally his pupils. "He was the most painstaking demonstrator," one of them declares, "I ever knew or heard of. No 'grinder' paid by the hour could have displayed more patience, or taken more trouble, to make anatomy easy to the meanest capacity. Where he might have contented himself in the discharge of his duty by a bare demonstration and description of the parts, he seemed to be animated by a sincere purpose of stereotyping his lesson on the memory and understanding of the duller of his audience. His patience with those who wished to learn had no limit." "We used to crowd round him," another pupil writes, "and ask questions on any point that was not thoroughly understood; but this was very seldom necessary; for such was the order, clearness, and minuteness of his description, that the subject was indeed made easy to the duller comprehension. That kind of instruction, also, which with him, as with every great anatomist of this country, sought for illustration in those points bearing on surgical or medical practice, was never lost sight of; and I, for one, up to this hour, and I firmly believe on this account, have never forgotten his admirable demonstrations." In this way he was wont, during nine months of each year, to give instructions daily in the dissecting-room from nine in the morning till four in the afternoon; and as some time was necessary for rest after such fatiguing labours, he generally commenced his private studies late in the evening, and continued them till long after midnight, declaring that he always found himself fittest for work when other people were going to their beds. He also attended, on the evenings of the six months of winter, the meetings of the scientific societies in Edinburgh connected with his profession, where the discussions were of such an interesting character as to attract the intellectual of every class, either as members or auditors. At this time, also, he gave the fruits of some of his more diligent investigations in the form of essays read before these societies, which were published in 1835. Two of these were on certain curious structures observed in connection with the veins; a third was on the organization of certain glands in the whale, and some peculiarities in the internal arrangement of the blood-vessels of man during the period of juvenility. But amidst all this heroism of labour and research, we must confess that with Dr. Reid one important subject had been, and still continued to be, omitted. On one occasion, a discussion among some of his medical friends who had met in his apartment was carried on, in which a religious question was involved, and Scripture was appealed to as conclusive evidence. But on searching his well-stored library for a Bible to quote chapter and verse, none could at first be found; and it was only after careful rummaging that at length this most momentous of all volumes was found thrust behind the other books and covered with dust. He was at present labouring for distinction, and had no time to study it; by and by, when the prize was won, he would again read his Bible as he had done when he was a boy. It is well that this indifference, lately so common among intellectual men, is now regarded not only as profane, but even unliterary and in bad taste. It was well, also, for Reid, that the "more convenient season," which so many have expected in vain, was vouchsafed to him at last.

In consequence of the high reputation which Dr. Reid had acquired as the anatomical demonstrator of Old Surgeons' Hall during three years' attendance, he was unanimously called, by his brethren of Edinburgh, to occupy a more honourable and important office. It was that of lecturer on physiology in the Extra-academical Medical School, now left vacant by the death of Dr. Fletcher, author of the *Rudiments of Physiology*. Into this new sphere he removed with considerable reluctance, for he was diffident of his powers as a lecturer, which were still untried. His perseverance, however, not only overcame his timidity, but enabled him to become as distinguished in the oratorical as he had formerly been in the conversational form of instruction. He now also had more leisure for self-improvement, as his course for the year commenced in November, and terminated with the close of April. In 1838 he was appointed pathologist to the Royal Infirmary of Edinburgh, where his duties consisted in collecting the weekly statistics of the institution, and conducting the *post-mortem* examinations of the patients who had died in the hospital; and in the following year he was also appointed superintendent of the infirmary. In this last capacity, we are told in the *Monthly Journal of Medical Science*, "he carried into his inquiries concerning morbid anatomy and pathology, the same accuracy in observing facts, and the same cautious spirit in drawing inferences from them, that characterized his anatomical and physiological researches. He at once saw the necessity of making his position serviceable to the advancement of medical knowledge, and, struck with the inconsistencies which existed as to the absolute and relative size and weight of the principal organs of the body, he commenced another laborious investigation on this subject. He introduced weighing-machines into the pathological theatre, by means of which the weight of the entire body was first ascertained, and then, respectively, the weights of the different organs." In 1839 Dr. Reid was candidate for the chair of medicine in King's College, Aberdeen, but was unsuccessful; in the same year he was candidate for the chair of anatomy in Marischal College, and was again unsuccessful. These disappointments, however, he bore with such good humour, as consciousness of desert and hope of better luck in store, acting upon a naturally cheerful, buoyant spirit, seldom fail to supply. Already he had broken ground, and most successfully, into those discoveries upon the anatomy and physiology of the heart, and especially of the nervous system, upon which he may be said to have established for himself a European reputation; and in the latter department he had produced and read before the British Association an epitome of his "*Experimental Investigation into the Functions of the Eight Pair of Nerves, or the Glosso-pharyngeal, Pneumogastric, and Spinal Accessory.*" The light which was dawning upon him in the course of these investigations was soon to be worth more than the distinction that can be conferred by a seat upon the bench of a college *senatus consultum*. All this was soon after attested at a public scientific meeting, in which it was declared, among other just encomiums, that Dr. Reid, by his "original investigations into the physiology of the nervous system, had made the profession acquainted with valuable facts, which had at once enriched the science their discoverer cultivated, and procured for himself an extensive and enviable reputation." Such was the testimony of Professor Alison, one of the most competent of judges upon such a subject.

Having now attained a high reputation in his own favourite walks of science, an appointment soon

offered that consoled Dr. Reid for his late mischances. This was the professorship of anatomy in the university of St. Andrews, which was conferred upon him in March, 1841. He had now only reached his thirty-first year; and from what he had already accomplished, combined with his robust, vigorous, healthy constitution, it was hoped that a long life was yet in store for him, as well as an ample field of research and discovery. He commenced in winter the course of lectures that properly belonged to his professorship; but as this class, composed of medical students only, was too limited a sphere, he also delivered a course of lectures on comparative anatomy and general physiology, which all were free to attend gratuitously, whether from town or college. A delighted crowd usually assembled at these prelections, composed not only of professors, ministers, and students from several classes, but also of the citizens of St. Andrews, whose earnest animated attention would of itself have been a rich reward to any public instructor. But even amidst all this, Dr. Reid felt that there was something wanting. St. Andrews was not a medical school of any mark, as most of the county students destined for the healing profession were wont to pass over to the university of Edinburgh. Besides, it was difficult to procure *subjects*, without which anatomical dissertations are all but useless—for even yet there still lingered among the living of Fifeshire that jealous care of their dead, which was placarded not a hundred years ago over one of their cemeteries, in these ominous words: "Whoever enters this churchyard will be shot." These drawbacks he felt so sensitively that he was impatient for wider action, until 1844, when St. Andrews was converted into a happy home for him, by his marriage with Miss Ann Blyth. Four years followed, in which his researches were chiefly directed to the natural history of the marine animals so plentiful on the Fifeshire coast, and the results of which he communicated in several papers to the *Annals and Magazine of Natural History*. In 1848 he made a collection, in one volume, of the essays which he had published in several scientific journals during the course of thirteen years. The work is entitled *Physiological, Anatomical, and Pathological Researches*, and consists of twenty-eight articles. Of the value of these, especially of the six that contain the results of his inquiries into the functions of living organs, it would be impossible to convey an adequate idea, without such a full analysis as would far exceed the plan and limits of our work. We content ourselves with quoting, from a host of congenial critics who reviewed the volume, the opinions of one who was well qualified to estimate its worth. "As a physiologist," says Dr. J. H. Bennett, "he [Dr. Reid] may be considered to have been unsurpassed; not, indeed, because it has fallen to his lot to make those great discoveries or wide generalizations which constitute epochs in the history of the science, but because he possessed such a rare degree of caution and conscientiousness in all his researches, that no kind of investigation, whether literary, anatomical, physiological, or pathological, that could illustrate any particular fact, did he ever allow to be neglected. . . . His volume contains more original matter and sound physiology than will be found in any work that has issued from the British press for many years."

Dr. Reid was now a happy man in the fullest sense of the term. With a happy home, and an extensive circle of friends, by whom he was honoured and beloved, his scientific aspirations were every day advancing towards that termination upon which his heart had been fixed for years. "My worldly

circumstances," he wrote afterwards to a friend, "were assuming a more comfortable aspect; my constitution, until lately, was robust; my age still in its prime (within some months of forty years); I had formed plans for carrying on investigations into the structure and vital actions of the lower organized bodies, which can be so readily procured from this coast, little thinking that disease was so soon to overtake me. I had my dreams of being able to add something of importance to the deeply attractive and instructive matters embraced in such investigations; and I was looking forward to the time when I should be able to say that I have done something which will prevent me from being readily forgotten." But while he was thus in the full flush of health and strength, of happiness and hope, a fearful pause occurred. A small insignificant-looking blister made its appearance upon his tongue, which, instead of departing, continued to increase, until it became a confirmed ulcer; and on examining this suspicious plague-spot, it was found to be the sure commencement of a cancer. He was thus to be the victim of a disease the most loathsome and incurable, while the only prospect which it held out was nothing but months of anguish and torture, until his iron frame should be worn out, and his strength prostrated into utter helplessness, so that death might come to his relief. He changed his residence from place to place in search of alleviation from pain, and submitted to torturing operations, in the faint hope that the malady might be eradicated; but its fangs were too deeply inserted, and too firmly closed, to be thus loosed from their hold. It was a barbed arrow which no surgery could extract; and nothing remained for him but to linger upon the outskirts of the fight of life, in which he had hitherto borne himself so bravely, and await the moment of release. It was then that the all-important subject, which hitherto he had too much neglected, summoned his attention with an authority that would not be gainsaid. For what had he spent the past? What provision had he made for the future? These were questions that occurred through the long days of helplessness and nights of sleeplessness and pain, and he knew that if not answered here, they would assuredly be repeated, and as certainly must be answered, elsewhere. And thither he felt that he was moving from day to day, and step by step, under an urgency which no power of earth could retard. The result of this solemn self-examination was, that Dr. Reid became a Christian in the true sense of the term. His life, indeed, had been one of unimpeachable honour and universal kindness and benevolence; and, as far as a profession of religion went, he had passed muster among the general file of Christian men. But now he felt that all his thoughts and studies had been devoted to the things that are seen and felt, while his futurity had been bounded by time and the world, which were fast vanishing away. He thus became a Christian, not, however, from selfish and craven fear, but from the same steady conviction and love of truth that had hitherto directed all his researches; and even to the last, while exhibiting the child-like simplicity and humility of his new character, he continued his scientific studies, but purified and elevated by the fresh impulse that had been given them. And thus he died, rejoicing, even in death, that the glorious future into which he was about to enter would fully open up to him those sciences of which as yet he had scarcely learned the alphabet. What are our studies worth unless they are to be eternal? After more than a year and a half of intense suffering Reid entered into his rest on the 30th of July, 1849. His widow

and two daughters, one a posthumous child, survive to lament him. A simple tablet on the wall of the ancient churchyard of St. Andrews indicates the place of his interment.

REID, DR. THOMAS, an eminent metaphysician and moral philosopher, and professor of the latter science in the universities of Aberdeen and Glasgow successively, was born at Strachan, in Kincardineshire, in the neighbourhood of Aberdeen, on the 26th of April, 1710, as shown by the minute researches of Professor Dugald Stewart, who affectionately wrote the life of his eminent friend. The family of Reid had been ornamented by producing different authors of considerable eminence in their age.¹ One of his ancestors, James Reid, was the first minister of Banchory-Ternan (a parish in the neighbourhood of Strachan) after the Reformation. His son Thomas has been commemorated by Dempster (whose praises of a Protestant clergyman's son may be deemed worthy of credit) as a man of great eminence. He collected in a volume the theses he had defended at foreign universities; and some of his Latin poems were inserted in the *Delitiae Poetarum Sotorum*. He was Greek and Latin secretary to James I., and bequeathed to Marischal College a sum for the support of a librarian, which has since disappeared or been directed to other purposes. Alexander, a brother of Thomas, was physician to King Charles I., and published some forgotten works on medicine and surgery. Another brother translated Buchanan's *History of Scotland* into English. The father of the subject of our memoir was the Rev. Lewis Reid, for fifty years minister of the parish of Strachan; and his mother was daughter to David Gregory of Kinnairdie, elder brother of James Gregory, the inventor of the reflecting telescope.

After spending two years at the parish school of Kincardine O'Neil, Thomas Reid was sent, for the further prosecution of his studies, to Aberdeen, where, at the age of twelve or thirteen, he was entered as a student of Marischal College. Little is known of his early studies or qualifications, with the exception of the not very flattering remark of his master, "That he would turn out to be a man of good and well-wearing parts." In a letter to a friend, written late in life, he has stated some circumstances connected with his habits of body in youth, which he appears to have recollected merely as the data of some of his philosophical speculations. They are perhaps not the least interesting, as showing that the physical state of the body produces effects in the procedure of the mind, different from what might be presumed as the mental characteristics of the individual, as derivable from his opinions. "About the age of fourteen," he says, "I was almost every night unhappy in my sleep from frightful dreams, sometimes hanging over a dreadful precipice, and just ready to drop down; sometimes pursued for my life, and stopped by a wall, or by a sudden loss of all strength; sometimes ready to be devoured by a wild beast. How long I was plagued with such dreams I do not recollect. I believe it was for a year or two at least; and I think they had quite left me before I was sixteen. In those days I was much given to what Mr. Addison, in one of his *Spectators*, calls castle-building: and in my evening solitary walk, which was generally all the exercise I took, my thoughts would hurry me into some active scene, where I generally acquitted myself much to my own satisfaction; and in these scenes of imagina-

¹ Stewart's *Biographical Memoirs*, p. 400.

tion I performed many a gallant exploit. At the same time, in my dreams I found myself the most arrant coward that ever was. Not only my courage, but my strength, failed me in every danger; and I often rose from my bed in the morning in such a panic that it took some time to get the better of it. I wished very much to get free of these uneasy dreams, which not only made me unhappy in sleep, but often left a disagreeable impression in my mind for some part of the following day. I thought it was worth trying whether it was possible to recollect that it was all a dream, and that I was in no real danger, and that every fright I had was a dream. After many fruitless attempts to recollect this when the danger appeared, I effected it at last, and have often, when I was sliding over a precipice into the abyss, recollected that it was all a dream, and boldly jumped down. The effect of this commonly was that I immediately awoke. But I awoke calm and intrepid, which I thought a great acquisition. After this my dreams were never very uneasy; and in a short time I dreamed not at all." That a mind such as Reid's should have been subject to "castle-building," and to singular dreams, must be accounted for from the state of his body; while the strong active powers of his mind are shown in the mastership which he at length acquired over the propensity.

While he remained at Marischal College, Reid was appointed to the librarianship which his ancestor had founded. During this period he formed an intimacy with John Stewart, afterwards professor of mathematics in Marischal College. In 1736 he accompanied this gentleman to England, and they together visited London, Oxford, and Cambridge, enjoying an intercourse with Dr. David Gregory, Martin, Folkes, and Dr. Bentley. In 1737 the King's College, as patrons, presented Dr. Reid with the living of New Machar, in Aberdeenshire. An aversion to the law of patronage, which then strongly characterized many districts of Scotland, excited hostile feelings against a man who, if the parishioners could have shown their will as well in making a choice as in vituperating the person chosen, would have been the very man after their heart. In entering on his cure he was even exposed to personal danger. "His unwearied attention, however," says Professor Stewart, "to the duties of his office, the mildness and forbearance of his temper, and the active spirit of his humanity, soon overcame all these prejudices: and not many years afterwards, when he was called to a different situation, the same persons who had suffered themselves to be so far misled as to take a share in the outrages against him, followed him, on his departure, with their blessings and tears." On his departure some old men are said to have observed, "We fought against Dr. Reid when he came, and would have fought for him when he went away." It is said that, for at least a considerable portion of the time which he spent at New Machar, he was accustomed to preach the sermons of Dr. Tillotson and Dr. Evans, instead of his own; a circumstance which his biographer attributes to modesty and self-diffidence. In 1740 he married Elizabeth, the daughter of his uncle, Dr. George Reid, physician in London. About this period he is said to have spent his time in intensely studying moral philosophy, and in making those observations on the organs of sense, and their operation on the external world, which formed the broad basis of his philosophy. Reid was not a precocious genius; and whatever he wrote in early life is said to have been defective in style: but he busied himself in planting good seed, which, in the autumn of his days, produced to himself and to the world a

rich and abundant harvest. His first public literary attempt was an "*Essay on Quantity*, occasioned by reading a Treatise, in which Simple and Compound Ratios are applied to Virtue and Merit," published in the *Transactions* of the Royal Society, in 1748. This paper is levelled at the *Inquiry into the Origin of our Ideas of Beauty and Virtue*, by Dr. Hutcheson, who had committed the venial philosophical sin of making use of a science which can only be brought to bear on moral science as a means of illustrating it, and abbreviating the method of reasoning, as affording grounds for reasoning by analogy. Perhaps, on a fair consideration, Hutcheson may not have intended to carry his system to the extent presumed in this valuable little treatise, most of the arguments of which are made to meet the application of the mathematics, not only as forming a regular series of analogies fit to be used in moral science, but likewise as so accurately corresponding, that, as it is all mensurable itself, it serves the purpose of a measurer in moral science. The following sentence contains the essence of his argument on this last point, and it is conclusive. "It is not easy to say how many kinds of improper quantity may, in time, be introduced into the mathematics, or to what new subjects measures may be applied: but this, I think, we may conclude, that there is no foundation in nature for, nor can any valuable end be served by, applying measure to anything but what has these two properties: First, it must admit of degrees of greater and less; secondly, it must be associated with or related to something that has proper quantity, so as that when one is increased the other is increased; when one is diminished the other is diminished also; and every degree of the one must have a determinate magnitude or quantity of the other corresponding to it."¹ Reid seems not to have been very certain whether the person whom he opposes (styled by him Dr. M.) did actually maintain mathematics as being a proper measure in the moral sciences, or that it merely afforded useful analogies; and perhaps some who are disposed to agree with Reid as to the former alternative, may not be prepared to join him in attacking the latter. He continues: "Though attempts have been made to apply mathematical reasoning to some of these things, and the quantity of virtue and merit in actions has been measured by simple and compound ratios; yet Dr. M. does not think that any real knowledge has been struck out this way: it may perhaps, if discreetly used, be a help to discourse on these subjects, by pleasing the imagination and illustrating what is already known; but till our affections and appetites shall themselves be reduced to quantity, and exact measures of their various degrees be assigned, in vain shall we essay to measure virtue and merit by them. This is only to ring changes on words, and to make a show of mathematical reasoning, without advancing one step in real knowledge."²

In 1752 the professors of King's College in Aberdeen elected Dr. Reid professor of moral philosophy, "in testimony of the high opinion they had formed of his learning and abilities." After having taken up his residence in Aberdeen, he became one of the projectors of that select society of philosophers which then dignified the northern city. It is perhaps partly to the influence of this association that, among many other works, we owe the *Inquiry into the Human Mind upon the Principles of Common*

¹ Reid's *Essays* (1820), vi.

² *Essays*, viii. Stewart, who praises the principles of this essay (*Life*, *ut sup.*, 510), was more than most philosophers of his eminence, addicted to the vice detected in one of its forms, viz. comparison between mental and physical nature, not merely to the extent of illustration, but of analogy.

Sense, which Dr. Reid published in 1764. As this work developed an argument against the sceptical philosophy of Mr. Hume, the author, with more magnanimity than some members of his profession displayed at the time, procured, by the interposition of Dr. Blair, a perusal of the manuscript by Hume, in order that any of those disputes from mere misunderstanding of words, so pernicious to philosophical discussion, might be avoided. Hume at first displayed some disinclination, founded on previous experience of others, to encourage this new assailant. "I wish," he said, "that the parsons would confine themselves to their old occupation of worrying one another, and leave philosophers to argue with temper, moderation, and good manners." But his liberal mind did not permit him, on seeing the manuscript, and knowing the worth of its author, to yield to his hasty anticipations. Writing personally to Reid he said, "By Dr. Blair's means I have been favoured with the perusal of your performance, which I have read with great pleasure and attention. It is certainly very rare that a piece so deeply philosophical is wrote with so much spirit, and affords so much entertainment to the reader, though I must still regret the disadvantages under which I read it, as I never had the whole performance at once before me, and could not be able fully to compare one part with another. To this reason chiefly I attribute some obscurities which, in spite of your short analysis or abstract, still seem to hang over your system. For I must do you the justice to own that, when I enter into your ideas, no man appears to express himself with greater perspicuity than you do; a talent which, above all others, is requisite in that species of literature which you have cultivated. There are some objections which I would willingly propose to the chapter "Of Sight," did I not suspect that they proceed from my not sufficiently understanding it; and I am the more confirmed in this suspicion, as Dr. Black tells me that the former objections I had made had been derived chiefly from that cause. I shall therefore forbear till the whole can be before me, and shall not at present propose any farther difficulties to your reasonings. I shall only say, that if you have been able to clear up these abstruse and important subjects, instead of being mortified, I shall be so vain as to pretend to a share of the praise; and shall think that my errors, by having at least some coherence, had led you to make a more strict review of my principles, which were the common ones, and to perceive their futility."

It may be as well here to pass over the intervening events of Dr. Reid's life, and give a brief sketch of the principles of his philosophy, as developed in his other works, to which, as Mr. Stewart has properly remarked, the *Inquiry into the Human Mind* forms an introduction. In 1785 he published his *Essays on the Intellectual Powers of Man*, and in 1788 those on the *Active Powers*. These two have been generally republished together, under the well-known title, *Essays on the Powers of the Human Mind*; a work which has gradually gained ground in the estimation of intelligent thinkers, and is now used as a text-book by many eminent teachers of philosophy. When it is said that Dr. Reid's philosophy is entirely, or intended to be entirely, synthetical, and that it adopts no theory, except as an induction from experiment, it will readily be understood that a view of its general principles and tendency cannot be given; but it is not on this account very difficult to describe the method by which he reasoned, and came to the different conclusions he has adopted.

Reid has generally received, and probably with

justice, the praise of having been the first to extend, by a general system, the process of reasoning from experiment, so strongly recommended by Bacon in natural science, to the operations of the mind. In this he was, to a certain extent, anticipated by Hume, who, especially in his arguments on cause and effect, and his essay on miracles, proceeded on analyses of our experience: but the two philosophers followed a different method; the sceptic using his experience to show the futility of any systems of philosophy which had been raised; while Reid made use of them to redeem, as it were, mental science, by eschewing these systems, and founding one of his own on that experience which he saw had enabled the sceptic to demolish the systems destitute of such a support. But to accomplish his purpose—and this is what distinguishes his philosophy from all other systems—Reid found it necessary to set bounds to his inquiries, which other philosophers had passed. He abstained from that speculation concerning the nature and essence of the mind itself, which, as followed by others, had formed the most convenient object of demolition to the sceptic, and limited himself to observations on the operations of the mind, as he saw them performed before him. Instead, therefore, of appealing to any theories of his own (which he knew would require to be founded on vague speculation, and independently of observation) on the essence of the mind, when he tried the truth of his observations he appealed to what he called "common sense," or that sense, however acquired, which prompts us to believe one thing and disbelieve another. Hence it might be said, in common language, that instead of making his inquiries by means of subtle and metaphysical reasonings, he stated his views, trusting that his readers would believe him from their common sense, and if they did not choose to do so, knowing that the greater part of the world was on his side, despite of any fine-spun objections which might be produced by the sophist. The following, perhaps, more than most other passages in his works, bears a marked stamp of his method of reasoning: "Perhaps Des Cartes meant not to assume his own existence in this enthymeme, but the existence of thought, and to infer from that the existence of a mind or subject of thought. But why did he not prove the existence of his thought? Consciousness, it may be said, vouches that. But who is voucher of the consciousness? Can any man prove that his consciousness may not deceive him? No man can: nor can we give a better reason for trusting to it, than that every man, while his mind is sound, is determined, by the constitution of his nature, to give implicit belief to it, and to laugh at, or to pity, the man who doubts its testimony. And is not every man in his wits as determined to take his existence upon trust as his consciousness?"¹ It is easier to find objections to, than to erect a system of metaphysical philosophy; and that of Reid affords ample room for controversy. Admitting that the only ground on which we can ever place metaphysical truths is, the general belief of men of sound mind, it must still, in every instance, be a very questionable matter, whether these men of sound mind have come to the *right* conclusion, and whether it may not be possible, by a little more investigation and argument, even though conducted by a sceptical philosopher, to show reasons for coming to a different conclusion, and to establish it upon the very same grounds, viz. the general belief of men of sound mind. When Galileo discovered that nature abhorred a vacuum, and was afterwards obliged to admit that this abhorrence did not extend above

¹ *Inquiry* (1819), 23.

thirty-three feet, many men of sound mind probably felt themselves "determined, by the constitution of their nature, to give implicit belief" to both positions, until one discovered the effect of atmospheric pressure, and got men of common sense to admit that nature had no greater horror at a vacuum than at a plenum. It became a necessary consequence of this method of reasoning, that Reid's first or instinctive principles were less simple and more numerous than those of other philosophers; and his opponents accused him of having by that means perplexed and complicated the science of mind. In simplifying this science there are two evils to be avoided—a propensity to refine everything into first principles, unsupported by reason; and the lesser vice of producing confusion, by not extending speculation so far towards the establishment of first principles as there may be good reason for proceeding. It was probably in his anxiety to avoid the former, that Reid incurred not unjust censure for sometimes embracing the latter alternative. The *Principle of Credulity* and the *Principle of Veracity* are certainly objectionable. Reid has had many warm followers, and many who have looked on his philosophy with great contempt. Those who conceive that all systems of mental philosophy are merely useful for the exercise they give the mind, and the undoubted truths which they occasionally lay open, will perhaps make the fairest appreciation of his merit, and by such it may perhaps be allowed, that the broad method he followed has enabled him to lay before the world a greater number of interesting circumstances connected with moral science, than most other philosophers have been enabled to display. Before leaving the subject of his works, it may be mentioned, that he composed, as a portion of Lord Kames' *Sketches of the History of Man*, "A Brief Account of Aristotle's Logic;" the chief defect of this production is its professed brevity. It is very clear and distinct, and leads one to regret that so accurately thinking and unprejudiced a writer had not enriched the world with a more extensive view of the Aristotelian and other systems.

In 1763, while he was, it may be presumed, preparing his *Inquiry* for the press, a knowledge of what was expected to come from his pen, and his general fame, prompted the university of Glasgow to invite him to fill the chair of natural philosophy there. In this office Professor Stewart remarks, that "his researches concerning the human mind, and the principles of morals, which had occupied but an inconsiderable space in the wide circle of science allotted to him by his former office, were extended and methodized in a course which employed five hours every week, during six months of the year. The example of his illustrious predecessor, and the prevailing topics of conversation around him, occasionally turned his thoughts to commercial politics, and produced some ingenious essays on different questions connected with trade, which were communicated to a private society of his academical friends. His early passion for the mathematical sciences was revived by the conversation of Simson, Moor, and the Wilsons; and at the age of fifty-five he attended the lectures of Black with a juvenile curiosity and enthusiasm." Dr. Reid's constant desire for the acquisition of facts on which to raise his deductions, kept him continually awake to all new discoveries; and he spent many, even of the latter days of his long life, in observing the truths which were developed by this illustrious chemist. The biographer, after observing that the greater part of the course of lectures delivered by Dr. Reid at Glasgow is to be found in his published

works, proceeds: "Beside his speculations on the intellectual and active powers of man, and a system of practical ethics, his course comprehended some general views with respect to natural jurisprudence, and the fundamental principles of politics. A few lectures on rhetoric which were read at a separate hour to a more advanced class of students, formed a voluntary addition to the appropriate functions of his office, to which, it is probable, he was prompted rather by a wish to supply what was then a deficiency in the established course of education, than by any predilection for a branch of study so foreign to his ordinary pursuits." It may be right to quote from the same authority those observations as to his method of teaching, which none but an ear-witness can make. "In his elocution and mode of instruction there was nothing peculiarly attractive. He seldom, if ever, indulged himself in the warmth of extempore discourse; nor was his manner of reading calculated to increase the effect of what he had committed to memory. Such, however, was the simplicity and perspicuity of his style; such the gravity and authority of his character; and such the general interest of his young hearers in the doctrines which he taught, that by the numerous audiences to which his instructions were addressed, he was heard uniformly with the most silent and respectful attention. On this subject I speak from personal knowledge, having had the good fortune, during a considerable part of winter 1772, to be one of his pupils." In 1781 Dr. Reid retired from the duties of his professorship; and while his labour and assiduity had earned for him a full right to enjoy his old age in literary retirement, his mental faculties remained unimpaired. After this period he communicated some essays to the Philosophical Society. The most important were: *An Examination of Priestley's Opinions concerning Matter and Mind; Observations on the Utopia of Sir Thomas More; and Physiological Reflections on Muscular Motion*. By this time Reid had suffered considerable domestic affliction; four of his children had died after reaching the age of maturity, leaving one daughter, married to Patrick Carmichael, M.D. After his retirement his wife died. In a letter to Professor Stewart he thus affectingly describes his situation after that event: "By the loss of my bosom friend, with whom I lived fifty-two years, I am brought into a kind of new world, at a time of life when old habits are not easily forgot, or new ones acquired. But every world is God's world, and I am thankful for the comforts he has left me. Mrs. Carmichael has now the care of two old deaf men, and does everything in her power to please them; and both are very sensible of her goodness. I have more health than at my time of life I had any reason to expect. I walk about; entertain myself with reading what I soon forget; can converse with one person if he articulates distinctly, and is within ten inches of my left ear; and go to church without hearing one word of what is said. You know I never had any pretensions to vivacity, but I am still free from languor and *ennui*. In the summer of 1796 he spent a few weeks in Edinburgh, and his biographer, who was then his almost constant companion, mentions that, with the exception of his memory, his mental faculties appeared almost unimpaired, while his physical powers were progressively sinking. On his return to Glasgow, apparently in his usual health and spirits, a violent disorder attacked him about the end of September; and after repeated strokes of palsy, he died on the 7th October following. The affectionate biographer, in drawing a character of this eminent and excellent man, may

be said to sum up the particulars of it in the words with which he commences. "Its most prominent features were—intrepid and inflexible rectitude; a pure and devoted attachment to truth; and an entire command (acquired by the unwearied exertions of a long life) over all his passions."

RENNIE, JOHN, a celebrated civil engineer, was the youngest son of a respectable farmer at Phantassie, in East Lothian, where he was born, June 7, 1761. Before he had attained his sixth year he had the misfortune to lose his father; his education, nevertheless, was carried on at the parish school (Prestonkirk) by his surviving relatives. The peculiar talents of young Rennie seem to have been called forth and fostered by his proximity to the workshop of the celebrated mechanic Andrew Meikle, the inventor or improver of the thrashing-machine. He frequently visited that scene of mechanism, to admire the complicated processes which he saw going forward, and amuse himself with the tools of the workmen. In time he began to imitate at home the models of machinery which he saw there; and at the early age of ten he had made the model of a wind-mill, a steam-engine, and a pile-engine, the last of which is said to have exhibited much practical dexterity.

At twelve Rennie left school, and entered into the employment of Andrew Meikle, with whom he continued two years. He then spent two years at Dunbar, for the purpose of improving his general education. So early as 1777, when only sixteen years of age, his Dunbar master considered him fit to superintend the school in his absence, and on being removed to the academy at Perth, recommended Rennie as his successor. This, however, was not the occupation which the young mechanician desired, and he renewed his former labours in the workshop of Andrew Meikle, employing his leisure hours in modelling and drawing machinery. Before reaching the age of eighteen he had erected two or three corn-mills in his native parish; but the first work which he undertook on his own account was the rebuilding of the flour-mills at Invergowrie, near Dundee.

Views of an ambitious kind gradually opened to him, and, by zealously prosecuting his professional labours in summer, he was enabled to spend the winter in Edinburgh, where he attended the lectures of Professor Robison on natural philosophy, and those of Dr. Black on chemistry. Having thus fitted himself in some measure for the profession of an engineer, he proceeded to Soho, with a recommendation from Robison to Messrs. Bolton and Watt. On the way he examined the aqueduct bridge at Lancaster, the docks at Liverpool, and the interesting works on the Bridgewater Canal. At Soho he was immediately taken into employment, and it was not long ere Mr. Watt discovered the extraordinary talents of his young assistant. In the erection of the Albion Mills in London, which was completed in 1789, Mr. Rennie was intrusted by his employers with the construction of the mill-work and machinery, which were admitted to be of superior excellence. These mills consisted of two engines, each of fifty horse power, and twenty pairs of millstones, of which twelve or more pairs, with the requisite machinery, were constantly kept at work. In place of wooden wheels, so subject to frequent derangement, wheels of cast-iron, with the teeth truly formed and finished, and properly proportioned to the work, were here employed; the other machinery, which used to be made of wood, was made of cast-iron in improved forms. This splendid establishment, which Mr.

Watt acknowledges to have formed the commencement of the modern improved system of mill-work, was destroyed in 1791 by wilful fire, being obnoxious to popular prejudices, under the mistaken supposition of its being a monopoly. The mechanism, however, established Mr. Rennie's fame, and he soon after began to obtain extensive employment on his own account.

The earlier years of his professional life were chiefly spent in mill-work; and his merits in this line may be briefly stated. One striking improvement was in the bridge-tree. It was formerly customary to place the vertical axis of the running millstone in the middle of the bridge-tree, which was supported only at its two extremities. The effect of this was that the bridge-tree yielded to the variations of pressure arising from the greater or less quantity of grain admitted between the millstones, which was conceived to be a useful effect. Mr. Rennie, however, made the bridge-tree perfectly immovable, and thus freed the machinery from that irregular play which sooner or later proves fatal to every kind of mechanism. Another improvement by Mr. Rennie has been adverted to in the above account of the Albion Mills; but the principal one was in the comparative advantage which he took of the water-power. He so economized the power of water as to give an increase of energy by its specific gravity to the natural fall of streams, and to make his mills equal to four-fold the produce of those which, before his time, depended solely on the impetus of the current.

Mr. Rennie was gradually attracted from the profession of a mechanician to that of an engineer. In the course of a few years after his first coming into public notice, he was employed in a considerable number of bridges and other public works, all of which he executed in a manner which proved his extraordinary genius. His principal bridges are those of Kelso, Leeds, Musselburgh, Newton-Stewart, Boston, and New Galloway. The first, which was erected between 1799 and 1803, has been greatly admired for its elegance, and its happy adaptation to the beautiful scenery in its neighbourhood. It consists of a level roadway resting on five elliptical arches, each of which has a span of seventy-three feet, and a rise of twenty-one. The bridge of Musselburgh is on a smaller scale, but equally perfect in its construction. A remarkable testimony to its merits was paid in Mr. Rennie's presence, by an untutored son of nature. He was taking the work off the contractor's hands when a magistrate of the town, who was present, asked a countryman who was passing at the time with his cart how he liked the new bridge. "Brig?" answered the man, "it's nae brig ava; ye neither ken whan ye're on't, nor whan ye're aff't." It must be remarked that this bridge superseded an old one in its immediate neighbourhood, which had a very precipitous roadway, and was in every respect the opposite of the new one.

Mr. Rennie was destined, however, to leave more splendid monuments of his talents in this particular department of his profession. The Waterloo Bridge across the Thames at London, of which he was the architect, would have been sufficient in itself to stamp him as an engineer of the first order. This magnificent public work was commenced in 1811, and finished in 1817, at the expense of rather more than a million of money. It consists of nine equal arches of 127 feet span; the breadth between the parapets is 42 feet; and the roadway is perfectly flat. Mr. Rennie also planned the Southwark Bridge, which is of cast-iron. The plan of the new London Bridge was likewise furnished by him; but of this public work he did not live to see even the commencement.

Among the public works of different kinds executed by Mr. Rennie may be mentioned;—of canals, the Aberdeen, the Great Western, the Kennet and Avon, the Portsmouth, the Birmingham, and the Worcester;—of docks, those at Hull, Leith, Greenock, Liverpool, and Dublin, besides the West India docks in the city of London;—and of harbours, those at Berwick, Dunleary, Howth, Newhaven, and Queensferry. In addition to these naval works he planned various important improvements on the national dockyards at Plymouth, Portsmouth, Chatham, and Sheerness; and the new naval arsenal at Pembroke was constructed from his designs. But by far the greatest of all his naval works was the celebrated breakwater at Plymouth. It is calculated that he planned works to the amount of fifty millions in all, of which nearly twenty millions were expended under his own superintendence.

Mr. Rennie died, October 16, 1821, of inflammation in the liver, which had afflicted him for some years. By his wife, whom he married in 1789, he left six children, of whom the eldest, Mr. George Rennie, followed the same profession as his father, and died near the beginning of the year 1866. Mr. John Rennie was buried with great funeral honours in St. Paul's Cathedral, near the grave of Sir Christopher Wren.

The grand merit of Mr. Rennie as an engineer is allowed to have been his almost intuitive perception of what was necessary for certain assigned purposes. With little theoretical knowledge he had so closely studied the actual forms of the works of his predecessors, that he could at length trust in a great measure to a kind of tact which he possessed in his own mind, and which could hardly have been communicated. He had the art of applying to every situation where he was called to act professionally the precise form of remedy that was wanting to the existing evil. Whether it was to stop the violence of the most boisterous sea—to make new harbours, or to render those safe which were before dangerous or inaccessible—to redeem districts of fruitful land from encroachment by the ocean, or to deliver them from the pestilence of stagnant marsh—to level hills or to tie them together by aqueducts or arches, or, by embankment, to raise the valley between them—to make bridges that for beauty surpass all others of their time, and for strength seem destined to last to the latest posterity—Rennie had no rival. Though he carried the desire of durability almost to a fault, and thus occasioned more expense perhaps, on some occasions, than other engineers would have considered strictly necessary, he was equally admired for his conscientiousness in the fulfilment of his labours, as for his genius in their contrivance. He would suffer no subterfuge for real strength to be resorted to by the contractors who undertook to execute his plans. Elevated by his genius above mean and immediate considerations, he felt in all his proceedings as if he were in the court of posterity: he sought not only to satisfy his employers, but all future generations.

Although Rennie did not devote himself to the acquisition of theoretical knowledge, excepting to that general extent which is required by every well-informed engineer, he was fond of those investigations of a mixed character, where the results of experiment are combined by mathematical rules and a train of inquiry directed and modified by the lights of theory. In his instrument for ascertaining the strength of flowing water he has made a contribution to science of no small importance.

In person Mr. Rennie was greatly above the usual size. His figure was commanding, and his features

massive and strong, but with a mild expression. He was endeared to all who knew him by the gentleness of his temper; and the cheerfulness with which he communicated the riches of his mind, and forwarded the views of those who made useful improvements or discoveries in machinery, procured him universal respect.

RENWICK, JAMES, a celebrated nonconforming clergyman, was born in the parish of Glencairn, Dumfriesshire, on the 15th of February, 1662. His parents, who were in humble circumstances, and of whom he was the only surviving child, seem to have looked upon him with peculiar fondness—especially his mother, who regarded him as a special gift, an answer to her prayers, and one who was intended to be more than ordinarily useful in the world. His childhood was watched over with peculiar solicitude; and their hopes were still further excited, and their confidence strengthened, by the sweetness and docility of his disposition. Piety marked his earliest years, and his attention to his books was unwearied, circumstances which induced his parents, amidst many difficulties, to keep him at school till he found the means of putting himself in the way of attaining greater proficiency in the city of Edinburgh, where, by attending upon and assisting in their studies the children of persons more wealthy than himself, he was enabled to prosecute his own. After having attended the university there, however, he was denied laureation, in consequence of refusing to take the oath of allegiance, and was under the necessity of prosecuting his studies more privately, and in the best manner he could. In the meantime, he was a diligent attendant on the secret meetings of the persecuted Presbyterians, and took a deep interest in the questions which at that time were so keenly agitated among, and at length so widely divided, that unfortunate party. Of the unfaithfulness of the indulged ministers in general he had long had strong impressions, and these seem to have been confirmed by hearing the testimony and witnessing the martyrdom of Mr. Donald Cargill, on the 27th of July, 1681; an event which determined him to attach himself to the small remnant which adhered to the principles of that sincere and excellent Christian.

On the death of Mr. Cargill, being deprived of public ordinances, this portion of the sufferers formed themselves into particular societies, united in one general correspondence, in which Mr. Renwick was particularly active. In the month of October he held a conference with a number of the more influential of the party, concerning the testimonies of some of the martyrs lately executed; when, it is said, he refreshed them much by showing them how much he was grieved to hear these martyrs disdainfully spoken of; how much he was offended with some that attended the curates, pleaded for the paying of cess, and for owning and defending the authority of the tyrant; and how much he longed to see a formal testimony lifted up against all those, with their attendant defections. On the 15th of December, in the same year in which Mr. Cargill suffered, his adherents held their first general meeting, at which was drawn up the paper known by the name of the Lanark Declaration, from the place where it was proclaimed, on the 12th day of January, 1682. Mr. Renwick was not the writer of this document, some parts of which he always allowed to be “inconsiderately worded;” but he was one of the party who proclaimed it, and at the same time burned the test and the act of succession of the Duke of York to the crown.

The boldness of this declaration, which embraced

both the Rutherglen and Sanquhar declarations, emitted in the years 1679 and 1680, and declared the whole acts of the government of Charles Stuart, from his restoration in 1660 down to that day, to be utterly illegal, as emanating from a pure usurpation upon the fundamental laws of the kingdom, and many of them, in their own nature, tyrannical and cruel in the highest degree, astonished their enemies, and astounded not a few of their best friends, who, to correct the unfavourable reports concerning them, which, through the malice of their enemies, were circulated among the churches of the Low Countries, found it necessary to commission Gordon of Earlstoun to the United Provinces, to state their case as it actually stood, and to solicit that compassion and sympathy which was denied them by their own countrymen. Earlstoun met with a very favourable reception: and it was proposed, seeing the universities in Scotland were closed against all such as were desirous of maintaining a clear conscience, to have students educated under the eye of these churches at their universities, who might be ordained to the work of the ministry; and that there should thus be a succession of faithful labourers kept up for the benefit of the present and of future generations. This proposal was at once embraced by the societies as the only probable method of being supplied with a dispensation of gospel ordinances; and Mr. Renwick, along with some others, was accordingly sent over and admitted into the university of Groningen. After he had attended six months the progress he had made was such, together with the urgency of the case (for the societies had not so much as one preacher all this time), that it was thought proper he should be ordained, and sent back to his native land. He was accordingly, after no little trouble, through the interest of Mr. Robert Hamilton, who was well known there, ordained by the classes of Groningen; when, longing to employ any little talent he possessed for the advancement of the cause of Christ and the benefit of his suffering people, he proceeded to Rotterdam, intending to avail himself of the first opportunity of a ship going for Scotland. Finding a ship ready to sail, Mr. Renwick embarked at the Brill for his native country; but after being some time on board, he was so much annoyed by some profane passengers, that he left the vessel and entered another that was going to Ireland. In consequence of a violent storm the vessel put into the harbour of Rye, in England, where he was in no small danger from the noise and disturbance created at the time by the Rye-house Plot. He, however, got safely off, and, after a tedious and stormy passage, was landed at Dublin. In a short time he embarked for Scotland, and with no little difficulty and danger succeeded in landing on the west coast of that kingdom, where he commenced those weary wanderings which were to close only with his capture and death. His first public sermon was delivered in the moss of Darmead, in the month of September, 1683, where he was cordially and kindly received by a poor and persecuted people, who had lost, for the gospel's sake, whatever they possessed of temporal enjoyments, and were ready for that consideration to peril their lives. On this occasion, for his own vindication and for the satisfaction of his hearers, he gave an account of his call to the ministry, and declared his adherence to the doctrine, worship, discipline, and government of the Church of Scotland. He at the same time gave them his opinion upon the particular questions which were agitating the minds of men at the time, stating particularly what class of ministers and professors he was willing to hold fellowship with, and also that with which he

could not. In this statement, as he studied to be plain and particular, he mentioned several names, which gave great offence to some, and it was employed with much assiduity to excite prejudices and create slanders against both his person and ministry; and with all the other hardships of his lot, he was pursued everywhere by misrepresentation and calumny.

Amidst so much clamour of friends and of enemies, he soon attracted the notice of the council, to whom nothing was so terrible as field-preaching. He was speedily denounced as a traitor, and all who followed him were pursued as abettors of rebellion. No house that he entered, if it was known, escaped pillage; and no one who heard him, if he could be found, escaped punishment. Nothing can be conceived more desperate than his situation; not daring to venture abroad, yet finding no place of rest except in the most remote and inaccessible retreats. Called upon nightly to confer, to preach, to pray, to baptize, and to catechise, with no better accommodation than the cavern of the rock, an excavation in the moss, or, at the best, a ruined and deserted shepherd's shiel, where a fire of sticks or heath, and a scanty morsel brought from afar by the hands of children, were his greatest luxuries; yet he prosecuted his labours with remarkable success, greatly increasing the number of his followers in the course of a few months.

In the succeeding year, 1684, his difficulties and discouragements were considerably increased. The revilings of those who should have been his helpers became more bitter, and the vigilance of his persecutors more unremitting. Often was he pursued for days and nights together, and to all appearance left without the possibility of escape; yet he still escaped as if by miracle. Enraged beyond measure at the increase of his followers, and their want of success in so many attempts to apprehend him, the council, in the month of September in this year, issued out letters of intercommuning against him; which, reducing the whole body of the sufferers to the most incredible hardships, drove them, between madness and despair, to publish, in the month of October following, their apologetical declaration; wherein, after stating their abhorrence of the idea of taking the lives of such as differ from them in opinion, they declared their firm persuasion of their right, from the word of God and fundamental laws of the kingdom, to defend themselves in the exercise of their religion; and, after naming the persons whom they supposed to be their chief persecutors, and whom they threatened with immediate and full retaliation, they add, "Now, let not any think, our God assisting us, we will be so slack-handed in time coming to put matters in execution as heretofore we have been, seeing we are bound faithfully and valiantly to maintain our covenants and the cause of Christ. Therefore let all these foresaid persons be admonished of their hazard. And particularly all ye intelligencers, who by your voluntary informations endeavour to render us up to the enemies' hands, that our blood may be shed—for by such courses ye both endanger your immortal souls, if repentance prevent not, seeing God will make inquisition for shedding the precious blood of his saints, whatever be the thoughts of men; and also your bodies, seeing ye render yourselves actually and maliciously guilty of our blood, whose innocency the Lord knoweth. However, we are sorry at our very hearts that any of you should choose such courses, either with bloody Doeg to shed our blood, or with the flattering Ziphites to inform persecutors where we are to be found. So we say again, we desire you to take warning of the hazard that ye incur by following such courses; for the sinless necessity of self-pre-

servation, accompanied with holy zeal for Christ's reigning in our land, and suppressing of profanity, will move us not to let you pass unpunished. Call to your remembrance all that is in peril is not lost, and all that is delayed is not forgiven. Therefore expect to be dealt with as ye deal with us, so far as our power can reach; not because we are incited by a sinful spirit of revenge for private and personal injuries; but, mainly, because by our fall reformation suffers damage, yea, the power of godliness, through ensnaring flatteries and terrible threatening, will thereby be brought to a very low ebb, the consciences of many more dreadfully surrendered, and profanity more established and propagated. And as upon the one hand, we have here declared our purposes anent malicious injurers of us; so, upon the other hand, we do hereby beseech and obtest all you who wish well to Zion, to show your good-will towards us, by acting with us, and in your places and stations, according to your abilities, counselling, encouraging, and strengthening our hands for this great work of holding up the standard of our Lord Jesus Christ. Think not that in anywise you are called to lie by neutral and indifferent, especially in such a day; for we are a people by holy covenants dedicated unto the Lord, in our persons, lives, liberties, and fortunes, for defending and promoting this glorious work of reformation, notwithstanding all opposition that is or may be made thereunto, yea, and sworn against all neutrality and indifferency in the Lord's matters. And moreover, we are fully persuaded that the Lord, who now hideth his face from the house of Jacob, will suddenly appear, and bring light out of darkness, and perfect strength out of weakness, and cause judgment return again unto righteousness."

When this declaration was first proposed, Mr. Renwick was averse to it, fearing that it might be followed by bad effects: nor were his fears disappointed. A reward of 500 merks was offered for every person who owned the declaration, or rather who would not disown it upon oath. No person was allowed to travel without a pass who was above the age of sixteen; many were shot instantly in the fields if they refused to take, even at the hands of a common trooper, the oath of abjuration; others, refusing the oath, were brought in, sentenced, and executed. On all which accounts Mr. Renwick was often heard to say, he wished from his heart that that declaration had never been published. The year 1685 did not at all better his situation; he was still persecuted with the utmost fury, yet he ventured, in the month of May that year, to the market-cross of Sanquhar, accompanied by 200 men, where he published a declaration against the succession of James Duke of York, called from that circumstance the Sanquhar Declaration. Refusing to concur with Argyle, who this year made an unsuccessful attempt from Holland, a division arose among his followers, several of whom withdrew from the societies, and became, both by word and pen, his bitter traducers; and in addition to all his other afflictions, when he had put his life in his hand, as it were, to dispense the ordinances of the gospel to the bereaved people, he was met even by those who had been his friends with protestations against him, taken in the name of large districts of the country. Even Mr. Peden was, by the multiplied slanders of his enemies, spirited up against him, and was not reconciled till after a conversation with him, when he was upon his death-bed, and unable to repair the injury. In the midst of these multiplied discouragements he was cheered by the assistance and fellowship of Mr. David Hunston, a minister from Ireland, and Mr. Alex-

ander Shields, a preacher who had made his escape from London, both of whom espoused the same testimony, and perilled their lives with him. It was but a short time, however, that he enjoyed the aid of these intrepid men; Mr. Hunston being necessitated to go to Ireland, and Mr. Shields going over to Holland, to superintend the printing of the informatory vindication. It was in this year that James VII., for the encouragement of the Catholics, set aside the penal statutes, and gave out his indulgences, allowing all to worship in their own way, except in barns or in fields; which, to the disgrace of the Scottish church, was embraced with abundance of gratulatory addresses by her whole body, ministers and members, Mr. Renwick and his followers excepted. This was a new addition to his troubles, and opened the mouths of complying professors still more against him. About this time, too, he became infirm in body, could neither walk nor ride, and was carried to his preaching places in the fields with great difficulty; though, in the time of preaching, he felt nothing of his weakness. The pursuit after him was now doubly hot, and £100 sterling was offered for him, either dead or alive. Coming to Edinburgh in the beginning of the year 1688, to give in a testimony to the synod of tolerated ministers against the toleration which they had accepted, and having delivered it into the hands of Mr. Kennedy, their moderator, he passed over to Fife, where he continued preaching at different places till the end of January, when he returned to Edinburgh and took up his lodgings in the house of a friend on the Castle Hill, a dealer in uncustomed goods. A party coming to search for these, discovered Mr. Renwick and apprehended him. He did not, however, surrender himself into the hands of his enemies without resistance. He drew out and fired a pocket-pistol, and having thus made an opening among his assailants, escaped into the Castle Wynd, and ran towards the head of the Cowgate; but one of the party having hit him a violent stroke on the breast with a long staff as he passed out, he was staggered, and fell several times, and having lost his hat, was laid hold of by a person in the street, who probably knew nothing of the man, or the crimes laid against him. Being taken to the guard-house, he was there kept for a considerable time, and suffered much from the insolence of some that came to see him. The captain of the guard seeing him of little stature, and of a comely countenance, exclaimed, "Is this the boy which the whole nation has been troubled about?" After undergoing examination before the council, he was committed close prisoner, and put in irons. Before he received his indictment he was carried before the Lord-chancellor Tarbet, and examined upon his owning the authority of James VII., the paying of cess, carrying arms at field-meetings, &c.; upon all of which he delivered his mind with such faithfulness, freedom, and composure as astonished all that were present. He was examined upon the paying of cess, in consequence of the notes of two sermons on the subject being found upon him when he was taken. Among these notes were also memorandums of names, some in full, and some with merely the initials; all these, to avoid threatened torture, he explained with the utmost freedom, knowing that the persons were already as obnoxious as anything he could say would make them. This ingenuousness on his part had a wonderful effect in calming their rage against him, and Tarbet mildly asked him what persuasion he was of; to which he replied, of the Protestant Presbyterian. He was then asked how he differed from other Presbyterians who had accepted

his majesty's toleration, owned his authority, &c. &c. ? to which he answered, that he adhered to the old Presbyterian principles (which all were obliged by the covenants to maintain) as generally professed by the church and nation from the year 1640 to 1660, from which some had apostatized for a little liberty (they knew not how short), as they themselves had done for a little honour. Tarbet admitted that these were the Presbyterian principles, and that all Presbyterians would own them as well as he, if they had but the courage. Mr. Renwick was tried, February 8th, before the high court of justiciary, upon an indictment which charged him with denying the king's authority, owning the covenants, refusing to pay cess, and maintaining the lawfulness of defensive arms; and, upon his confession, was condemned to die. The day fixed for his execution was the 11th, but it was postponed to the 17th, in the hope that he would gratify the court by petitioning for a pardon, which it has never been doubted would have been gladly extended to him. With the constancy which had marked his whole life, he refused to do so, and was accordingly executed, being the last person who suffered a judicial death for the sake of religion in Scotland.

RHIND, ALEXANDER HENRY. This talented and enthusiastic antiquary was the only surviving son of Josiah Rhind of Sibster, banker in Wick, and was born on the 26th of July, 1833. Having been educated in early life at the Pultneytown Academy, he afterwards became a student in the university of Edinburgh, where, from 1848 to 1850, he attended the classes of natural history and natural philosophy. But his chief bent while at college was towards historical pursuits, and in 1849-50 he attended the lectures delivered in the university by Professor Cosmo Innes on "Scottish history and antiquities," and had his love of antiquarianism confirmed for life. And none but the votaries of the science can know the devoted affection which it inspires. To them the fragments of past ages, which to common eyes have no attraction whatever, transcend in value all living realities of the present. It is thus that the rusty coin, which ages ago has ceased to be current, can now realize its value a hundred-fold in the antiquarian market.

Impatient to extend his investigations and bring them into useful application, Mr. Rhind in March, 1851, and before he had completed his eighteenth year, was occupied in opening a set of cairns in the southern corner of the parish of Wick; and about the same time he translated from the German, Worsaae's *National Knowledge of Antiquities in Germany, and Notes of a Tour*. In the summer of this year he also visited the Great Exhibition in London, and afterwards set out in a tour of some months' duration to the Continent, during which he passed through the Low Countries, Switzerland, Italy, Austria, Saxony, Prussia, and Denmark, and gratified the chief purpose of his visit by examining the antiquarian stores of their museums. In the close of the following year Mr. Rhind, who already had acquired the character of an ingenious and indefatigable investigator into the graves of departed ages, was elected a fellow of the antiquaries of Scotland, and on this occasion he presented two remarkable stone vessels found near Wick to their museum. In the following year he brought before the society a paper, an abstract of which is printed in their *Proceedings* (vol. i. p. 182), under the title of *An Attempt to Define how far the Cymric encroached upon the Gaelic Branch of the Early Celtic Population of North Britain*. About the same time, and in 1853-4,

he employed himself in excavating those ancient remains called Picts' houses, to which such interest is attached by the students of the prehistoric records of Scotland; and the results of these explorations were communicated to the Antiquarian Society of Scotland, and published in their *Transactions*. Still ardent upon the subject of archaeology, and desirous that its discoveries should be generally known, he in 1854 proposed to the Crystal Palace Company that they should erect models of certain early British remains in their grounds at Sydenham. Alluding to their design, "not merely to gratify or educate the eye, but also to supply suggestive materials for intellectual information," he says in his proposal, "It will not, therefore, I imagine, be an objection to British aboriginal remains, that in an ornamental point of view they would be deficient, since, as practical and really attractive instructors, their value would be undoubted. Nor does it seem altogether free from anomaly that the visitors to the 'great popular educator,' as it has been justly termed, should have every facility for ascertaining how an Assyrian monarch was housed 3000 years ago, or for studying the sepulchral customs which prevailed on the banks of the Nile more than a millennium before our era; while no means whatever are afforded to enable them to form any idea of the manners and state of civilization at those periods of their predecessors on British soil—their ancestors it may be." It was not the smaller tools, weapons, and utensils of which he wished specimens or facsimiles to be exhibited—these were already to be found in local museums—but models of Picts' houses, hill-forts, cromlechs, and chambered cairns.

In 1853 Mr. Rhind, in the number of the *Retrospective Review* for February, published an article on "Early Scottish History and its Exponents," chiefly in reference to the *questio vexata*, Who were the Picts? In the *London Quarterly Review* for September, 1854, he also wrote a review of Worsaae's *Account of the Danes and Norwegians in England, Scotland, and Ireland*. It was reckoned at the time a very remarkable paper, on account of its suggestive character and extensive knowledge of the subject, although the source of its authorship was unknown until a considerable time afterwards. As his contemplated occupation was the Scottish bar, it was now time for Mr. Rhind to be up and doing, and he was making preparations for abjuring his beloved studies for the time, in favour of a regular attendance on the law classes in 1853 and 1854. But this purpose, as well as his active researches and manly athletic recreations, had to be set aside, in consequence of symptoms of a pulmonic disease which began to manifest themselves in 1854. A change to a milder atmosphere being judged necessary, he removed to Clifton in April, 1854. An ominous change had taken place on his physical system, from which the worst might be apprehended; and writing from Clifton he thus describes it: "The ascent of a gentle acclivity has now more terrors for me than climbing to a point in the Mont Blanc range 10,000 feet above the sea-level had two or three years ago." At Clifton he received accounts of the death of his elder and only surviving brother, and soon after he abandoned his purpose of studying for the law. He was now entirely at liberty to follow his favourite pursuits, and in the winter of 1854-5 he sent a paper to the Scottish Antiquarian Society, which was published in its *Proceedings*, "On the Bronze Swords occasionally attributed to the Romans." During the same season he also sent to it another on "British Primeval Antiquities; their Present Treatment and their Real Claims," which Mr. Rhind afterwards

published as a pamphlet. His aim in this proceeding was to create a general respect for the relics of the past, and secure them from that careless or destructive spirit by which they were so often rendered useless. With the same object in view he afterwards wrote a paper "On the Present Condition of the Monuments of Egypt and Nubia," which was published in the *Archæological Journal* for 1856. While thus employed he also induced the Scottish Antiquarian Society to exert their influence upon the ordnance survey, so that all primeval vestiges should be carefully set down in the ordnance map of Scotland. By this plan the inquirer would learn at a glance where certain relics are located, or what remains exist in specific districts, instead of being obliged to find them for himself by minute and laborious research.

During the winter of 1855-6 Mr. Rhind resided in Egypt, and in this new and important field of archæological exploration he commenced his researches in the tombs at Thebes, which were afterwards to throw such light upon ancient Egyptian history. "It is my earnest desire," he wrote in a letter to his biographer, "to add to our museum such a series of Egyptian antiquities as will form a fair comparative representation of the archæology of the extraordinary people who lay so near the primary fountains of civilization. With this view I shall gladly purchase where I can objects suitable for my purpose, which any of the peasantry around may possess, with the view of supplementing where the results of my own excavations may be wanting." This double expenditure of money and personal labour was successful, so that he was enabled to send many objects of interest, including a set of bilingual papyri and a painted bier, both supposed to be unique, to our national museum. He exerted himself in procuring skulls for such of his friends as were zealous in studying the successive races by whom the country had been occupied. Desirous also of recommending this locality to valetudinarians and tourists in general, he published, in November, 1856, a little volume entitled *Egypt: its Climate, Character, and Resources as a Winter Resort*, which contained not only the fruits of his own experience, but thermometrical notes contributed by the late Earl of Aberdeen, Sir Gardener Wilkinson, and others.

In the summer of 1856 Mr. Rhind had returned to Sibster, and renewed his excavations in the neighbourhood, the result of which was a communication entitled "Notes of Excavations of Tumuli in Caithness made in the Summer of 1856," which was published in the *Proceedings of the Antiquarian Society*, vol. ii. p. 372. In July of the same year a congress of the Archæological Institute, in the preliminary arrangements of which Mr. Rhind took an active interest, was held in Edinburgh, and at its meeting he read a paper "On Megalithic Remains in Malta," distinguished by the cautious character of its conclusions, and rejection of merely traditional premises. He also read before it a paper "On the History of Systematic Classification of Primeval Relics," in which he showed that the plan of arranging by fixed progressive periods had been known in Scotland before it was adopted in Scandinavia. Both papers were printed in the *Archæological Journal* for 1856.

In the winter of 1856-7 Mr. Rhind was once more in Egypt, and among the tombs at Thebes. The difficulties of his explorations, and the extent on which they were conducted, may be surmised from the following amusing letter which he wrote to a friend in the beginning of 1857:—"Having stated to our consul-general, Mr. Bruce, when at Cairo, the ob-

jects I had in view, he very kindly applied for and obtained for me a firman from the viceroy. Armed with this precious document under the seal of Said Pacha, enjoining all the governors throughout Egypt to aid me in whatever I may require, and permitting me to excavate wherever I like in the whole country, I possess here where I have taken up my position a sort of irresponsible power. I certainly shall not abuse it; and I do need it, for I have a shocking set of scoundrels to deal with. I have already forty men at work at one point and twenty at another. At the former I was cheered yesterday by the discovery of eight mummy cases, and to-day of six more. They were not within a tomb, but give evidence, I hope, of the proximity of one, and I shall diligently persevere in search of it, as from the position it would probably be interesting. On Monday I intend to have fifty more men in the valley of the splendid tombs of the kings. I have several times gone diligently over the ground, and I have marked off several spots that seem promising. . . . I have also originated an excavation on the island of Elephantine, 150 miles up the river, which Lord Henry Scott and Mr. Stobart have undertaken to superintend for me, sending for me should it prove favourably." But for this wide and laborious range of action his health was incompetent, so that he was obliged to yield, after having made a few discoveries, the chief of which was a large and remarkable tomb with its deposit in untouched security. Constrained by this and the advance of the season, he set sail from Alexandria, on the 4th of April for Malta, and thence proceeded to Palermo. It was a climate and scene fitted for such a toil-worn invalid, as his following description will testify:—"A more delicious place I have never seen. The eye may be almost constantly intoxicated with the exquisite landscape; and all around the city the air is redolent of the perfumes of endless varieties of flowers, orange blossoms, and the other products of a most luxuriant vegetation. Man is the sole saddening element in the prospect, both from what he too often appears to be in point of comfort, and from what we know he *is* in point of liberty. It had been my design to go on to Naples and Rome, but everything here is so attractive that I shall not tear myself away until it is necessary to turn homewards."

This deprecated necessity soon arrived, for during the summer of 1857 he returned to Sibster, and there we find him as busy with ruined towers and Celtic crania as he had lately been in Egypt with subterranean tombs and mummies. But every fresh exertion, whether of mind or body, was now certain to be followed by a severe penalty; and he was so utterly prostrated by hæmoptysis as to make it necessary at the close of the year to retire to Malaga. Early in the following year he was further saddened with tidings of the death of his father; and soon after, from the gloom which this event occasioned, he left Malaga and crossed over to Algeria. In the former place he wrote a paper, which was read to the Society of Scottish Antiquaries in his absence, and which he afterwards published as a pamphlet under the title of the *Law of Treasure Trove*. Finding the climate of Algiers too stimulating for his exhausted constitution, he shifted his quarters to the south of France, and made a temporary return to Sibster, where we find him studying "sculptured stones" and their deposits, and investigating the question about certain disinterred skulls as to whether they were Celtic or Scandinavian. After this we again find him in the south of France, in Nice, in Genoa, in Leghorn, and Rome, the last of which places was well calculated to gratify his antiquarian enthusiasm;

and of this mighty churchyard of the tombs of ancient nations he thus writes:—"I need not tell you of the archaeological profusion here. It is overpowering in quantity and dazzling in kind. During the past week I have examined most of the ruins of ancient Rome. The art galleries and the churches I have not yet entered upon. With regard to these, however, I intend on this occasion only to familiarize myself with the most prominent exemplars; and my time I propose chiefly to devote to the study of the Etruscan antiquities, with respect to which I want to lay a good basement in my memory for comparative purposes." In these brief notices of his last journeying we have a distinct outline of the character of Alexander Henry Rhind. He was travelling in quest of health, and to escape a deadly malady; but even this was of secondary importance to his scientific pursuits, which these changes of locality were so well suited to advance; and at whatever place he sojourned we find him studying its ancient history, not in myths and legends, but in its relics and ruins. Not content with seeing the world as it now existed, he must also see it as it had been—and not from the lying inscriptions on its tombstone, but the distinguished reality. And this knowledge alone he identified as veritable history, from which we could learn the real origin and progress of nations, and apply it to the welfare of living communities and the direction of those who were still to come. This, and not the gratification of an idle curiosity, was his generous aim, and for this his life-long career had been exclusively an antiquarian pilgrimage.

Mr. Rhind, at his departure from Edinburgh, had continued, as an honorary member, to maintain his connection with the Society of Scottish Antiquaries; and in 1859, when they were engaged in determining the principles on which their museum was to be arranged, he was desirous to aid them with his experience. This also he could offer with a good grace, as at various times he had visited, and carefully examined, the chief antiquarian museums of Europe. He accordingly wrote from Clifton, where he at that time resided, a *Memorandum on the Arrangement of the National Museum of Scottish Antiquities*, which he forwarded to the society. That the establishment of a right plan was no trivial or easy task may be learned from the following requirements of such a museum, which he stated at the outset. "The first is, that a collection calculated to teach inductively or deductively, should be arranged with respect to its instructive capabilities, and not merely in the manner most convenient for general adjustment or reference, as for example books in a library. The second is, that such a collection being an embodiment, or rather the data, of scientific inquiries not fully developed, speculative and progressive, should not, as far as possible, be classified according to any conclusion that may be doubtful, and thus cramped into a mere illustration of a foregone formula, instead of being allowed, by a quasi-natural juxtaposition of the objects, to evolve whatever shades of meaning they may bear." It was in accordance with these principles that the plan he suggested was drawn out, and the details were characterized by sagacity and clearness. After this his journeyings were resumed, sometimes with benefit to his health and sometimes the reverse; but at each remove we still find him busy among ethnological questions, and those chiefly which had a reference to his own country. In 1862 he was at Madeira, and here it was that he published his largest and most important work, on which he had been employed for many years, entitled *Thebes, its Tombs and their Tenants, Ancient and Present, including a Record of Excavations in the Necropolis*.

The following is an abstract of the contents of the work given by Rhind's biographer:—"It contains eleven chapters, the first of which is devoted to the general history of Thebes; the second describes the necropolis as one of the most remarkable in the world; the third gives the result of former sepulchral researches; the fourth describes the unified tomb of a Theban dignitary and its contents, portions of which were of an unusual character, and others unique; the fifth gives an account of a burial-place of the poor; the sixth records excavations among tombs of the kings, and of various grades; the seventh is devoted to the theories explanatory of Egyptian sepulture; the eighth to the sepulchral evidence of early metallurgic practice; the ninth points out how the demand for Egyptian relics has been supplied, and its influence on the condition of the monuments; the tenth furnishes an account of the present tenants of the tomb; and the eleventh continues the account of these tenants and of their rulers. The volume is illustrated by plates of the more remarkable objects."

After the completion of this laborious task, the wanderings of Mr. Rhind were renewed; but however his antiquarian tastes may have been gratified, his health underwent little or no improvement. Having visited Teneriffe, he wished once more to return to it; but this was for the purpose of investigating the relics of the Guanches, its early population before the Spanish conquest of the island 400 years ago, who presented, as he thought, some interesting resemblances to the primeval races of Europe. He revisited Egypt in 1862, where he spent the winter in tracing the operations of the Nile for 1000 miles, for the purpose of adding a preface to his work on Thebes, which he meant to have for its title, *The Nile Valley in relation to Chronology*. But the failure of health obliged him to abandon his intention and return to Europe, where he took up his residence first at La Majolica, on the Lake of Como, and afterwards at Zürich. And here his journeys and studies were to terminate, as he was found dead in his bed on the morning of the 3d of July, 1863, having passed away so tranquilly, that even his head had not moved on the pillow. His body was brought from Zürich, and interred in the family burying-ground in the parish churchyard of Wick. Such was the end of Alexander Henry Rhind, before he had attained the age of thirty. His will attested his love of the science to which his whole life had been devoted. To the Scottish Antiquarian Society he bequeathed his library, consisting of 1600 volumes, more or less connected with antiquarianism, and some of them of great rarity and value. He left to the society the sum of £400, "to be expended on practical archaeological excavations in the north-eastern portions of Scotland, where the remains are mostly unknown to the general student, and, from ethnographical reasons, are likely to afford important information." He also bestowed upon it the copyright of his work, *Thebes, its Tombs and their Tenants*; and after providing for the foundation and endowment of an institution at Wick for the industrial training of young women from certain parishes in Caithness, the foundation of two scholarships in the university of Edinburgh, and many other bequests of a private character, he left the residue of his estate of Sibster for the endowment of a professor or lecturer on archaeology in connection with the Antiquarian Society of Scotland. This bequest, which would ultimately realize a sum of about £7000, was to be available for the purpose when the life-rent of the occupant of Sibster had expired.

RICHARDSON, SIR JOHN, M.D. This distinguished naturalist was born at Dumfries in 1787.

His father, Gabriel Richardson, Esq., of Rosebank, was a magistrate of the county, and provost of the town of Dumfries. After an education at the grammar-school of his native town, John Richardson, at the age of fourteen, was sent to the university of Edinburgh, where he prosecuted his studies chiefly with a view to the medical profession; and in 1807 he entered the royal navy as an assistant-surgeon. In this capacity he served at the siege of Copenhagen, and afterwards on the coasts of Spain and Portugal; and before he had attained the age of twenty-one he was promoted to the rank of acting-surgeon of the *Hercules*, 74 guns, in reward of his bravery and coolness displayed in a night-attack by boats on a French brig in the Tagus. It was a distinguished rise for one so young in years, but it was succeeded by the dull monotonous duty of cruising and protecting in the Baltic, on the West African coast, and at Quebec, until the American war of 1813 and 1814, in which he served as surgeon to a battalion of marines. With this last expedition his services in naval warfare terminated. In 1816 he took his degree of M.D. at the university of Edinburgh; and two years after, he married his first wife, a daughter of William Stiven, Esq., of Leith.

Although thus settled ashore, and married, Dr. Richardson was not to enjoy the peaceful easy life of a physician. He had resumed his studies, and his progress in these was accompanied with an ardent desire to enter the field of scientific enterprise and discovery. Accordingly, when Captain Franklin was about to set out on his expedition to the Arctic seas, Richardson volunteered his services, which were gladly accepted, and he accompanied the first overland expedition in 1819 as surgeon and naturalist. This dangerous enterprise was for the purpose of tracing the coast-line of the North American continent, at that time imperfectly known, and to achieve it the party were obliged to travel 5550 miles over ground as yet mostly unexplored. The privations, the trials, and dangers they underwent during their route were terrible, constituting a very martyrdom in the cause of scientific discovery; but the adventurers persevered in their course, and their devotedness was crowned by large acquisitions which were made to our knowledge of these concealed regions, both as to their physical geography and natural productions. The expedition was not completed until the year 1822, and in the following year Captain Franklin published his account of it, under the title of *Narrative of a Journey to the Shores of the Polar Sea*, in 1819 to 1822. This work had an appendix of "Geognostical Observations, Remarks on the Aurora Borealis, Notices of Fishes, and a Botanical Appendix, by Dr. Richardson;" and in the introduction Franklin wrote the following honourable attestation of the services of his talented assistant:—"To Dr. Richardson in particular the exclusive merit is due of whatever collections and observations have been made in the department of natural history; and I am indebted to him in no small degree for his friendly advice and assistance in the preparation of the present narrative."

The love of locomotion, especially if attended with the excitement of danger, is apt to become a passion, and to settle into a habit—and hence it is that sailors and travellers are so apt to return to their chosen occupation with the ardour of a first love. Notwithstanding the hardships and perils through which they had passed, Franklin and Richardson were to be no exceptions to this general rule, so that in 1825 a second expedition was undertaken by the pair to the shores of the Arctic Sea, the former in his capacity of commander, and the latter as medi-

cal officer and naturalist. Having reached Great Bear Lake in safety, they passed the winter of 1825–26 at Fort Franklin, which they had constructed for the purpose. When the season became fit for travelling, they descended the Mackenzie River, and having arrived at the spot where it separates into two main branches, the expedition was divided into two detachments, the one headed by Franklin and the other by Richardson. Captain Franklin's division with two boats descended the western branch of the river, while Dr. Richardson and his party, also in two boats, descended the eastern branch. The latter, after tracing the coast eastwards to the mouth of the Coppermine River, then ascended in their boats eleven miles to Bloody Fall, where the river ceases to be navigable; and there leaving their boats, they proceeded along the banks of the Coppermine on foot, and across the country, until they joined Captain Franklin, who had returned to Fort Franklin on Great Bear Lake, after he had traced the shores of the Arctic Sea from the Mackenzie River westwards to nearly 149° W. long. Having thus effected all that could be achieved by their second expedition, the pair returned to London, where they arrived on the 29th of September, 1827; and in the following year their discoveries were published as a "*Narrative of the Second Expedition to the Shores of the Polar Sea*, in the Years 1825, 1826, and 1827, by John Franklin, Captain, R.N., F.R.S., &c., and Commander of the Expedition; including an Account of the Progress of a Detachment to the Eastward by John Richardson, M.D., F.R.S., F.L.S., &c., Surgeon and Naturalist to the Expedition. Illustrated with numerous Plates and Maps," 4to. Richardson's part of the narrative gives a full detail of his overland journey of 1980 miles, which occupied him seventy-one days. But a more important result of his expedition was the appearance of his "*Fauna Boreali-Americana; or the Zoology of the Northern Parts of British America*: containing Descriptions of the Objects of Natural History collected on the late Northern Land Expeditions under the command of Sir John Franklin; by John Richardson, M.D.; F.R.S., &c., assisted by William Swainson, Esq., F.R.S., &c., and the Rev. William Kirby, M.A., F.R.S., &c.," 4to. The first part of this truly magnificent work was published in 1829; part 2, comprising "the Birds," by Swainson and Richardson, appeared in 1831; part 3, "the Fishes," by Richardson, in 1836; and part 4, "the Insects," in 1837.

Dr. Richardson's first wife having died in 1831, he married in 1833 the only daughter of John Booth, Esq., of Stickney. In 1838 he was appointed physician to the fleet, and in 1840 an inspector of hospitals. In 1846 he received the honour of knighthood. His second wife having died in the previous year, he in 1847 married his third wife, who was the youngest daughter of Archibald Fletcher, Esq., of Edinburgh. After a career so useful and so honourably acknowledged both by government and the public, Sir John, it might be thought, would have devoted the rest of his life to the tranquil enjoyments of his home, and the prosecution of those studies in which he had already won such distinction. On his appointment of physician to the fleet he had gone to reside at the Royal Naval Hospital at Haslar, near Gosport; and there he not only was active in the discharge of his professional duties, but in the establishment of an asylum for lunatic sailors, which he effected against much opposition; and he had the satisfaction of daily witnessing from his own windows the success of his plan of treatment, in the comfort and conduct of his patients. He was also carrying on his scientific observations, and imparting them to society in

his valuable publications, besides establishing the museum of Haslar, which owed its existence to his zeal and energy. But from all this the united calls of duty and affection called him away, to undertake, at the age of sixty-one, a third Arctic expedition, to ascertain the fate of his beloved friend and commander of former years, Sir John Franklin. That intrepid navigator and traveller, still as ardent in old age as in his youth for geographical discovery, had left England in 1845 in search of the north-west passage; but the expedition never returned; and as time passed onward, the public feeling became more intense either to aid the enterprising travellers, or at least to ascertain their fate. Three distinct expeditions of search were instituted by the British government for the purpose: one to Lancaster Sound under Sir James Clarke Ross; a second down Mackenzie River, under Sir John Richardson; and a third to Behring's Straits, under Captain Kellett. Thus Sir John in his old days was again gratuitously to brave those dangers between the Mackenzie and the Coppermine Rivers, which he had confronted with such difficulty in the strength of his matured manhood. So widely spread was the enthusiasm for such a generous enterprise, that persons the most unlikely were desirous to share in it. "I was almost daily," says Richardson, "receiving letters from officers of various ranks in the army and navy, and from civilians of different stations in life, expressing an ardent desire for employment in the expedition. It may interest the reader to know that among the applicants there were two clergymen, one justice-of-peace for a Welsh county, several country gentlemen, and some scientific foreigners, all evidently imbued with a generous love of enterprise, and a humane desire to be the means of carrying relief to a large body of their fellow-creatures."

The chief object of the expedition under Sir John Richardson was to search the coast between the mouths of the Mackenzie and Coppermine Rivers, and the shores of Victoria Land and Wollaston Land lying opposite to Cape Krusenstern. With him was associated Mr. John Rae, chief trader of the Hudson's Bay Company, a bold explorer, and possessed of those qualities best fitted for such an enterprise, having lived fifteen years in Prince Rupert's Land. They left Liverpool by a steamer on the 25th of March, 1848, and on the 18th of the following month they had reached Montreal. Having crossed the Canadian lakes in steamers, they afterwards travelled with canoes along the northern series of lakes and rivers to the Great Slave Lake. Boats and all necessary stores having been provided for the expedition, they commenced the descent of the Mackenzie River on the 24th of July, and on the 6th of August reached the sea. After tracing and examining the shores as far as Cape Krusenstern, they proceeded to Cape Kendall, but were prevented by the ice from reaching the mouth of the Coppermine River. They therefore were obliged to leave their boats, and proceed overland on foot, till they reached Fort Confidence, on Dease River, where they passed the winter of 1848-9, log-houses having been constructed for their use. On the return of summer in 1849, Mr. Rae made a bold attempt to reach Wollaston Land by sea, as a search in that quarter was included in the purposes of the expedition, while only one boat remained sea-worthy for such service. But although the attempt was gallantly made and skilfully conducted, it was baffled by the ice and stormy weather, which compelled the adventurers to return. And thus after dangers surmounted and hardships endured, the mere narrative of which makes the home-keeping reader shudder at his fireside, and

look around him to be assured of his safety, the generous purpose of the expedition had proved a failure, as no traces of the lost ones could be ascertained. The dreary residence of Richardson and his party at Fort Confidence, in which they had passed the winter, gives a strange picture of their comforts when their condition was at the best. "Our winter dwelling, though dignified, according to custom, by the title of 'the fort,' had no defensive works whatever, not even the stockade which usually surrounds a trading-post. It was a simple log-house, built of trunks of trees laid over one another, and morticed into the upright posts of the corners, door-ways, and windows. The roof had considerable slope: it was formed of slender trees laid closely side by side, resting at the top on a ridge-pole, and covered with loam to the depth of six or eight inches. A man standing on the outside could touch the eaves with his hand. Well-tempered loam or clay was beat into the spaces left in the walls by the roundness of the logs, both on the outside and inside, and as this cracked in drying, it was repeatedly coated over, for the space of two months, with a thin mixture of clay and water, until the walls became nearly impervious to the air. The rooms were floored and ceiled with deal. Massive structures of boulder-stones and loam formed the chimney-stacks, and the capacious fire-places required three or four armfuls of fire-wood, cut into billets three feet long, to fill them. The building was forty feet long by fourteen wide, having a dining-hall in the centre measuring sixteen by fourteen, and the remaining space divided into a store-room and three sleeping apartments. A kitchen was added to the back of the house, and a small porch to the front. Mr. Rae's room and mine had glazed windows, glass for the purpose having been brought up from York factory. The other windows were closed with deer-skin parchment, which admitted a subdued light. Two houses for the men stood on the east, and a storehouse on the west, the whole forming three sides of a square, which opened to the south. The tallest and straightest tree that could be discovered within a circuit of three miles was brought in, and being properly dressed, was planted in the square, for a flag-post; and near it a small observatory was built, for holding magnetic instruments." Such was the *fort* in which they gallantly held out against the siege and blockade of an Arctic winter. It was well that their necessary occupations left them no time to be idle; and every day each man had his allotted task of house repairing, carpentering, wood-cutting, hunting, fishing, &c., which kept them in a healthy excitement of constant occupation. "From this sketch," adds Sir John, "of our occupations it will be seen that our time was filled up, and that we had no leisure for ennui in the long winter. In fact, we enjoyed as much comfort as we could reasonably expect, and had our postal arrangements succeeded as well as the others, we should have had little more to desire. Our schemes for sending and receiving letters were, however, failures, and productive of much subsequent disappointment."¹

On the 7th of May, 1849, Sir John Richardson left his winter-quarters of Fort Confidence, and returning by the former route he and his party reached the Great Bear Lake, and afterwards the Great Slave Lake. Having safely arrived in Canada, Sir John left Montreal in October, and landed at Liverpool on the 6th of November. On returning home his resting time must have been very brief, as in 1851 he published an account of the expedition in

¹ Richardson's *Arctic Searching Expedition*, &c.

two volumes, with the following title: "*Arctic Searching Expedition: a Journal of a Boat Voyage through Rupert's Land and the Arctic Sea, in Search of the Discovery Ships under command of Sir John Franklin.*" With an Appendix on the Physical Geography of North America. By Sir John Richardson, C.B., F.R.S., Inspector of Naval Hospitals and Fleets, &c. &c." This work is one of the most interesting of the records of travel, not only on account of the journal of his route and the scientific matter with which it abounds, but the lively sketches of the Indians and Esquimaux by whom these strange regions are inhabited, and the pictorial illustrations, maps, &c., with which the narrative is accompanied.

The rest of Richardson's biography, although largely abounding in action and interest, must be briefly told. After returning from his third Arctic exploration, he once more took up his abode at Haslar, where he resided from 1849 to 1855, when he retired from the service in which he had been occupied for nearly half a century; but during the ten years of his life which followed he actively discharged the duties of a magistrate, officiated frequently as a chairman at public meetings, carried through the press several volumes of his revised scientific works, especially those connected with ichthyology, and visited Rome and Naples. Finally, he died at Lancrigg, near Grasmere, on the 5th of June, 1865, after an honourable, active, and useful life of seventy-eight years. His personal and private virtues were those of truthfulness, charity, devotedness to the welfare of others, and a spirit of chivalrous friendship, which the expedition in search of Sir John Franklin so well attested. Besides his publications which have been already mentioned, he contributed to the natural history of the following voyages:—

The "Mammalia," to the Zoology of *Captain Beechey's Voyage to the Pacific and Behring's Straits, in H.M.S. Blossom*, 4to, 1839. The "Fishes," to the Zoology of the "*Voyage of H.M.S. Erebus and Terror*, under the Command of Sir James Clarke Ross, during the Years 1839 and 1843," 4to, 1845. The "Fishes," to the Zoology of the "*Voyage of H.M.S. Samarang*, under the Command of Captain Sir Edward Belcher, during the Years 1843-1846," 4to, 1848. "Fossil Mammals," to the Zoology of the "*Voyage of H.M.S. Herald*, under the Command of Captain Henry Kellett, R.N., C.B., during the Years 1845-51," 4to, 1852. "Notes on the Natural History," to the "*Last of the Arctic Voyages*, being a Narrative of the Expedition of H.M.S. *Assistance*, under the command of Captain Sir Edward Belcher, C.B., in Search of Sir John Franklin, during the Years 1852-1854." 2 vols. 8vo, 1855.

RICHARDSON, WILLIAM, an elegant miscellaneous writer, and professor of humanity in the university of Glasgow, was born, October 1, 1743, at Aberfoyle, of which parish his father, James Richardson, was minister. After a course of Latin and Greek under the parish schoolmaster, he was placed in his fourteenth year at the university of Glasgow, where he pursued his studies under Professors Muirhead and Moor, and distinguished himself by his extraordinary diligence and capacity. Even at this early period of his life he was noted for the composition of verses, which, if not of any high positive merit, were at least thought to display an uncommon degree of taste for so boyish a writer. He thus recommended himself to the friendship of the professors, and at the same time formed an intimacy with Messrs Foulis, the eminent printers, whose notice he is said to have first attracted by the eagerness with which he bade, at one of their sales, for a

copy of *Marcus Antoninus*. When he had finished the usual course of languages and philosophy, and had taken the degree of Master of Arts, he began the study of theology, with the intention of becoming a clergyman. He had attended nearly three sessions, when the design was laid aside, in consequence of his being appointed tutor to the sons of Lord Cathcart, then about to go to Eton. At the latter place he spent two years, after which he accompanied his pupils, with their father Lord Cathcart, to St. Petersburg, whither his lordship was sent as ambassador extraordinary and plenipotentiary. He remained in the Russian capital from 1768 till 1772, during which time he acted also as secretary to Lord Cathcart. In the latter year he returned with his only surviving pupil to the university of Glasgow, and before the commencement of the ensuing session, by the interest of Lord Cathcart, who was lord-rector of the college, was chosen to succeed Professor Muirhead in the chair of humanity, the duties of which he performed without any intermission till his death in 1814.

The remaining history of Mr. Richardson is the history of his works. His first publication was a small volume, entitled *Poems, chiefly Rural*, which appeared in 1774; the next was his *Philosophical Analysis and Illustration of some of Shakspeare's Remarkable Characters*, which appeared early in the succeeding year. The latter volume, containing analyses of the characters of Macbeth, Hamlet, Jacques, and Imogen, was followed up in 1784 by a sequel, containing essays on the characters of Richard III., King Lear, and Timon of Athens; and some time after by a third volume, adverting to Sir John Falstaff, and containing various other critical speculations upon the writings of Shakspeare. The whole were united in one volume in 1797, and have been frequently reprinted. The other chief works of Professor Richardson are:—*Anecdotes of the Russian Empire; The Indians, a Tragedy; The Maid of Lochlin, a Lyrical Drama, with other Poems; The Philanthrope*, a periodical essayist which appeared in London in 1797. He also contributed to Gilbert Stuart's *Edinburgh Magazine and Review*, and to the *Mirror and Lounger*. He wrote the life of Professor Arthur prefixed to that gentleman's works, and an *Essay on Celtic Superstitions* appended to the Rev. Dr. Graham's inquiry into the authenticity of the poems of Ossian. An *Essay on Figurative Language*, and other works, were left at his death in manuscript.

The genius of Professor Richardson was more elegant than strong; he was rather fitted to produce a tasteful dissertation or an ingenious inquiry, than a work of nervous and original character. Hence his works are now put aside in a great measure by those of succeeding writers. In his professional character he enjoyed a high degree of reputation, and in private life his character was singularly amiable. He shone in conversation, at a time when conversation was more an art than it now is. From his earliest years to the period of his death, he cherished the best principles of religion and morality.

After a short but severe illness, he died on the 3d of November, 1814, in the seventy-second year of his age.

RITCHIE, LEITCH. This talented writer of several popular works was born in Greenock at or near the close of the last century, but the particular date we are unable to ascertain. Being designed for business, he was apprenticed in a banking-office in his native town; but when the time of his apprenticeship had expired, and while he was yet a mere youth,

he visited London, furnished with several letters of recommendation, and having been there thrown into the society of literary persons, his original love of literature and ambition to distinguish himself in authorship revived. After a considerable stay in London he was recalled to Scotland by his father, upon which he performed the journey on foot, spending two months on the way, and making a visit to the lakes of Cumberland. At his return the mercantile interest of his family obtained for him a situation in the counting-house of a firm in Glasgow that carried on an extensive West India and North American trade; and here he also joined several friends in commencing a periodical called the *Wanderer*. It was as well that he had thus prepared a second string to his bow, for his employers became bankrupt, in consequence of which he again set off for London, and commenced authorship there as a contributor to several of the periodicals; and besides these occasional attempts, he published a volume of tales entitled *Head-pieces and Tail-pieces*.

After these literary attempts Mr. Ritchie visited Ireland, but his health having become impaired, he abandoned all thoughts of business, and resolved to stick to the profession of authorship. On returning to London he therefore threw himself with his whole heart into literary occupation, and contributed several articles to the *Foreign Quarterly Review*, the *Westminster Review*, and several other periodicals; he also published a volume under the title of *Tales and Confessions*, and another called *London Night Entertainments*. The *London Weekly Review*, in which he was chiefly employed, having passed into other hands, he and the editor, Mr. J. A. St. John, resolved to devote themselves to works of literature and fiction in relation to continental countries and their history, with which view the pair with their families took up their residence in Normandy; and it was here that Ritchie wrote the *Game of Life* and the *Romance of French History*. This last-mentioned work was so greatly superior to his previous productions, as to introduce him at once to the notice of the literary world, so that occupation flowed in upon him abundantly; and in addition to his other engagements, he, in connection with Mr. William Kennedy, author of *Fifteen Fancies*, started a periodical named by Coleridge the *Englishman's Magazine*; but in these numerous attempts Mr. Ritchie had overtasked his strength so greatly as to produce an attack of severe illness, so that the magazine was discontinued. His next engagement was to write two series of books of travels illustrative of the views in Turner's *Annual Tour* and Heath's *Picturesque Annual*, and in consequence of this commission he made an extensive tour on the Continent from Venice to Moscow. The result was a work of twelve volumes, to which he supplied the letter-press, and as he had an observant eye for scenery and a just appreciation of its beauties, he described the scenes he had visited for the purpose of illustrating the above-mentioned pictorial works, not only with remarkable accuracy but eloquent descriptive power.

After this series of annual volumes was finished, Mr. Leitch Ritchie published an illustrated *Pedestrian Tour of the Wye*, diligently filling up the intervals of his time with many papers contributed to the *Athenæum*; and turning once more to fictitious writing, he produced the *Magician*, and *Schinderhannes, or the Robber of the Rhine*. These were tales of considerable note in their day, although the strong ever-flowing tide of novel-writing has nearly borne them to oblivion, with many still more distinguished productions of the same period. He also edited the *Library of Romance*, published by Messrs. Smith

& Elder. The demand for annuals, to which Mr. Ritchie had so abundantly ministered, having lasted its day, he next became editor of the *Era*, a London weekly newspaper, and subsequently established and edited the *Indian News*; and on the latter becoming a remunerative undertaking, the copyright of it was presented to him by the proprietors. While engaged in this work, he published in connection with it the *British World in the East; Guide to India*, a work in two volumes. The copyright of the *Indian News* he disposed of in consequence of the publishers of the *Asiatic Journal* having brought out a periodical called the *Indian Mail*. From this brief sketch of Mr. Ritchie's literary labours it will be seen that although not originally trained to a life of authorship, he possessed an industry and perseverance which only belong to a chosen few in literature. During this period of his career he had written more than thirty original volumes, besides editing and partly writing about fifty more, and had contributed extensively to the principal periodicals of the day. To a discursive fancy he added correct perceptions and a sound judgment; and to all his multifarious occupations in literature he brought those methodical habits which he had acquired in business, so that he was enabled to encounter an amount of work at which ordinary authorship would have quailed. His study was a counting-house, in which regularity and method prevailed, and where everything was done at the right time and in the proper way.

The latter portion of Mr. Leitch Ritchie's life was spent chiefly in Scotland, in consequence of having accepted an engagement from the Messrs. Chambers to be editor of their well-known *Journal*; and in this office he continued several years, occasionally assisting his employers also in several of their publications. His last production was a tale of considerable interest entitled "Wearyfoot Common," which appeared in portions in *Chambers' Journal*. At length exhausted with years and still more by intellectual labour, Mr. Ritchie retired to London and died in 1865.

ROBERTS, DAVID, R.A. This excellent painter of landscape and architectural subjects was one of those many "self-made" men whom it is so peculiarly the distinction of Scotland to produce. He was born at Stockbridge, near Edinburgh, October 24th, 1796. His father was a shoemaker in Church Lane; his mother was a native of St. Andrews. From her influence, it may be presumed, David's original tendency to art was directed so strongly towards ecclesiastical architecture; for she often spoke to him of the ancient buildings of her native town, and described its magnificent ruins. Even when a boy Roberts displayed his prevailing bias, by visiting every old castle and ruined chapel round Edinburgh, and making sketches of such as struck his fancy. Perceiving the bent of his genius, and hopeful of its development, Graham, the director of the Trustees' Academy, advised that David should commence with house-painting, and at the same time pursue the study of drawing. Accordingly, at the early age of ten years, the boy was apprenticed to Gavin Beugo, a house-painter, who had formerly been a painter of heraldry. It was fortunate for him that he had several fellow-prentices who, like himself, loved drawing and painting, and who afterwards became respectable artists. Their mode of study at this time was sufficiently aspiring. Resolved to have a life-studio of their own, they hired a cellar in Mary King's Close, one of the many ravines branching from the High Street, Edinburgh; and having clubbed

together a few shillings, they purchased a donkey to serve them as their live model, each member in turn supplying the animal with its daily provender of thistles, kail-blades, and other such appropriate fare. Such was the first studio of David Roberts.

Having served a seven years' apprenticeship with Beugo, who was a harsh and exacting master, Roberts commenced business on his own account, and was obliged to begin at the lowest round of the ladder by becoming in 1818 assistant scene-painter at the Pantheon, a second-rate theatre in Edinburgh. On the following year he mounted a step, by becoming principal painter at the Theatre Royal, Glasgow; and in 1820 and 1821 he held the same office at the Theatre Royal, Edinburgh. Even in this obscure position his merits had reached the ears of Elliston, at that time lessee of Drury Lane, and before the close of 1821 Roberts was engaged by that celebrated manager for a term of three years. He accordingly went to the metropolis, and in painting scenery for the theatre of Drury Lane he had for his fellow-worker Clarkson Stanfield, afterwards the celebrated landscape painter, with whom he formed a friendship that continued through life. Under two such artists dramatic scene-painting attained the very highest excellence; and the gorgeous views upon the stage of Drury Lane could draw full houses whatever might be the dullness of the play or indifference of the acting. Both of these great artists also were influenced by the nature of their occupation, so that in their after productions the result of their practice in scene-painting was visible in the telling effects of light and shadow, and the dramatic character of the figures they frequently introduced into their paintings. Roberts also, like his associate Stanfield, had an ambition that sought something higher than the applause of mere play-goers, and in 1826 and the following year he exhibited in the gallery of the Royal Academy a view of Rouen Cathedral, and a picture of the cathedral of Amiens. These paintings showed the bent of his genius, and he began to be regarded as one of the most promising painters of architectural subjects.

Having thus effectually opened for himself a new and higher path, Mr. Roberts abandoned scene-painting, and went abroad in search of congenial objects for his pencil. These he found abundantly in Spain, the land of ancient chivalry and romance; and as the results of his sojourn there he produced pictures which were highly esteemed, while a folio volume of tinted lithographs from these Spanish sketches extended his reputation widely among that portion of the public who had no access to the originals. From 1835-1838 inclusive, he furnished the drawings for the illustrations of four successive volumes of Jennings' *Landscape Annual*. These consist of views in Granada, Andalusia, Biscay, and the Castiles, together with several in Morocco; and the engravings from them are generally of the choicest description. About this time he also made the drawings for the original edition of Sir Bulwer Lytton's *Pilgrims of the Rhine*. In the meantime Roberts made a judicious use of the professional reputation he was thus acquiring. At the outset of his public career he, like many other young painters, joined the Society of British Artists, of which he subsequently became vice-president; but when the celebrity of his *Spanish Pictures and Sketches* made it evident that he could gain admission into the ranks of the Royal Academy, he resigned his connection with the British Artist Society. His prospects were fully realized, as he was elected A.R.A. in 1839, and an academican in 1841, an unusually short period intervening between his two elections.

Having achieved such successful results from his Spanish travels, Mr. Roberts resolved to attempt a new and still more interesting field, for which purpose he made a protracted visit to Syria and Egypt. His patient endurance of a long sojourn in such a climate, and his artistic industry, which seemed never to remit or grow weary, were crowned with their merited success: a mass of drawings and sketches were produced, so numerous, so varied, and so finished, as no single artist has produced under such trying circumstances of country and climate; and the lithographic facsimiles of these productions compose that rich pictorial work in four volumes folio, entitled *The Holy Land, Syria, Idumæa, Arabia, Egypt, and Nubia*. This work was not only fortunate in its artist but its lithographer, and Mr. Haghe and assistants, by whom the drawings were placed on the stone, left nothing undone which the most fastidious could desire. In consequence of this combination, as well as the grandeur and importance of the scenes delineated, the four massive volumes acquired immense popularity in England and over the Continent, where they are acknowledged as holding one of the foremost places among all such artistic productions.

After his election as member of the Royal Academy, the paintings of Roberts for successive years adorned the walls of its annual exhibitions, and found ready purchasers at high prices, while their number and their merit as works of art attested his rare genius and unflagging industry. They were chiefly subjects connected with his eastern tour, but the principal of these we can only afford space to indicate by their names. In the exhibition of 1840 appeared "The Outer Court of the Temple at Edfou in Upper Egypt;" "Statues of the Vocal Mennon, on the Plain of Thebes;" and "the Greek Church of the Holy Nativity at Bethlehem," during the resort of the pilgrims at Easter. In 1841 was "The Temple of Denderah;" and "Jerusalem from the Mount of Olives." In 1842, "Thebes, looking across the Great Hall;" "Petra;" and "Interior of the Church of St. Miguel, Xeres, Spain." In 1843, "Gateway of the Great Temple at Baalbec;" "Ruins on the Island of Philæ;" and "Entrance to the Crypt, Roslin Chapel." In 1844, "Pyramids of Ghizeh;" and "Chapel in Church of St. Jean, at Caen, Normandy." In 1845 he exhibited two pictures of large size and ambitious character, that struck by the grandeur of their style: these were "Ruins of the Great Temple of Karnak, looking towards the Lybian Hills—sunset;" and "Jerusalem from the South-east—the Mount of Olives." Passing over his productions of the two following years, we come to 1848, when he exhibited "Chancel of the Collegiate Church of St. Paul, Antwerp," which has now become the property of the nation; and after that period Roberts chiefly devoted his pencil to the interiors of ecclesiastical buildings, and the picturesque features of public worship in the churches and cathedrals of the Continent. In 1849 appeared his large and widely known painting of "The Destruction of Jerusalem," which has since been copied in the largest chromo-lithograph yet published. In 1850-51 his chief contributions were the interiors of Belgian churches; and from 1852 to 1854 these were exchanged for the architecture of Vienna, Verona, and Venice. In 1853 also he painted, by command of her majesty Queen Victoria, his picture of "The Inauguration of the Exhibition of All Nations;" and in 1855 his noble and striking "Rome," one of his best productions, in which the "Niobe of Nations" is represented in the stern sombre glow of a setting sun. In 1856 were ex-

hibited his more varied and popular productions: "Christmas-day in St. Peter's at Rome;" "St. Peter's—looking back upon Rome;" "Venice—approach to the Grand Canal;" "Italy—a composition;" and "Monument to Bartolomeo Colleoni in SS. Giovanni e Paolo, Venice." In 1857, "Interior of the Duomo at Milan;" "The Piazza Novana at Rome;" and the "Interior of the Church of St. Gommaire at Lierre, in Brabant." After Venice and Rome had supplied their subjects, the mind of Roberts, as if weary of its long career of foreign travel, reverted to home-scenes, and he seemed content to find within and around London subjects worthy of his delineation. He was engaged by an eminent picture-dealer to furnish a series of metropolitan views, and of these some appeared at the exhibitions of the Royal Academy, while others were sketched out and in progress at the time of his death. That closing event was sudden and unexpected. While walking in Berners Street on the afternoon of Friday, the 25th of November, 1864, he fell down in a fit of apoplexy. To those who went to his assistance he could only utter the words, "Fitzroy Street" (the place of his residence), and never spoke afterwards. He died at seven o'clock in the evening of the same day.

The private character of David Roberts was in many respects a contrast to his manner and appearance. A dry exterior covered an affectionate genial heart, and while he painted with such fire and rapidity, his conversation was slow, inanimate, and sparing. Such peculiarities could easily be forgiven by those who knew his kindly disposition, and how eloquent he was with his pencil. He delighted in private acts of benevolence, especially to old friends in reduced circumstances, and often his bounty was conveyed to them under the strictest injunctions of secrecy. While thus liberal, however, his early life had also taught him the value of economy; his business dealings were conducted with most mercantile exactness, and he died more wealthy than the generality of successful artists. Although so short a period of his life had been spent in Scotland, his love of country had never decayed, and scarcely a year elapsed, while he was in England, without his paying a visit to Edinburgh, to renew old friendships and his love of old localities. Edinburgh also appreciated her distinguished son, and in 1858 the freedom of the city was conferred upon him; while in the evening of the same day himself and his old friend Stanfield were entertained at a banquet given by the Royal Scottish Academy. It only remains to be added, that, according to his own request, the remains of David Roberts were buried in a private unostentatious manner in the Norwood Cemetery.

In affectionately describing him as "a kindly canny Scot, well-to-do, amazingly clever in his own sphere of art, and liked by all who knew him," the *Times* thus specifies his qualities as an artist:—"He was certainly the best architectural painter that our country has yet produced. In this department of art, indeed, he stands almost alone among us, the artist who comes next to him being Samuel Prout, the water-colour painter, who died in 1852. Probably the chief reason why he stands so nearly alone is, that the artist who has an eye for the picturesque in architecture naturally becomes an architect, and will not be content to make pictures of architecture. Mr. Roberts had a wonderfully quick eye for all striking effects of architecture, and transferred them to his canvas with great ease. Nothing can be more effective than his views of cathedral interiors lit up with the magnificent pageants of Roman Catholic religion. He gave a grand broad effect, a truthful general result, and did not much trouble himself with minute-

ness of workmanship. In this respect one is apt now and then while looking at his pictures to remember the scene-painter; but, in point of fact, minuteness of work would be misplaced in an architectural painting, and there if anywhere the artist may be allowed to generalize. In this broad style of treatment Mr. David Roberts was particularly happy, and he could be very prolific. He painted quickly, and he painted much. . . . Apart from the interest which attaches to him as an artist, and which is to be measured by the amount of his actual achievement, there is another interest which belongs to his career, and which is to be measured by the amount of difficulties he had to overcome. He who began as a humble house-painter, and ended as a royal academician, has not a little to boast of. He too belongs to that proud phalanx of men whose biographies touch most keenly all young ambition—the self-made men who from small beginnings have fought their way upwards to fame, to wealth, and to station."

ROBERTSON, ALEXANDER, of Strowan, a distinguished Highland chief and poet, was the second son of the preceding laird of Strowan, who bore the same name, by Marion, daughter of General Baillie of Letham, and was born about the year 1670. He was educated, with the design of his becoming a clergyman, under John Menzies, regent in the university of St. Andrews, who aided the influence of hereditary associations in inspiring him with a zealous attachment to the persons and principles of the Stuarts. His father died in 1688, after having enjoined upon him, with his latest breath, that he should never forget the loyal example of his ancestors; and as his elder brother only survived his father a few months, he fell into the family inheritance at a very early age, immediately before the Revolution. When Dundee raised the clans in the ensuing year on behalf of the exiled King James, young Strowan joined him with his men, but does not appear to have been present at the battle of Killiecrankie. He was taken prisoner in September, and put under honourable confinement at Perth; but was soon after liberated, in exchange for the laird of Pollock.

Being now attainted and deprived of his estate, he joined the court of the expatriated monarch at St. Germain, where he lived for several years, chiefly supported by remittances from his friends in Scotland. He also served one or two campaigns in the French army. In 1703, Queen Anne having promised him a remission of his attainder and forfeiture, he returned to Scotland; and though, from some unexplained cause, the remission never passed the seals, he does not appear to have found any difficulty in obtaining possession of his estates, or any danger to his person in a residence within the seas of Britain. Unwarned by the misfortunes which had flowed from his first military enterprise, he joined the Earl of Mar in 1715, with between 400 and 500 men, and took a very active part in the whole enterprise. He seized the castle of Weem, belonging to a Whig gentleman, Menzies of Weem; was present at the battle of Sheriffmuir, where he was taken prisoner but rescued; and with great reluctance yielded to the order for the dispersion of his clan, which was issued to him, in common with the other chiefs, at the departure of the unfortunate Chevalier and his generalissimo from the country. Strowan was soon after taken prisoner in the Highlands, but making his escape from a party of soldiers who were escorting him to Edinburgh Castle, again proceeded to France, to spend another period of poverty and

exile. Long ere this time he had gained the esteem of his party both at home and abroad by his poetical effusions, which were chiefly of the class of political pasquils, and also by his pleasing and facetious manners. Having received an excellent education, and seen much of the world, he exhibits in his writings no trace of the rudeness which prevailed in his native land. He shows nothing of even that kind of homeliness which then existed in Lowland Scotland. His language is pure English; and his ideas, though abundantly licentious in some instances, bear a general resemblance to those of the Drydens, the Roscommons, and the Priors of the southern part of the island. Ker of Kersland, who saw him at Rotterdam in 1716, speaks of him "as a considerable man among the Highlanders, a man of excellent sense, and every way a complete gentleman." He seems to have also been held in great esteem by both James II. and his unfortunate son, whom he had served in succession. By the intercessions of his sister with the reigning sovereign, he was permitted to return home in 1720, and in 1731 had his attainder reversed. The estates had in the meantime been restored to the sister in liferent, and to his own heirs male in fee, but passing over himself. He nevertheless entered upon possession; and hence, in 1745, was able a third time to lend his territorial and hereditary influence to the aid of a Stuart. He met Prince Charles on his way through Perthshire; and on being presented, said, "Sir, I devoted my youth to the service of your grandfather, and my manhood to that of your father; and now I am come to devote my old age to your royal highness." Charles, well acquainted with his history, folded the old man in his arms, and wept. The ancient chief was unable, on this occasion, to take a personal concern in the enterprise, and as his clan was led by other gentlemen, he escaped the vengeance of the government. He died in peace at his house of Carie, in Rannoch, April 18, 1749, in the eighty-first year of his age.

A volume of poems by Strowan was subsequently published surreptitiously, by means of a menial servant, who had possessed himself of his papers. It contains many pieces characterized by the licentious levity which then prevailed in the discourse of gentlemen, and only designed by their author as another kind of conversation with his friends. While he is chargeable, then, in common with his contemporaries, with having given expression to impure ideas, he stands clear of the fault of having disseminated them by means of the press.

ROBERTSON, JOSEPH, LL.D. This distinguished leader in the march of Scottish antiquarianism, by whose labours so much light has been thrown upon the early history of our country, was born at Aberdeen in 1810. His parents, however, were settled in the parish of Leochel Cushnie, in Aberdeenshire, where his father, who was a small farmer, died while Joseph was still in childhood. His mother, however, on whom devolved a double duty by the death of her partner, had both capacity and means to attend to the education of her son, and was rewarded by living long enough to witness the result of her cares, and rejoice in his literary distinction. His education as a school-boy was at Udney, where he had for his teacher Mr. Bisset, afterwards the Rev. Dr. Bisset, minister of Bourtree, and one of the moderators of the Church of Scotland. But although he enjoyed the benefit of such learned tuition, Joseph Robertson as a schoolboy was not distinguished either by remarkable diligence or great classical attainments. His *forte* rather lay in feats

of activity and daring, in which he acquired such renown at the school of Udney that his name was only second among the two heroes with which the traditions of the school-boys were associated. The one was James Outram, who had attended the school a few years previous, and who afterwards became the mighty tiger-hunter, statesman, general, and "Bayard of India." The other was the subject of this memoir, who also afterwards won distinction, but in a more peaceful and less distinguished sphere. After the usual education of a school-boy, Joseph Robertson became a student of Marischal College; and through life he always spoke warmly of the advantages enjoyed by his countrymen in having the means of a university education within the reach of all who sought it. At college he put away boyish things, and soon acquired among the students the character of a painstaking and accomplished scholar. Happily, also, he became a proficient in Latin, an acquirement more necessary for the antiquary than even for the physician or the lawyer. How, indeed, could the mysteries of the dark or the mediæval periods be deciphered without a complete knowledge of the language in which they are inscribed?

After leaving Marischal College, Joseph Robertson was apprenticed to a writer in Aberdeen, but it was soon evident that his inclinations did not tend towards the study of the law; and so early as 1831 he was detected in the unprofessional practice of writing articles which appeared in the *Aberdeen Magazine*. In 1835 he published a drolling production entitled *A Guide to Deeside*, under the name of "John Brown," a well-known car-driver of the period. About a year afterwards he showed his antiquarian bent by publishing a *History of Bon-Accord*, the old name of his native city; a work which, besides being a guide-book to Aberdeen, abounded in archaeological, historical, anecdotal interest—such a work as Mr. Murray has often projected, and sometimes accomplished. This publication, however, notwithstanding its merits, is now little read or remembered. Something more serious than this was necessary for one who depended on his own industry, and had chosen authorship for his profession, and antiquarianism for its department; and in 1839 he published a volume of selections from some of the least-known authors, under the title of *Delicia Literaria*. In the same year, in connection with a few gentlemen of the county, he founded the Spalding Club publications, a series by which the antiquarian history of our country has been so greatly benefited, and into this enterprise, so congenial to his tastes and so new in a county town, he threw himself with ardour. As editor of the Spalding Club, his chief contributions consisted of many volumes of charters arranged parochially; a work suggested, and in part paid, by that distinguished statesman the Earl of Aberdeen, and forming the nearest approach we possess to the valuable county histories of England. Besides these he edited the *Diary of General Patrick Gordon*, the favourite soldier of Peter the Great of Russia, which he has illustrated with valuable historical annotations—and in conjunction with his friend Dr. Grub of Aberdeen, *Gordon of Rothiemay's History of Scottish Affairs*. Such was the care and ability with which Mr. Robertson edited these publications, that his aid was eagerly sought by the Maitland Club, and readily accorded.

But let him labour as he might, he soon discovered that literature was not a remunerative profession in Aberdeen; and he passed to Edinburgh, for the purpose of finding occupation there in connection with his antiquarian studies. But being disappointed he

returned to Aberdeen, and began to contribute to the *Aberdeen Observer*, a Conservative journal afterwards merged in the *Aberdeen Constitutional*, of which Mr. Robertson was editor for about a year. He then went to Glasgow, where he undertook the editorship of the *Glasgow Constitutional*, also a Conservative newspaper. Thus he continued until 1849, when the editorship of the *Courant* Edinburgh newspaper, which had been in commission for two years, was conferred upon Mr. Robertson, who was selected from a numerous list of candidates. During the interregnum the *Courant* had been losing in its popularity, but on his assuming the editorship the case was altered, and a new life was imparted to the newspaper. "The *Courant*," thus declares a contemporary journal, "under Mr. Robertson's management became a great deal more pronounced in its opinions, Mr. Robertson being an Episcopalian rather of the High-church school, and a great friend of Mr. Forbes of Brechin. Many of his articles were very vigorous, and those which he wrote on the question of double-sheriffships attracted a good deal of attention at the time. Mr. Robertson was in favour of having only one sheriff, and making him resident, and advocated his opinion with much force, indulging occasionally, at the same time, in philippics against the late lord-advocate." Still, however, he was not in his right place and occupation. It was to antiquarianism, not politics, that he was devoted; the great national questions of the middle ages, rather than the civic brawls of the nineteenth century; and he felt greater interest in the progress of Malcolm Canmore, or the exploits of the early Stuarts, than the passing of a turnpike-road bill or discussions of an Edinburgh town-council. The labour also of conducting a thrice-a-week newspaper was telling upon his health as well as hindering him in his more congenial studies. At length the desirable change occurred which transferred him into his proper sphere of action. In 1853 he was appointed superintendent of searches in the Register House, Edinburgh. No one was thought so well fitted to take charge of the valuable national muniments that were stored within its walls; and the appointment was made by the government of Lord Aberdeen, his lordship having already known Mr. Robertson's fitness by his literary labours in the Spalding Club publications. It was also owing to the liberality of the then lord-advocate, Moncrieff, of whom he had been a sharp antagonist during his late political journalism. The lord-advocate believed Mr. Robertson to have been the author (although erroneously) of a particularly stinging article against himself, and to this he smilingly alluded when he handed to him the appointment. It is well that hard words break no bones; but it is better still when they break no friendships, and produce no breach in the mutual esteem of generous enemies.

Thus Mr. Robertson found himself in the right place at last. His labours were transferred to that noble hall of historical records which perhaps has no equal in Britain, and he renounced for it the editorship of the *Courant*, although the salary of the latter was considerably larger. As superintendent of searches his salary at first was only £200 a year; but as his services became better appreciated, it was raised to £300, and during his last year of office to £600. The Register House was now not only his home but his world, and vast and varied though its stores were, they were not too great or too complicated for his large antiquarian knowledge, his genius, his patience, and industry. "Mr. Robertson," writes one of the journals of the day, "had attained a wonderful facility—we would not say in

deciphering, for effort in it there was none—in reading old manuscripts, and he was often able to leap upon truths which other antiquaries were with slow effort endeavouring to reach. He had a surprising power of penetration, and with that decision of character which specially marked him, he always hit the point of inquiry at once. He had a love of his labours which was thoroughly chivalrous. He altogether scorned the inglorious ease of the sinecurist, and his only desire was that his useful, earnest, and active life should be spent and ended, as it had been, in harness. The office which he filled was in a great measure created for him, and we gravely doubt whether it will ever be again filled with so much vigour and success." Not only also were the tasks of his office directly, but indirectly, abundant. Having under his especial care the great repertory of our national history, and being supposed to be fully cognizant of its contents, he naturally became the referee of every inquirer into our ancient records. Of these persons his reception was kind and courteous; to them his communications were always ready, and often invaluable; and much light has been thrown upon various departments of our annals which was derived from such applications.

It was not, however, merely as a *cicerone* of the Register House that Mr. Robertson was to perform the duties of his office. He was now in charge of the archives of his country, and desirous that these should be known to the world, he proceeded to classify and arrange the more important of them for the purpose of publication. The first result of his preparations was the publication of an *Inventory of Queen Mary's Jewels and Furniture*, as a contribution to the Bannatyne Club, to which he prefixed a historical dissertation remarkable for its erudition and research; and it is mainly perhaps upon the ground he has thus cleared that the long-continued controversy of Mary's innocence or guilt must be waged over again. His next undertaking was still more toilsome and important: it was a collection and digest of the councils and canons of the Scotch church—a difficult and laborious work, which was only finished at his death, and published under the title of *Statuta Ecclesie Scoticonæ*. In conjunction with Sir William Gibson-Craig, when he came to the Register House as lord-register, Mr. Robertson organized and worked out that system of record publications which promises to throw such light upon the more obscure periods of Scottish history. Of the less important literary achievements with which he occupied his leisure time, we might refer to many elaborate antiquarian articles written for the *Quarterly Review* and the *British Archaeological Journal*—his investigations among the cranogues or lake-houses of ancient Europe, so much the wonder and study of our modern antiquaries—and his services to the Scottish Antiquarian Society, of which he was one of the vice-presidents. Mr. Robertson had now acquired such a European reputation in his own department, that in April, 1864, the university of Edinburgh conferred upon him the honorary degree of LL.D.; and on introducing him on this occasion to the vice-chancellor, Professor Cosmo Innes, after stating his various literary performances, thus summed up his claims to academical honours: "But more than all these Mr. Robertson's fame will rest permanently on two books on which he has been recently engaged. In one, he has with curious felicity made a collection of inventories of the jewels and personal property of Queen Mary, which tell—truly and pathetically tell—the story of that passionate and most unhappy life. Another undertaking, of which we watch the completion anxiously, is an

authoritative collection of the canons and councils of the ancient Scottish church—a work of immense importance for history, and which, with some means of knowledge, I predict will repay the expectation of the lawyer and the historian. The appointment of Mr. Robertson to his office in the Record Office has begun a new era in our literature. The Scotch scholar will no longer be reproached for ignorance of records. The difficulties of reference—the puzzles of old-hand and cramp Latin—disappear with such a guide as Mr. Robertson.”

While he was thus esteemed and honoured by society not only for his talents and learning, but his genial disposition and personal worth, a long period of exertion still seemed to stretch before him—and this vista he had filled with those anticipated literary achievements by which all that he had already done should be surpassed. Among these he had contemplated a series of lives of the eminent divines of the seventeenth century who figured in the Scottish Episcopal church—the bishops William, John, and Patrick Forbes, Lindsay, Maxwell, Barron, and the “Aberdeen doctors.” But the darkness of night descended upon this bright noon, and his work was abruptly closed. His eldest surviving son, a youth of great promise, lost his life owing to a railway accident; and this calamity inflicted such a shock to the paternal feeling of Joseph Robertson, that he never recovered from the blow. Only two months after, his own death occurred at his residence, Buccleugh Place, Edinburgh, on the 13th December, 1866, in the fifty-sixth year of his age.

ROBERTSON, WILLIAM, the historian of Scotland and Charles V., was born in the manse of the parish of Borthwick, Mid-Lothian, in the year 1721. His father, also named William, was at first minister of that parish, and finally of the Old Grayfriars’ Church, Edinburgh; his mother was Eleanor Pitcairne, daughter of David Pitcairne, Esq., of Dreg-horn. By his father he was descended from the Robertsons of Gladney, in the county of Fife, a branch of the ancient house of Strowan. Dr. Robertson received the first rudiments of his education at the school of Dalkeith, under the tuition of Mr. Leslie, then a celebrated teacher. In 1733 he removed with his father’s family to Edinburgh, and towards the end of that year commenced his course of academical study. From this period till 1759, when he published his Scottish history, there occurred nothing beyond the natural progress of events in the life of a young man devoted to the Scottish church as a profession. During this long space of time he was silently pursuing his studies, and labouring in retirement and obscurity on that work which was afterwards to bring both fame and fortune to his humble door. Yet though he thus permitted so large a portion of his life to pass without making any effort to distinguish himself, it was not because he was not desirous of an honourable distinction amongst men; but because he had wisely determined to do something worthy of a lasting reputation, and to do it deliberately, to secure, in short, a firm footing before he stretched out his hand to seize the golden fruit of popular applause. That he was early imbued with literary ambition, and that of the most ardent kind, is, notwithstanding the long obscurity to which he was content to submit, sufficiently evident from the motto which he was in the habit of prefixing to his commonplace books, while only in the fourteenth or fifteenth year of his age. The motto was, *Vita sine literis mors est*; a sentiment which adhered to him through life.

Having completed his studies at the university,

he was licensed to preach by the presbytery of Dalkeith in 1741, and in 1743 he was presented to the living of Gladsmuir, in East Lothian, by the Earl of Hopetoun. This appointment came opportunely; for soon after he obtained it, his father and mother died within a few hours of each other, leaving a family of six daughters and a younger brother almost wholly dependent upon him for support. He instantly invited his father’s family to his humble residence at Gladsmuir, where, we are credibly informed, his professional income hardly exceeded £60 a year. Nor did his benevolence stop here. He undertook the education of his sisters, and on their account delayed a matrimonial union which he had long desired, but which he did not carry into effect until he saw them all respectably settled in the world. This accomplished, he, in 1751, married his cousin, Miss Mary Nisbet, daughter of the Rev. Mr. Nisbet, one of the ministers of Edinburgh. Previously to this, a remarkable instance of the enthusiasm of his disposition, and of the warmth of his patriotic feelings, occurred. When the capital of Scotland was threatened by the Highland army in 1745, Dr. Robertson hastened into the city, and joined the ranks of the volunteers, who had been called up for its defence; and when it was resolved to surrender the town without resistance, he was one of a small band who proceeded to Haddington, where General Cope then lay, and made offer of their services to that commander. The general, fortunately for Dr. Robertson and his party, declined to admit them into his disciplined ranks, alleging that their want of that essential qualification might throw his men into disorder; and they thus escaped the dangers and disgrace which afterwards befell his army at Prestonpans. This rebuff terminated the historian’s experience of military life. He returned to the discharge of the sacred duties of his calling, and to the peaceful enjoyment of his literary pursuits. In his parish he was exceedingly beloved. The amenity of his manners, the purity and uprightness of his conduct, had secured him the esteem and veneration of all; while the eloquence and elegant taste which he displayed in his sermons procured him a high degree of respect from the neighbouring clergy. These qualifications as a preacher he had been at much pains to acquire, and he had early aimed at introducing a more refined taste and a more persuasive eloquence into pulpit oratory, than were then generally to be found. With this view he had, during the last two or three years of his attendance in college, maintained a connection with a society whose objects were to cultivate the arts of elocution, and to acquire the habit of extemporary debate. Dr. Robertson himself had the principal share in forming this society, and he was fortunate in the selection of its members, the greater part of them having afterwards arrived at distinction in their different walks of life.

The first of Dr. Robertson’s publications was a sermon which he preached in the year 1755 before the Society for the Propagation of Christian Knowledge.

This sermon possesses a singular degree of merit, and exhibits all the felicities of composition and strength of reasoning for which his after productions are so remarkable. That he himself had a favourable opinion of this sermon appears from a letter written by him to his son-in-law, Mr. John Russell, on June 16, 1788, along with which he had sent him, “as a monument of his friendship and attachment,” a very handsomely bound copy of his works, as “I wish you to possess them in their most perfect form, as I purpose they should be transmitted to

posterity;" and he adds, "my solitary sermon, naked as it came into the world, accompanies its well-dressed brothers, but though the least of my works, I would not have you esteem it the last in merit."

A few years afterwards he made his appearance in the debates of the General Assembly, where his eloquence acquired for him the ascendancy which he long maintained as a leader in the church courts. It is remarkable that one of the first uses he made of his influence in the General Assembly, was to defend his co-presbyter Home from the censures of the church for his having written the tragedy of *Douglas*. Dr. Robertson could, indeed, scarcely have done less, after having himself taken part in the rehearsal of the piece in common with Blair and Carlyle, as has already been narrated in our memoir of HOME. He exerted himself warmly in behalf of his peccant brother; and it is allowed that his arguments and eloquence had a great effect in softening the vengeance of the General Assembly. As the play-going portion of the public sympathized but little in the feelings of the clergy on this subject, and felt besides a strong prejudice in favour of Mr. Home, these efforts of Dr. Robertson were exceedingly grateful to that party, amongst whom his defence had the effect of acquiring for him an extensive popularity.

In the meantime his *History of Scotland during the Reigns of Mary and James VI.*, which, in the midst of all his other avocations, he had been noiselessly but assiduously bringing forward, approached a close, and he was about to commit to the caprice of popular taste and opinion the labours and the hope of years. On the final completion of that work he proceeded to London to make arrangements regarding its publication; and in February, 1759, it appeared. The effect which it produced was instantaneous and extraordinary. Letters of congratulation, of admiration, and of praise, poured in upon its author from all quarters, and many of them from the most eminent men of the time, all outvying each other in the language of panegyric and compliment. Nor was it praise alone that attended his literary success; the work cleared to its author no less a sum than £600; preferment also immediately followed, and changed at once the whole complexion of his fortunes. While his work was going through the press he had received a presentation to one of the churches of Edinburgh, to which he removed with his family; and in the same year in which the work was published he was appointed chaplain of Stirling Castle; in two years afterwards he was nominated one of his majesty's chaplains in ordinary for Scotland; in the following year he was elected principal of the university of Edinburgh; and in two years more appointed by the king as historiographer for Scotland, with a salary of £200 a year. From being an obscure country clergyman he was now become one of the most conspicuous men in the kingdom. His society and correspondence were courted by the noble and the wealthy, and his self-love was flattered by encomiums and eulogiums from the dignified and learned.¹

¹ His friend Dr. Carlyle thus sarcastically remarks the rush of honours with which his merits were rewarded, in a letter to the Rev. Thomas Hepburn (author of a curious and clever *jeu d'esprit*, entitled *Mago-Pico*), dated Musselburgh, Sept. 5, 1763:—"Robertson has managed with great address. He is principal, chaplain, minister, historiographer, and historian; that is to say, he has £50 a-year and a house certain, besides what he can make by his books. It was taken for granted that he was to resign his charge on being appointed historiographer with £200 salary; but that he will do at his leisure. It is also supposed by his patrons that he is to write the history of Britain in ten volumes quarto. This also, I presume (dreadful task!), he will execute at his leisure.

Some of his advisers, in the warmth of their zeal, thinking that the Scottish church was too limited a field for a man of his talents, proposed to him to seek in the English church for rewards befitting his high merits. Into this proposal, however, Dr. Robertson did not enter, but continued to abide by both the country and the religion of his fathers; a line of conduct consistent with the purity and dignity of his character.

The success of his *History of Scotland* now urged him on to further efforts, and he lost no time in looking out for another subject to work upon. After some deliberation, and carefully weighing the merits of several, he at length fixed upon a *History of the Reign of Charles V.* This work, which appeared in 1769, in three volumes quarto, still further increased the reputation of its author,² and was received with equally flattering marks of approbation as his Scottish history. Hume, his contemporary and intimate friend, and who, superior to the low jealousy which would have seized upon a mean mind on witnessing the success of a rival historian, had always been among the first to come forward and acknowledge his merits, thus speaks of the work as it passed through his hands in sheets direct from the printing-office: "They even excel, and I think in a sensible degree, your *History of Scotland*. I propose to myself great pleasure in being the only man in England, during some months, who will be in the situation of doing you justice; after which you may certainly expect that my voice will be drowned in that of the public." Mr. Hume was not mistaken in this anticipation. Congratulatory and complimentary letters again flowed in upon the historian from all quarters, and his fame not only spread rapidly wherever the language in which he wrote was understood, but by a felicitous translation of his *Charles V.*, by M. Suard, he became equally well known throughout all France.

Previously to his undertaking the *Life of Charles V.*, Dr. Robertson had been urgently entreated by his friends, and had even the wishes of the monarch conveyed to him on the subject, to undertake a history of England. This, though promised the support of government while he should be engaged in the work, he declined from motives of delicacy towards his friend Mr. Hume, who was already employed on a history of that kingdom. He was afterwards, however, prevailed upon to entertain the idea, from the consideration that his work would not appear for many years after Mr. Hume's, and that it would necessarily be so different as to have an entirely separate and distinct claim on public favour, without any encroachment on the portion due to the merits of Mr. Hume. The work, however, was never undertaken, nor is it now known what were the causes which prevented it. His biographer, Mr. Dugald Stewart, conjectures that the resignation of Lord Bute, who had always been a

"Honest David Home [Hume], with the heart of all others that rejoices most at the prosperity of his friends, was certainly a little hurt with this last honour conferred on Robertson. A lucky accident has given him relief. The Earl of Hertford is appointed ambassador to France; not very capable himself, they have loaded him with an insignificant secretary, one Charles Bunbury, who, for the sake of pleasure, more than the thousand a year, solicited for the office. Hertford knew David, and some good genius prompted to ask him to go along and manage the business. It is an honourable character—he will see his friends in France; if he tires he can return when he pleases. Bunbury will probably tire first, and then David will become secretary!"—Thorpe's *Catalogue of Autographs*, 1833.

² In consequence of the great success of his *History of Scotland*, Dr. Robertson received for *Charles V.* from the booksellers no less than £4500, then supposed to be the largest sum ever paid for the copyright of a single book.

warm and steady friend of Dr. Robertson, might have contributed to alter his views with regard to the writing a history of England; but he acknowledges his inability to discover any certain or positive reason for the interruption of its execution.

Eight years after the publication of *Charles V.* (1777) Dr. Robertson produced the *History of America*, a work which fully maintained the author's high reputation, and procured him a repetition of all those gratifying marks of both public and private approbation which had attended his former works. One of these was his election as an honorary member by the Royal Academy of History in Madrid. This learned body at the same time appointed one of its members to translate the work into Spanish, and a considerable progress was made in the translation when the jealousy of the Spanish government interfered to prevent it from proceeding any further.

The reputation of Dr. Robertson, however, did not rest alone upon his writings. His powerful and persuasive eloquence had gained him an influence in the General Assembly, which intimately and conspicuously associated his name with the ecclesiastical affairs of the kingdom. He introduced and established a system of subordination throughout the various gradations of ecclesiastical judicatories, which had not been before exerted, and the neglect of which had given rise to many unbecoming scenes in the settling of ministers—scenes deemed at once highly derogatory to the dignity of the supreme court, and subversive of all order in the church government of the kingdom.

Of his eloquence, a part of his fame, as his biographer remarks, which must soon rest on tradition only, the latter thus speaks: "I shall not be accused of exaggeration when I say, that in *some* of the most essential qualifications of a speaker, he was entitled to rank with the first names which have in our times adorned the British senate." This is high praise, but when it is recollected who he is that bestows it, there is little reason to doubt its justice.

In his preface to his *History of America*, Dr. Robertson had mentioned his intention of resuming the subject; and it is known that, but for the colonial war which was now raging, he would have commenced a history of the British empire in that continent. Having abandoned this design, he looked out for some other subject worthy of his pen. Mr. Gibbon recommended to him a history of the Protestants in France, a subject which has since been illustrated by Dr. McCrie; and several other persons suggested the history of Great Britain from the Revolution to the accession of the house of Hanover. It appears from a letter to Dr. Waddilour, Dean of Ripon, dated July, 1778, that he had made up his mind to encounter the responsibilities of such a task: but he very early abandoned it, in consequence of a correspondence with his friend Mr. James Macpherson, who, three years before, had published a history of the same reigns, and whose feelings, he found, must be severely injured by his attempting a rival work. As he was now approaching his sixtieth year, it is probable that he was by no means eager to commence a new subject of study. His circumstances, too, were independent; he had acquired fame sufficient to gratify his most ambitious hopes: and thus were removed two of the greatest incentives to literary exertion. His constitution, besides, was considerably impaired by a long, sedentary, and studious life; and he probably conceived that, after having devoted so large a portion of his existence to the instruction and entertainment of others, he had a right to appropriate what remained to himself.

In the year 1780 he retired from the business of

the ecclesiastical court of which he had been so long an ornament, but still continued to discharge the duties of his pastoral office, and that with a diligence always exemplary, which increased rather than diminished with his growing infirmities. As long as his health permitted he preached every Sunday, and continued to do so occasionally till within a few months of his death. In regard to his style of preaching, his nephew, Lord Brougham, in his life of the principal, contained in his *Lives of Men of Letters and Science who Flourished in the Time of George III.*, gives a very interesting account of it from his own personal knowledge; and in particular of a sermon which he heard Dr. Robertson preach on November 5, 1788, the celebration of the centenary of the Revolution.

Notwithstanding his resolution to write no more for the public, the principal was accidentally led to the composition of another work. In perusing Major Rennel's *Memoirs of a Map of Hindostan*, he began to inquire into the knowledge which the ancients had of that country, solely for his own amusement and information. His ideas, as he himself remarks, gradually extended, and became more interesting, till he at length imagined that the result of his researches might prove amusing and instructive to others. In this way he was led to publish his "*Historical Disquisition concerning the Knowledge which the Ancients had of India*, and the Progress of Trade with that Country prior to the Discovery of the Cape of Good Hope," which appeared in 1791 in quarto. He had in the meanwhile enjoyed several years of good health and honoured leisure, dividing the time which he could spare from his clerical duties between the amusement of reading and the enjoyment of the society of his friends. Immediately, however, on the termination of the above self-imposed labour, his health became materially affected. Strong symptoms of jaundice showed themselves, and laid the foundation of a lingering and fatal illness. At an early stage of this disease, he was impressed with the belief that his death was not far distant; but, like his great contemporary Hume, he contemplated its approach, not only without terror, but with cheerfulness and complacency. In the latter part of his illness he was removed to Grange House, in the neighbourhood of Edinburgh, in the vain hope that he might be benefited by the free air of the country. He was still, however, able to enjoy the beauties of the rural scenery around him, and that with all the relish of his better days. Early in June, 1793, his increasing weakness confined him to his couch; his articulation began to fail, and on the 11th he died, in the seventy-first year of his age.

Dr. Robertson's talents were not precocious. The early part of his career was wholly undistinguished by any remarkable pre-eminence over his contemporaries; but his mind, though silently and unobtrusively, was yet gradually advancing towards that high intellectual station in which it first attracted the attention of the world. He did not, with that ill-judged precipitancy by which authors have often seriously suffered in their reputation and fortunes, come unfledged before the world. As already remarked, he wisely refrained from stepping into the arena of literary competition until he was completely accoutred for the contest, and the success he met with was one result of this prudence and forethought.

The friendship which subsisted between Dr. Robertson and Mr. Hume is, perhaps, next to the genius of these great men, the circumstance connected with them most deserving of our admiration. Though both struggling forward in the same path of historical composition, there were not only no mean

jealousies in the race, but each might be seen in turn helping forward the other, and a more interesting sight than this cannot readily be conceived. The letters of Mr. Hume to Dr. Robertson are full of amiable feeling, and of that light, cheerful railery, in which the historian of England so much delighted to indulge, and which contrasted so pleasingly with the gravity and dignity of his writings. "Next week," he says, in one of these letters, "I am published, and then I expect a constant comparison will be made between Dr. Robertson and Mr. Hume. I shall tell you in a few weeks which of these heroes is likely to prevail. Meanwhile, I can inform both of them for their comforts, that their combat is not likely to make half so much noise as that between Broughton and the one-eyed coachman."

Dr. Robertson in person was rather above the middle size, with an apparently ordinary degree of physical strength. His eye was intelligent, and his features regular and manly. "He appeared," says his biographer, "to greatest advantage in his complete clerical dress, and was more remarkable for gravity and dignity in discharging the functions of his public stations, than for ease or grace in private society." His moral character was unimpeachable. His manners were mild and conciliating, and all his dispositions amiable. "He was," says Dr. Erskine, "temperate, without austerity; condescending and affable, without meanness; and in expense, neither sordid nor prodigal. He could feel an injury, yet bridle his passion; was grave, not sullen; steady, not obstinate; friendly, not officious; prudent and cautious, not timid."

He left behind him three sons and two daughters. The eldest son adopted the profession of the law, and passed through its highest honours. His two younger sons entered the army. His elder daughter was married to Mr. Brydone, author of the *Tour in Sicily and Malta*; the youngest, to John Russell, Esq., clerk to the signet. His two younger sons rose to high rank in the army, and the elder of the two especially distinguished himself in India under Lord Cornwallis.¹

In the year 1781 Dr. Robertson was elected one of the foreign members of the Academy of Sciences at Padua, and in 1783 one of the foreign members of the Imperial Academy of Sciences at St. Petersburg. The Empress Catherine was so much delighted with his works, that she presented him, through Dr. Rogerson, with a handsome gold enamelled snuff-box, richly set with diamonds. He was the founder of the Royal Society of Edinburgh, and exerted himself with his usual zeal, not only in forming the plan of that institution, but in carrying it on after it was established.

ROBISON, DR. JOHN, an eminent mechanical philosopher, and professor of natural philosophy in the university of Edinburgh, was the son of John Robison, a merchant in Glasgow, and was born there in the year 1739.² The first part of his education he received at the grammar-school of Glasgow, whence he entered as a student of the university of Glasgow so early as the year 1750, and took the degree of

Master of Arts in 1756. What progress he made in his early studies is not known, and in after-life he used to speak lightly of his early proficiency, and accuse himself of want of application. In the year following his graduation he made a proposal to be appointed assistant to Mr. Dick, professor of natural philosophy, in place of the son of that gentleman, who had just died; but was considered too young for the important duty. At that time his friends had wished him to study for the church; but preferring some employment in which his mechanical pursuits might be indulged, he turned his eyes towards London. Professor Dick and Dr. Simson sent along with him recommendations to Dr. Blair, prebendary of Westminster, who might have had influence to procure for him the situation of tutor in mathematics and navigation to the Duke of York, younger son of Frederick Prince of Wales, whom there was then some intention of educating for the navy. The plan was given up, and Robison received a severe disappointment, but the event served as his introduction to an excellent friend, Admiral Knowles, a gentleman whose son was to have attended the duke on his voyage. Young Mr. Knowles' nautical education was not to be given up with that of the duke; and his father, perceiving Robison's knowledge of mechanical philosophy, employed him to take charge of the instruction of his son while at sea. Mr. Robison sailed from Spithead in 1759 with the fleet which assisted the land forces in the taking of Quebec. His pupil was a midshipman in the admiral's ship, in which he was himself rated of the same rank. Two years of such active service as followed this expedition enabled Robison to make many observations, and collect a fund of practical knowledge, while he was sometimes usefully employed in making surveys. On his return on the 3d of August, he was a sufferer from the sea-scurvy, which had disabled the greater part of the crew. At this time Mr. Robison seems to have had a surfeit of a sailor's life, one which, however pleasing for a limited time, as serving to exemplify his favourite studies, possessed perhaps few charms as a profession to a man of studious habits. He intended to resume the discarded study of theology; but an invitation from Admiral Knowles to live with him in the country, and assist in his experiments, prevailed. "What these experiments were," says Mr. Robison's biographer, "is not mentioned; but they probably related to ship-building, a subject which the admiral had studied with great attention." He had not been thus situated many months when his young friend and pupil Lieutenant Knowles was appointed to the command of the *Peregrine* sloop of war of 20 guns, and probably from a passion for the sea recurring, after recovery from his disorder, and a residence in the country, Robison accompanied him. At this period his ambition seems to have been limited to the situation of purser to his friend's vessel. On his return from a voyage, during which he visited Lisbon before the traces of the great earthquake had been effaced, he again took up his residence with Admiral Knowles. By his patron he was soon afterwards recommended to Lord Anson, then first lord of the admiralty, who conceived him a fit person to take charge of the chronometer constructed, after many years of patient labour, by Mr. Harrison, on a trial voyage to the West Indies, in which its accuracy was to be tried, at the suggestion of the Board of Longitude. On the return, which was hastened by the dread of a Spanish invasion of St. Domingo, Mr. Robison suffered all the hardships of the most adventurous voyage, from the rudder being broken in a gale of wind, to the ship's catching fire, and being with diffi-

¹ It may further be mentioned, that his niece, Miss Eleanor Syme, the daughter of one of his sisters, was the mother of one of the greatest men of the passing age, Lord Brougham, who wrote the life of his uncle above alluded to; and that Mr. Brydone's eldest daughter having married the late Earl of Minto, their second daughter became the wife of Lord John (now Earl) Russell, the eminent constitutional statesman, whose name stands honourably associated with all the great political reforms of the present day.

² Memoir by Professor Playfair: *Trans. Royal Society, Edinburgh*, vii. 495.

culty extinguished. The result of the observation was satisfactory, the whole error from first setting sail, on a comparison with observations at Portsmouth, being only $1^{\circ} 53\frac{1}{2}''$, a difference which would produce very little effect in calculations of longitude for ordinary practical purposes. For the reward of his services Mr. Robison had made no stipulation, trusting to the consideration of government; but he was disappointed. Lord Anson was in his last illness, Admiral Knowles was disgusted with the admiralty and the ministry, and the personal applications which he was obliged to make, unaided by interest, were met with a cold silence which irritated his mind. It appears that at this period the reward he sought was the comparatively humble appointment of purser to a ship. In 1763 such a situation was offered to him by Lord Sandwich, then first lord of the admiralty, in a vessel of 40 guns, which it is probable that a dawning of brighter prospects prompted him, certainly not to the regret of his admirers, to decline. Notwithstanding his having been connected with a branch of society not generally esteemed propitious to clerical pursuits, he is said to have still felt a lingering regard for the church, and to have adhered to his friends in the navy, solely from the better chance of advancement, because, as his biographer with unquestionable truth observes, "it lay more in the way of the Board of Longitude to help one to promotion in the navy than in the church." He returned to Glasgow, and renewing an acquaintance long since commenced with Dr. Black, entered with ardour on the new views in chemistry connected with the existence of latent heat, which his eminent friend was beginning to divulge to the world. He at the same time commenced an intimacy with Mr. Watt, and was so far acquainted with his proceedings as to be able to certify the justice of his claim to those vast improvements in the steam-engine, which a singular accident had been the means of suggesting to his genius. At the recommendation of Dr. Black, Robison was appointed his successor in the chemical chair of Glasgow, which in 1766 he had relinquished for that of Edinburgh. After continuing four years in this situation, one of a novel and uncommon character presented itself for his acceptance. The Empress of Russia had made a request to the government of Britain, for the service of some able and experienced naval officers to superintend the reformation of her marine. With more liberality than generally characterizes the intercourse of nations, the request was agreed to, and Mr. Robison's tried friend, Admiral Knowles, was appointed president of the Russian Board of Admiralty. It had been his intention to recommend Robison for the situation of official secretary to the board, but finding such an office incompatible with the constitution of the Russian board, he contrived to engage his services to the public in the capacity of his private secretary, and in the end of December, 1770, both proceeded overland to St. Petersburg. For a year after his arrival he assisted the admiral in forcing on the attention of the Russians such improvements in ship-building, rigging, and navigation, as their prejudices would allow them to be taught by foreigners, backed by the influence of government. Meanwhile he had sedulously studied the Russian language, and in the summer of 1772 the reputation of his accomplishments induced the offer of the vacant mathematical chair attached to the sea-cadet corps of nobles at Cronstadt. On his acceptance of the appointment, the salary attached to it was doubled, and he was raised to the rank of colonel, an elevation to which he could not step with proper Russian grace, without producing such documents as bore

the appearance of evidence to the nobility of his birth. Besides his duties as mathematical professor, he acted in the room of General Politika, who had retired, as inspector-general of the corps; a duty in which he had to inspect the conduct and labours of about forty teachers. He did not long remain in this situation.

In 1773, from the death of Dr. Russel, a vacancy occurred in the natural philosophy chair of Edinburgh, which the patrons, at the instigation of Principal Robertson, invited Mr. Robison to fill. On hearing of this invitation, prospects of a still more brilliant nature were held out to him by the empress: he hesitated for some time, but, being apart from such society as even the more enlightened parts of Russia afforded, he finally preferred the less brilliant but more pleasing offer from his native country, and in June, 1771, he set sail from Cronstadt to Leith. The empress, on his departure, requested that he would undertake the care of two or three of the cadets who were to be elected in succession, and promised him a pension of 400 rubles or £80 a year. The pension was paid for three years, and is supposed to have been discontinued because Robison had not communicated to the Russian government the progressive improvements in British marine education. In the winter of 1774 he commenced his lectures in Edinburgh. "The sciences of mechanics," says his biographer, "hydrodynamics, astronomy, and optics, together with electricity and magnetism, were the subjects which his lectures embraced. These were given with great fluency and precision of language, and with the introduction of a good deal of mathematical demonstration. His manner was grave and dignified. His views, always ingenious and comprehensive, were full of information, and never more interesting and instructive than when they touched upon the history of science. His lectures, however, were often complained of as difficult and hard to be followed; and this did not, in my opinion, arise from the depth of the mathematical demonstrations, as was sometimes said, but rather from the rapidity of his discourse, which was generally beyond the rate at which accurate reasoning can be easily followed. The singular facility of his own apprehension made him judge too favourably of the same power in others. To understand his lectures completely, was, on account of the rapidity and the uniform flow of his discourse, not a very easy task, even for men tolerably familiar with the subject. On this account his lectures were less popular than might have been expected from such a combination of rare talents as the author of them possessed." Mr. Robison had exerted himself with zeal in the revival of that association of philosophers which merged itself into the Royal Society of Edinburgh; and on its being incorporated by royal charter in 1783 he was appointed secretary; an office in which he signalized himself, by attention to the interests of the society. In March, 1786, he read to the society a paper entitled *Determination of the Orbit and Motion of the Georgium Sidus, directly from Observations*. In this paper, he is generally understood by scientific men to have with some haste drawn conclusions for which the limited time during which Herschel's newly discovered planet had been observed by philosophers, did not afford data. His next paper to the society, *On the Motion of Light, as affected by Refracting and Reflecting Substances, which are themselves in Motion*, was of more utility to science. In December, 1785, he began to be attacked by a chronic disease, which gradually undermined his health, but did not for some time interrupt his ordinary labours. Twelve volumes of the third and much

enlarged edition of the *Encyclopædia Britannica* had been published, when the editor turned his eyes on Mr. Robison, as a person likely to give it lustre from his scientific knowledge. He commenced his contributions with the article "Optics," in 1793, and contributed a variety of useful treatises, till the completion of the work in 1801. His biographer remarks, that "he was the first contributor who was professedly a man of science; and from that time the *Encyclopædia Britannica* ceased to be a mere compilation." The observation must be received with limitations in both its branches. To the *Supplement* he contributed the articles "Electricity" and "Magnetism." At the period while he was acquiring fame by his physical researches, he chose to stretch his studies into a branch of knowledge which he handled with scarcely so much effect. Along with many people, among whom we regret to find a philosopher, a panic that the whole "system," as it was termed, of society, was in progress of demolition by the French revolution, seized on his mind. He strayed from more accordant subjects to look for the causes of all the confusion, and had the merit of attracting some of the maddened attention of the period, by finding an untrodden path, which led him farther from the highway than any other speculator had ventured. In 1797 he published *Proofs of a Conspiracy against all the Religions and Governments of Europe*. This work is now forgotten; and it will serve for little more than amusement to know, that the crimes, so evidently prompted by forcibly carrying the usages and exclusions of a dark age, when the people respected them, into an age when they were not respected, were traced to the machinations of the illuminati and freemasons. Professor Robison had the merit of quoting authorities not much read, and in the inflamed feelings of the period the secrecy of the sources, instead of proving a *prima facie* objection to the probability that a tissue of open national outrages, prompted by passion, and unguided by prearranged motive, could be the consequence of what was so carefully concealed, or rather overlooked, served to inflame the spirit of mystery which other branches of literature were then fostering; and the book was rapidly sold to the extent of four editions, and was greedily read. In an age which has acquired the power of influencing masses of men by public opinions, secret tenets or intentions do not acquire numerous followers. That there were some grounds in opinion, and even in intention, for many of the statements of Mr. Robison, may be granted; but a few German enthusiasts, pleased with mysticism, were the only conspirators, and the appalling statements in the works which he used as authorities were from men still more given to credulity than the persons of whom they spoke were to mystery.

In 1799 Professor Robison was employed in the difficult task of preparing for the press the manuscript lectures and notes of Dr. Black, who had just died. "Dr. Black," says Robison's biographer, "had used to read his lectures from notes, and these often but very imperfect, and ranged in order by marks and signs only known to himself. The task of editing them was therefore difficult, and required a great deal both of time and labour; but was at last accomplished in a manner to give great satisfaction." Meanwhile, however, the discoveries of Dr. Black had produced many alterations in chemistry, and the science had assumed a new aspect. Among other things, the new nomenclature of Lavoisier had been almost universally received, and rendered any work which did not adopt it antiquated and comparatively useless. It was supposed that Robison, with some

labour, but without any injustice to the labours of his friend, might have adopted it; but he preferred the system in the original: a choice attributed by some to respect for the memory of his friend, and by others to prejudice. He sent a copy of his publication to the Emperor of Russia, and received in return a box set in diamonds, and a letter of thanks.

Professor Robison had long intended to digest his researches into a work, to be entitled "*Elements of Mechanical Philosophy*," being the Substance of a Course of Lectures on that Science." The first volume of this work, containing "Dynamics" and "Astronomy," he published in 1804; but he did not live to complete it. In the end of January, 1805, he yielded to the lingering disorder which had long oppressed his body, before it enervated his mind. His biographer gives the following account of his character:—"He possessed many accomplishments rarely to be met with in a scholar or a man of science. He had great skill and taste in music, and was a performer on several instruments. He was an excellent draughtsman, and could make his pencil a valuable instrument, either of record or invention. When a young man, he was gay, convivial, and facetious, and his *vers de société* flowed, I have been told, easily and with great effect. His appearance and manner were in a high degree favourable and imposing; his figure handsome, and his face expressive of talent, thought, gentleness, and good temper. When I had first the pleasure to become acquainted with him, the youthful turn of his countenance and manners was beginning to give place to the grave and serious cast which he early assumed; and certainly I have never met with any one whose appearance and conversation were more impressive than his were at that period. Indeed, his powers of conversation were very extraordinary, and, when exerted, never failed of producing a great effect. An extensive and accurate information of particular facts, and a facility of combining them into general and original views, were united in a degree of which I am persuaded there have been few examples. Accordingly, he would go over the most difficult subjects, and bring out the most profound remarks, with an ease and readiness which was quite singular. The depth of his observations seemed to cost him nothing: and when he said anything particularly striking, you never could discover any appearance of the self-satisfaction so common on such occasions. He was disposed to pass quite readily from one subject to another; the transition was a matter of course, and he had perfectly, and apparently without seeking after it, that light and easy turn of conversation, even on scientific and profound subjects, in which we of this island are charged by our neighbours with being so extremely deficient. The same facility, and the same general tone, were to be seen in his lectures and his writings. He composed with singular facility and correctness, but was sometimes, when he had leisure to be so, very fastidious about his own compositions. In the intercourse of his life he was benevolent, disinterested, and friendly, and of sincere and unaffected piety. In his interpretation of the conduct of others he was fair and liberal while his mind retained its natural tone, and had not yielded to the alarms of the French revolution, and to the bias which it produced."

Mr. Robison's various works, printed and unprinted, were, after his death, put into the hands of Professor Playfair; but that gentleman finding that he could not devote his time sufficiently to them, they were afterwards published, with notes, by Dr. Brewster, in four volumes octavo, 1822. This work consists of some manuscript papers on "Projectiles"

and "Corpuscular Action," and the papers which the author prepared for the *Encyclopædia Britannica*, abridged of some of their digressions.

ROLLOCK, ROBERT, an early and zealous promoter of Scottish literature, was born in the year 1555. He was nearly related through his mother to the noble family of Livingston. Discovering an early aptitude for letters, he was sent by his father, Mr. David Rollock, to the grammar-school of Stirling, at that time taught by Mr. Thomas Buchanan, nephew to the author of the *History of Scotland*. Under the care of this teacher he continued till he was fit for entering the university, when he was sent to the college of St. Salvador, St. Andrews. By his docility, modesty, and sweetness of disposition, young Rollock had already engaged the affections of his preceptor, and laid the foundation of a friendship which continued till his death. The possession of these virtues also procured him, in a short time, the particular and favourable notice of the whole university. Having gone through the regular course of four years' study, which was at that time the prescribed period in all the Scottish colleges, and taken out his degree, he was immediately elected professor of philosophy, being then only in the twenty-third year of his age. Here he continued for four years, discharging the duties of his office with singular diligence, and with a success almost without example in Scottish colleges. It was at this time, and long after this, the practice in the Scottish universities for the same professor to conduct the studies of the same set of students through the whole course; and the remarkable progress of his pupils, with the public applause he received at their laureation, induced the magistrates of Edinburgh to fix upon Mr. Rollock as a fit person to open their university, for which they had obtained a charter from King James the previous year. This invitation Mr. Rollock was persuaded to accept, and in the beginning of winter 1583 he entered with all his accustomed zeal upon his laborious office, being the sole teacher, and in his own person comprising the character of principal and professors to the infant establishment. The fame, however, of so celebrated a teacher as Mr. Rollock opening a class for philosophy in the newly erected seminary, operated as a charm, and multitudes from all corners of the kingdom hastened to the capital to take the benefit of his prelections. Having no assistant, Mr. Rollock joined all his students at first into one class, which, from the want of preparation on the part of the students, rendered his labours at first of little utility. All the books used, all the lectures delivered, and the whole business of the class, was transacted in Latin, without some competent knowledge of which the student could not possibly make any progress. From a defective knowledge in this respect among the students, Mr. Rollock was soon under the necessity of dividing his class into two, with one of which he found it the most profitable mode of proceeding to begin them anew in the rudimental parts of humanity. At the recommendation of Mr. Rollock, however, the patrons of the college elected a young man of the name of Duncan Nairn a second master of the college, who undertook the charge of this first class in the month of November, 1583. Mr. Nairn, who was the second professor in the college of Edinburgh, taught his class Latin the first year, Greek the second, there being properly no humanity professor in the university till a number of years after this. The emoluments of office in the new university must have been very moderate, for the students paid no fees, and any funds which had yet been provided were altogether

trifling. The town-council, however, seem to have been careful of the comfort of the new professors, as they allowed Mr. Rollock, on the 17th of September, 1583, twenty pounds Scots for his expenses in coming from St. Andrews to Edinburgh at the commencement of his regency, and on the 25th of the succeeding month of October, thirty pounds Scots for his services. They also, in the month of November, ordered Robert Rollock, first regent, and Duncan Nairn, second, twenty pounds Scots each for boarding till Candlemas, and in the succeeding year a committee was appointed to confer with the former "anent taking up house." It no doubt required all the patronage the city of Edinburgh could bestow, and all the exertions of Rollock and his associate, to carry on the seminary successfully with so little means, and in an age of so much ignorance and poverty. Circumstances, too, were greatly against it. In the year 1585 the plague made its appearance in Edinburgh on the 4th day of May, and raged till the succeeding month of January, during which time the city was abandoned by all who had the means of leaving it. The university was thus wholly deserted at a time when the students were in the very middle of their course, a circumstance which, considering that it was but the third year of the establishment, must have been highly prejudicial to its interests. The professors, however, returned about the middle of January, and the students, by an order of council, were ordered to be in their places upon the 3d of February. In this same year the national covenant, or confession of faith, was introduced into the college, and tendered to every student. Mr. Rollock was also created principal, though he still continued to teach his class. His associate, Duncan Nairn, died the succeeding year, and the council having resolved to have three classes taught, Messrs. Adam Colt and Alexander Scrimger were elected in his place.

Mr. Rollock continued to teach his private class till the first laureation, which was public, and attended by all the nobility in town. The number graduated, and who of course signed the covenant, was forty-eight. As soon as this ceremony was concluded Mr. Rollock resigned his regency, retaining the principalship, to which was now annexed the professorship of theology, for which, and preaching regularly on the Sabbath, he was allowed four hundred merks yearly. It was the practice of Mr. Rollock to pray in public with the students every morning, and on one day of the week to explain to them some passage of Scripture, which he never failed to conclude with most pertinent and practical exhortations. With the more advanced students he was particularly careful that they might enter upon the work of the ministry, not only in some measure prepared for, but with a deep feeling of, its important duties. With all this diligence among his pupils he was a faithful and acceptable minister of the gospel. With literary ardour, however, almost boundless, and the warmest piety, Mr. Rollock's simplicity of character degenerated into, or rather originally possessed, a natural imbecility, not at all uncommon in minds of this description, which disqualified him from acting a consistent or a profitable part in the conduct of the public affairs of the church, which at this period were of paramount importance, involving at once the civil and the religious rights of the community. This facile disposition was at once seen and appreciated by King James, who, having now matured his plans for reducing the church to an entire dependence upon himself, was sedulously employed in carrying them into effect. For advancing this purpose he had procured a meeting of

the clergy at Perth in the month of February, 1597, which by threatenings, flatteries, and bribes, and by preventing some individuals from giving their opinion in the matter, he managed to have set down for a General Assembly, whose conclusions were to be considered as binding upon the whole church. Naturally endowed, however, with a more than ordinary share of cunning, he proceeded with the utmost caution. Disclaiming all intention of introducing anything like change in any part of either the worship, government, or discipline of the church, and professing the utmost reverence for religion and respect for its ministers, he submitted to this assembly only thirteen articles to be reasoned upon; all of them worded in a manner so gentle, and so ambiguous, as to conceal from all but acute and narrow observers their real spirit and true meaning; which was, in the first place, to lay open the present established order of the church to be called in question, though it was supposed to have been set at rest by the solemn oaths of his majesty, his council, his household, and by all who had any concern in the matter; secondly, to circumscribe the liberty of the pulpit, so that no warning might, through that medium, be given to the people of the designs of the king and his courtiers, when they should come to be discovered; and thirdly, that a commission of a few of the most prudent and orderly of the ministers should be appointed to confer with his majesty and council upon all these or other questions, as opportunity or necessity might call for, subject to the after consideration of a General Assembly, to be indicted only by his majesty, which was in the above articles not unequivocally claimed as one of the prerogatives of his crown. With all the diligence he exerted, however, he carried his purpose no very great length; some of his articles being answered doubtfully, some of them disallowed, and some of them not answered at all. Still greater diligence was therefore necessary to prepare matters for the assembly that was to meet at Dundee in the month of May the same year, where there was not only danger of gaining nothing further in his advances towards Episcopacy, but of all that had been gained in the last assembly being lost. Care was taken to prevent the regular meeting of the assembly which should have been held at St. Andrews in the month of April. Only a very few of the commissioners ventured to appear, who, along with the moderator, made humble confession of their sins, formed or constituted the assembly, and took protestations for the liberty of the kirk, continuing all summonses, references, and appellations to the assembly following. In the following month the assembly met at Dundee, but it was in the new fashion; the difference between which and those that had been held previously to that at Perth, of which we have spoken above, is thus stated by a writer of that period of the highest respectability. "1st. Christ by his spiritual office having convoked and appointed times and places before; now times and places are appointed by the king, claiming this as his only due. 2d. The moderator and brethren were directed by the word of God, and his Spirit; now and hereafter they are to be directed by the king, his laws, and state policy. 3d. Matters were before proposed simply, and the brethren sent to seek light out of the word by reasoning, conference, meditation, and prayer; now means are devised before in the king's cabinet to bring his purposes to pass, and heed is taken in public and private what may hinder his course. He that goeth his way is an honest man, a good peaceable minister; those that mean or reason in the contrary are seditious, troublesome, coffered, factious! 4th. In reasoning, the word

was alleged, the reason weighed, and if of weight yielded unto willingly; now the word is passed by, or posted over and shifted, and if the reason be insisted upon, the reasoner is borne down and put to silence. 5th. The fear of God, the care of the kirk, learning, the power of preaching, motion and force of prayer, and other gifts shining in those who were present, procured before estimation, reverence, and good order; now the person, presence, and regard to the prince's favour and purpose swayeth all. If any had a gift or measure of learning, utterance, zeal, or power in exhortation beyond others, it was employed at these assemblies; now plots are laid how none shall have place but such as serve for their purpose. 6th. The assemblies of old aimed at the standing of Christ's kingdom in holiness and freedom; now the aim is how the kirk and religion may be framed conform to the political state of a monarch, and to advance his supreme and absolute authority in all causes. In a word, where Christ ruled before, the court now beginneth to govern. The king's man may stand at the king's chair, use what countenance, gesture, or language he pleaseth, but good men must be taunted, checked," &c. Such, according to Calderwood, was the assembly held at Dundee, 1597. According to the same authority, "After exhortation made by the last moderator, the assembly was delayed, and the commissioners wearied till the coming of Mr. Robert Rollock, whom the king, and such as were to further his course, intended to have moderator. He was a godly man, but simple in the matters of the church government, credulous, easily led by counsel, and tutored in a manner by his old master Thomas Buchanan, who was now gained to the king's course. Many means were used to have him chosen, and the king and his followers prepared him for the purpose. Sir Patrick Murray (brother to the laird of Balvaire, the same who had been his majesty's agent for corrupting the assembly at Perth), and such ministers as were already won, travailed with others of chief note, and brought them to be acquaint with the king, which was their exercise morning and evening." Mr. Rollock having been appointed moderator, the assembly proceeded to pass several acts strongly tending to support the whole superstructure of Episcopacy. This was effected chiefly by a representation of his majesty "anent a solid order to be taken anent a constant and perpetual provision for the sustentation of the whole ministry within this realme, to the end that they be not, as in time bygone, forced to depend and await upon the commissioners appointed for modifying of their stipends, and so to absent themselves the most part of the year from their flocks, to the great disgrace of their calling, disheartening of the congregation, discontentment of his majesty, whose care ever hath been, and earnest desire continueth as yet, that every congregation have a special pastor, honestly sustained for the better awaiting upon his cure, and discharging his dutiful office in the same. Therefore, his majesty desired the brethren to consider whether it were expedient that a general commission should be granted to a certain number of the most wise and discreet of the brethren to convene with his majesty for effectuating of the premises. This, his majesty's advice, the assembly judged to be necessary and expedient, and therefore gave and granted their full power and commission to the brethren," &c. &c. These brethren, fourteen in number, seven of whom with his majesty were to be a quorum, were unhappily, with the exception of one or two that were named to save appearances, already captivated with the hopes, some of them with the express promise, of

preferment, and the assembly was scarcely risen when they began to display all the arrogance of a bench of bishops or a high commission court. In the month of June they convened at Falkland, called before them the presbytery of St. Andrews, upon a complaint by Mr. John Rutherford, who had been deposed from the ministry of Kinnocher by that presbytery, and reduced the sentence. The culprit had purchased the favour of the court by forging calumnies upon Mr. David Black, "who was a great eyesore," says Calderwood, "to negligent, loose, and unfaithful ministers, of which number this Mr. John Rutherford was one, but he lived in disgrace ever after, and was condemned by the bishops themselves, because he could serve them to no further use." Proceeding to St. Andrews they cast out Mr. Wallace and Mr. Black, who had but lately been restored; banishing the latter to Angus, whence they brought Mr. George Gladstones, soon after created a bishop, to fill his place.

While they thus broke down the hedge of the church, by thrusting out two of her most faithful ministers, and bringing in Mr. Gladstones without the consent of either presbytery or people, they also interfered with the laws of the university; obliging Andrew Melville to demit his rectorship, and forbidding all professors within the university, especially professors of divinity, to sit in the presbytery upon any matter of discipline. Robert Rollock, moderator of the last assembly, and consequently of the meetings of the commissioners with the king, betrayed, according to Calderwood, "great weakness, which many that loved him before construed to be simplicity." By the aid of Mr. Rollock and his friends the commissioners, however, his majesty was enabled to restore the Popish Earls of Huntly, Angus, and Errol, with whose assistance he carried in parliament an act for ministers of the gospel to have a place and a vote in that assembly. This act declared, "that such pastors and ministers within the same, as at any time his majesty shall please to provide to the office, place, title, and dignity of a bishop, abbot, or other prelate, shall at any time hereafter have vote in parliament seditious and as freely as any other ecclesiastical prelate had at any time bygone. It also declared that all or whatsoever bishoprics presently vaiking in his majesty's hands, which are yet undisposed to any person, or which shall happen at any time hereafter to vaik, shall be only disposed by his majesty to actual preachers and ministers in the kirk," &c.

Soon after this, Mr. Rollock was seized with an illness which confined him to his house, and finally terminated his existence. While on his death-bed he requested two friends, who called upon him, to go from him, as a dying man, to the king, and exhort him to cherish religion and the church, and to protect and comfort its pastors, and to proceed with these good works with an unflinching step till the last hour of life; and not allow himself to be drawn from it, either by the hope of enlarging his authority, or by the evil advices of wicked men. To the same persons he added, "You will remember that I was chosen by the assembly at Dundee to watch for the interest of this church. In this I had the glory of God and the safety of the church, miserably tossed with tempests and shaking, before mine eyes; and I can now declare that my conscience does not smite me with any wicked departure from duty, in doubling the number of the ministers of Edinburgh; and particularly, in my activity to bring in two (Messrs. Robertson & Stewart) who studied under me, when I thought I saw in them gifts suitable to such a trust, and hoped God would bless their

labours. I am so far from repenting any share I had in this, that to this hour it is satisfying to me. I am persuaded the wise Maker of the world has tied the church and state together with a brotherly and adamant chain; and it hath been my great care to advance the good of both: and yet the love of peace hath not so far bewitched me, that I could not distinguish between genuine and adulterous peace; neither hath my affection to my sovereign carried me that length, that to please him I should submit to the least stain on my conscience. I hope the integrity and candour of my conduct shall appear when I am dead. In a word, brethren, join together with the most intimate love and concord in the work of the Lord. Let me put you in mind to pay every obedience to the king. You live in happy times and enjoy a singular felicity. You are blessed with a prince who drank in religion with his milk; who hath guarded your doctrine with a right discipline, and covers both the doctrine and discipline of religion with his protection; who hath taken the church so much into his care, as by open and plain unanswerable documents, to make it evident that he will never desert her while he breathes. Therefore, what you may easily and pleasantly enjoy, it will be folly to seek after by harsh methods. You will, then, take particular care that the church be not ruined by a fall from such high happiness." Mr. Rollock died on the 8th of January, 1598, in the forty-third year of his age. His remains were attended to the place of interment by nearly the whole population of Edinburgh, who considered him as their spiritual father, and regarded his death as a public calamity. The town-council had paid his house-rent for many years, and they allowed his widow the one half of his salary for five years, and to his posthumous daughter they gave, from the city funds, 1000 merks, by way of dowry. He published several works, chiefly commentaries on parts of Scripture, several of which were printed at Geneva, and obtained the warm approbation of the learned and judicious Beza. These works are still to be met with, and though tinged with the scholastic theology of the times, discover great natural acuteness, a full acquaintance with his subject, and very extensive learning. His whole life seems, indeed, to have been devoted to literature.

ROSE, GEORGE, an eminent modern political character, was born at Brechin, June 11, 1744. He was the son of a poor non-jurant clergyman of the Scottish Episcopal communion, who, through the persecution which his order endured from the government after the insurrection of 1745, seems to have lost the means of supporting his family. Under these unfortunate circumstances, George Rose was received by an uncle who kept an academy near Hampstead, by whom he was, at a very early period of life, placed in a surgeon's shop. Not liking this employment, he had the good fortune to attract the attention of the Earl of Marchmont, who, from sympathy for the cause of his father's distresses and other considerations, procured him a situation on board a ship of war. Here the office of purser, to which George soon attained, enabled him to display his qualities of activity, industry, and punctuality in so extraordinary a manner as to attract the notice of the Earl of Sandwich, then at the head of the admiralty. After occupying several subordinate situations in the public offices, he was appointed keeper of the records, for which his qualifications were entirely suited. The confused mass of papers which filled this office were by him arranged and classed in such a manner, that any one could be found immediately when wanted. This achievement

was attended with such extreme convenience to the ministry, that it attracted the particular attention of Lord North, and established Mr. Rose as the man whose services were to be resorted to for all such systematic and laborious work.

In 1767 he was appointed to complete the Journals of the House of Lords in thirty-one folio volumes; a laborious and creditable duty, for which he received a very handsome sum. Mr. Rose from this time found regular employment in the public offices; but it was not till the Pitt and Dundas administration that he was raised to any eminent station in the public service. He was then appointed joint-secretary to the treasury, and introduced into that department his habits of order, of regularity, and of careful attention to details. Mr. Rose's qualifications were not of that class which make a great display; but which, nevertheless, are so necessary, that the want of them soon becomes conspicuous. In the business of every administration there is a great deal of laborious second-rate work, which cannot be conveniently executed by the highest order of statesmen. The bold and comprehensive plans which they are called upon to form, require talents and habits which are very seldom found united with the power of minute calculation and patient inquiry. A laborious man, therefore, whose diligence and accuracy can be depended on, is an important acquisition to every administration. Such a one, who does not venture into the high and uncertain ground of political contention, may survive many ministerial shocks, and may recommend himself without discredit to cabinets differing considerably in their political aspect. Such an assistant was found by Mr. Pitt in the subject of the present memoir, who, with the exception of two short intervals, continued during half a century a sort of ministerial fixture, carrying on the routine of public offices, with many useful plans and objects of a subordinate nature. While superintending the business of the treasury, his vigilance was unremitted in inspecting and keeping on the alert every department of the widely ramified system. Trade also occupied a considerable share of his attention; and no man was more intimately acquainted with its facts and details; though he does not seem to have reached those sound and comprehensive views which were familiar to Mr. Pitt. Amid a variety of delicate employments, no charge was ever made against his integrity, except one, which turned out quite groundless.

On the accession of the Addington administration in 1801, and afterwards on the formation of that of the Talents in 1806, Mr. Rose retired along with Mr. Pitt, but resumed the public service in both cases on the restoration of the Tories. On Mr. Pitt's return to power he was made vice-president, and soon after president of the Board of Trade, with a salary of £4000 a year; in which situation, excepting during the Talents administration, he continued till his death. As a matter of course, Mr. Rose was in parliament during the greater part of his public career. His speeches in that assembly were generally on subjects connected with trade, and were confined chiefly to details of facts, which he stated in a manner that aimed at nothing like ornament. He deserves particular praise for the zeal with which he engaged in plans no way connected with ministerial influence, and having for their sole object to improve the condition of the indigent classes of society. He gave his full support to friendly societies and savings-banks; and introduced laws to encourage, and to secure the property of those establishments. In questions relating to the corn-laws he usually took part with the people against the landed interest. The plans

for taking a census of the population were conducted under his auspices.

Early in life Mr. Rose married a lady connected with the island of Dominica, by whom he had a large family. He purchased the estate of Cuffnells, in the New Forest, which he spent a large sum in ornamenting. His regular and temperate life was prolonged to a greater extent than might have been expected from the laborious way in which he had spent it. He died at Cuffnells, January 13, 1818, in the seventy-fifth year of his age. It was the singular fortune of Mr. Rose, that he could declare in his last moments, in reference to his family, that "they had been a blessing to him during a long series of years, and had never caused him one hour's pain."

Mr. Rose was the author of a considerable number of fugitive political writings, and of a respectable historical treatise, which he published with his name, under the title of *Observations on the Historical Work of Mr. Fox*. These *Observations* were prompted partly by a dissent from some of the political views in the *History of James II.*, and partly by a wish to clear some charges brought against Sir Patrick Hume, the ancestor of his patron and friend the Earl of Marchmont, whose executor he was. The political opinions in the work, though opposed in some points to those of Mr. Fox, are considered liberal, considering the general strain of the author's political life. Mr. Rose also superintended, under the direction of the House of Lords, the publication of a superb engraved edition of *Doomsday Book*.

ROSS, ALEXANDER, a very voluminous writer, but remembered less for his numerous works, than for a celebrated couplet in *Hudibras*:—

"There was an ancient sage philosopher,
Who had read Alexander Ross over."

He was born in Aberdeen in the year 1590; but his parentage has not been ascertained, nor have the circumstances of his early life been recorded. He has been generally confounded with a contemporary of the same name, of whom some account will be found in the next memoir. At what time he quitted Scotland is unknown; but it is supposed that not long after his arrival in England he was appointed master of the grammar-school of Southampton, and chaplain to Charles I. These appointments were probably procured through the influence of Laud, Archbishop of Canterbury, to whom he expresses his obligations in the dedication of his *Commentum de Terræ Motu Circulari Refutatum*. This work appeared at London in 1634; and though professedly written against Lansbergius and Carpentarius, two advocates of the Copernican theory, contains, in fact, an epitome of all the arguments that have been adduced against that system. The Latinity is respectable, and the argument is managed with considerable skill. During the struggles of the great civil war Ross espoused the royal cause, and his writings are filled with praises of the king and denunciations of the parliament. It has been remarked by Echard, however, that he "so managed his affairs, that in the midst of these storms he died very rich, as appears from the several benefactions he made." His death took place early in 1654. We learn from the MSS. of Sir Robert Sibbald, that by his will, dated 21st February, 1653, and probated 19th April, 1654, among numerous other benefactions, he left £200 to the town-council of Aberdeen, for the foundation of two bursaries; £50 to the poor of Southampton; £50 to the poor of the parish of All-Saints; and £50 to the Bodleian Library. There is scarcely a subject in the wide range of literature on which Ross has not left a work. His first publication

appears to have been poetical: *Rerum Judaicarum Libri Duo*, London, 1617. To these he added a third book in 1619, and a fourth in 1632. The rarest of his poetical effusions bears no date, but is entitled "Three Decads of Divine Meditations, whereof each one containeth three parts: 1. History. 2. An Allegory. 3. A Prayer. With a Commendation of a Private Country Life." This work has been priced so high as £8, 8s. *Four Books of Epigrams in Latin Elegiacs* also appeared without a date; and in 1642 he published "*Mel Ihdicentum*;" or Poetical Honey Gathered out of the Weeds of Parnassus. The first book is divided into vii chapters, according to the first vii letters of the alphabet, containing 48 fictions, out of which are extracted many historicall, naturall, morall, politicall, and theological observations, both delightful and useful; with 48 Meditations in Verse." But his most celebrated work in the department of poetry, is his *Virgillii Evangelisantis Christiados Libri xiii.*, which was published at London in 1634, and again in 1638 and 1659. This is a cento from Virgil, giving a view of the leading features of sacred history, from the murder of Abel to the ascension of Christ. It excited considerable notice in its day, and was more lately brought before the public attention by Lauder, who accused Milton of having plagiarized it. Lauder says, that by many Ross's *Christiad* is esteemed equal with the *Æneid*. The opening lines may serve as a specimen:—

"Acta, Deumque cano, cœli qui primus ab oris
Virginis in læte gremium descendit et orbem
Terrarum invisit profugis, Chanaanæque venit
Littora, multum ille et terra jactatus et alto
In superum, sævi memorem Plutonis ob iram."

His chief works in the department of history are, "*Animadversions and Observations upon Sir Walter Raleigh's History of the World*, wherein his Mistakes are noted, and some Doubtful Passages noted," London, 1653; and the "*History of the World*, the Second Part, in Six Books, being a Continuation of Sir Walter Raleigh's," London 1652. "This," says Granger (3d edit. vol. iii. p. 32), "is like a piece of bad Gothic tacked to a magnificent pile of Roman architecture, which serves to heighten the effect of it, while it exposes its own deficiency in strength and beauty." In 1652 was published, with a portrait of the author, "*Pansebia*, or View of all the Religions in the World, with the Lives of Certain Notorious Hereticks." Afterwards reprinted in 1672, 1675, 1683, &c. Ross entered into controversy with Hobbes, Sir Thomas Browne, Hervey, and Sir Kenelm Digby; and has left, among others, the following controversial writings: "*Observations upon Hobbes' Leviathan*, 1653; "*Arcana Microcosmi*, or the Hid Secrets of Man's Body Discovered, in Anatomical Duel between Aristotle and Galen, with a Refutation of Thomas Browne's Vulgar Errors, from Bacon's *Natural History* and Hervey's book *De Generatione*," 1651; the *Philosophical Touchstone*, or Observations on Sir Kenelm Digby's Discourse on the Nature of Bodies and of the Reasonable Soul, and Spinoza's Opinion of the Mortality of the Soul, briefly Confuted," 1645. This does not exhaust the catalogue of Ross's writings. Besides many ascribed to him on doubtful authority, there remain to be mentioned: the "*New Planet no Planet*, or the Earth no Wandering Star, against Galilæus and Copernicus," 1640; "*Mystagogus Poeticus*, or the Muses' Interpreter," 1647, which went through six editions; "*Enchiridium Oratorium et Poeticum*, 1650; "*Medicus Medicatus*, or the Physician's Religion Cured," 1645; "*Melismachia*;" "*Colloquia Plantina*;" "*Chrenology in English*;" "*Chymera Pythagorica*," no date; "*Tonsor ad*

Cutem Rasus, 1629; "*Questions and Answers on the First Six Chapters of Genesis*, 1620; "*The Picture of the Conscience*, 1646; "*God's House*, or "*the House of Prayer*, Vindicated from Profaneness, 1642; "*God's House made a Den of Thieves*, 1642. These two last pieces are sermons.

ROSS, ALEXANDER, frequently confounded with the former, was the son of James Ross, minister at Strachan, in Kincardineshire, and afterwards at Aberdeen. The date of his birth has not been ascertained, but it was probably between 1570 and 1580. He was for some time minister of the parish of Insch, in 1631 he was appointed minister of Footdee, a catechetical charge in the close vicinity of Aberdeen; and in 1636 was chosen one of the ministers of St. Nicholas' Church in that city. Ross, like his colleagues, supported the Episcopal form of government, and subscribed the *Generall Demands* propounded to the commissioners appointed by the Tables to enforce the subscription of the covenant in Aberdeen. The day before their arrival he thundered from the pulpit against their proceedings, and exhorted his hearers to resist their threats. He appears also to have been in correspondence with Laud. In March, 1639, the Covenanting forces approached Aberdeen, and the chiefs of the Episcopal party fled. Ross was unable to quit the town from a sickness, from which he seems never to have recovered; he died on 11th August, 1639. His only publication appears to be the following, which is extant in Bishop Forbes' *Funerals* (p. 149-178): "A Consolatorie Sermon, preached upon the Death of the R. R. Father in God Patrick Forbes, late Bishop of Aberdene. By Alexander Rosse, Doctour of Divinitie, and Minister of the Evangell in Aberdene, in Saynt Nicholas Church there. Anno 1635, the xv of Aprill."

ROSS, ALEXANDER, a poet of some eminence, was born in the parish of Kincardine O'Neil, Aberdeenshire, on the 13th April, 1699. His father was Andrew Ross, a farmer in easy circumstances. Ross received the first elements of his education at the parochial school, under a teacher of considerable local celebrity; and after four years study of the Latin language, succeeded in gaining a bursary at the competition in Marischal College in November, 1714. Having gone through the usual curriculum of the university, he received the degree of Master of Arts in 1718, and shortly after was engaged as a tutor to the family of Sir William Forbes of Craigievar and Fintray; a gentleman who appears to have possessed considerable taste and learning. How long the poet remained in this situation has not been ascertained; but he seems to have earned the good opinion of his patron, who recommended him to study divinity, with the assurance that his interest should not be wanting to procure a comfortable settlement in the church. Favourable as this offer was, from a gentleman who had no fewer than fourteen patronages in his gift, Ross declined it, on a ground which evinces extraordinary modesty—"that he could never entertain such an opinion of his own goodness or capacity as to think himself worthy of the office of a clergyman." On leaving the family of Sir William Forbes, Ross for some time taught, apparently as an assistant, the parochial school of Aboyne in his native county, and afterwards that of Laurencekirk in Kincardineshire. While in this last situation he became acquainted with the father of Dr. Beattie; a man who, in our poet's opinion, "only wanted education to have made him perhaps as much distinguished in the literary world as his son. He knew something of

natural philosophy, and particularly of astronomy, and used to amuse himself in calculating eclipses. He was likewise a poetical genius, and showed our author some rhymes of considerable merit."¹ In 1726, Ross married Jane Catanach, the daughter of a farmer in Aberdeenshire, and descended by the mother from the ancient family of Duguid of Auchinhove. In 1732, by the influence of his friend Mr. Garden of Troup, he was appointed schoolmaster of Lochlee in Angus; and the rest of his life was spent in the discharge of the duties of this humble office. There are perhaps few pieces of scenery in Scotland of a more wild and poetical character than that in which Ross's lot was cast. Lochlee is a thinly peopled parish, lying in the very centre of the Grampians, at the head of the valley of the North Esk. The population is almost entirely confined to one solitary glen, the green fields and smoking cottages of which are singularly refreshing to the eye of the traveller after the weary extent of bleak moor and mountain which hem in the spot on all sides. On a mound in the centre stands the ruin of an ancient fortalice, built by the powerful family of the Lindsays of Edzel as a place of retreat, where they could defy those dangers which they could not cope with in their Lowland domains, in the How of the Mearns. The loch, which gives its name to the parish, is a very beautiful sheet of water, imbedded deep among steep and craggy mountains. The Lee, the stream which feeds it, flows through a very wild glen, and over a rocky channel, in several picturesque waterfalls. On one of the tall precipices that form its sides an eagle has built its nest, secure from molestation in the inaccessible nature of the cliff. The remains of Ross's house still exist, situated near the eastern extremity of the loch, and only a few feet from the water's edge. Near at hand, surrounded by a few aged trees, is the little burying-ground of the parish, the tombstones of which bear some epitaphs from Ross's pen, and there his own ashes are deposited. The poet's house in now occupied as a sheepfold; and the garden, on which it is said he bestowed much of his time, can still be traced by the rank luxuriance of the weeds and grass, and the fragments of a rude wall. It is impossible to look on the ruins of this humble hut without interest; its dimensions are thirty feet in length and twelve in breadth; and this narrow space was all that was allotted to the school-room and the residence of its master. The walls seem to have contained but two apartments, each about twelve square feet in size, and the eastern was that occupied by Ross, from whom one of the windows, now built up, is still named the poet's window. He had trained to cluster around it honeysuckle and sweet-briar; and here, looking forth on the waters of the loch, is said to have been his favourite seat when engaged in composition. So deep and confined is the glen at this spot, that for thirty days of the winter the sun never shines on the poet's dwelling. The emoluments of Ross's office were small, but perhaps more lucrative than the majority of parochial schools in the same quarter, from his being entitled to a sort of glebe, and some other small perquisites. One of his biographers has quoted some lines of the introduction to *Helenore* as a proof of Ross's poverty and want:—

"Pity anes mair, for I'm out-through as clung,
 'Twas that grim gossip, chandler-chafed want
 Wi' thread-bare claehting, and an ambry scant," &c.

It is consoling to be satisfied that these lines are not to be understood in a literal sense. We are assured

by his grandson, that "no person in his station, or perhaps in any station, enjoyed a greater share of personal and domestic happiness. His living was indeed but small, not exceeding twenty pounds a year, exclusive of the profits of his glebe; but he had no desire beyond what was necessary to support himself and family in a way suitable to his station; and, considering the strict economy observed in his house, and the simple though neat mode of living to which he was accustomed, the emoluments of his office, as well as the profits arising from his publications, rendered him in some degree comfortable and independent." It also appears that he joined to his avocations as schoolmaster, session-clerk, and precursor, the duties of a notary-public, his name occurring in the register in 1730. It was not until he had resided here for thirty-six years, that, in the year 1768, when he was nearly seventy, Ross appeared before the public as an author. So early as his sixteenth year he had commenced writing verse; a translation from the Latin of Buchanan, composed at that age, having been published by his grandson in the memoir we have just quoted. From that time he seems to have cultivated his poetical talents with ceaseless assiduity: Dr. Beattie, who appears to have advised him in the selection of his works for publication, writes in a letter to Dr. Blacklock, "He put into my hands a great number of manuscripts in verse, chiefly on religious subjects: I believe Sir Richard Blackmore is not a more voluminous author. He told me that he had never written a single line with a view to publication, but only to amuse a solitary hour."² The poems which by Dr. Beattie's advice were chosen for publication consisted of "*Helenore*, or the Fortunate Shepherdess," and some songs, among which were "*The Rock and the Wee Pickle Tow*," "*To the Begging we will go*," and "*Wood'd and married and a'*." They appeared at Aberdeen in 1768,³ in one volume 8vo, and a considerable number of subscribers having been procured, the profits of the publication amounted to about twenty pounds; "a sum," says Beattie, "far exceeding his most sanguine expectations, for I believe he would thankfully have sold his whole works for five." To promote the sale, Beattie (whose interest in Ross was excited by the latter's acquaintance with the doctor's father) addressed a letter to the editor of the *Aberdeen Journal*, together with some verses inscribed to Ross, which are remarkable from being their author's only composition in the Scottish dialect; they have been prefixed to all the subsequent editions of *Helenore*, and possess much merit. The success of the volume does not seem to have been very rapid, for ten years elapsed before the publication of the second edition. While this was going through the press, Dr. Beattie wrote to Ross from Gordon Castle, with an invitation from the noble owners to pay them a visit. Though now eighty years of age, the poet at once accepted the invitation, and took that opportunity of presenting a copy of the second edition of his work, dedicated to the Duchess of Gordon. He remained at the castle for some days, says his grandson, and "was honoured with much attention and kindness both by the duke and duchess, and was presented by the latter with an elegant pocket-book, containing a handsome present, when he returned to Lochlee in good health, and with great satisfaction."

² Forbes' *Life of Beattie*, i. 119. We may add Dr Beattie's description of Ross at this date: "He is a good-humoured, social, happy old man; modest without clownishness, and lively without petulance."

³ *The Fortunate Shepherdess*, a Pastoral Tale in the Scottish Dialect, by Alexander Ross, Schoolmaster at Lochlee, to which are added a few Songs by the Author. Aberdeen, printed by and for Francis Douglas—1768." Pp. 150.

¹ Life of Ross, by his grandson, the Rev Alexander Thomson of Lentrathen—prefixed to an edition of the *Fortunate Shepherdess*, printed at Dundee, 1812.

The next year he experienced the loss of his wife, who died at the advanced age of eighty-two, and to whose memory he erected a tombstone with a poetical epitaph. He himself did not long survive: on the 20th of May, 1784, "worn out with age and infirmity, being in his eighty-sixth year, he breathed his last, with the composure, resignation, and hope becoming a Christian." Of Ross's numerous family two sons and a daughter died in early youth, and four daughters survived him. Such are the few facts that constitute the biography of Alexander Ross. His character appears to have been marked by much cheerfulness and simplicity; lowly as was his lot, he found tranquillity and content in it, and the picture of his household piety which has come down to us is singularly affecting. Regrets have been expressed that a man of his merits should have been allowed to toil on in the humble situation of a parish school-master; but it should be remembered that he was nearly seventy years old before he gave the public proof of his talents, and it may be very doubtful if at that advanced age he would have found in a higher sphere the same peace and happiness which he had so long enjoyed in his Highland glen. It is also gratifying to think that the profits of his publications, trifling as they would now be viewed, were still sufficient to afford him many additional luxuries; and that the fame which his poems received from the world reached his retired home, and secured to him honour from his neighbours, and marks of attention from the few strangers of rank that found their way to Lochlee. Neither should it be forgotten that his songs became even in his own day, as they still continue, the favourite ditties of his neighbourhood, and that the poet's ears were gratified by hearing his own verses chanted on the hill-sides in summer and by the cottage ingle in winter. This is the incense to his genius prized by the poet beyond other earthly rewards, and which cheers him even when stricken by the poverty which is "the badge of all his tribe." Ross left eight volumes of unpublished works, of which an account has been preserved in Campbell's *Introduction to the History of Poetry in Scotland* (p. 272-284). The chief of these is a tale in the same measure with the *Fortunate Shepherdess*, entitled the *Fortunate Shepherd, or the Orphan*. The specimens which are given are too unsatisfactory to permit us to judge if we ought to regret its suppression, which we are informed was owing to the advice of Dr. Beattie. "A Dream, in Imitation of the Cherry and Slat," and composed in 1753, seems to possess some stanzas of considerable merit. "Religious Dialogues," written in 1754, are characterized by Beattie as unfit for publication; and Mr. Campbell, certainly a favourable critic, can find no word of commendation for the six pieces which bear the following titles: "A Paraphrase on the Song of Solomon;" "A View of King David's Afflictions;" "The Shunamite, from 2 Kings iv.;" "Moses exposed in the Ark of Bulrushes;" "An Incitement to Temperance, from a Thought of the Nice Construction of the Human Body;" and "Moses' Story Continued." This long catalogue seems to have been the origin of Beattie's comparison of Ross with Sir Richard Blackmore. In addition to these there are in the same strain, "The Book of Job rendered into English Verse," 1751, and "A Description of the Flood of Noah." A translation of Andrew Ramsay's beautiful poem on the *Creation* seems to possess more merit; and from the specimens given is at least fully equal to that of the notorious Lander, whose attack on Milton had the effect of attracting attention to Ramsay's works. The list of Ross's unpublished works is closed by a dramatic piece, called "The

Shaver," founded on an incident which occurred in Montrose; and by a prose composition, "A Dialogue of the Right of Government among the Scots, the Persons George Buchanan and Thomas Maitland." "There are ninety sections in this tract," says Campbell, "and from the slight look I have taken through it I am of opinion it might be rendered a very valuable performance." The specimen given does not indicate the direction of Ross's political sentiments, nor does Campbell supply that information; his grandson tells us that "he was best pleased with such religious discourses as were strictly Calvinistic."

From the information thus preserved regarding Ross's unpublished writings, there seems little reason to regret their loss. His reputation must be founded on his *Fortunate Shepherdess*, and the songs which were published along with it. With all its faults, this poem is possessed of a high degree of merit; and, in addition to its local fame, will continue to be esteemed by the student of Scottish poetry. Burns has written of him, "Our true brother Ross of Lochlee was a wild warlock;" and "the celebrated Dr. Blacklock," says Dr. Irving, "as I have learned from one of his pupils, regarded it as equal to the pastoral of Ramsay." This last opinion, it is to be feared, will be shared by few; nor is it any strong evidence of its soundness to say that it was adopted by John Pinkerton, who writes:—"Some of the descriptions are exquisitely natural and fine; the language and thoughts are more truly pastoral than any I have yet found in any poet, save Theocritus." Ross, indeed, is far inferior to Ramsay in delicacy of feeling, in taste, and in the management of his story. In reading the *Fortunate Shepherdess* we constantly meet with expressions and allusions of the most unworthy nature. Dr. Irving has quoted two lines of this description:—

"And now the priest to join the pair is come,
But first is welcom'd with a glass o' rum."

And it were easy to fill a page with similar instances:—

"Now Mary was as modest as a fawn,
And at their jeering wist na how to laugh."

Nor can the reader easily overlook Ross's absurd nomenclature. Thus the hero is honoured with the female name of Rosalind, and Scottish glens are clothed with the classic appellations of Flaviana and Sevitia; which last name, intended by the author to be expressive of fierceness, was, by a typographical error in the first edition, converted into Sevilia. But the most forcible objection undoubtedly lies in the plot, than which it were difficult to conceive anything more unpoetical. The early part of the poem is devoted to the description of the love of the hero and heroine, which is beautifully painted in its various stages, growing up from their infancy to their youth, and strengthened by all the love-inspiring incidents and situations of a pastoral life. And at the very moment when the poet has succeeded in completing this beautiful picture of simple affection and guileless innocence, he sets himself to undo the charm, weds the heroine to a richer lover, and sacrifices the hero to a marriage which his heart cannot approve, and of which the chief object is the recovery of certain sheep and horned cattle. Ross seems to have been aware of the objections which are chargeable against this *dénouement*, and endeavours to obviate them in the preface prefixed to the first edition, by pleading that it is productive of a salutary moral:—"This important lesson is inculcated, that when two young people have come under engagements to one another, no consideration whatever should induce them to break faith, or to promise

things incompatible with keeping it entire." It is certainly difficult to see the force of this apology; and Ross's error on this head is the more noteworthy from his taking objection in his invocation to the plot of his model, the *Gentle Shepherd*:—

"Allan bears
The gree himself, an' the green laurels wears;
We'el mat he brook them, for tho' ye had spair'd
The task to me, Pate might na been a laird."

It is singular how Ross could have overlooked the circumstance that Ramsay, in elevating his hero, sacrifices no long-cherished feeling or former affection; while not only is the *Fortunate Shepherdess* raised to a similar rank, but this upon the very ruins of an affection which had twined itself round her heart-strings from her earliest years. We have perhaps dwelt too long upon the ungracious task of fault-finding. Ross's chief talent lies, as was remarked by Beattie, in his descriptions of scenery, and of the habits of a rude and pastoral life. Many of these will cope with the best passages in the *Gentle Shepherd*, or in any of our Scottish poets. We may refer to the description of a valley at noon (at page 28 of the second edition); to the picture of Flaviana, which has been quoted by Sir Walter Scott in the *Heart of Mid-Lothian*; and to the numerous descriptions of morning, evening, and night, scattered through the poem. It must not be concealed, however, that few of the delineations possess that consistency in their parts, completeness, and nice finish, which are to be found in the *Gentle Shepherd*. Ross's songs, though certainly of a very high order of merit, have unfortunately been omitted in the more popular editions of his works. This is to be regretted, as they are disfigured by none of the faults of his larger work, and, notwithstanding their length, would be valuable additions to the Scottish song-book. It has been already mentioned that two editions of his work appeared in the author's lifetime; a third was printed at Aberdeen in 1789; a fourth in 1791, a fifth in 1796, a sixth in 1804 at Edinburgh, in the same volume with Macneill's "Will and Jean," and some other poems; a seventh in Aberdeen in 1811; and an eighth appeared at Dundee in 1812. This last has a life prefixed by his grandson; and it is to be regretted that the liberties taken with the text, the omission of the preface, songs, and glossary, should have rendered it so defective. A later edition, supplying these deficiencies, and preceded by "A Sketch of Glenesk, a Life of the Author, and an Account of his Unedited Works, by John Longmuir, LL.D.," was published at Edinburgh in 1866. Besides these, there have appeared numerous editions on coarse paper, and at a low price, to be hawked through the north of Scotland, where they ever find a ready sale. Of the number of these reprints it is not easy to obtain an account; we believe the last is that published at Aberdeen in 1826. In Aberdeenshire, and in Angus, the Mearns, and Moray, there is no work more popular than the *Fortunate Shepherdess*. It disputes popularity with Burns and the *Pilgrim's Progress*; is read, in his idle hours, by the shepherd in the glens, and wiles away the weariness of the long winter night at the crofter's fireside. On its first appearance Beattie predicted—

"And ilka Mearns and Angus bairn
Thy tales and songs by heart shall learn."

The prediction has been amply verified, and a hope which Ross expressed in one of his unpublished poems has been realized:—

"Hence lang, perhaps, lang hence may quoted be
My hamely proverbs lined wi' bythesome glee;
Some reader then may say, 'Fair fa' ye, Ross,
When, aiblins, I'll be lang, lang dead and gane,
An' few remember there was sic a anc."

ROSS, REAR-ADMIRAL SIR JOHN. This bold explorer of the Arctic regions, like many of his distinguished countrymen, was born in a manse, and was the fourth son of the Rev. Andrew Ross, minister of Inch, a parish in the western division of Wigtownshire. His mother was Elizabeth Corsan, of the family of the Corsans, who, for seventeen generations, were provosts of Dumfries. The subject of this memoir was born on the 24th June, 1777. His birth-place of Inch, an isthmus between Loch Ryan and Luce Bay, and his consequent early familiarity with the sea, probably decided his choice of a profession, and he entered the navy as a first-class volunteer, November 11, 1786. He commenced his naval career on board the *Pearl*, of 32 guns, and served in the Mediterranean until 1789; from November 7, 1790, till 1791 he served on board the *Impregnable*, 98 guns, in the English Channel; and after some years spent in the merchant service, he in 1799 became a midshipman on board the *Wasel*, sloop of war, in that year forming part of an expedition employed on the coast of Holland. His promotion had thus been unusually slow, but the years which he had spent at sea, as well as the weariness of waiting, were fit preparations for his future life of enterprise, where both professional skill and patience were severely tested. After serving in other ships of the royal navy besides the *Wasel*, he was promoted, on March 13, 1805, to the rank of lieutenant; and in the following year, while lieutenant of the *Surinam*, he was severely wounded in four places while cutting out a Spanish vessel under the batteries of Bilbao—for which in 1808 he was granted a pension of £98 per annum, which in 1815 was increased to £150. In 1812 he was appointed commander of the *Brisis*, sloop of war, on the Baltic station, where he signalized himself by the recapture of an English merchant ship, armed with six guns, and defended by a body of French troops, while his own party only consisted of his lieutenant, a midshipman, and eighteen men. After this he captured a French privateer, and drove three other vessels of the same class on shore. In 1814 he was appointed to the *Acteon*, of 16 guns, and in 1815 to the *Driver* sloop. The war being ended, and having little prospect of further active service, Captain Ross in 1816 married his first wife, with the prospect of enjoying domestic life on shore.

But whatever might have been his expectations of repose after this happy change, they were soon disappointed, and he found that the most important of his services, instead of having come to an end, were only about to commence. They were also to be of a more difficult and dangerous kind than the boarding of hostile ships and the storming of batteries. The attention of our government had been roused by reports of extraordinary changes that had taken place in the state of the Polar Sea; and it was thought that our good ships and their brave skilful commanders might be usefully employed during this long interval of peace in voyages of scientific discovery. The chief of these was to "ascertain the existence or non-existence of a north-west passage," and to Captain Ross was assigned the honour of the attempt. Accordingly, in December, 1817, while in command of the *Driver* sloop of war in Loch Ryan, he received a letter from Sir George Hope, one of the lords of the admiralty, informing him that two ships were to be sent out in quest of a north-west passage, and asking him if he would undertake the command of the expedition. Captain Ross closed at once with the proposal, on which he was directed to repair to London, where, on arriving, he found that two vessels were fitted out for the expedition,

one called the *Isabella*, of 385 tons, of which he was appointed commander, and the other the *Alexander*, of 252 tons, commanded by Lieutenant W. E. Parry. These two ships commenced their expedition in April 25, 1818. The directions given to Captain Ross were, to explore Baffin's Bay, and search for a north-west passage from it into the Frozen Ocean, and thence into the Pacific; and to stimulate the spirit of enterprise, parliament offered a reward of £20,000 to the first vessel which should reach the north pole and pass it.

In this voyage Ross and Parry sailed up the eastern side of Davis' Strait and Baffin's Bay, and returned by the western side. They entered Lancaster Sound, up which they proceeded a considerable way, until Ross and the officer of the watch thought they saw "land round the bottom of the bay, forming a chain of mountains connected with those which extended along the north and south sides; and under this impression, conceiving it useless to proceed further, the *Isabella's* course was turned eastwards, and a signal made for her consort to follow. But the *Alexander*, which was a slow-sailing vessel, was considerably behind the *Isabella*; Parry could see no mountains, or tokens of their existence; and it was with wonder and disappointment that he beheld the signal of his superior officer, and was obliged to return. So fully, however, was Captain Ross impressed with the idea that Lancaster Sound was in this way closed, that he laid down the fancied high land, which he called the Croker Mountains, in a chart. He returned to England in November, 1818, and in the following month he was advanced to the rank of post-captain. In 1819 he published "*A Voyage of Discovery*, made under the orders of the Admiralty, in his Majesty's Ships *Isabella* and *Alexander*, for the Purpose of Exploring Baffin's Bay, and Inquiring into the Probability of a North-west Passage," 4to.

It will thus be seen that the enterprise was a failure, but Lieutenant Parry was of opinion that the failure had been occasioned by a mistake. Although this opinion was privately expressed, it soon reached the ears of the admiralty; and as the lieutenant's knowledge of nautical science was deservedly high, his remarks compelled attention. The result was a second attempt for the discovery of a north-west passage, under the command of Parry himself, and two ships, the *Hecla* and *Griper*, were repaired and strengthened at Deptford for this especial service. The expedition set sail on the 11th of May, 1819, and on reaching the entrance to Lancaster Sound, the ships were boldly pushed through the masses of ice that nearly blocked it up, forced into the sound, and even through the place of the Croker Mountains, which were found to have no existence; and on the 4th of September, 1819, having crossed the meridian of 110° W. long. in 74° 44' 20" N. lat., the bold enterprisers were entitled to the reward of £5000 offered by our government to any of his majesty's subjects who should go thus far to the westward within the Arctic circle. Lieutenant Parry gave the name of Barrow's Strait to the continuation of Lancaster Sound, and discovered the north side of Melville Island, the north side of Baring Island, Prince Regent's Inlet, and the Wellington Channel; and after many hardships, dangers, and delays, returned to England in November, 1820. His success was distinguished by honours and rewards, and his account, entitled the *Journal of a Voyage for the Discovery of a North-west Passage*, 4to, 1821, with maps and engravings, was published by authority of the lords-commissioners of the admiralty.

This success of another in an enterprise for which

he had prepared the way only strengthened the emulation of Captain Ross, and after three subsequent voyages of discovery by Captain Parry—the last of which, an attempt in 1827 to reach the north pole, proved a failure—our navigator of the frozen seas presented to the admiralty the plan of another voyage of Arctic discovery. But the recent failures of such attempts had cooled the enthusiasm of their lordships, and his proposal was not accepted. But what government refused, a friend of Captain Ross was willing to undertake in supplying the means of such an adventure: this was Mr. (afterwards Sir) Felix Booth, at that time Sheriff of London. This munificent citizen procured and fitted up a steamship, the *Victory*; and to make success more assured, it was provided with a newly invented and patented engine, which could waft a ship with double ease and speed, and carry her anywhere. But when this "execrable machinery," as Ross justly called it, was put to the test, the sailors wished it at the bottom of the Thames, and an ordinary steam-engine in its place. Captain Ross had for his lieutenant Commander Clark Ross, his nephew, who had accompanied his uncle in his first expedition, and afterwards sailed with Sir Edward Parry in all his voyages to the Polar Seas. The particular attempt of the present undertaking was to decide the practicability of a new passage which had been confidently said to exist by Prince Regent Inlet. To the *Victory* was joined an attendant vessel of sixteen tons supplied by government, and named the *Krusenstern*. On the 24th of May, 1829, the *Victory*, and its little attendant the *Krusenstern*, left the Thames to proceed upon their voyage.

And truly this was one of the most hazardous voyages ever undertaken since the ship *Argo* was launched with its crew of demigods. Captain Ross had calculated that it would occupy at least two years, and had fixed upon 1832 as the year of his return; but when that time had elapsed he did not reappear, no tidings had been heard of him, and it was mournfully concluded that he and all his brave company had fallen victims to the inclemency of the Arctic region. But they were alive the while, and struggling against nature itself to effect the desired discovery, and return home that they might make it known to the world. Of this long and dismal four years' exploration our limits can only afford a very few notices; but this is the less to be regretted, as Captain Ross published in 1835 a full account of the whole, under the title of a "*Narrative of a Second Voyage in Search of a North-west Passage*, and of a Residence in the Arctic Regions during the Years 1829, 1830, 1831, 1832, 1833; by Sir John Ross, C.B., &c., Captain in the Royal Navy; including the Reports of Commander (now Captain) James Clark Ross, R.N., F.R.S., F.L.S., &c., and the Discovery of the Northern Magnetic Pole," 4to, with maps and plates.

Using partly her sails, and partly her all but useless machinery, the *Victory*, accompanied by the *Krusenstern*, entered Davis' Straits on July 5, 1829, after a voyage of six weeks. Expecting to find a north-west passage through Prince Regent Inlet, Captain Ross entered the inlet on the 12th of August, and discovered the wreck of the *Fury*, one of Captain Parry's vessels that had been abandoned in his Arctic voyage of 1824. Taking from the wreck such stores as were necessary, Captain Ross proceeded further down the inlet, until, on the 8th of October, his ships were frozen up in Felix Harbour, on the west side of the Gulf of Boothia. Here they remained ice-bound until the 17th of Septem-

ber, 1830, when they were able to emerge from their prison, and proceed on their voyage; but their deliverance was brief, as they were again frozen up on the 31st of October. Ten months of dreary captivity were endured by the navigators, from which they were not set free until the 29th of August, 1831; but the *Victory*, on the 25th of September, in consequence of the pressure of the ice, was forced into another harbour, where she remained land-locked. A dismal sojourn among the ice again awaited them until April, 1832, when it was resolved to abandon the *Victory* to her fate. Two boats were accordingly carried northward by the sailors, with sledges and provisions, and on the 29th of May they commenced their precarious route of land-and-water travel with such scanty means as they possessed. Grieving over his forsaken ships as only a sailor can lament such a disaster—for he had served in thirty-six vessels and never been obliged to abandon one—Captain Ross abandoned the *Victory* to the northern elements that had seized and secured her in their death-grip, and with a crew diminished by death and enfeebled with sickness, proceeded on his journey through ice and fog. Thus they struggled on until July—a march of nearly 300 miles—when they reached Fury Beach. But the toils and sufferings of that land-route, if thus it may be termed, were such as may well make us proud of the endurance of our brave countrymen. During the journey they had to carry not only their provisions and the sick, but also a supply of fuel, and without melting the snow they could not procure a drop of water to drink. Winter set in upon this unequal struggle, and no choice was left them but to retrace their steps, and spend another dismal season in their canvas tents beneath the snow. On the 15th of August, 1833, the ice broke, so that they were enabled to set sail in their boats; and on the 26th of August, when near the entrance of Lancaster Sound, they espied the prospect of relief in a whaling-ship looming in the distance. A boat was sent to them from the whaler, and on the mate, who commanded the boat, being asked the name of his ship, he replied that it was the *Isabella* of Hull, once commanded by Captain Ross. How strange that the captain's own old ship should thus have been brought for his rescue! He told the mate that he was the identical man who had commanded the *Isabella*, and that his company was the crew of the *Victory*; but the other disbelieved the assertion, and declared that Captain Ross had been dead two years. His scepticism was pardonable not only on account of the general report at home, but the wretched appearance of the strange crew, for they were dirty, unshaven, and worn almost to skeletons, and clothed in tattered skins of the Polar animals. Sailors, however, have a free-masonry of their own that soon brings them to a right understanding with each other, and the mate was quickly convinced that this ghostly figure was no other than Captain Ross still in the body. The yards and rigging of the *Isabella* were manned, and Ross and his crew were welcomed into his old vessel with three hearty cheers. The *Isabella* arrived at Hull on the 18th of September, 1833, and Captain Ross, on reaching London next day by steamer, was welcomed as one who had returned from the dead. Among the many affectionate tokens which showed him how he was valued, not the least must have been the public solicitude about his long absence, or lamentations for his supposed fate. When he failed to reappear at the appointed period, there was a general stir, and after hope had been long deferred, there was a sickness of heart that intensified the solicitude, which was manifested by the sum of £7000 being raised to fit out

an expedition either to relieve him or ascertain his fate. The ship fitted for this purpose, under the command of the experienced Captain Buck, set sail in the spring of 1833, but happily had not got beyond reach of the tidings of Captain Ross's return, and was accordingly recalled.

The honours which were now conferred upon the bold Arctic navigator were neither few nor trivial. In 1834 he was knighted, and made a companion of the order of the Bath. He was honoured with the freedom of the cities of London, Liverpool, Bristol, Hull, and other towns. He was presented with gold medals from the Geographical Society of London, the Geographical Institute of Paris, and the Royal Societies of Sweden, Austria, Denmark, &c. Nor were foreign titles conferring rank withheld, for he was appointed a commander of the Sword of Sweden, a knight of the second class of St. Anne of Russia, of the second class of the Legion of Honour of France, of the second class of the Red Eagle of Prussia, and of the second class of Leopold of Belgium. He also got six gold snuff-boxes from Russia, Holland, Denmark, Austria, London, and Baden; a sword of the value of £100 from the Patriotic Fund, and one of the value of £200 from the King of Sweden for service in the Baltic and White Seas.

We have already mentioned the *Narrative* of his second voyage published by Sir John Ross in 1835. During the same year he published an *Appendix to the Narrative*, &c., also in 4to, chiefly containing accounts of the Esquimaux, and of the zoology, the meteorology, and similar matters. On the 8th of March, 1839, he was appointed British consul at Stockholm, where he remained till February, 1845.

Still desirous of discovering a navigable north-west passage, and haunted by extravagant hopes of the advantages it would secure for our commerce, the admiralty fitted out for the purpose a fresh expedition, the command of which was given to Rear-admiral Sir John Franklin. His ships, the *Erebus* and *Terror*, left England for the purpose in May, 1845; and too well aware of the dangers of such an undertaking, Sir John Ross made him a promise that if he should be lost or frozen up in the Arctic regions, he would go out in search of him. When year after year had elapsed, and the hope of Franklin's return was becoming desperate, Ross, although now at the age of seventy-three, resolved to prosecute the promised search or perish in the attempt. Although he had already achieved such a reputation as a skilful Arctic navigator, and notwithstanding the nature of the attempt itself, in which the national honour might be said to be at stake, he received no assistance from government, so that he was obliged to fit out the *Felix*, a small vessel of ninety tons, at his own expense, having relinquished his half-pay and pensions for the purpose. In 1850 he set out upon the quest, remained a winter in the ice, and would have stayed there another year had his means permitted. He was thus obliged to return home unsuccessful, and his disappointment was embittered by the neglect with which his generous enterprise had been treated. This, and the other fruitless attempts that followed for the discovery of Franklin or his remains, tasked the remaining strength of Sir John Ross in authorship, and he published in 1855 a pamphlet, entitled a "Narrative of the Circumstances and Causes which led to the Failure of the Searching Expeditions sent by Government and others for Rescue of Sir John Franklin," &c.

His first wife having died in 1822, Sir John Ross married a second in October 21, 1834. By his first wife he had one son, who went to India, and became a magistrate in Cawnpore. Besides the works we

have already mentioned, Sir John published *Letters to Sea-officers, Memoirs and Correspondence of Admiral Lord de Saumarez, a Treatise on Navigation by Steam*, and several smaller works. He succeeded to the rank of rear-admiral July 8, 1851, and died in London, August 30, 1856.

Although the discovery of a navigable north-west passage was made by Sir John Franklin, it has failed to lead to the advantages originally contemplated. But the indirect advantages of the search, in enlarging the bounds of science, as well as the acquisition of hitherto unknown territories that can be turned to good account, may be presented as a set-off to the expense, sufferings, and losses of our successive Arctic expeditions. In his second voyage Sir John discovered Boothia Felix, which he so named in honour of Sir Felix Booth, who had been at the expense of fitting out the enterprise. His nephew, Sir James Clark Ross, who accompanied him as second in command, among other valuable services, made the important discovery of the northern magnetic pole. The worth and advantages of the series of Arctic discoveries, which to the common mind appeared so useless and so abortive, were thus comprised by Rear-admiral F. W. Beachey in his address delivered to the Royal Geographical Society in 1856:

"It is now nearly forty years since the revival of our Polar voyages, during which period they have been prosecuted with more or less success, until, at length, the great problem has been solved. Besides this grand solution of the question, these voyages have, in various ways, been beneficial, and science at least has reaped her harvest. They have brought us acquainted with a portion of the globe before unknown. They have acquired for us a vast addition to our stores of knowledge—in magnetism, so important an element in the safe-conduct of our ships; in meteorology, in geography, natural and physical; and which has led to the prosecution of like discoveries in the regions of the Antarctic pole. They have shown us what the human frame is capable of undergoing and of accomplishing under great severity of climate and privations. They have opened out various sources of curious inquiry as to the existence, at some remote period, of tropical plants and tropical animals in those now icy regions, and of other matters interesting and useful to man. They have, in short, expunged the blot of obscurity which would otherwise have hung over and disfigured the page of the history of this enlightened age; and, if we except the lamentable fate which befell the expedition under Sir John Franklin, we shall find that they have been attended with as little, if not less, average loss of life than that of the ordinary course of mankind. And if any one should be disposed to weigh their advantages in the scale of pecuniary profit, they will find that there also they have yielded fruit, if not to us, at least to a sister nation in whose welfare we are greatly interested, and whose generous sympathy in the fate of our countrymen endears her to us, and would render it impossible that we should begrudge her this portion of the advantage of our labours. I need scarcely remind you of the report from the secretary of the United States navy to the senate, to the effect that, in consequence of information derived from one of our Arctic expeditions to Behring's Straits, a trade had sprung up in America by the capture of whales, to the north of that strait, of more value to the states than all the commerce with what is called the East; and that in two years there had been added to the national wealth of America, from this source alone, more than eight millions of dollars."

On this concluding fact we would only observe,

that if our country was too inert to reap the benefits of her own discoveries, it was well that there were others to make amends for the remissness—that if the advantages were lost to Britain, they were still secured for the world at large.

ROSSLYN, EARL OF. *See* WEDDERBURN (ALEXANDER).

ROW, JOHN, a celebrated divine, was descended from a family of some note for the part they had borne in the ecclesiastical history of their country. His grandfather, John Row, had gone abroad in early youth, and the fame of his talents and learning having reached the Vatican, he was in 1559 selected by the pope as an emissary to watch over the dawning Reformation in Scotland. But in a short time after his return to his native country, he embraced the principles of the Reformed religion, and advocated them with much zeal and ability. He was in 1560 appointed minister of Perth, and from that time enjoyed considerable influence in the councils of the Reformed clergy, sharing the friendship of Knox and other distinguished men of that age. His eldest son was for fifty-two years minister of Carnock in Fife, and died at the advanced age of seventy-eight. He was partly author of the "*Historie of the Kirk of Scotland from the Year 1558 to August in Anno 1637*," written by Mr. John Row, late Minister at Carnock, in the Province of Fife and Presbyterie of Dunfermline." This is preserved in MS. in the Advocates' Library, and has been pronounced by one well fitted to judge, "a very valuable but rather prolix work."¹ The date of the birth of John Row, his second son, the subject of the present memoir, has not been preserved, but it may be referred to the latter years of the sixteenth, or more probably to the beginning of the seventeenth century.² At a very early period of life he was appointed rector of the grammar-school at Perth, and for many years discharged that office with much reputation. He was the first Hebrew scholar of that day, an accomplishment which seems to have been hereditary in the family; his father, it is reported, having "discovered some genius for Hebrew when he was only a child of four or five years old;" and his grandfather having been, it is said, the first who publicly taught Hebrew in Scotland. While rector of the Perth school, Row composed his *Hebræe Lingue Institutiones Compendiosissimæ et Facillimæ in Discipulorum Gratiam Primum Concinnatæ*, which was published at Glasgow in 1644. This work was dedicated to Lord-chancellor Hay of Kinnoul, to whom he expresses himself obliged for benefits conferred on his father, and for having procured for himself the situation he held. After the fashion of the day, the book was prefaced by several commendatory verses; and of these some are from the pen of the celebrated Alexander Henderson, Samuel Rutherford, and John Adamson. The work also bore the record of the unanimous approbation of the faculty of the College of St. Leonard in the university of St. Andrews. Three years previous to the publication of the *Hebræe Lingue Institutiones*, Row was, by the influence of the famous Andrew Cant, appointed one of the ministers of Aberdeen. In 1643 he published a *Vocabulary of the Hebrew Language*, which he dedicated to his new patrons, the town-council of Aberdeen. This mark of respect was rewarded by the following ordinance of that

¹ This *History*, with a continuation written by his son, John Row, principal of King's College, Aberdeen, was published in 1842 by the Wodrow Society.

² The learned editor of *Memoirs of the Family of Row* a work to which we are indebted for much of the information given in the following memoir erroneously calls John Row the eldest son of his father.

body: "20th September, 1643, the counsell considering the panes taken be Mr. John Row in teaching the Hebrew tongue, and for setting forth ane Hebrew dictionar, and dedicating the same to the counsell, ordanes the thesaurar to deliver to the said Mr. John Row for his paines four hundred merk Scotts money."¹ In his office of minister of Aberdeen, Row supported the principles of his coadjutor Andrew Cant, and was with him highly obnoxious to the more moderate party of the Presbyterians, and to those who still favoured Episcopacy. The amusing annalist Spalding, who attended his prelections, loses no opportunity of holding him up to ridicule or detestation; and language seems sometimes to fail him for the expression of his horror at Row's innovations. "One of the town's officers," he relates, "caused bring a bairn to the lecture lesson, where Mr. John Row had taught, to be baptized; but because this bairn was not brought to him when he was baptizing some other bairns, he would not give baptism; whereupon the simple man was forced to bring back this child unbaptized. The wife lying in child-bed, hearing the child was not baptized, was so angry, that she turned her face to the wall, and deceased immediately through plain displeasure, and the bairn also ere the morn; and the mother and her bairn in her oter were both buried together. Lamentable to see," writes the indignant chronicler, "how the people are thus abused!" In 1644 Row was chosen moderator of the provincial assembly at Aberdeen; and the next year, on the approach of Montrose at the head of the royalist forces, he, with Cant and other "prime Covenanters," sought refuge with the earl-marischal in the castle of Dunnottar. In 1649 the Scottish parliament appointed a committee to remonstrate against the contemplated murder of Charles I., and Row was one of six clergymen nominated to act with the committee. In 1651 a commission, consisting of five colonels from the army of Monk, visited the King's College of Aberdeen, and among other acts deposed the principal, Dr. Guild; and the next year Row was chosen his successor. He seems to have filled the principal's chair with much credit; he maintained strict discipline, and added to the buildings of the college, while his own learning extended the reputation of the university. On the 8th October, 1656, being a day appointed for a public thanksgiving, he preached in Westminster Abbey before the parliament, and his sermon was afterwards printed by their orders, under the title of *Man's Duty in Magnifying God's Work*. On the restoration, Principal Row lost no time in paying his court to the new authorities. In 1660 he published at Aberdeen, "*Εὐχαριστία Βασιλική*, ad Carolum II. Carmen;" a work which was laudatory of the king, and abusive of Cromwell, who is styled "Trux vilis vermes," being the anagram of "O vile cruel worm" (Oliver Cromwell) latinized. This panegyric, however, availed him little. Some of his works, which contained reflections on the royal family, were taken from the college and burned at the cross of Aberdeen by the hands of the hangman; and in 1661 Row resigned his office of principal. He soon after established a school at Aberdeen, and lived for some years on the scanty emoluments derived from this source, eked out by charitable donations. Thereafter he retired to the family of a son-in-law and daughter in the parish of Kinellar, about eight miles from Aberdeen, where he spent the remainder of his days. He was interred in the churchyard of the parish, but no monument marks his grave. Besides the works we have mentioned, and some

others which seem to be lost, Principal Row wrote a continuation of his father's *History of the Church*, which is extant in the Advocates' Library, under the title of "*Supplement to the Historie of the Kirk of Scotland*, from August Anno 1637 and thenceforward to July, 1639; or Ane Handful of Goates Haire for the Furthering of the Building of the Tabernacle: a Short Table of Principall Things for the Promoving of the Most Excellent Historie of this late Blessed Work of Reformation, in the Hands of such as are employed therein by the General Assemblie; written by Mr. John Row, Minister at Aberdene." Mr. James Row, minister of Monivaird and Strowan, a younger brother of Principal Row, is well known to the curious in Scottish literature as the author of the celebrated *Pockmanty Sermon*, preached in Saint Giles', in 1638, and which was subsequently reprinted under the titles of the *Red-Shank's Sermon*; and *A Cupp of Bon-Accord*.

ROXBURGH, WILLIAM, a physician and eminent botanist, was born at Underwood in the parish of Craigie, on the 29th June, 1759. His family was not in affluent circumstances, but they nevertheless contrived to give him a liberal education. On acquiring all the learning which the place of his nativity afforded, he was sent to Edinburgh to complete his studies, which were exclusively directed to the medical profession. After attending for some time the various classes at the university necessary to qualify him for this pursuit, he received, while yet but seventeen years of age, the appointment of surgeon's mate on board of an East Indiaman, and completed two voyages to the East in that capacity before he had attained his twenty-first year. An offer having been now made to him of an advantageous settlement at Madras, he accepted of it, and accordingly established himself there. Shortly after taking up his residence at Madras, Mr. Roxburgh turned his attention to botany, and particularly to the study of the indigenous plants and other vegetable productions of the East; and in this he made such progress, and acquired so much reputation, that he was in a short time invited by the government of Bengal to take charge of the botanical gardens established there. In this situation he rapidly extended his fame as a botanist, and introduced to notice, and directed to useful purposes, many previously unknown and neglected vegetable productions of the country. Mr. Roxburgh now also became a member of the Asiatic Society, to whose *Transactions* he contributed, from time to time, many valuable papers, and amongst these one of singular interest on the lacca insect, from which a colour called lac lake is made, which is largely used as a substitute for cochineal. This paper, which was written in 1789, excited much attention at the time, at once from the ability it displayed, and from the circumstance of its containing some hints which led to a great improvement on the colour yielded by the lacca insect.

In 1797 Mr. Roxburgh paid a visit to his native country, and returned (having been in the meantime married) to Bengal in 1799, when he resumed his botanical studies with increased ardour and increasing success. In 1805 he received the gold-medal of the Society for the Promotion of Arts, for a series of highly interesting and valuable communications on the subject of the productions of the East. He had again, in this year, returned to England, and was now residing at Chelsea, but in very indifferent health; he, however, once more proceeded to Bengal, and continued in his curatorship of the botanical gardens there till 1803, when, broken down in

¹ Council Register of Aberdeen, vol. lii. p. 771.

constitution, he finally returned to his native country. In this year he received a second gold medal, for a communication on the growth of trees in India; and, on the 31st of May, 1814, was presented with a third in the presence of a large assembly which he personally attended, by the Duke of Norfolk, who was then president of the Society of Arts.

Soon after receiving this last honourable testimony of the high respect in which his talents were held, Mr. Roxburgh repaired to Edinburgh, where he died on the 10th of April in the following year, in the fifty-seventh year of his age, leaving behind him a reputation of no ordinary character for ability, and for a laudable ambition to confer benefits on mankind, by adding to their comforts and conveniences; which objects he effected to no inconsiderable extent by many original and ingenious suggestions.

ROY, MAJOR-GENERAL WILLIAM, a distinguished practical mathematician and antiquary, was born in Carluke parish, May 4, 1726. John, the father, who was born April 15, 1697, at Milton-head, must have been an active and intelligent man, if we may judge from the many references made to him by the heritors of the parish. He is variously designated as gardener, factor, &c., to Sir William Gordon, and to Charles Hamilton Gordon, of Hallcraig. John, the grandfather, seems to have been succeeded in office by his son John. The earliest notice of the elder John Roy is in the "Roll of Polleable Persons in Carluke Parish, 1695," and the entry there is in these terms:—"Jo roy, servitor to my Lord hallcraig, oo. 19. 04." The general, and his brother James, afterwards minister of Prestonpans, were educated partly at the school of their native parish, and partly at the grammar-school of Lanark, the latter having been a bursar in Glasgow College on the foundation of the Countess of Forfar, from 1737 till 1751. A characteristic anecdote of Roy is still current. An old woman, a native of Carluke, who had all her life been a servant at Lee, used to relate with pride that, in her young days, Roy came to Lee as attendant on great men; shortly afterwards he came again, but in a higher office; after the lapse of years he came a third time, and now he sat at the right hand of the laird!

The birth-place of General Roy is accidentally marked in a singular manner. The buildings of Milton-head have long been cleared away. An old willow that grew near the end of the steading, no longer able to bear the weight of its own arms, bent under the burden, and now represents an arch of fair proportions. The tree in this position continues to grow, and is itself an object of interest; but, marking as it does the birth-place of an eminent man, it is doubly worthy of notice and preservation.

No record has been discovered of the early career of General Roy. He was first brought into notice in 1746, when he was employed by government to make an actual survey of Scotland. This arduous and difficult duty he performed in a meritorious manner, and gave the world the result in what goes under the name of the "Duke of Cumberland's Map." Upon this map, which is a very large sheet, the sites of all ascertainable Roman camps or stations were accurately and distinctly laid down. It was afterwards reduced by the general to a smaller size, under the title of "Mappa Britanniae Septentrionalis," &c.

The first geodesic survey executed in England was undertaken with the immediate object of establishing a trigonometrical connection between the observatories of Paris and Greenwich, in order to determine the difference of longitude. This was executed by

General Roy, who began his operations by measuring a base of 27,404 feet on Hounslow Heath, in the summer of 1784. Amongst the numerous and valuable papers contributed to the *Transactions* of the Royal Society by General Roy, was an account of these operations, which obtained for him the Copley medal. To this paper was appended an account of the mode proposed to be followed in determining the relative situations of the Greenwich and Paris observatories, which led to the author's being employed by royal command to ascertain this point by the method thus suggested, from actual experiment. In obedience to his majesty's mandate, the general completed an exceedingly curious, accurate, and elaborate set of trigonometrical experiments and observations, to determine the true and exact latitude and longitude of the two observatories, illustrated by tables computed from actual measurement; to enable him to accomplish which he was furnished by the king with several costly trigonometrical instruments. General Roy presented an account of these interesting proceedings to the Royal Society, and was employed in superintending its publication in the society's *Transactions*, when he was seized with an illness which carried him off in two hours. He died at his house, Argyle Street, London, July 1, 1790. General Roy's investigations laid the groundwork of the trigonometrical survey of the three kingdoms, which is (1869) still in progress. In the *History of the Royal Society* by Weld, 1848, it is expressly stated that this survey was commenced by General Roy in 1784. It was subsequently conducted, under the direction of the master-general of the ordnance, by Colonel Williams and Captain (afterwards General) Mudge, of the Royal Engineers, and Mr. Dalby, who had previously assisted General Roy. Three years after his death, General Roy's elaborate antiquarian work was published at the expense of the Antiquarian Society of London, under the title of *Military Antiquities of the Romans in Britain*. General Roy was deputy quartermaster-general of his majesty's forces, surveyor of the coasts and batteries, colonel of the 30th regiment of foot, F.R.S., &c.

RUDDIMAN, THOMAS, a celebrated philologist and Latin grammarian, was born in the month of October, 1674, in the parish of Boyndie, county of Banff. His father, James Ruddiman, was a respectable farmer, and was at the period of his son's birth tenant of the farm of Raggel, in Banffshire. He was esteemed by his neighbours as a man profoundly skilled in agricultural matters, and was besides greatly respected for the benevolence of his disposition. He was strongly attached to monarchy—an attachment which he evinced in a remarkable manner by bursting into tears on first hearing of the death of Charles II. This ebullition of loyal feeling made a strong impression on his son, who witnessed it, and although he was then only in the tenth year of his age, it is thought to have influenced the opinions of his after-life on similar subjects. Young Ruddiman commenced his initiatory course of learning at the parish grammar-school of Boyndie, which was then taught by a Mr. George Morrison, of whose attention and skill in his profession his pupil ever after retained a grateful and respectful recollection. In this seminary the subject of this memoir rapidly outstripped his fellows in classical learning. The *Metamorphoses* of Ovid early struck his fancy, and had the effect of inducing such a degree of application to the acquisition of the language in which they are written, as carried him far in advance of all the other scholars in the school. His master, per-

ceiving his arduous, allowed him to press on, abandoning all idea of restraining so forward a spirit to the slow march of those associated with him in the study of classical learning.

The consequence of this assiduity and enthusiastic devotion to Roman literature, was an early and singular proficiency in its language. Of this young Ruddiman himself felt so conscious, that when only sixteen years of age he left his father's house without giving any previous intimation of his departure, or of its object, to any of the family excepting one sister, and proceeded to Aberdeen to compete for the annual prize given at King's College of that city for proficiency in classical learning. Previously to his setting out, his sister, to whom he had confided his secret, slipped a guinea into his pocket; but of this, and of nearly all his apparel, he was robbed by the way, having been met and assailed, at a place called Starbrigs, by a band of gipsies, who first plundered and then stripped him. This mishap, however, did not deter the young enthusiast from proceeding on his mission. He reached Aberdeen, though in a miserable plight, competed for the prize, and carried it off. Having obtained a bursary in the college by this success, he now took up his residence in Aberdeen, and commenced his academical studies in November, 1690, under Professor William Black. His father, in the meantime, having heard whither his son had gone, and for what purpose, hastened after him, and had the satisfaction, on meeting with him, to find him surrounded with friends, whom his youth and singular acquirements had already procured for him.

At the college of Aberdeen Mr. Ruddiman pursued his studies with an arduous and devotion which daily increased, and which at the end of four years procured him the degree of Master of Arts. This honour, of which the young scholar was extremely proud, was conferred on him on the 21st June, 1694. Amongst Mr. Ruddiman's fellow-students at this period was the well-known Lord Lovat, whose earthly career was terminated on Tower Hill by the axe of the executioner, at the distance of more than half a century afterwards. Of this nobleman, the biographer of Ruddiman remarks, that, when at college, "he was at the head of every mischief."

On completing his academical course, Mr. Ruddiman was engaged by Mr. Robert Young of Auldbar, in the county of Forfar, to assist the studies of his son. He was still under twenty years of age, but his acquirements in classical literature were far in advance of this period of life, as compared with the ordinary progress of proficiency in others. While advancing the knowledge of his pupil, Mr. Ruddiman did not permit his own to remain stationary. He continued to study assiduously, and every day added to his acquirements in classic lore.

During his residence at Auldbar, Mr. Ruddiman heard of the death of the incumbent schoolmaster of Lawrencerkirk, in Kincardineshire, and thinking this a favourable opportunity for advancing his fortunes, applied for and obtained the situation, partly through the interest of Mr. Young, and partly through the influence of his own reputation for extraordinary learning. In this situation, a sufficiently obscure one, he remained, still applying himself with unabated zeal to the study of the classics, till the year 1699, when a rather singular occurrence opened up a wider field to his ambition and his merits. The celebrated Dr. Pitcairne of Edinburgh, happening to be detained for a day in the village of Lawrencerkirk by the inclemency of the weather, asked the hostess of the inn where he put up, whether she could not find him some intelligent person who would partake of his

dinner, and help, by his conversation, to divert the tedium of the evening. His landlady immediately suggested the schoolmaster, Mr. Ruddiman. He was accordingly sent for, and in the course of the conversation which followed made so favourable an impression on the doctor, by the extent of his acquirements and the judiciousness of his remarks, that the latter, before they parted, invited him to come to Edinburgh, and promised him his patronage. Mr. Ruddiman gratefully closed with the proposal, and repaired to the metropolis in the beginning of the year 1700. On his arrival his patron procured him employment in the Advocates' Library as a sort of assistant librarian, though for upwards of a year he had no regular or formal engagement in that capacity. During this interval he employed himself in arranging books, copying papers, and making extracts from interesting works. In 1701 Mr. Ruddiman married Barbara Scollay, the daughter of a gentleman of small estate in Orkney, and in the year following he was formally admitted, on the 2d of May, assistant librarian, with a salary of £8, 6s. 8d. sterling per annum. His diligence, learning, and steadiness of character had already attracted the notice and called forth the approbation of his employers, who, as a token of their sense of these merits, presented him with an extra allowance of fifty pounds Scots at the end of the year succeeding that of his appointment. Mr. Ruddiman now set himself seriously and earnestly to the task of improving his circumstances by literary industry and diligence, and his situation eminently favoured such a design. He copied chronicles and chartularies for the Glasgow university, which gave him constant and regular employment in this way. He formed connections with booksellers, and revised, corrected, and added to the works which they were publishing, particularly those of a learned character, and to all this he added the expedient of keeping boarders, whom he also instructed in classical learning. The first work to which he is known to have lent his assistance was Sir Robert Sibbald's *Introductio ad Historiam Rerum a Romanis Gestarum in ea Boreali Britanniae Parte que ultra Murum Picticum est*. He was next employed to revise *The Practiques of the Law of Scotland*, by Sir Robert Spottiswood, for which he received £5 sterling. Mr. Ruddiman's active mind, and laudable desire of independence, suggested to him still another means of increasing his emoluments. This was to commence book-auctioneer, a calling for which his habits and pursuits peculiarly qualified him, and he accordingly added it, in the year 1707, to his other avocations, but confined himself, in the exercise of it, principally to learned works and school-books.

In the same year in which he commenced auctioneer, he published an edition of Wilson's *Animi Tranquillitate Dialogus*. To this work he added a new preface, and subjoined a sketch of the life of Wilson, besides correcting the numerous typographical errors of Gryphus of Leyden, by whom it was first published in 1543. His extraordinary and unwearied diligence enabled Mr. Ruddiman to present the world, in 1709, with a new edition, with notes, of another learned work. This was *Johnstoni Cantici Solomonis Paraphrasis Poetica*, which he dedicated, in a copy of verses, to his patron Dr. Pitcairne, a compliment which the latter acknowledged by presenting the learned editor with a silver cup, inscribed with the following couplet from Horace:

"Narratur et prisci Catonis.
Sæpe mero incluisse virtus."

Mr. Ruddiman, however, was not permitted long to rejoice in the possession of this elegant testimony

of his patron's esteem for him. His house was shortly after broken into by robbers, and the silver cup, with many other articles, carried off.

The reputation which the learned and acute grammarian had acquired by the new editions of the works just named, was still farther increased by that in which he next engaged. This was an edition of Virgil's *Æneid*, as translated into Scottish verse by the celebrated Gavin Douglas. To this work, which was published by Freebairn of Edinburgh, besides superintending and correcting the press, he contributed a glossary, explaining difficult and obsolete words; a performance which bespeaks great depth of research, soundness of judgment, and singular acuteness of perception. Mr. Ruddiman's modesty (for he was as modest as learned) prevented him from associating with the glossary any kind of notice which should point out to the public that he was the author of it: but after some time this fact transpired, and compliments poured in upon him from the most eminent and learned men of the day.

A vacancy happening to occur about this period in the grammar-school of Dundee, Mr. Ruddiman, whose fame as a scholar was now rapidly spreading abroad, was invited to become rector of that seminary; but an advance of salary having been tendered him by the faculty of advocates to induce him to remain, he accepted it, and declined the offer of the magistrates of Dundee, although he thereby sacrificed his pecuniary interests to a considerable amount, for the additional salary which was conferred upon him was still short of that of the rectorship of the Dundee grammar-school.

Still pursuing his literary labours with unremitting industry, he in 1711 assisted in preparing a new edition of the works of Drummond of Hawthornden, printed by Watson of Edinburgh, and immediately after lent his aid to Abercromby, to publish his *Martial Achievements of the Scots Nation*. Mr. Ruddiman next devoted himself to philological pursuits; and in 1713 published a new edition of the *Latin Vocabulary* of John Forrest, with improvements. In the year following he published that work which filled up the measure of his fame. This was his *Rudiments of the Latin Tongue*, a work which he lived to see go through no less than fifteen editions. It is almost unnecessary to add, that it immediately supplanted all those of a similar kind which had been previously in use, every one of which was singularly defective; and that it has remained in extensive use throughout the grammar-schools of Scotland ever since.

Shortly after this Mr. Ruddiman was employed by Freebairn to edit *Buchanani Opera Omnia*, now collected for the first time. To this work, which was published in 1715, in two vols. folio, he contributed large annotations, in which he treated freely both the character and political principles of the author; a procedure which raised him a host of enemies, and involved him in a litigated and annoying controversy. This hostility assumed in one instance the formidable shape of a "Society of the Scholars of Edinburgh, to Vindicate that Incomparably Learned and Pious Author (Buchanan) from the Calumnie of Mr. Thomas Ruddiman." This association, however, though it included no less than four professors of the university, never made any progress in their proposed "vindication," and finally dissolved without accomplishing anything, although they frequently and confidently promised the world a new edition of Buchanan, with a *confutation* of Ruddiman.

In 1715 Mr. Ruddiman added to his other avocations that of printer, admitting a younger brother of his own, who had been bred to the business, as

a partner of the concern. The first production of his press was the second volume of Abercromby's *Martial Achievements*. Amongst the learned works of note which he printed subsequently, were, the first volume of *Epistolæ Regum Scotorum*, 1722, for which he wrote a preface; *Ovidii Excerpta ex Metamorphoseon Libris*, containing English Notes, by Willymot and himself, 1723; *Herodian*, 1724; "Pars Prima" of his own *Grammaticæ Latinæ Institutiones*, 1725, which brought him a great accession of fame and profit; and "Pars Secunda" of the same work. He also printed, in 1733, *A Dissertation upon the Way of Teaching the Latin Tongue*.

In 1718 Mr. Ruddiman took an active part in forming a literary society—the first, it is believed, which was established in Edinburgh. It was originally composed of the masters of the high-school, but was soon joined by many of the most eminent persons in the city; amongst these was Mr. Henry Home, afterwards Lord Kames. Of the proceedings of this society, however, nothing is known, as its records, if there ever were any, have all disappeared.

It had long been an object of Mr. Ruddiman's ambition, after he became a printer, to obtain the appointment of printer to the university, and he was at length gratified with the office. In 1728 he was nominated, conjunctly with James Davidson, printer to the college, during the lives of both (so their patent ran), and during the life of the longest liver. Previously to this, viz. in 1724, Mr. Ruddiman began to print the continuation of the *Caledonian Mercury* for Rolland, who was then its proprietor; but in 1729 he acquired the whole interest in that paper, which was transferred to him in March of the year just named, and continued in his family till 1772, when it was sold by the trustees of his grandchildren.

Notwithstanding the variety and importance of his numerous avocations, Mr. Ruddiman still retained the appointment of assistant-librarian in the Advocates' Library, and never allowed any of these avocations to interfere, in the smallest degree, with the faithful and diligent discharge of the duties of that office. He was still, however, up to the year 1730, but assistant-librarian, the situation of principal keeper being in the possession of Mr. John Spottiswood; but in the year named his long and faithful services in the library were rewarded by the chief appointment, on the death of Mr. Spottiswood. In Mr. Ruddiman's case, however, this promotion was entirely honorary, for it was unaccompanied by any additional salary.

Mr. Ruddiman's reputation as a Latinist now stood so high, that he was employed to translate public papers. Amongst these he translated the charter of the Royal Bank from English into Latin, before the seals were affixed to it; and also the city of Edinburgh's "Charter of Admiralty." His wealth, in the meantime, was improving apace. All his undertakings succeeded with him, and his diligence and economy turned them to the best account. He was in the habit of making periodical estimates of his riches, which he entered in his memorandum books. These show a gradual increase in his wealth, and discover that it had amounted in 1736 to £1985, 6s. 3d.

Amongst the last of his literary labours was an elaborate preface, or rather introduction, to Anderson's *Selectus Diplomatum et Numismatum Scotiæ Thesaurus*; an able and learned disquisition on various subjects of antiquity. Being now in the sixty-fifth year of his age, he ceased for a time, after the completion of the work just spoken of, from every

kind of literary employment; and, nearly at the same period, resigned his half of the printing concern to his son, allowing, however, his name to remain in the firm, in order to continue its credit.

During the summer of 1745 Mr. Ruddiman, to avoid the dangers of the rebellion, retired to the country, where he resided for several months, amusing himself by literary pursuits. He afterwards prepared a "*Pars Tertia*" to his *Grammaticæ Latine*, &c., but did not adventure on its publication, as he feared the sale would not pay the expense. He subsequently, however, published an abstract of this work, subjoined to what is called his *Shorter Grammar* of which he received in 1756 the royal privilege of being exclusive printer. In 1751 the venerable grammarian's sight began to fail him, and under this affliction, finding that he could no longer conscientiously retain the appointment of keeper of the Advocates' Library, he resigned it early in the year 1752, after a faithful discharge of the duties of librarian in that institution of nearly half a century. The latter years of Mr. Ruddiman's life were embittered by a political controversy, into which he was dragged by the vanity and pertinacity of Mr. George Logan, who persecuted him with unrelenting virulence in no less than six different treatises, which he wrote against the political principles avowed in Mr. Ruddiman's *Annotations on Buchanan*, particularly that which asserted the hereditary rights of the Scottish kings. Mr. Ruddiman died at Edinburgh on the 19th of January, 1757, in the eighty-third year of his age; and his remains were interred in the Grayfriars' Churchyard of that city. A handsome tablet to the memory of Ruddiman was erected in 1806, in the New Grayfriars' Church, at the expense of his relative Dr. William Ruddiman, late of India. It exhibits the following inscription:—

SACRED TO THE MEMORY
OF THAT CELEBRATED SCHOLAR AND WORTHY MAN,
THOMAS RUDDIMAN, A.M.,

KEEPER OF THE ADVOCATES' LIBRARY NEAR FIFTY YEARS.

Born, October, 1674, within three miles of the town of Banff;

Died at Edinburgh, 19th January, 1757,

In his eighty-third year.

Post obitum, benefacta manent, æternæque virtus,

Non metuit Stygiis ne rapiatur aquis.

RUNCIMAN, ALEXANDER, a painter of considerable note, was the son of a builder in Edinburgh, where he was born in the year 1736. Having shown in his earliest years a decided inclination for drawing, his father furnished him with the proper materials; and while a mere boy, he roved through the fields, taking sketches of every interesting piece of landscape which fell in his way. At fourteen he was placed under the care of Messrs. John and Robert Norrie, house-painters; the former of whom used to adorn the mantle-pieces of the houses which he was employed to paint with landscapes of his own, which were then deemed respectable productions, and of which many a specimen is still preserved in the houses of the old town of Edinburgh. The youth devoted himself entirely to his art. "Other artists," said one who had been his companion, "talked meat and drink; but Runciman talked landscape." About this time the academy for rearing young artists was commenced at Glasgow by the brothers Foulis, and Runciman became one of its pupils. He soon acquired considerable local fame for his landscapes, but failed entirely to make a living by them. Despairing of success in this branch of art, he commenced history-painting; and in 1766 visited Italy, where he met Fuseli, whose wild and distempered character matched aptly with his own. He spent five years in Rome assiduously studying

and copying the Italian masters; and in 1771 returned to his native country, with powers considerably increased, while his taste, formerly over-luxuriant and wild, had experienced a corresponding improvement. Just at that time a vacancy had occurred in the mastership of a public institution, called the Trustees' Academy; and the place, to which was attached a salary of £120, was offered to and accepted by Runciman. Being thus secured in the means of bare subsistence, he applied his vacant time to historical painting, and produced a considerable number of specimens, which, though not destitute of faults, were regarded with much favour, not only in his native country, where native talent of this kind was a novelty, but also in England, where several of them were exhibited. Among the productions of Runciman may be mentioned, "Macbeth and Banquo," in a landscape; "a Friar," in a landscape; "Job in Distress;" "Samson Strangling the Lion;" "Figure of Hope;" "St Margaret Landing in Scotland, and her Marriage to Malcolm Canmore in Dunfermline Abbey;" "Christ Talking to the Woman of Samaria;" "Agrippina Landing with the Ashes of Germanicus;" "the Princess Nausicaa surprised by Ulysses;" "Andromeda;" "Sigismunda Weeping over the Heart of Tancred;" "the Ascension (in the Cowgate Episcopal Chapel, Edinburgh);" "the Prodigal Son (for which Ferguson the poet was the study);" and the paintings in Ossian's Hall at Pennycook. The work last mentioned was the *chef d'œuvre* of Runciman, and is allowed to be one of no small merit, though not exempt from his usual faults. The design was his own, but was only carried into effect through the liberality of Sir John Clerk of Pennycook, the representative of a family which has been remarkable throughout a century for talent, enlightened views, and patronage of men of genius. The principal paintings are twelve in number, referring to the most striking passages in the work called *Ossian's Poems*. The task was one of no small magnitude, but the painter dreamed of rivalling the famed Sistine Chapel, and laboured at his work with only too much enthusiasm. In consequence of having to paint so much in a recumbent posture, and perhaps denying himself that exercise which the physical powers demand, he contracted a malady which carried him slowly to the grave. He died, October 21, 1785, dropping down suddenly on the street, when about to enter his lodgings.

Runciman was remarkable for candour and simplicity of manners, and possessed a happy talent for conversation, which caused his company to be courted by some of the most eminent literary men of his time. Hume, Robertson, Kames, and Monboddo, were among the number of his frequent visitors. But his real worth and goodness of heart were best known to his most intimate friends, who had access to him at all times. Nor was he less remarkable for his readiness in communicating information and advice to young artists, in order to further their improvement in the arts. His pupil, John Brown, has passed the following judgment upon his merits as a painter:—"His fancy was fertile, his discernment of character keen, his taste truly elegant, and his conceptions always great. Though his genius seems to be best suited to the grand and serious, yet many of his works amply prove that he could move with equal success in the less elevated line of the gay and the pleasing. His chief excellence was composition, the noblest part of the art, in which it is doubtful whether he had any living superior. With regard to the truth, the harmony, the richness, and the gravity of colouring—in that style, in short, which is the peculiar characteristic of the ancient Venetian and

the direct contrast of the modern English school—he was unrivalled. His works, it must be granted, like all those of the present times, were far from being perfect; but it was Runciman's peculiar misfortune, that his defects were of such a nature as to be obvious to the most unskilful eye; whilst his beauties were of a kind which few have sufficient taste or knowledge of the art to discern, far less to appreciate.

JOHN RUNCIMAN, a brother of the above, was also a painter of some note, and produced, among other pieces, "Judith with the Head of Holofernes;" "Christ with his Disciples going to Emmaus;" "King Lear and Attendants in the Storm;" and the "Pulling Down of the Netherbow Port," usually attributed to Alexander, and which has the honour to be placed in the gallery of the Duke of Sutherland. Of most of the pictures of both artists, engravings and etchings have been executed, some of the latter by themselves.

RUSSELL, ALEXANDER, author of the *History of Aleppo*, was born in Edinburgh, and educated for the medical profession. After finishing his studies in the university of that city about the year 1734, he proceeded to London, and soon after went to Aleppo, where he settled as physician to the English factory in 1740. The influence of a noble and sagacious character was here soon felt, and Mr. Russell became in time the most influential character in the place: even the pasha hardly entered upon any proceeding of importance without consulting him. After residing there for a considerable time, during which he wrote his *History of Aleppo*, he returned to his native country, and, settling in London, soon acquired an extensive and lucrative practice. His work was published there in 1755. He also contributed several valuable papers to the Royal and Medical Societies. This excellent individual died in London, November 25, 1768.

Dr. Russell was one of a family of seven sons, all of whom acquired the respect of the world. His younger brother, Patrick, succeeded him as physician to the factory at Aleppo, and was the author of a *Treatise on the Plague*, published in 1791, and *Descriptions of Two Hundred Fishes collected on the Coast of Coromandel*, which appeared in 1803, in two volumes folio. Dr. Patrick Russell died July 2, 1805, in his seventy-ninth year.

RUSSELL, WILLIAM, a historical and miscellaneous writer, was the elder son of Alexander Russell and Christian Ballantyne, residing at Windydoors, in the county of Selkirk, where he was born in the year 1741. At the neighbouring school of Innerleithen he acquired a slender knowledge of Latin and Greek, and having removed in 1756 to Edinburgh, he there studied writing and arithmetic for about ten months. This completed the amount of his school education. He now commenced an apprenticeship of five years under Messrs. Martin & Wotherspoon, booksellers and printers, during which period he added considerably to his stock of knowledge by private study. At the end of his apprenticeship he published a selection of modern poetry, which was thought judicious, and helped to extend the reputation of Gray and Shenstone in his native country. In 1763, while working as a journeyman printer, he became a member of a literary association styled the Miscellaneous Society, of which Mr. Andrew Dalzell, afterwards Professor of Greek in the Edinburgh university, and Mr. Robert Liston, afterwards Sir Robert and ambassador at Constantinople, were also members. To these two gentlemen he sub-

mitted a translation of Crebillon's *Rhadamisthe et Zenobie*, which, after their revival, was presented to Garrick, but rejected. Not long after he seems to have formed an intimacy with Patrick Lord Elibank, who invited him to spend some time at his seat in East Lothian, and encouraged him in the prosecution of a literary career. He therefore relinquished his labours as a printer; and after spending a considerable time in study at his father's house in the country, set out, in May, 1767, for London. Here he was disappointed in his best hopes, and found it necessary to seek subsistence as corrector of the press to Mr. Strachan, the celebrated printer. While prosecuting this employment he published several essays in prose and verse, but without arresting popular attention. His *Sentimental Tales* appeared in 1770; his *Fables, Sentimental and Moral*, and translation of Thomas' *Essay on the Character of Women*, in 1772; and his *Julia*, a poetical romance, in 1774. Other pieces were scattered throughout the periodical works. His success was nevertheless such as to enable him to give up his office at the press, and depend upon his pen for subsistence. After an unsuccessful *History of America*, he produced in 1779 the first two volumes of the work by which alone his name has been rescued from oblivion—the *History of Modern Europe*: the three remaining volumes appeared in 1784.

This has ever since been reckoned a useful and most convenient work on the subject which it treats. "It possesses," says Dr. Irving, with whose opinion we entirely concur, "great merit, as a popular view of a very extensive period of history. The author displays no inconsiderable judgment in the selection of his leading incidents, and in the general arrangement of his materials; and he seems to have studied the philosophy of history with assiduity and success. His narrative is always free from languor; and his liberal reflections are conveyed in a lively and elegant style." Dr. Irving states that, in the composition of each volume of this book, the author spent twelve months. He closed the history with the peace of Paris in 1763; and it has been continued to the close of the reign of George IV. by Dr. Coote and other writers.

Mr. Russell's studies were interrupted for a while in 1780, by a voyage to Jamaica, which he undertook for the purpose of recovering some money left there by a deceased brother. In 1787 he married Miss Scott, and retired to a farm called Knottholm, near Langholm, where he spent the remainder of his days in an elegant cottage on the banks of the Esk. In 1792 he received the degree of Doctor of Laws from St. Andrews, and in the ensuing year published the first two volumes of a *History of Ancient Europe*, which is characterized by nearly the same qualities as the former work. He did not live, however, to complete this undertaking, being cut off by a sudden stroke of palsy, December 25, 1793. He was buried in the churchyard of the parish of Westerkirk. This accomplished writer left a widow and a daughter.

Dr. Russell was a man of indefatigable industry. Before he had perfected one scheme another always presented itself to his mind. Besides two complete tragedies, entitled *Pyrrhus* and *Zenobia*, he left behind him an analysis of Bryant's *Mythology*, and the following unfinished productions: 1. *The Earl of Strafford*, a tragedy. 2. *Modern Life*, a comedy. 3. *The Love Marriage*, an opera. 4. *Human Happiness*, a poem intended to have been composed in four books. 5. *A Historical and Philosophical View of the Progress of Mankind in the Knowledge of the Terrestrial Globe*. 6. *The History of Modern Europe, Part III., from the Peace of Paris in 1763,*

to the *General Pacification* in 1783. 7. *The History of England from the Beginning of the Reign of George III. to the Conclusion of the American War.* In the composition of the last of these works he was engaged at the time of his death. It was to be composed in three volumes 8vo, for the copyright of which Mr. Cadell had stipulated to pay £750.

"Dr. Russell," says one who knew him,¹ "without exhibiting the graces of polished life, was an agreeable companion, and possessed a considerable fund of general knowledge, and a zeal for literature and genius which approached to enthusiasm. In all his undertakings he was strictly honourable, and deserved the confidence reposed in him by his employers."

RUTHERFORD, JOHN, a learned physician of the eighteenth century, was the son of the Rev. Mr. Rutherford, minister of the parish of Yarrow in Selkirkshire, and was born August 1, 1695. After going through a classical course at the school of Selkirk, and studying mathematics and natural philosophy at the Edinburgh university, he engaged himself as apprentice to a surgeon in that city, with whom he remained till 1716, when he went to London. He there attended the hospitals, and the lectures of Dr. Douglas on anatomy, André on surgery, and Strother on *materia medica*. He afterwards studied at Leyden under Boerhaave, and at Paris and Rheims; receiving from the university of the latter city his degree of M.D. in July, 1719.

Having in 1721 settled as a physician in Edinburgh, Dr. Rutherford was one of that fraternity of able and distinguished men—consisting, besides, of Monro, Sinclair, Plummer, and Innes—who established the medical school which still flourishes in the Scottish capital. Monro had been lecturing on anatomy for a few years, when, in 1725, the other gentlemen above-mentioned began to give lectures on the other departments of medical science. When the professorships were finally adjusted on the death of Dr. Innes, the chair of the practice of medicine fell to the share of Dr. Rutherford. He continued in that honourable station till the year 1765, delivering his lectures always in Latin, of which language it is said he had a greater command than of his own. About the year 1748 he began the system of clinical lectures; a most important improvement in the medical course of the university. After retiring, in 1765, from his professional duties, Dr. Rutherford lived, highly respected by all the eminent physicians who had been his pupils, till 1779, when he died in the eighty-fourth year of his age. This venerable person, by his daughter Anne Rutherford, was the grandfather of that eminent ornament of modern literature, Sir Walter Scott.

RUTHERFORD, SAMUEL, a celebrated divine, was born about the year 1600, in the parish of Nisbet (now annexed to Crailing), in Roxburghshire, where his parents seem to have been engaged in agricultural pursuits. The locality and circumstances of his early education are unknown. He entered in 1617 as a student at the university of Edinburgh, where he took his degree of Master of Arts in 1621. Nothing has been recorded of the rank he held, or the appearances he made as a student, but they must have been at least respectable; for at the end of two years we find him elected one of the regents of the college. On this occasion he had three competitors; one of them of the same standing with himself, and

two of them older. Of these, Mr. Will, a master of the high-school, according to Crawford in his history of the university, "pleased the judges best, for his experience and actual knowledge; yet the whole regents, out of their particular knowledge of Mr. Samuel Rutherford, demonstrated to them his eminent abilities of mind and virtuous dispositions, wherewith the judges being satisfied, declared him successor in the profession of humanity." How he acted in this situation we have not been told; nor did he continue long enough to make his qualifications generally apparent, being forced to demit his charge, as asserted by Crawford, on account of some scandal in his marriage, towards the end of the year 1625, only two years after he had entered upon it. What that scandal in his marriage was has never been explained; but it is presumed to have been trifling, as it weighed so little in the estimation of the town-council of Edinburgh, the patrons of the university, that they granted him "ane honest gratification at his demission;" and at a subsequent period, in conjunction with the presbytery, warmly solicited him to become one of the ministers of the city, particularly with a view to his being appointed to the divinity chair in the university, so soon as a vacancy should take place; and they were disappointed in their views with regard to him, only by the voice of the General Assembly of the church, which appointed him to St. Andrews. Relieved from the duty of teaching others, Mr. Rutherford seems now to have devoted himself to the study of divinity under Mr. Andrew Ramsay, whose prelections, it is not improbable, he frequented during the time he acted as a regent in teaching humanity. Theology, indeed, in those days, was conjoined with every part of education. This was particularly the case in the college of Edinburgh, where the principal, every Wednesday at three o'clock, delivered a lecture upon a theological subject to the whole of the students, assembled in the common hall. The students were also regularly assembled every Sunday morning in their several class-rooms, along with their regents, where they were employed in reading the Scriptures; after which they attended with their regents the public services of religion; returned again to the college, and gave an analysis of the sermons they had heard, and of the portion of Scripture they had read in the morning. By these means their biblical knowledge kept pace with their other acquirements, and they were insensibly trained to habits of seriousness and devotion. In this manner were all our early reformers educated; and though they spent less time in the theological class, properly so called, than is generally done in modern times, judging by the effects that followed their administrations, as well as by the specimens of their works that yet remain, they were not less qualified for their work than any of those who have succeeded them. When, or by whom, Mr. Rutherford was licensed to preach the gospel has not been recorded; but in the year 1627 he was settled pastor of the parish of Anwoth, in the stewartry of Kirkcudbright. Anwoth, before the Reformation, had been a dependency on the monastery of St. Mary's Isle; but was united *quoad sacra* to Kirkdale and Kirkmabreck, and the three parishes were under the ministry of one clergyman. In consequence of "this most inconvenient union," the people of Anwoth had sermon only every alternate Sabbath. It was now, however, disjoined from the other parishes, and a place of worship had been newly built for their accommodation; which, though the parish has erected a modern and more elegant church, is still preserved, and regarded, for the sake of the first occupant, the subject

¹ Mr. Alexander Chalmers, in his *General Biographical Dictionary*—art. "William Russell."

of this memoir, with a kind of religious veneration. The disjunction of the parishes had been principally effected by the exertions of John Gordon of Kenmure, afterwards created Viscount Kenmure, who had selected the celebrated Mr. John Livingstone to occupy it. Circumstances, however, prevented that arrangement from taking effect; and "the Lord," says Livingstone in his memoirs, "provided a great deal better for them, for they got that worthy servant of Christ, Mr. Samuel Rutherford." Of the manner of his settlement we know no particulars; only that by some means or other he succeeded in being settled without acknowledging the bishops, which was no easy matter at that time. Perhaps no man ever undertook a pastoral charge with a more thorough conviction of its importance than Rutherford; and the way had been so well prepared before him that he entered upon it with great advantages, and his endeavours were followed by very singular effects. The powerful preaching of Mr. John Welsh, aided by his other labours of love, had diffused a spirit of religion through all that district, which was still vigorous, though he had left Kirkcudbright seventeen years before.

Rutherford was accustomed to rise every morning at three o'clock. The early part of the day he spent in prayer and meditation; the remainder he devoted to the more public duties of his calling, visiting the sick, catechising his flock, and instructing them, in a progress from house to house. "They were the cause and objects," he informs us, "of his tears, care, fear, and daily prayers. He laboured among them early and late; and my witness," he declares to them, "is above, that your heaven would be two heavens to me, and the salvation of you all as two salvations to me." Nor were his labours confined to Anwoth. "He was," says Livingstone, "a great strengthener of all the Christians in that country, who had been the fruits of the ministry of Mr. John Welsh, the time he had been at Kirkcudbright;" and the whole country, we are told by Mr. M'Ward, accounted themselves his particular flock.

In the month of June, 1630, Mr. Rutherford was bereaved of his wife, after an illness of upwards of thirteen months, when they had been yet scarcely five years married. Her death seems to have greatly distressed him, and though he nowhere in his correspondence ventures to introduce the subject directly, he frequently alludes to it in terms of the deepest tenderness. In the month of September, 1634, Mr. Rutherford lost his great patron, John Gordon, who had been created in the previous year Viscount of Kenmure, and a storm was now brooding over him which was soon to drive him from his station at Anwoth. The see of Galloway became vacant by the death of Lamb, who was succeeded by Sydserff, Bishop of Brechin, an Arminian, and a man of the most intolerant disposition. This appointment gave a new turn to affairs in that quarter. A person of sentiments altogether opposite to those of the people of Kirkcudbright was forced upon them, while their old and valuable pastor was forbidden the exercise of any part of his office. Nor did Rutherford escape. He had been summoned before the high commissioners in the year 1630, at the instance of a profligate person in his parish. Sydserff, Bishop of Galloway, had erected a high-commission court within his own diocese, before which Rutherford was called, and deprived of his office in 1636. This sentence was immediately confirmed by the high commission at Edinburgh, and he was sentenced before the 20th of August to confine himself within the town of Aberdeen till it should be the king's pleasure to relieve him. The crimes charged against him were,

preaching against the Articles of Perth, and writing against the Arminians. The time allowed him did not permit of his visiting his friends or his flock at Anwoth; but he paid a visit to David Dickson at Irvine, whence he wrote, "being on his journey to Christ's palace at Aberdeen." He arrived at his place of confinement within the time specified; being accompanied by a deputation from his parish of Anwoth. His reception in this great stronghold of Scottish Episcopacy was not very gratifying. The learned doctors, as the clergy of Aberdeen were called *par excellence*, hastened to let him feel their superiority, and to display the loyalty of their faith, by confuting the principles held by the persecuted stranger. The pulpits were everywhere made to ring against him, and Dr. Baron, their principal leader, did not scruple to attack him personally for his antipathy to the doctrines of Arminius and the ceremonies; "but three yokings," Rutherford afterwards wrote, "laid him by, and I have not been since troubled with him." Notwithstanding the coolness of his first reception, he soon became popular in Aberdeen, and his sentiments beginning to gain ground, the doctors were induced to petition the court that he might be removed still farther north, or banished from the kingdom. This last seems to have been determined on, and a warrant by the king was forwarded to Scotland to that effect, the execution of which was only prevented by the establishment of the Tables at Edinburgh, and the consequent downfall of Episcopacy. In consequence of these movements, Rutherford ventured to leave Aberdeen, and to return to his beloved people at Anwoth, in the month of February, 1638, having been absent from them rather more than a year and a half. His flock had, in the meantime, successfully resisted all the efforts of Sydserff to impose upon them a minister of his own choosing. It is not probable, however, that after this period they enjoyed much of the ministrations of Rutherford, as we soon after find him actively employed in the metropolis, in forwarding, by his powerful and impressive eloquence, the great work of reformation which was then going so successfully forward. On the renewal of the covenant he was deputed, along with Mr. Andrew Cant, to prepare the people of Glasgow for a concurrence in that celebrated instrument. He was also a delegate from the presbytery of Kirkcudbright to the General Assembly which met in that city in November, 1638, and was by that court honourably assiozied from the charges preferred against him by the bishops and the high commission. To the commission of this Assembly applications were made by the corporation of Edinburgh to have Mr. Rutherford transported from Anwoth, to be one of the ministers of that city, and by the university of St. Andrews to have him nominated professor of divinity to the new college there. To the latter situation he was appointed by the commission, greatly against his own mind, and to the no small grief of the people of Anwoth, who omitted no effort to retain him. The petitions of the parish of Anwoth and of the county of Galloway on this occasion are both preserved, and never were more honourable testimonies borne to the worth of an individual, or stronger evidence afforded of the high estimation in which his services were held. The public necessities of the church, however, were supposed to be such as to set aside all private considerations, and Rutherford proceeded to the scene of his new duties in October, 1639.

On the 19th of that month, having previously entered upon his labours in the college, he was inducted by the presbytery as colleague to Mr. Robert Blair in the church of St. Andrews, which seems

at this time to have been no very pleasing situation. In the days of Melville and Buchanan the university was the most flourishing in the kingdom; now it was become, under the care of the bishops, the very nursery of superstition in worship and error in doctrine: "but God," says one of Rutherford's pupils, "did so singularly second his indefatigable pains, both in teaching and preaching, that the university forthwith became a Lebanon, out of which were taken cedars for building the house of God throughout the land." In the Assembly of 1640 Rutherford was involved in a dispute respecting private society meetings, which he defended, along with Messrs. Robert Blair and David Dickson, against the greater part of his brethren, who, under the terrors of Independency, which in a short time overspread the land, condemned them. It was probably owing to this dispute that two years afterwards he published his *Peaceable Plea for Paul's Presbytery*, an excellent and temperate treatise; equally remote from anarchy on the one hand, and that unbending tyranny which Presbytery has too often assumed on the other. In 1642 he received a call to the parish of West Calder, which he was not permitted to accept, though he seems to have been desirous of doing so. He was one of the commissioners from the General Assembly of the Church of Scotland to the Westminster Assembly, where his services were acknowledged by all parties to have been of great importance. The other commissioners from the General Assembly of the Church of Scotland were permitted to visit their native country by turns, and to report the progress which was made in the great work; but Rutherford never quitted his post till his mission was accomplished. His wife (for he married the second time after entering upon his charge at St. Andrews) and all his family seem to have accompanied him. Two of his children, apparently all that he then had, died while he was in England. He had also along with him as his amanuensis, Mr. Robert M'Ward, afterwards minister of the Tron Church, Glasgow, and who was banished for non-conformity at the Restoration. Mr. Rutherford exerted himself to promote the common cause, not only in the Assembly, but by means of the press, in a variety of publications, bearing the impress of great learning and research, combined with clear and comprehensive views of the subjects of which they treated. The first of these was the "*Due Right of Presbytery*;" or a Peaceable Plea for the Government of the Church of Scotland," a work of great erudition, and which called forth a reply from Mr. Mather of New England; one of the best books that has yet been produced on that side of the question. The same year he published *Lex Rex*, a most rational reply to a piece of insane loyalty emitted by John Maxwell, the excommunicated Bishop of Ross. Next year, 1645, he published *The Trial and Triumph of Faith*, an admirable treatise of practical divinity; and in 1646, "*The Divine Right of Church Government*, in Opposition to the Erastians." In 1647 he published another excellent piece of practical theology, *Christ Dying and Drawing Sinners*; which was followed next year, though he had then returned to Scotland, by a *Survey of the Spiritual Antichrist*, written against Saltmarsh, Dee, Town, Crisp, Eaton, and the other Antinomians of that day. In 1649 he published at London a *Free Disputation against Pretended Liberty of Conscience*, particularly directed against the Independents. All of these productions are highly honourable to the talents of the author, and place his industry and fertility of mind in a singularly favourable point of view.

Rutherford, in returning to the former scene of

his professorial and pastoral labours, must have felt agreeably relieved from the business and the bustle of a popular assembly, and hoped probably that now he might rest in his lot. Far otherwise, however, was the case. He was, in January, 1649, at the recommendation of the commission of the General Assembly, appointed principal of the new college, of which he was already professor of divinity; and not long after he was elevated to the rectorship of the university. An attempt had also been made in the General Assembly of 1649 to have him removed to the university of Edinburgh, which, Baillie says, "was thought to be absurd, and so was laid aside." He had an invitation at the same time to the chair of divinity and Hebrew in the university of Hardewyck in Holland, which he declined; and on the 20th of May, 1651, he was elected to fill the divinity chair in the university of Utrecht. This appointment was immediately transmitted to him by his brother, Mr. James Rutherford, then an officer in the Dutch service, who by the way fell into the power of an English cruiser, and was stripped of everything, and confined a prisoner in Leith, till he was, through the intervention of the States, set at liberty. As he had, in consequence of this disaster, nothing but a verbal invitation to offer, Rutherford refused to accept it. James Rutherford returned directly to Holland, and the magistrates of Utrecht, still hoping to succeed, sent him back with a formal invitation in the end of the same year. Rutherford seems now to have been in some degree of hesitation, and requested six months to advise upon the subject. At the end of this period he wrote to the patrons of the college, thanking them for the high honour they had done him, but informing them that he could not think of abandoning his own church in the perilous circumstances in which it then stood.

The whole of the subsequent life of Samuel Rutherford was one continued struggle with the open and concealed enemies of the Church of Scotland. After the Restoration, when, though infirm in body, his spirit was still alive to the cause of religion, he recommended that some of the protesters should be sent to the king, to give a true representation of the state of matters in the church, which he well knew would never be done by Sharp, whose the resolution party had employed, and in whom they had the most perfect confidence,—when the protesters applied to the resolution party to join them in such a necessary duty, they refused to have anything to do with their more zealous brethren; and when these met at Edinburgh to consult on the matter, they were dispersed by authority, their papers seized, and the principal persons among them imprisoned. This was the first act of the committee of estates after the Restoration; and it was composed of the same persons who had sworn to the covenant along with Charles ten years before. The next act of the committee was an order for burning *Lex Rex*, and punishing all who should afterwards be found in possession of a copy. The book was accordingly burned, with every mark of indignity, at the cross of Edinburgh; a ceremony which Sharp repeated in front of the new college, beneath Mr. Rutherford's windows, in St. Andrews. Rutherford was at the same time deprived of his situation in the college, his stipend confiscated, himself confined to his own house, and cited to appear before the ensuing parliament, on a charge of high treason. Before the meeting of parliament, however, he was beyond the reach of all his enemies. He had long been in bad health, and now the utter ruin that he saw coming on the church entirely broke his spirit. Sensible that he was dying, he published, on the 26th of February, 1661, a testimony to the

reformation in Great Britain and Ireland. This testimony occupies ten octavo pages, and is remarkably clear and particular. Of his last moments we can afford space only for a very brief account. He seemed to enjoy a singular rapture and elevation of spirit. "I shall shine," he said; "I shall see him as he is: I shall see him reign, and all his fair company with him, and I shall have my share. Mine eyes shall see my Redeemer; these very eyes of mine, and none for me. I disclaim," he remarked at the same time, "all that ever God made me will or do, and I look upon it as defiled or imperfect, as coming from me. But Christ is to me wisdom, righteousness, sanctification, and redemption." Of the schisms that had rent the church, he remarked, "those whom ye call protesters are the witnesses of Jesus Christ. I hope never to depart from that cause, nor side with those of the opposite party who have broken their covenant oftener than once or twice. But I believe the Lord will build Zion, and repair the waste places of Jacob. Oh to obtain mercy to wrestle with God for their salvation!" To his only surviving child (a daughter) he said, "I have left you upon the Lord; it may be you will tell this to others, that the lines are fallen to me in pleasant places. I have got a goodly heritage. I bless the Lord that he gave me counsel." His last words were, "Glory, glory dwell-eth in Immanuel's land;" and he expired on the morning of the 20th of March, 1661, in the sixty-first year of his age.

Mr Rutherford was unquestionably one of the most able, learned, and consistent Presbyterians of his age; while in his *Familiar Letters*, published posthumously, he evinces a fervour of feeling and fancy, that, in other circumstances, and otherwise exerted, would have ranked him among the most successful cultivators of literature. Wodrow has observed, that those who knew him best were at a loss which to admire, his sublime genius in the school, or his familiar condescensions in the pulpit, where he was one of the most moving and affectionate preachers in his time, or perhaps in any age of the church.

RYMER, THOMAS, of Ercildon, commonly called Thomas the Rhymer, and otherwise styled Thomas Learmont, was a distinguished person of the thirteenth century. So little is known respecting him, that even his name has become a matter of controversy. How the name of LEARMONT came to be given him is not known; but in none of the early authorities do we find it; and although it has long been received as the bard's patronymic, it is now, by inquiring antiquaries, considered a misnomer. In a charter granted by his son and heir to the convent of Soltra, he is called *Thomas Rymer de Erceldun*. Robert de Brunne, Fordun, Barbour, and Winton call him simply Thomas of Erceldoun; while Henry the Minstrel calls him Thomas Rymer.

Erceldoune, or, according to the modern corruption, Earlstoun, is a small village on the right bank of the Leader water, in Berwickshire. At the western extremity of this village stand, after a lapse of seven centuries, the ruins of the house which Thomas inhabited, called *Rhymer's Tower*; and in the front wall of the village church there is a stone with this inscription on it:—

"Auld Rymer's race
Lies in this place."

The poet must have lived during nearly the whole of the thirteenth century. His romance of *Sir Tristram* is quoted by Gottfried of Strasburg, who flourished about 1230; and it is known he was alive, and in the zenith of his prophetic reputation, in 1286, at the death of Alexander III. He must have been

dead, however, before 1299, as that is the date of the charter, in which his son calls himself *filius et hæres Thomæ Rymour de Erceldoun*. Henry the Minstrel makes him take a part in the adventures of Wallace, in 1296; so, if this authority is to be credited, he must have died between that year and 1299.

To this day the name of Thomas the Rhymer is popularly known in Scotland as a prophet; and it is only by a late discovery of the MS. of a metrical romance called *Sir Tristram* that he has acquired a less exceptional claim to remembrance. The *Prophecies of Thomas the Rhymer* were published, in Latin and English, at Edinburgh, in 1615, and have been repeatedly reprinted, copies of them being still to be found among the country people of Scotland. He is mentioned in his prophetic capacity by many of our early writers. Among the most noted of his predictions is the following, regarding the death of Alexander III., which is thus narrated by Boece, as translated by Ballenden:—"It is said, the day afore the kingis dethe, the erle of Marche demandit ane prophet namit Thomas Rhymour, otherwayis namit Ersiltoun, quhat wedder suld be on the morow. To quhome answert this Thomas, that on the morow afore none, sall blow the gretist wynd that ever was hard afore in Scotland. On the morow, quhen it was neir noon the lift appering loane, but ony din or tempest, the erle send for this prophet, and reprevit hym that he prognosticat sic wynd to be, and nae apperance thairof. This Thomas maid litel answer, bot said, noun is not yet gane. And incontinent ane man came to the yet, schawing the king was slain. Than said the prophet, yone is the wynd that sall blaw to the gret calamity and truble of all Scotland. Thomas wes ane man of gret admiration to the peple, and schaw sundry thingis as thay fell." The common-sense translation of this story is, that Thomas pre-saged to the Earl of March that the next day would be windy; the weather proved calm; but news arrived of the death of Alexander III., which gave an allegorical turn to the prediction, and saved the credit of the prophet.

Barbour, Winton, Henry the Minstrel, and others, all refer to the prophetic character of Thomas. In Barbour's *Bruce*, written about 1370, the Bishop of St Andrews is introduced as saying, after Bruce had slain the Red Cumyn:—

"I hop Thomas' prophecye
Off Hersildowne, weryfyd be
In him; for swa our Lord halp me,
I haiff gret hop he schall be king;
And haiff this land all in leding." —*Bruce*, ii. 26.

Winton's words are these:—

"Of this sycht quhilum spak Thomas
Of Erceldoune, that sayd in derne,
Thare suld meet stalwartly, stark, and sterne.
He sayd it in his prophecie,
But how he wist, it was ferly."

Henry the Minstrel represents him as saying, on being falsely told that Wallace was dead:—

"Forsuth, or he decess,
Many thousand on feild sall mak thar end.
And Scotland thriss he sall bring to the peess;
So gud of hand agayne sall nevir be kend."

—*Wallace*, b. ii. ch. 3.

How far Rymer himself made pretensions to the character of a prophet, and how far the reputation has been conferred upon him by the people in his own time and since, it is impossible to determine. It is certain, however, that in almost every subsequent age metrical productions came under public notice, and were attributed to him, though, it might be supposed, they were in general the mere coin of contemporary wits applied to passing events. There are nevertheless a considerable number of rhymes

and proverbial expressions of an antique and primitive character attributed to Thomas the Rhymer, and applicable to general circumstances: of some of these we deem it by no means unlikely that they sprung from the source to which they are ascribed, being in some instances only such exertions of foresight as a man of cultivated understanding might naturally make; and in others dreamy vaticinations of evil which never have been, and perhaps never will be, realized. Many of these may be found in the *Border Minstrelsy*, and in *Popular Rhymes of Scotland* and the *Picture of Scotland*. It may also be mentioned, as illustrative of the forceful character of this early and obscure genius, that he and his predictions are as well known in the Highlands and Hebrides as in our southern counties. The *Cambrian and Caledonian Magazine*, 1833, gives the two following *Gaelic* predictions, as imputed to him by the Highlanders:—

"Cuiridh fiacail nan caoraich an crann air an sparr."
The teeth of the sheep will lay the plough on the shelf.

"Bithidh muiltèan air gach allt, agus ath air gach enoc;
tombac aig na bunchailleàn, a's gruagachan gun naire;" i.e.
There shall be a mill on every brook, a kiln on every height;
herds shall use tobacco, and young women shall be without shame.

In the introduction to Robert de Brunne's *Annals*, written about 1238, Thomas of Erceldoune is commemorated as the author of the incomparable romance of *Sir Tristrem*. Gottfried of Strasburg, also, a German minstrel of the 13th century, already alluded to, says that many of his profession told the tale of *Sir Tristrem* imperfectly and incorrectly; but that he derived his authority from "Thomas of Britannia [evidently our Thomas], master of the art of romance, who had read the history in British books, and knew the lives of all the lords of the land and made them known to us." This work of our poet was considered to be lost, till a copy of it was discovered among the Auchinleck MSS. belonging to the library of the Faculty of Advocates, Edinburgh, and published, with introduction and notes, by Sir Walter Scott.

From the opening lines of this copy, viz.

"I was at Erceldoune;
With Tomas spak y thare;
Ther herd y rede in rounne,
Who Tristrem gat and bare," &c.

A doubt has arisen whether it be the identical romance composed by Thomas of Erceldoune which was pre-

ferred by his contemporaries to every minstrel tale of the time. But the celebrated editor very satisfactorily demonstrated, from the specific marks by which Robert de Brunne, a contemporary of Thomas, describes the work, that this must be the genuine *Sir Tristrem*, taken probably from the recitation of a minstrel who had heard and retained in his memory the words of Thomas. The date of the MS. does not seem to be much later than 1330, which makes an interval of about forty years between it and the author's time, a period in which some corruptions may have been introduced, but no material change in the formation of the language. Accordingly, the structure of the poem bears a peculiar character. The words are chiefly those of the fourteenth century; but the turn of phrase is, either from antiquity or the affectation of the time when it was written, close, nervous, and concise, even to obscurity. The stanza is very complicated, consisting of eleven lines, of which the 1st, 3d, 5th, and 7th rhyme together, as do the 2d, 4th, 6th, 8th, and 10th. A single stanza will serve to show its intricate and difficult structure. This one speaks of the education of Tristrem by Roland:

"Fiftene yere he gan him fed;
Sir Rohant the trewe;
He taught him ich alede,
Of ich maner of glewe;
And everich playing thede,
Old lawes and newe;
On hunting oft he yede,
To swiche alawe he drew,
Al thus;
More he couthe of veneri,
Than couthe Manerious."

It may be remarked that a complicated verse has been a favourite among the Scottish poets down to the present time. Burns, for instance, has injured some of his best pieces by adopting the jingling stanza of the *Cherry and the Slae*.

By the recovery of this work Scotland can lay an earlier claim to a poem than England; and, indeed, it would appear from what is said by Robert de Brunne, and other circumstances, that the *gests* of the northern minstrels were written in an ambitious and ornate style which the southern harpers marred in repeating, and which plebeian audiences were unable to comprehend; in other words, that the English language received its first rudiments of improvement in this corner of the island, where it is now supposed to be most corrupted.

S.

SAGE, THE RIGHT REV. JOHN, was born in 1652, in the parish of Creich, in the north-east part of the county of Fife, where his ancestors had lived with much respect, but little property, for seven generations; his father was a captain in Lord Duffus's regiment, which was engaged in the defence of Dundee when it was stormed and taken by the parliamentary general Monk, on the 30th August, 1651. Captain Sage's property was diminished in proportion to his loyalty, and all the fortune he had to bestow on his son was a liberal education and his own principles of loyalty and virtue. Young Sage received the rudiments of his education at the school of his native parish, and at a proper age was removed to the university of St. Andrews, where he remained during the usual course, performing the exercises required by the statutes of the Scottish

universities, and where he took the degree of Master of Arts in the year 1672. He made letters his profession; but his means being narrow, he was compelled to accept the office of parochial schoolmaster of Bingry in Fife, from which parish he was soon afterwards removed to the same office in Tippermuir, near Perth. Though in these humble stations he wanted many of the necessities and all the comforts of life, he prosecuted his studies with unwearied diligence; unfortunately, however, in increasing his stock of learning, he imbibed the seeds of several diseases, which afflicted him through the whole of his life, and, notwithstanding the native vigour of his constitution, tended ultimately to shorten his days. To the cultivated mind of such a man as Sage, the drudgery of a parish school must have been an almost intolerable slavery; he therefore

readily accepted the offer from Mr. Drummond of Cultmalundie, of a situation in his family, to superintend the education of his sons. He accompanied these young persons to the grammar-school of Perth, and afterwards attended them in the same capacity of tutor to the university of St. Andrews. At Perth he acquired the esteem of Dr. Rose, who was afterwards Bishop of Edinburgh, and one of the most distinguished men of his age; and at St. Andrews he obtained the friendship and countenance of all the great literary characters of the period.

In 1684 the education of his pupils was completed, and he was again thrown on the world, without employment, without prospects, and without any means of subsistence. His friend Dr. Rose, however, having been promoted from the station of parish minister at Perth to the chair of divinity at St. Andrews, did not forget young Sage at this moment of indecision and helplessness, but recommended him so effectually to his uncle Dr. Rose, then Archbishop of Glasgow, that he was by that prelate admitted into priest's orders, and presented to one of the city churches. At the period of his advancement in the church he was about thirty-four years of age: his knowledge of the Scriptures was very great; and he had studied ecclesiastical history, with the writings of all the early fathers of the church: he was thorough master of school divinity, and had entered deeply into the modern controversies, especially those between the Romish and the Protestant churches, and also into the disputes among the rival churches of the Reformation. He was in consequence very highly esteemed by his brethren, and was soon after appointed clerk of the diocesan synod of Glasgow, an office of great responsibility.

During the establishment of Episcopacy in Scotland, from the restoration of Charles II. till the year 1690, the authority of the bishops in the government of the church was exceedingly limited; they possessed indeed the sole power of ordination, but their government was shared by presbyteries and diocesan synods, in which they presided as perpetual moderators, having only the insignificant prerogative of a negative voice over the deliberation of these assemblies. The bishop delivered also a charge to the presbyters at the opening of these meetings, which, with the acts of the synodal or presbyterial meetings, was registered by the clerk, who was always one of the most eminent of the diocesan clergy. In all this period there were neither liturgy, nor forms, nor ceremonies, nor surplices, nor black gowns, nor any mark whatever by which a stranger, on entering a parish church, could discover that any difference in worship or external appearance existed between the established Episcopal church and the tolerated Presbyterian chapel; and we believe it is an established fact, that so much were the minds of the moderate Presbyterians reconciled to Episcopacy, that almost all the indulged ministers, with their congregations, took the communion at the parish churches with the Episcopal clergy towards the latter end of the reign of Charles II.

Mr. Sage continued to officiate as clerk of the diocese, and as a parish minister in Glasgow, till the Revolution in 1688. In executing the duties of his pastoral office, he gained the esteem and affection not only of his own parishioners, but even of the Presbyterians; so much so, that when the common people took the reformation of the church into their own hands, and, with no gentle means, turned the Episcopal clergy of the western shires out of their churches and livings, he was treated in a manner which was considered as comparatively lenient and humane, being warned privately, "to shake off the

dust from his feet and withdraw from Glasgow, and never venture to appear there again." Many of his brethren were trimmers both in ecclesiastical as well as political affairs; they had been Presbyterians and republicans in the days of the covenant, and when, from the signs of the times in the short reign of the infatuated and ill-advised James, a change in the establishment seemed to be approaching, these overzealous converts to Episcopacy suddenly became all gentleness and condescension to the Presbyterians, whom they now courted and caressed. Sage's conduct was the reverse of this; he was heartily and from conviction an Episcopalian and a royalist; and in all his discourses in public and private he laboured to instil those principles into the minds of others. To the persecution of others for difference of opinion he was always steadily opposed, not from any indifference to all opinions, but from a spirit of perfect charity, for he never tamely betrayed through fear what he knew it was his duty to maintain, notwithstanding his indulgence to the prejudices of others.

Thus expelled from Glasgow, he sought shelter in Edinburgh, carrying with him the synodical books, which, it would appear, he had delivered to Bishop Rose, for, after the death of that venerable ecclesiastic, they were found in his possession, and delivered by his nephew to the presbytery of Glasgow. These books had been repeatedly demanded by the new presbytery, but had always been refused from a hope still lingering in Sage's mind that a second restoration should take place; but as the captivity of the Jews always increased in duration in proportion to their number, so has that of the Episcopal church of Scotland. Partly to contribute towards that restoration for which he ardently longed, and partly to support himself under that destitution to which he was now reduced, he commenced as polemical writer, to the infinite annoyance of his adversaries: the following is a list of his works, which are now scarce, and chiefly to be found in the libraries of those who are curious in such things:—1. The second and third letters concerning the "Persecution of the Episcopal Clergy in Scotland," printed in London in 1689. The first letter was written by the Rev. Thomas Morer, and the fourth by Professor Monro.—2. "An Account of the Late Establishment of Presbyterian Government by the Parliament of Scotland, in 1690." London, 1693.—3. *The Fundamental Charter of Presbytery*. London, 1695.—4. *The Principles of the Cyprianic Age with Regard to Episcopal Power and Jurisdiction*. London, 1695.—5. *A Vindication of the "Principles of the Cyprianic Age"*. London, 1701.—6. "Some Remarks on a Letter from a Gentleman in the City to a Minister in the Country, on Mr. David Williamson's Sermon before the General Assembly." Edinburgh, 1703.—7. "A Brief Examination of Some Things in Mr. Meldrum's Sermon preached on the 6th May, 1703, against a Toleration to those of the Episcopal Persuasion." Edinburgh, 1703.—8. "The Reasonableness of a Toleration of those of the Episcopal Persuasion, inquired into purely on Church Principles," 1704.—9. *The Life of Gavin Douglas*, 1710.—10. "An Introduction to Drummond's History of the Five Jameses." Edinburgh, 1711.

He left, besides, several manuscripts on various subjects that are mentioned in his life by Bishop Gillan, and which were published at London in 1714.

On his retirement to the metropolis he began to officiate to a small body who still adhered to the displaced church; but, peremptorily refusing to take the oaths to the revolution government, such was then the rigour of the officers of state, and the viol-

ence of the populace, that he was ere long compelled at once to demit his charge, and to leave the city, his person being no longer deemed safe. In this extremity he was received into the family, and enjoyed the protection and friendship, of Sir William Bruce, then sheriff of Kinross, who approved of his principles and admired his virtues. Here he remained till 1696. On the imprisonment of his patron, Sir William, who was suspected of disaffection to the government, he ventured in a clandestine manner to visit him in Edinburgh Castle; but his persecutors would give him no respite; he was obliged again to flee for his life to the Grampian Hills, where he lived destitute and penniless under the assumed name of Jackson.

After he had wandered in a destitute state for some time among the braes of Angus, the Countess of Callander offered him an asylum, and the appointment of domestic chaplain for her family, and tutor for her sons. Here he continued for some time, and when the young gentlemen intrusted to his charge were no longer in want of his instructions, he accepted an invitation from Sir John Stewart of Granthly, who desired the assistance of a chaplain, and the conversation of a man of letters. In this situation he remained till the necessities of the church required the Episcopal order to be preserved by new consecrations. The mildness of his manners, the extent of his learning, and his experience recommended him as a fit person on whom to bestow the Episcopal character. He was accordingly consecrated a bishop, on the 25th January, 1705, when no temporal motives could have induced him to accept an office at all times of great responsibility, but at that time of peculiar personal danger. His consecrators were John Paterson, the deprived Archbishop of Glasgow, Dr. Alexander Rose, deprived Bishop of Edinburgh, and Robert Douglas, deprived Bishop of Dunblane.

Soon after his promotion, this illustrious man was seized with that illness the seeds of which had been sown in the difficulties and privations of his youth. After patiently lingering a considerable time in Scotland without improvement, the persecutions to which he was subjected increasing his malady, he was induced to try the efficacy of the waters at Bath, in 1709. But this also failed him: the seat of his disease lay deeper than medical skill could reach. He remained a year at Bath and London, where the great recognized and the learned caressed and courted him, and where it was the wish of many distinguished persons that he should spend the remainder of his life. The love of his country and of his native church overcame all entreaties, and he returned to Scotland in 1710, with a debilitated body, but a mind as vigorous as ever. Immediately on his arrival he engaged with undiminished ardour in the publication of Drummond's *Works*, to which Ruddiman, whose friendship he had for many years enjoyed, lent his assistance. Worn out with disease and mental anguish, Bishop Sage died at Edinburgh, on 7th June, 1711, lamented by his friends and feared by his adversaries. His friend Ruddiman always spoke of him as a companion whom he esteemed for his worth, and as a scholar whom he admired for his learning. Sage was unquestionably a man of great ability, and even genius. It is to be lamented, however, that his life and intellect were altogether expended in a wrong position and on a thankless subject. All the sophistical ingenuity that ever was exerted would have been unable to convince the great majority of the Scottish people that the order of bishops was of scriptural institution, or that the government of the two last male Stuarts, in which

a specimen of that order had so notable a share, was a humane or just government. He was a man labouring against the great tide of circumstances and public feeling; and accordingly, those talents which otherwise might have been exerted for the improvement of his fellow-creatures, and the fulfilment of the grand designs of Providence, were thrown away, without producing either immediate or remote good.

SCOT, DAVID, M.D. The nature of the Scottish system of education, by which the means of acquiring the common branches of knowledge are placed within the reach of even the poorest, has had a wondrous power in developing that love of learning which is so common to the better class of intellects; and a mind being thus supplied with the key that opens every gate of art and science, the national energy and perseverance are sufficient for a successful entrance. Hence it is that Scotland can show so many accomplished scholars derived from the lower ranks, who appeared by their position to be doomed to nothing higher than the lot of a common ploughman or artisan. Among the persons of this description, Dr. David Scot holds an honoured place.

He was born in the parish of Pennicuik, near Edinburgh. His father was a small farmer in that locality, a man renting a few acres which he cultivated with his own hands; but he was of an intellect superior to his class, as was shown by his writing and publishing a pamphlet under the signature of a "Pennicuik Ploughman," levelled against the Dissenters of the day, and especially against Gibb and his book called the *Display*, in which the opinions of himself and his followers were embodied. It was inevitable that the son of such a man should be sent to the parish school, and there David distinguished himself by his aptitude for learning and diligence in his lessons. His own aim, as well as his father's ambition, was that he should fill a pulpit; and accordingly, having completed the education of the parish school, he became a student of the university of Edinburgh, where his diligent habits and success in learning attracted the notice both of students and professors. After completing the college course prescribed by the church, he was licensed as a preacher by the presbytery of Edinburgh, but here his career seemed to have ended; for no kind patron appeared to present him to a living, and his talents were not of that kind which catch the popular ear. Thus disappointed, he turned his attention to medicine, and having duly qualified himself, obtained the degree of M.D.; but it was neither as a minister nor doctor that his highest distinction was to be won. His chief predilection was the study of languages, for which he showed extraordinary aptitude, and he was so fortunate as to have for his fellow-students Drs. Murray and Leyden, renowned philologists, whose example would have whetted him had such an incentive been necessary. From his superior knowledge of the Hebrew tongue, he was encouraged to betake himself to the oriental languages; and to perfect himself in the pronunciation of Hindostanee and Persic, he took lessons in these from Dr. Borthwick Gilchrist, one of the most competent of all our authorities in these departments of eastern literature. Having now made himself master of the greater part of the Asiatic languages, both ancient and modern, including Syriac, Ethiopic, Arabic, and some knowledge of Sanscrit, Dr. Scot began to give lessons to young gentlemen who were preparing for service in India, and with such success, that the oriental scholarship of his pupils was noted, and many of them won high distinction both in the civil and military service of the East India Company.

Among the pupils whom he thus trained for life in India, it fortunately happened that he taught some of the sons of Sir John Marjoribanks, of Lees; and with their proficiency the baronet was so highly pleased, as well as with the learning and excellent teaching of their preceptor, that he resolved to bestir himself in obtaining for the latter a living in the church. In 1812 the Hebrew chair in the university of Edinburgh having become vacant, Dr. Scot offered himself as candidate for the professorship; but he had a still more learned, or at least a better-known rival, in his old class-fellow Dr. Murray, against whom competition was hopeless, and Murray was chosen by universal acclamation. Happily, however, Dr. Scot's disappointment was not to be lasting. In a year or two afterwards the church of Corstorphine in the neighbourhood of Edinburgh, was deprived of its minister, and Sir John Marjoribanks, who had zealously but ineffectually laboured to obtain the Hebrew professorship for his protégé, had now interest sufficient to obtain for him the parish living. Thus, after eighteen years of dreary waiting, in which, however, the long interval was not idly or uselessly employed, the worthy preacher, physician, and teacher of eastern languages, succeeded in his original choice by becoming a minister in the Church of Scotland.

As a parish minister Dr. Scot acquired the love and esteem of his people, and how well he deserved their regard, not only his personal worth, but his talents as a preacher, sufficiently show. In lecturing, his oriental knowledge was brought to the elucidation with a distinctness and force not often exhibited in pulpit instruction, while his superiority as a preacher was attested by his work entitled "*Discourses on some Important Subjects of Natural and Revealed Religion*," introduced by a Short View of the Best Specimens of Pulpit Eloquence given to the World in Ancient and Modern Times." These discourses are distinguished by learned and solid illustration, and frequently by powerful language and positive eloquence, while they are pervaded throughout by rich Christian doctrine and scriptural morality.

After being minister of Corstorphine for nineteen years, a new call summoned Dr. Scot to a different, but still congenial, field. In 1832 a vacancy occurred in the Hebrew chair of St. Mary's College, St. Andrews, and his love of oriental learning, which had never abated, was roused by such an opportunity of bringing it into active use. Of the several competitors who entered the lists, he was judged indisputably the best, and greatly to their honour the patrons elected him to the professorship. From his high reputation, the hope was entertained in the colleges of St. Andrews that a new impetus would be given to the study of oriental literature, but the hope was not to be realized. After having discharged the duties of his professorship for two short sessions, he visited Edinburgh for the purpose of attending a meeting of the British Association, but was there seized with a dropsical complaint, which, after two or three days of suffering, ended his life on the 18th of September, 1834.

Such was the simple uneventful life of one of the most distinguished scholars of his day; but it was fortunate for his memory that his literary achievements were too signal to be soon forgot. Besides the work we have already mentioned, he published others more closely connected with the literature of the East; and when an editor was in request for Dr. Murray's *History of the European Languages*, Dr. Scot was unanimously appointed to revise it, a duty which he discharged to the satisfaction of the literary world. He published a *Key to the Hebrew Pentateuch*, and a *Key to the Psalms, Proverbs, Ecclesiastes, and the Song*

of Solomon, works well fitted to facilitate the progress of the student in acquiring a knowledge of the Hebrew tongue. He likewise published a Hebrew Grammar for the use of his own class; and such was his mastery of the language, that he did not need to set down the work in manuscript, but dictated it extempore to the printers, as its various portions were passed through the press. Dr. Scot was also the author of *Essays on Belles-lettres*, and lives of several of the Scottish poets. His personal character is thus summed up in the obituary from which the facts of the foregoing memoir have been derived:—"In estimating the character of Dr. Scot we perceive almost everything to love and esteem. His modest nature, his simple manners, his amiable disposition, his literary taste, his extensive knowledge, and his sterling worth, procured him the cordial esteem and affection of every one who knew him. We have seldom known a man more generally beloved or more sincerely regretted. As he lived, so we believe he died, without having an enemy in the world."

SCOTT, DAVID. Of this poet-painter, whose whole life was a feverish struggle with great conceptions, and whose artistic productions showed that had his life been but continued, he might have embodied these conceptions in paintings that would have created a new school of art—of him it may truly be said, that a generation must yet pass away, and a new world of living men enter into their room, before his talents are fully appreciated, and their place distinctly assigned. David Scott was the youngest of five children, all sons, and was born either on the 10th or 12th of October, 1806; but only a year after his birth he was the sole surviving child of his parents, the rest having died, with only a few days of interval between each. Like other boys of his standing in Edinburgh, David was sent to study Latin and Greek at the high-school; but, like the generality of artists, he made no great proficiency in these languages. Is it that nature has implanted such a different spirit of utterance within the artistic heart as to make words unnecessary? As his father was an engraver of respectable attainments in his profession, having had, among other pupils, John Burnet, the engraver of some of Wilkie's best drawings, and John Horsburgh, David had thus, even in his earliest boyhood, such opportunities for pictorial study as formed an excellent training for the profession to which nature had designed him. He also learned the art from his father, and became one of his assistants. But the mere mechanical work of engraving was not enough for such an original spirit, he must draw as well as engrave, create as well as copy; and therefore he frequently drew those designs which he afterwards produced with his graver, as the frontispieces and vignettes of books. Although he abandoned the graving-tool for the pencil as soon as circumstances permitted the exchange, he did not lose sight of the early art which had formed the chief stepping-stone of his progress; and, accordingly, he etched with his own hand the "Monograms of Man," and the illustrations of Coleridge's *Ancient Mariner*; and just previous to his death had purposed to do the same for his designs expressive of the emotions produced by the contemplations of sidereal astronomy. Still, however, his love of painting so completely predominated that among his early sketches there were two that especially indicated the ardour of his aspirations. The one was inscribed "Character of David Scott, 1826," in which he was delineated as seated at the engraving table, with his hands clenched in despair. Another, of a similar bearing, dated 1828, represents him with the engraving

tools thrown away, and the palette pressed to his heart. But he did not confine himself to aspirations merely; on the contrary, he accompanied them with that laborious diligent practice for which his life was distinguished to the close. Having associated himself with the young lovers of art with whom Edinburgh even already had begun to abound, he formed with them the Life Academy in 1827, in which, as the name indicates, the living model was the subject of study and delineation. In the following year he attended Dr. Monro's class of anatomy, and made a short visit to London for the purpose of taking sketches in the National Gallery and the British Institution. Of the same date, also, was his first exhibited picture, entitled "The Hopes of Early Genius dispelled by Death." As may be supposed, it was a stern, Dante-like allegory, chiefly valuable for the indication it gave of the bent of the young artist's mind, and the struggle, already commenced, that was certain to lead to high excellence. His next, of a similar unearthly character, was the "Combat of Fingal with the Spirit of Lodi," on which a considerate friend remarked to him, "Shoot a lower aim; you speak a dead language." Following these were his "Adam and Eve singing their Morning Hymn;" "The Death of Sappho;" "Wallace defending Scotland," and "Monograms of Man;" and subsequently, "Lot;" "Nimrod;" "Sarpedon carried by Sleep and Death," and "Cain." These, and several other intermediate sketches, were produced between the years 1828 and 1832; and as most of them were sent to the exhibition, the talents of Mr. Scott, as an artist of high promise, were generally felt, although this feeling was mingled with much wonderment, and not a little misgiving as to the ultimate tendency of such fervid idealism. This inability of the public to sympathize in his views, and consequent tendency to disparage them, Scott very keenly felt; and he thus writes of the subject in his journal: "Various are the causes that render my going abroad necessary. I lose myself in thinking over the journey, and what it may do. Everything I have yet attempted has been unsuccessful; so many disappointments make effort appear vain. What I must do is to cut off all recurrence to former efforts, except in so far as they may coincide with my later formed ideas of art, and to hold grimly on in the conscientious course. A great happiness it is that futurity is yet unseen and unmade; therein yet may be somewhat to answer my desires. Happy are those new hopes and wishes that still descend on us when all we value in ourselves is burned up and scattered!"

David Scott had now resolved to become the pupil of art, as he had formerly been of nature; and for this purpose to repair to Italy, and study in its galleries the productions of those great masters whose excellence had endured the test of centuries, and come out more brilliant from the ordeal. He would there learn the mighty secret by which they had enthralled the world so completely and so long—that true language of painting which every age and nation can understand. He set off upon his quest in August, 1832, and, after a short stay in London, visited Paris and Geneva, where the Louvre and the Alps alternately solicited his study. Milan and Venice, Parma and Bologna, Florence and Sienna, followed in turn, until he finally settled at Rome, once the nursing-mother of heroes, but now of painters and sculptors, by whom her first great family have been embalmed, that the present world might know how they looked when they lived. It seems to have been only by degrees that the true grandeur of these objects fully dawned upon the

mind of David Scott; for there was within him not only much that needed to be improved, but much to be unlearned and renounced. His impressions upon all the principal works of art are contained in his diary; and these will, no doubt, be studied as a rich suggestive fund of thought by our future young artists who repair to the great Italian fountain-head. But indefatigable though he was in these explorations, the most striking though the least ostentatious part of his diary is to be found in the scattered notices that everywhere occur of his own daily occupations, and from eight to sixteen hours seem with him to have been nothing more than an ordinary diurnal measure. The fruits of this diligence, independently of his critical writings upon works of art, are thus summed up by his biographer:—"During that short residence in Rome, he made a set of eleven sheets of anatomical drawings, forming one of the most perfect artistical surveys of superficial anatomy ever made, with 137 studies from life in oil or chalk; and in painting he did four small pictures of the 'Four Periods of the Day;' a copy of the 'Delphic Sybil,' from the Sistine, with a number of studies from the 'Last Judgment;' several exercises in fresco; painted 'Sappho and Anacreon,' a picture with life-size figures; and two or three smaller but well-finished pictures; and, last and greatest, the picture of 'Family Discord,' or, as it was afterwards called, 'The Household Gods Destroyed.' The size of this last was nearly thirteen feet by ten and a half. This amount of work, if we consider the time lost in a new scene and among new habits, and add the designs, sketch-books, and other little matters which he accomplished, shows us a Hercules in perseverance and impulse." It is interesting to see Scott's own account of the effect produced upon him by this pilgrimage and labour; and this we have in his diary a short time after his return home, under the date of 16th August, 1834:—"The anniversary of my leaving Scotland two years ago—the crowning of my desires—the journey of art—the sacrifice to enthusiasm—the search after greatness, in meeting the great men of the present, and the great labours of the past. Among my old pictures and people, I now feel how different I am from the man who left this but so short a time ago. I have looked too much for what was without individual prototype in nature. The veil withdraws and withdraws, and there is nothing left permanent. But I believe I can now meet difficulties practically. Analyzing one's own thoughts and actions—studying things in their relations—is often a painful task; but he who has not done so is a child."

Having returned to Scotland inspired with new perceptions, as well as braced with fresh courage, David Scott commenced the business of life in earnest, and his whole course from this period was one of continual artistic action. He must give full proof of high talent as a painter if he would reap the renown and win the emoluments of such a position; and to indicate his claims he must descend into the arena, and let the onlookers judge what he was worth. In these competitions we shall content ourselves with summing up his future history.

To the Edinburgh exhibition of 1835 he sent four pictures: these were "Sappho and Anacreon," "The Vintager," a fresco, and "Sketch of the Head of Mary Magdalene."

In that of the following year were exhibited his "Descent from the Cross," a painting which he had prepared as an altar-piece for the new Roman Catholic chapel in Lothian Street; "Oberon and Puck," and "Macchiavelli and the Beggar." The first of these was made the subject of the annual

engraving circulated by the Association for the Promotion of the Fine Arts; the last was the commencement of a series of historic sketches, which Scott continued till near the close of his life.

To the exhibition of 1837 he sent only two pictures, "The Abbot of Misrule," and "Judas Betraying Christ." This paucity was chiefly occasioned by the time he devoted to the illustrations of the *Ancient Mariner*, in which he evinced a congenial spirit with that of the author of the wild and wondrous legend. Indeed, Coleridge himself thought it incapable of pictorial illustration, until these productions of David Scott agreeably convinced him of his mistake. "The whole series," he thus wrote to the painter, "is exceedingly impressive, and gives you a good claim to be our Retsch, if that is a compliment. It is curious to see how many conceptions may be formed of the imagery of a work of pure imagination. Yours is not like mine of the *Ancient Mariner*, and yet I appreciate and am deeply sensible of the merit of yours."

As an artist, Scott, whose commencement with the exhibition of 1835 had been both unpromising and disheartening, was now successfully surmounting the public neglect, as well as its inability to appreciate him, and steadily winning his way to that eminence which would place him among the highest of his degree. Invigorated by this prospect, his four pictures which he sent to the exhibition in 1838 had a sunniness of fancy as well as completeness of touch that indicated the hopeful feelings under which they were executed. The subjects were, "Orestes seized by the Furies after the Murder of his Mother, Clytemnestra, to which he was prompted by his Sister Electra, in Revenge of the Assassination of their Father Agamemnon;" "Rachel Weeping for her Children;" "Puck Fleeing before the Dawn;" and "Ariel and Caliban." About the same time he also painted, as a companion to the "Orestes," "Achilles Addressing the Manes of Patroclus over the Body of Hector." Another, which he painted during this year, and which was the most successful he had hitherto produced, so that it took the stubborn criticism of Edinburgh by storm, was the "Alchymical Adept Lecturing on the Elixir Vitæ." This picture was purchased by the Association for the Promotion of the Fine Arts for £200. Turning his attention also to the literary department of his profession, he published, in 1839 and the two following years, a series of essays in *Blackwood's Magazine*, of which the subjects were, "The Genius of Raffaele," "Titian, and Venetian Painting," "Leonardo da Vinci and Correggio," and the "Caracci, Caravaggio, and Monachism."

The year 1840 was signalized in Scott's life by the exhibition of his terrible painting which he had executed at Rome, under the title of "Agony of Discord, or the Household Gods Destroyed," and over which he exclaimed, when it was finished, "That is the work I must live by!" The figures of this strange myth are scarcely human, or if human, at least pre-adamite, when stature, and strength, and passionate expression may be supposed by a poet or artist to have far transcended the present type of humanity; while over them towers a colossal Laocoon-like form, exhausted in the struggle, and about to sink with crushing downfall upon those members of the rebellious home with whom he has been contending to the last. In the midst of this wild strife the mother has thrown her infant upon the floor; the household altar is overturned, and the household god broken. It was the impersonation, in a single tremendous scene, of the continual strife and struggle of humanity in its path of progress from age to age; and there-

fore fraught in every part with deep and hidden meaning, which nothing but careful examination could detect, and anxious study comprehend. Of course it was "caviare to the multitude," who gazed helplessly upon it, and shook their heads: it was such also to not a few of those penny-a-line critics whom our provincial journals extemporize for the nonce, to fill up a column with a "Report of the Exhibition," and whose whole stock consists of a few terms of art, which they sow at random over their paragraphs. But was it not thus at first with *Paradise Lost* and the *Excursion*; or to come nearer to the comparison, with *Christabelle* and the *Ancient Mariner*? The highest excellence is slowly appreciated, and thus it fared with Scott's "Discord;" but who would now venture to criticize it in the style that was used in 1840? At the same exhibition were Scott's "Philoctetes left in the Isle of Lemnos by the Greeks, in their Passage towards Troy," a painting also finished during his stay in Rome; "Cupid Sharpening his Arrows," and "The Crucifixion."

In 1841 Scott sent to the exhibition "Queen Elizabeth in the Globe Theatre," "Queen Mary receiving the Warrant for her Execution," "The Death of Jane Shore," "Ave Maria," and "A Parthian Archer." In "The Globe Theatre," which was a painting of large dimensions and plentiful detail, there were, besides the audience, draped and arranged in the fashion of the period, the virgin queen herself, listening to the *Merry Wives of Windsor*, which had been written at her desire—its still more illustrious author—and Spenser, Fletcher, Sackville, Ben Jonson, and other towering spirits of the age, with whom Shakspeare was wont to wage such glorious conflicts of wit at their meetings in the "Mermaid."

In 1842 Scott exhibited "The Duke of Gloucester taken into the Water Gate of Calais," "Silenus Praising Wine," and "The Challenge." At the commencement of this year also, being excited to the task by the proposal of painting the new houses of parliament with designs in fresco, he published a pamphlet, entitled *British, French, and German Painting*. At the close of this year he likewise exhibited, on his own account, in the Calton Hill Rooms, his large picture of "Vasco de Gama, the Discoverer of the New Passage to India, encountering the Spirit of the Storm while attempting to double the Cape of Good Hope," at that time known as Capo Tormentoso. Magnificent though the original conception is in the *Lusiad* of Camoens, it falls greatly short of its illustration by the painter—and how seldom can this be said of imitation, whether in poetry or painting! The terrible apparition of the "stormy spirit of the cape," whose frown itself seems enough to annihilate a navy—the daring hero-navigator recovering from his astonishment, and preparing to confront the prohibition of this unknown power with defiance, or even with actual battle, if such should be needed—and the strange figures upon the crowded deck, each of which tells its own tale, compose of themselves an epic such as mere narrative would find it difficult to equal. But who in Edinburgh cared about De Gama, or had read the *Lusiad*, even in a translation? The exhibition, therefore, so far as pecuniary profit went, was a failure; and it was not until historic knowledge, combined with critical taste, had pointed out the striking merits of this production, that public attention atoned for its neglect. It was afterwards secured for the Trinity House of Leith, where it now remains.

To the exhibition of 1843 Scott sent his paintings of

"Richard III. receiving the Children of Edward IV. from their Mother;" "The Four Great Masters, being Michael Angelo, Raffaele, Titian, and Coreggio," which were in separate pictures but forming one series; and the "Belated Peasant," from Milton. These are reckoned to be among the best of his productions. At this period, also, in consequence of the competition for the painting of the new houses of parliament, Scott, whose emulation had been roused by the subject, sent two cartoons as a competitor, the subjects being "Drake witnessing the Destruction of the Ships of the Spanish Armada," and "Wallace defending Scotland." These he painted exclusively in his own style, and with a reference to his own principles of art; but as they had a different ordeal to pass through they were tried and rejected. When the competition in fresco for the same purpose succeeded, Scott, who was one of the few Scottish artists that understood this style of painting, sent two specimens, executed upon the principles which had occasioned the condemnation of his first attempts, and these also shared in the fate of their predecessors. Returning to a species of competition in which he now had better chances of success, he sent to the exhibition of 1844, "Wallace the Defender of Scotland;" "Sir Roger Kirkpatrick Stabbing the Red Comyn in the Cloisters of the Grayfriars, Dumfries;" the "Baron in Peace;" and "May," from the "Merchant's Tale," in Chaucer's *Canterbury Pilgrims*.

The contributions of David Scott to the exhibition of 1845 were two pictures, the one having for its subject, "Christian listening to the Instructions of Piety, Charity, and Discretion;" and the other, "The Dead rising at the Crucifixion." In 1846 were exhibited his "Peter the Hermit Preaching the Crusades;" "Dante and Beatrice;" "Fragment from the Fall of the Giants;" "Rhea bewailing the Overthrow of her Titan Sons;" and "The Ascension." In 1847 he had only two paintings in the exhibition; these were "The Triumph of Love," and a small fresco which he had formerly exhibited in London. In 1848 he sent to it "Time Surprising Love;" "Children Following Fortune;" "Queen Mary of Scotland at the Place of Execution;" "Hope passing over the Sky of Adversity;" and "The Baptism of Christ." To the exhibition of 1849 he sent "Delusive Pleasures;" "A Sketch of the Fire of London;" and "The Domestic Arcadia."

In this catalogue of his annual productions, great though it is, and implying an amount of diligence, perseverance, and intellectual enterprise, such as the artistic studio can seldom equal, we have not taken into account the numerous portraits and sketches with which every interval of leisure seems to have been fully occupied. Alone and unaided, and confronted by a whole world of hostile criticism, Scott had fought the battle step by step, and been obliged to struggle for every inch of ground that brought him nearer to the mark of his ambition. It was an unequal conflict, which death rather than victory could be expected to terminate. That mournful closing event occurred on the 5th of March, 1849. As yet only at the period when life is strongest, and hope, if not at the brightest, is yet the most firmly established—it was then that he passed away, worn out and weary, and longing to be at rest. He thus added one name more to that long list of the sons of promise who have been snatched from the world when the world could least spare their presence, and when their loss was to be most regretted. But in the case of David Scott how, indeed, could it be otherwise with such a restless, fervid, sensitive spirit, inclosed within such a delicate frame and sickly

constitution? But he had held out bravely to the last; and even during his final illness, his love of art predominated in conceptions that needed full health to embody, and sketches that were left unfinished. At the most, he was only in his forty-third year at the period of his decease.

SCOTT, MICHAEL, a learned person of the thirteenth century, known to the better informed as a philosopher, and to the illiterate, especially of Scotland, as a wizard or magician, was born about the year 1214. The precise locality of his birthplace is unknown, although that honour has been awarded to Balwairie in Fife, but on insufficient authority. Neither is there anything known of his parents, nor of their rank in life; but judging of the education he received, one of the most liberal and expensive of the times, it may be presumed that they were of some note.

Scott early betook himself to the study of the sciences; but soon exhausting all the information which his native country afforded in those unlettered times, he repaired to the university of Oxford, then enjoying a very high reputation, and devoted himself to philosophical pursuits, particularly astronomy and chemistry, in both of which, and in the acquisition of the Latin and Arabic languages, he attained a singular proficiency. At this period astronomy, if it did not assume entirely the shape of judicial astrology, was yet intimately blended with that fantastic science; and chemistry was similarly affected by the not less absurd mysteries of alchemy: and hence arose the imaginary skill and real reputation of Scott as a wizard, or foreteller of events; as, in proportion to his knowledge of the true sciences, was his imputed acquaintance with the false.

On completing his studies at Oxford, he repaired, agreeably to the practice of the times, to the university of Paris. Here he applied himself with such diligence and success to the study of mathematics, that he acquired the academic surname of Michael the Mathematician; but neither his attention nor reputation was confined to this science alone. He made equal progress, and attained equal distinction, in sacred letters and divinity; his acquirements in the latter studies being acknowledged by his having the degree of Doctor in Theology conferred upon him.

While in Paris he resumed, in the midst of his other academical avocations, the study of that science on which his popular fame now rests, namely, judicial astrology, and devoted also a further portion of his time to chemistry and medicine. Having possessed himself of all that he could acquire in his particular pursuits in the French capital, he determined to continue his travels, with the view at once of instructing and of being instructed. In the execution of this project he visited several foreign countries and learned universities; and amongst the latter, that of the celebrated college at Padua, where he eminently distinguished himself by his essays on judicial astrology. From this period his fame gradually spread abroad, and the reverence with which his name now began to be associated, was not a little increased by his predictions, which he, for the first time, now began to publish, and which were as firmly believed in and contemplated with as much awe in Italy, where they were first promulgated, as they were ever at any after period in Scotland.

From Italy he proceeded to Spain, taking up his residence in Toledo, whose university was celebrated for its cultivation of the occult sciences. Here, besides taking an active part and making a conspicuous figure in the discussions on these sciences, he began and concluded a translation, from the Arabic

into Latin, of Aristotle's nineteen books on the *History of Animals*. This work procured him the notice and subsequently the patronage of Frederick II., who invited him to his court, and bestowed on him the office of royal astrologer. While filling this situation, he translated, at the emperor's desire, the greater part of the works of Aristotle. He wrote, also, at the royal request, an original work, entitled *Liber Introductorius sive Indicia Questionum*, for the use of young students; and a treatise on physiognomy, entitled *Physiognomia et de Hominis Procreatione*; besides several other works, of which one was on the *Opinions of Astrologers*.

After a residence of some years at the court of Frederick, Michael resigned his situation, and betook himself to the study of medicine as a profession, and soon acquired great reputation in this art. Before parting with the emperor, with whom he seems to have lived on a more intimate and familiar footing than the haughty and warlike disposition of that prince might have been expected to permit, he predicted to him the time, place, and manner of his death; and the prophecy is said to have been exactly fulfilled in every particular. After a residence of some years in Germany he came over to England, with the view of returning to his native country. On his arrival in the latter kingdom he was kindly received and patronized by Edward I.; and, after being retained for some time at his court, was permitted to pass to Scotland, where he arrived shortly after the death of Alexander III. That event rendering it necessary to send ambassadors to Norway to bring over the young queen, Margaret, or, as she is more poetically called, the Maid of Norway, grand-daughter of the deceased monarch, Michael Scott, now styled Sir Michael, although we have no account either of the time or occasion of his being elevated to this dignity, was appointed, with Sir David Weems, to proceed on this important mission, a proof that his reputation as a wizard had not affected his moral respectability. With this last circumstance the veritable history of Sir Michael terminates; for his name does not again appear in connection with any public event, nor is there anything known of his subsequent life. He died in the year 1292 at an advanced age, and was buried, according to some authorities, at Holme Coltrame, in Cumberland; and, according to others, in Melrose Abbey.

Although, however, all the principal authenticated incidents in the life of Sir Michael which are known, are comprehended in this brief sketch, it would take volumes to contain all that is told, and to this hour believed, by the peasantry of Scotland, of the terrible necromancer, *auld Michael*. For some curious specimens of the traditional character of the great magician of other days, the reader may be referred to the notes appended to the *Lay of the Last Minstrel*, by the still greater magician of modern times. He will there learn how Sir Michael, on one occasion, rode through the air to France on a huge black horse; how the devil made an unsuccessful attempt to entrap him by the way; how, on another occasion, when

"Maister Michael Scott's man
Sought meat and gat none,"

from a niggardly farmer, he threw down a bonnet which his master had previously enchanted, and which, becoming suddenly inflated, began to spin round the house with supernatural speed, and drew, by its magical influence, the whole household after it—man, maid, and mistress—who all continued the goblin chase, until they were worn out with fatigue. It may not, perhaps, be unnecessary to add, that all

these *cantrips*, and a thousand more, were performed by the agency of a "mighty book" of necromancy, which no man, but on peril of soul and body, might open or peruse, and which was at last buried in the same grave with its tremendous owner.

SCOTT, MICHAEL. From the nature of the authorship of the present day, as well as its exuberant abundance, the desire of literary fame has undergone a striking change. Formerly, to write a book was equivalent to achieving the conquest of a kingdom; and no one ventured upon the feat except upon the principle of do or die, *Aut Cesar aut nullus*. The general diffusion of intelligence and equalization of talent have produced a change in this respect that constitutes the chief intellectual distinction of the present age. Able writers are now produced by the hundred, and that too not for a century, but a single year; while their productions appear, not in ponderous tomes, but in reviews, magazines, and newspapers, the readers of which, however delighted they may be with the perusal, never trouble themselves with the anonymous source from which their gratification has proceeded. In this fashion authors of first-rate excellence appear and pass away with no other designations than some unmeaning letter of the alphabet, and are only known, even at their brightest, as *alpha* or *omega*. From such a fate, so common to thousands amongst us, Michael Scott escaped by a mere hair's-breadth.

This talented writer was born at Glasgow, on the 30th October, 1789. He was educated first at the high-school, and afterwards at the university of that great emporium of Scottish merchandise and manufacture. As he was destined for business, and obliged to betake himself to it at an early period, his stay at college was a brief one; for in October, 1806, when he had only reached the age of seventeen, he sailed for Jamaica, and was there employed in the management of several estates till 1810, when he joined a mercantile house in Kingston, Jamaica. As he was much employed in the active business of this establishment, his avocations led him often to the adjacent islands and the Spanish main; and it was in that rich tropical climate, and in his peregrinations by land and water, that he acquired his knowledge of West India scenery and character, as well as of sea-life, which he afterwards so richly and powerfully delineated. Mr. Scott returned home in 1817, and was married in the following year, after which he went back to Jamaica; but after remaining there till 1822 he finally bade adieu to the West Indies, and became permanently a settler in his native Scotland. He does not appear to have been particularly successful as a merchant; but the buoyant imagination and restless love of adventure which his writings betoken were perhaps scarcely compatible with that plodding persevering spirit for which his countrymen are so generally distinguished, especially in mercantile enterprise abroad and in the colonies. It is difficult, indeed, if not impossible, at one and the same time to establish a goodly rich mansion on *terra firma* and build bright castles in the air.

It was not till 1829 that Michael Scott appears to have ventured into authorship, by the publication of *Tom Cringle's Log*. The first specimens which he sent to *Blackwood's Magazine* were fragmentary productions, under the name of "Tom Cringle;" but the sharp, experienced eye of "Old Ebony" was not long in detecting their merit, and he therefore advised the anonymous author to combine them into a continuous narrative, even though the thread that held them together should be as slender as he

pleased. This advice Mr. Scott adopted; and when the papers appeared as a "log" detailing the eventful voyage of a strange life through calm and hurricane, through battle and tempest, as they successively occurred to his fancy, the *Quarterly Review* characterized them as the most brilliant series of magazine papers of the time, while Coleridge in his *Table Talk* proclaimed them "most excellent." The magazine-reading public was of the same opinion, and accordingly the question was circulated through every class, "Who is the author of *Tom Cringle's Log*?" But no one could answer; no, not even Blackwood himself, so well had Scott preserved his incognito; and this eminent publisher descended to the grave without knowing assuredly by whom the most popular series in his far-famed magazine had been written. Afterwards the chapters were published as an entire work in two volumes, and so highly was it prized, that it was generally read upon the Continent, while in Germany it has been repeatedly translated. After Michael Scott had thus led a life almost as mythic as that of his wondrous namesake, he died in Glasgow, on the 7th of November, 1835, and it was only through this melancholy event that the full fact of his authorship was ascertained by the sons of Mr. Blackwood.

SCOTT, SIR WALTER, Baronet, a distinguished poet and novelist, was born in Edinburgh, August 15, 1771. He was a younger son of Mr. Walter Scott, writer to the signet, by Anne, daughter of Dr. John Rutherford, professor of the practice of medicine in the university of Edinburgh. Sir Walter's father was grandson to a younger son of Scott of Raeburn, a branch of the ancient baronial house of Harden; and his mother was grand-daughter to Sir John Swinton, of Swinton, in Berwickshire. Being an ailing child he was sent at a very early period of life to Sandyknow, a farm near the bottom of Leader water, in Roxburghshire, occupied by his paternal grandfather, where he had ample opportunities of storing his mind with border tradition. The first school he attended is said to have been one in Kelso, taught by a Mr. Whale, where he had for schoolfellows James and John Ballantyne, who subsequently became intimately connected with him in public life. He entered the high-school of Edinburgh in 1779, when the class with which he was ranked (that of Mr. Luke Fraser) was commencing its third season. Under this master he continued during two years, after which he entered the rector's class, then taught by Mr. Alexander Adam. In October, 1783, having completed the usual classical course, he was matriculated at the university of Edinburgh, studying *humanity*, or Latin, under Professor Hill, and Greek under Professor Dalzell. Another year under Dalzell, and a third in the logic class taught by Professor Bruce, appear to have formed the sum of his unprofessional studies at college. He was much devoted at this period to reading; and an illness, which interrupted his studies in his sixteenth year, afforded him an unusually ample opportunity of gratifying this taste. He read, by his own confession, all the old romances, old plays, and epic poems contained in the extensive circulating library of Mr. Sibbald (founded by Allan Ramsay); and soon after extended his studies to histories, memoirs, voyages, and travels. On the restoration of his health he commenced, in his father's office, an apprenticeship to legal business, which was completed in July, 1792, by his entering at the Scottish bar.

The literary character of Scott is to be traced to the traditionary lore which he imbibed in the country, and the vast amount of miscellaneous reading

above referred to, in conjunction with the study of the modern German poets and romancers, which he entered upon at a subsequent period. The earlier years of his life as an advocate were devoted rather to the last-mentioned study than to business; and the result was, a translation of Burger's *Lenore* and *Der Wilde Jäger*, which he published in a small quarto volume in 1796. The success of this attempt was by no means encouraging; yet he persevered in his German studies, and in 1799 gave to the world a translation of Goethe's *Goetz of Berlichingen*. Previously to the latter event, namely, on the 24th December, 1797, he had married Miss Carpenter, a young Frenchwoman of good parentage, whom he accidentally met at Gilsland Wells, in Cumberland, and who possessed a small annuity. It is also worthy of notice, that in 1799 he was appointed sheriff of Selkirkshire, a respectable situation, to which an income of £300 was attached.

The success of Burger in ballad-writing, operating upon his predilection for that part of our own national poetry, induced him, about this time, to make several attempts in that line of composition, and soon after to commence the collection of those ancient original ballads which in 1802 were published in two volumes octavo, as the *Minstrelsy of the Scottish Border*. On the reprinting of this work in the ensuing year, he added a third volume, consisting chiefly of original ballads, by himself and others. The work was, upon the whole, a pleasing mélange of history, poetry, and tradition; and it gained the author a considerable reputation, though certainly not that of an original poet in any eminent degree. In the annotations to the ancient romance of *Sir Tristram*, which he published in 1804, he gave still more striking proof of the extent of his acquirements in metrical antiquities.

It was not till the year 1805, when Scott had reached the age of thirty-four, and had a family rising around him, that he attracted decided attention as an original poet. He published in that year his *Lay of the Last Minstrel*, an extended specimen of the ballad style, and one which fell upon the public mind as something entirely new in poetry. The caution which he may be said to have observed in coming before the world arose from prudential considerations. He hesitated to come to a breach with his professional hopes, which a decided attempt in literature would have implied, before he should have attained something to assure him of a competency in the worst resort. This he had in some measure secured by his patrimony, his wife's annuity, and his salary as sheriff; but it was not till 1806, when he received the appointment of a principal clerk of session, that he considered himself at perfect liberty to pursue a literary career. For this latter appointment he was indebted to the interest of the Buccleuch and Melville families, which he had conciliated, partly by his talents, and partly by the zeal with which he entered into the volunteer system at the close of the past century. He succeeded Mr. George Home upon an arrangement by which that gentleman was to enjoy the salary for life; so that it was not till 1811 that the poet reaped any actual benefit from it. The appointment was given by Mr. Pitt, but was formally completed under the ensuing administration of Lord Grenville.

In 1808 Mr. Scott published his second poem of magnitude, *Marmion*, which displayed his metrical genius in greater perfection than the *Lay of the Last Minstrel*, and greatly increased his reputation. While the latter work had produced him £600, the present secured 1000 guineas. Previously to 1825 no fewer than 36,000 copies of *Marmion* were sold.

1. The first part of the document is a list of the names of the persons who were present at the meeting. The names are listed in alphabetical order.

In the same year Mr. Scott published an edition of Dryden's works, with notes, and a life of that poet. In 1809 he edited the *State Papers and Letters of Sir Ralph Sadler*; and soon after he became a contributor to the *Edinburgh Annual Register*, started by Mr. Southey.

The *Lady of the Lake*, in which his poetical genius seems to have reached the acme of its powers, was published in 1810. His earlier efforts were less matured and refined; and the later are all, in various degrees, less spirited and effective. In 1811 appeared *Don Roderick*, a dreamy vaticination of modern Spanish history; in 1813 he published *Rokeby*, in which he attempted, but without success, to invest English scenery and a tale of the civil war with the charm which he had already thrown over the Scottish Highlands and Borders, and their romantic inhabitants. *Rokeby* met with a decidedly unfavourable reception; and, it cannot be denied, the public enjoyed to a greater extent a burlesque which appeared upon it, under the title of *Jokeby*. The evil success of this poem induced him to make a desperate adventure to retrieve his laurels; and in 1814 he published the *Lord of the Isles*. Even the name of Bruce, however, could not compensate the want of what had been the most captivating charm of his earlier productions—the development of new powers and styles of poesy. The public was now acquainted with his whole “fence,” and could therefore take no longer the same interest in his exhibitions. As if to try how far his name now operated in promoting the sale of his writings, he produced, anonymously, two small poems in succession, *Harold the Dauntless* and the *Bridal of Triermain*. Neither made any considerable impression upon the public; and he therefore seems to have concluded that poetry was no longer a line in which he ought to exercise his talents.

Many years before, while as yet unknown as a poet, he had commenced a prose tale upon the legendary story of Thomas the Rhymer, which never went beyond the first chapter. Subsequently he contemplated a prose romance, relating to an age much nearer our own time. “My early recollections,” says he, “of the Highland scenery and customs made so favourable an impression in the poem called the *Lady of the Lake*, that I was induced to think of attempting something of the same kind in prose. I had been a good deal in the Highlands at a time when they were much less accessible, and much less visited, than they have been of late years, and was acquainted with many of the old warriors of 1745, who were, like most veterans, easily induced to fight their battles over again, for the benefit of a willing listener like myself. It naturally occurred to me that the ancient traditions and high spirit of people, who, living in a civilized age and country, retained so strong a tincture of manners belonging to an early period of society, must afford a subject favourable for romance, if it should not prove a curious tale marred in the telling.

“It was with some idea of this kind that, about the year 1805, I threw together about one-third part of the first volume of *Waverley*. It was advertised to be published by the late Mr. John Ballantyne, bookseller in Edinburgh, under the name of *Waverley*. . . . Having proceeded as far, I think, as the seventh chapter, I showed my work to a critical friend, whose opinion was unfavourable; and having some poetical reputation, I was unwilling to risk the loss of it by attempting a new style of composition.

I therefore threw aside the work I had commenced without either reluctance or remonstrance. . . . This portion of the manuscript was laid aside in the drawers of an old writing-desk, which, on my first coming to reside at Abbotsford in 1811, was placed in a lumber garret, and entirely forgotten. Thus, though I sometimes, among other literary avocations, turned my thoughts to the continuation of the romance which I had commenced, yet, as I could not find what I had already written, after searching such repositories as were within my reach, and was too indolent to attempt to write it anew from memory, I as often laid aside all thoughts of that nature.”

The author then adverts to two circumstances which particularly fixed in his mind the wish to continue this work to a close—namely, the success of Miss Edgeworth's delineations of Irish life, and his happening to be employed in 1808 in finishing the romance of *Queen-Hoo-Hall*, left imperfect by Mr. Strutt. “Accident,” he continues, “at length threw the lost sheets in my way.”

“I happened to want some fishing-tackle for the use of a guest, when it occurred to me to search the old writing-desk already mentioned, in which I used to keep articles of that nature. I got access to it with some difficulty; and in looking for lines and flies, the long-lost manuscript presented itself. I immediately set to work to complete it according to my original purpose. . . . Among other unfounded reports it has been said that the copyright was, during the book's progress through the press, offered for sale to various booksellers in London at a very inconsiderable price. This was not the case. Messrs. Constable and Cadell, who published the work, were the only persons acquainted with the contents of the publication, and they offered a large sum for it while in the course of printing, which, however, was declined, the author not choosing to part with the copyright.

“*Waverley* was published in 1814, and as the title-page was without the name of the author, the work was left to win its way in the world without any of the usual recommendations. Its progress was for some time slow; but after the first two or three months, its popularity had increased in a degree which must have satisfied the expectations of the author, had these been far more sanguine than he ever entertained.

“Great anxiety was expressed to learn the name of the author, but on this no authentic information could be attained. My original motive for publishing the work anonymously, was the consciousness that it was an experiment on the public taste, which might very probably fail, and therefore there was no occasion to take on myself the personal risk of discomfiture. For this purpose considerable precautions were used to preserve secrecy. My old friend and schoolfellow Mr. James Ballantyne, who printed these novels, had the exclusive task of corresponding with the author, who thus had not only the advantage of his professional talents, but of his critical abilities. The original manuscript, or, as it is technically called, *copy*, was transcribed under Mr. Ballantyne's eye, by confidential persons; nor was there an instance of treachery during the many years in which these precautions were resorted to, although various individuals were employed at different times. Double proof-sheets were regularly printed off. One was forwarded to the author by Mr. Ballantyne, and the alterations which it received were, by his own hand, copied upon the other proof-sheet for the use of the printers, so that even the corrected proofs of the author were never seen in the printing-office; and thus the curiosity of such eager inquirers as

¹ In the autobiographical introduction to the revised editions of his works.

made the most minute investigation was entirely at fault."

To this account of the publication of *Waverley* it is only to be added, that the popularity of the work became decided rather more quickly, and was, when decided, much higher, than the author has given to be understood. It was read and admired universally, both in Scotland and England, so that, in a very short time, about 12,000 copies were disposed of.

Previously to 1811 Mr. Scott had been in the habit of residing, during the summer months, at a villa called Ashetiel on the banks of the Tweed, near Selkirk, belonging to his kinsman Colonel Russell. He now employed part of his literary gains in purchasing a farm a few miles farther down the Tweed, and within three miles of Melrose. Here he erected a small house which he gradually enlarged, as his emoluments permitted, till it eventually became a Gothic castellated mansion of considerable size. He also continued for some years to make considerable purchases of the adjacent grounds, generally paying much more for them than their value. The desire of becoming an extensive land-proprietor was a passion which glowed more warmly in his bosom than any appetite which he ever entertained for literary fame. The whole cast of his mind from the very beginning was essentially aristocratic; and it is probable that he looked with more reverence upon an old title to a good estate, than upon the most ennobled title-page in the whole catalogue of contemporary genius. Thus it was a matter of astonishment to many, that, while totally insensible to flattery on the score of his works, and perfectly destitute of all the airs of a professed or practised author, he could not so well conceal his pride in the possession of a small patch of territory, or his sense of importance as a local dispenser of justice. As seen through the medium of his works, he rather appears like an old baron or chivalrous knight, displaying his own character and feelings, and surrounded by the ideal creatures which such an individual would have mixed with in actual life, than as an author of the modern world, writing partly for fame, and partly for subsistence, and glad to work at that which he thinks he can best execute. It was unquestionably owing to the same principle that he kept the *Waverley* secret with such pertinacious closeness—being unwilling to be considered as an author writing for fortune, which he must have thought somewhat degrading to the baronet of Abbotsford. It was now the principal spring of his actions to add as much as possible to the little realm of Abbotsford, in order that he might take his place—not among the great literary names which posterity is to revere, but among the country gentlemen of Roxburghshire!¹

Under the influence of this passion—for such it must be considered—Mr. Scott produced a rapid succession of novels, of which it will be sufficient here to state the names and dates. To *Waverley* succeeded, in 1815, *Guy Mannering*; in 1816, the *Antiquary*, and the *First Series of the Tales of my Landlord*, containing the *Black Dwarf* and *Old Mortality*; in 1818, *Rob Roy*, and the *Second Series of the Tales of my Landlord*, containing the *Heart of Mid-Lothian*; and in 1819, the *Third Series of the Tales of my Landlord*, containing the *Bride of Lammermoor* and a *Legend of Montrose*.

It is to be observed that the series called *Tales of my Landlord* were professedly by a different author from him of *Waverley*: an expedient which the

real author had thought conducive to the maintenance of the public interest. Having now drawn upon public curiosity to the extent of twelve volumes in each of his two incognitos, he seems to have thought it necessary to adopt a third, and accordingly he intended *Ivanhoe*, which appeared in the beginning of 1820, to come forth as the first work of a new candidate for public favour. From this design he was diverted by a circumstance of trivial importance, the publication of a novel at London, pretending to be a fourth series of the *Tales of my Landlord*. It was therefore judged necessary that *Ivanhoe* should appear as a veritable production of the author of *Waverley*. To it succeeded, in the course of the same year, the *Monastery* and the *Abbot*, which were judged as the least meritorious of all his prose tales. In the beginning of the year 1821 appeared *Kenilworth*; making twelve volumes, if not written, at least published, in as many months. In 1822 he produced the *Pirate* and the *Fortunes of Nigel*; in 1823, *Peveril of the Peak* (four volumes) and *Quentin Durward*; in 1824, *St. Ronan's Well* and *Redgauntlet*; in 1825, *Tales of the Crusaders* (four volumes); in 1826, *Woodstock*; in 1827, *Chronicles of the Canonicate, first series* (two volumes); in 1828, *Chronicles of the Canonicate, second series*; in 1829, *Anne of Geierstein*; and in 1831, a fourth series of *Tales of my Landlord*, in four volumes, containing two tales, respectively entitled *Count Robert of Paris* and *Castle Dangerous*. The whole of these novels, except where otherwise specified, consisted of three volumes, and, with those formerly enumerated, make up the amount of his fictitious prose compositions to the enormous sum of seventy-four volumes.

Throughout the whole of his career, both as a poet and novelist, Sir Walter was in the habit of turning aside occasionally to less important avocations of a literary character. He was a contributor to the *Edinburgh Review* during the first few years of its existence. To the *Quarterly Review* he was a considerable contributor, especially for the last five or six years of his life, during which the work was conducted by his son-in-law, Mr. Lockhart. To the *Supplement* of the sixth edition of the *Encyclopædia Britannica* he contributed the articles "Chivalry," "Romance," and the "Drama." In 1818 he wrote one or two small prose articles for a periodical, after the manner of the *Spectator*, which was started by his friend Mr. John Ballantyne, under the title of the *Saleroom*, and was soon after dropped for want of encouragement. In 1814 he edited the *Works of Swift*, in nineteen volumes, with a life of the author. In 1814 Sir Walter gave his name and an elaborate introductory essay to a work, entitled *Border Antiquities* (two volumes quarto), which consisted of engravings of the principal antique objects on both sides of the Border, accompanied by descriptive letter-press. In 1815 he made a tour of France and Belgium, visiting the scene of the recent victory over Napoleon. The result was a lively traveller's volume, under the title of *Paul's Letters to his Kinsfolk*, and a poem, styled the *Field of Waterloo*. In the same year he joined with Mr. Robert Jamieson and Mr. Henry Weber in composing a quarto on Icelandic antiquities. In 1819 he published an *Account of the Regalia of Scotland*, and undertook to furnish the letter-press to a second collection of engravings, under the title of *Provincial Antiquities and Picturesque Scenery of Scotland*, one of the most elegant books which has ever been published respecting the native country of the editor.

In the year 1820 the agitated state of the country was much regretted by Sir Walter Scott; and he endeavoured to prove the absurdity of the popular

¹ Lest these speculations may appear somewhat paradoxical, the editor may mention that they were pronounced, by the late Mr. James Ballantyne, in writing, to be "admirably true."

excitement in favour of a more extended kind of parliamentary representation, by three papers, which he inserted in the *Edinburgh Weekly Journal* newspaper, under the title of "The Visionary." However well intended, these were not by any means happy specimens of political disquisition. Some months afterwards it was deemed necessary, by a few Tory gentlemen and lawyers, to establish a newspaper, in which the more violent of the radical prints should be met upon their own grounds. To this association Mr. Scott subscribed, and, by means partly furnished upon his credit, a weekly journal was commenced, under the title of the *Beacon*. As the scurrilities of this print inflicted much pain in very respectable quarters, it sank, after an existence of a few months, amidst the general execrations of the community. Mr. Scott, though he probably never contemplated, and perhaps was hardly aware of the guilt of the *Beacon*, was loudly blamed for his connection with it.

In 1822 Sir Walter published *Trivial Poems and Triplets*, by P. Carey, with a Preface; and, in 1822, appeared his dramatic poem of *Halidon Hill*. In the succeeding year he contributed a smaller dramatic poem, under the title of "Macduff's Cross," to a collection of Miss Joanna Baillie. The sum of his remaining poetical works may here be made up, by adding "The Doom of Devergoil," and "The Auchindrane Tragedy," which appeared in one volume in 1830. It cannot be said of any of these compositions, that they have made the least impression upon the public.

The great success of the earlier novels of Sir Walter Scott had encouraged his publishers, Messrs. Archibald Constable and Company, to give large sums for those works; and, previous to 1824, it was understood that the author had spent from £50,000 to £100,000, thus acquired, upon his house and estate of Abbotsford. During the months which his official duties permitted him to spend in the country—that is, the whole of the more genial part of the year, from March till November, excepting the months of May and June—he kept state, like a wealthy country gentleman, at this delightful seat, where he was visited by many distinguished persons from England and from the Continent. As he scarcely ever spent any other hours than those between seven and eleven A.M. in composition, he was able to devote the greater part of the morning to country exercise and the superintendence of his planting and agricultural operations; while the evenings were, in a great measure, devoted to his guests. Almost every day he used to ride a considerable distance—sometimes not less than twenty miles—on horseback. He also walked a great deal; and lame as he was, would sometimes tire the stoutest of his companions.

Among the eminent persons to whom he had been recommended by his genius, and its productions, King George the Fourth was one, and not the least warm in his admiration. The poet of *Marmion* had been honoured with many interviews by his sovereign when Prince of Wales and prince regent; and his majesty was pleased, in March, 1820, to create him a baronet of the United Kingdom, being the first to whom he had extended that honour after his accession to the crown.

In 1822, when his majesty visited Scotland, Sir Walter found the duty imposed upon him as in some measure the most prominent man in the country, of acting as a kind of master of ceremonies, as well as a sort of dragoman or mediator between the sovereign and his people. It was an occasion for the revival of all kinds of historical and family reminiscences; and Sir Walter's acquaintance with national antiquities, not less than his universally honoured

character, caused him to be resorted to by innumerable individuals, and many respectable public bodies, for information and advice. On the evening of the 14th of August, when his majesty cast anchor in Leith Roads, Sir Walter Scott went out in a boat, commissioned by the LADIES of SCOTLAND, to welcome the king, and to present his majesty with an elegant jewelled cross of St. Andrew, to be worn on his breast as a national emblem. When the king was informed of Sir Walter's approach, he exclaimed, "What! Sir Walter Scott? The man in Scotland I most wish to see! Let him come up." Sir Walter accordingly ascended the ship, and was presented to the king on the quarter-deck, where he met with a most gracious reception. After an appropriate speech, Sir Walter presented his gift, and then knelt and kissed the king's hand. He had afterwards the honour of dining with his majesty, being placed on his right hand. Throughout the whole proceedings connected with the reception and residence of the king in Scotland, Sir Walter Scott bore a very conspicuous part.

Sir Walter Scott had now apparently attained a degree of human greatness such as rarely falls to the lot of literary men; and he was generally considered as having, by prudence, fairly negated the evils to which the whole class are almost proverbially subject. It was now to appear, that, though he had exceeded his brethren in many points of wisdom, and really earned an unusually large sum of money, he had not altogether secured himself against calamity. The bookselling house with which he had all along been chiefly connected, was one in which the principal partner was Mr. Archibald Constable, a man who will long be remembered in Scotland for the impulse which he gave by his liberality to the literature of the country, but at the same time for a want of calculation and prudence which in a great measure neutralized his best qualities. It is difficult to arrive at exact information respecting the connection of the author with his publisher, or to assign to each the exact degree of blame incidental to him, for the production of their common ruin. It appears, however, to be ascertained, that Sir Walter Scott, in his eagerness for the purchase of land, and at the same time to maintain the style of a considerable country gentleman, incurred obligations to Messrs. Constable and Company, for money or acceptances, upon the prospect of works in the course of being written, or which the author only designed to write, and was thus led, by a principle of gratitude, to grant counter-acceptances to the bookselling house, to aid in its relief from those embarrassments of which he was himself partly the cause. It is impossible otherwise to account for Sir Walter Scott having incurred liabilities to the creditors of that house to the amount of no less than £72,000, while of its profits he had not the prospect of a single farthing.

On the failure of Messrs. Constable and Company, in January, 1826, Messrs. Ballantyne and Company, printers, of which firm Sir Walter Scott was a partner, became insolvent, with debts to the amount of £102,000, for the whole of which Sir Walter was of course liable, in addition to his liabilities for the bookselling house. It thus appeared that the most splendid literary revenue that ever man made for himself, had been compromised by a connection, partly for profit and partly otherwise, with the two mechanical individuals concerned in the mere bringing of his writings before the world. A percentage was all that these individuals were fairly entitled to for their trouble in putting the works of Sir Walter into shape; but they had absorbed the whole, and more than the whole, leaving both him and themselves

poorer than they were at the beginning of their career.

The blow was endured with a magnanimity worthy of the greatest writer of the age. On the very day after the calamity had been made known to him, a friend accosted him as he was issuing from his house, and presented the condolences proper to such a melancholy occasion.

"It is very hard," said he, in his usual slow and thoughtful voice, "thus to lose all the labours of a lifetime, and be made a poor man at last, when I ought to have been otherwise. But if God grant me health and strength for a few years longer, I have no doubt that I shall redeem it all."

The principal assets which he could present against the large claims now made upon him, were the mansion and grounds of Abbotsford, which he had entailed upon his son, at the marriage of that young gentleman to Miss Jobson of Lohore, but in a manner now found invalid, and which were burdened by a bond for £10,000. He had also his house in Edinburgh, and the furniture of both mansions. His creditors proposed a composition; but his honourable nature, and perhaps a sense of reputation, prevented him from listening to any such scheme. "No, gentlemen," said he, quoting a favourite Spanish proverb, "Time and I against any two. Allow me time, and I will endeavour to pay all." A trust-deed was accordingly executed in favour of certain gentlemen, whose duties were to receive the funds realized by our author's labours, and gradually pay off the debts, with interest, by instalments. He likewise insured his life, with the sanction of his trustees, for the sum of £22,000, by which a *post-obit* interest to that amount was secured to his creditors. He was the better enabled to carry into execution the schemes of retrenchment which he had resolved on, by the death of Lady Scott, in May, 1826. Her ladyship had born to him two sons and two daughters; of the latter of whom the elder had been married in 1820 to Mr. J. G. Lockhart, advocate.

Sir Walter was engaged, at the time of his bankruptcy, in the composition of a *Life of Napoleon Bonaparte*, which was originally designed to fill only four volumes, but eventually extended to nine. In the autumn of 1826 he paid a visit to Paris, in company with his youngest and only unmarried daughter, in order to acquaint himself with several historical and local details requisite for the work upon which he was engaged. On this occasion he was received with distinguished kindness by the reigning monarch, Charles X. The *Life of Napoleon* appeared in summer, 1827; and though too bulky to be very popular, and perhaps too hastily written to bear the test of rigid criticism, it was understood to produce to its author a sum little short of £12,000. This, with other earnings and accessory resources, enabled him to pay a dividend of six shillings and eightpence to his creditors.

Till this period Sir Walter Scott had made no avowal to the public of his being the author of that long series of prose fictions which had for some years engaged so much of public attention. It being no longer possible to preserve his incognito, he permitted himself, at a dinner for the benefit of the Edinburgh Theatrical Fund, February 23, 1827, to be drawn into a disclosure of the secret. On his health being proposed by Lord Meadowbank, as the "Great Unknown," now unknown no longer, he acknowledged the compliment in suitable terms, and declared himself, unequivocally, to be the sole author of what were called the *Waverley Novels*.

About the same time the copyright of all his past

novels was brought to the hammer, as part of the bankrupt stock of Messrs. Constable and Company. It was bought by Mr. Robert Cadell, of the late firm of Archibald Constable and Company, and who was now once more engaged in the bookselling business, at £8400, for the purpose of republishing the whole of these delightful works in a cheap uniform series of volumes, illustrated by notes and prefaces, and amended in many parts by the finishing touches of the author. Sir Walter or his creditors were to have half the profits in consideration of his literary aid.

This was a most fortunate design. The new edition began to appear in June, 1829; and such was its adaptation to the public convenience, and the eagerness of all ranks of people to contribute in a way convenient to themselves towards the reconstruction of the author's fortunes, that the sale soon reached an average of 23,000 copies. To give the reader an idea of the magnitude of this *concern*—speaking commercially—it may be stated that, in the mere *production* of the work, not to speak of its sale, about a thousand persons, or nearly a hundredth part of the population of Edinburgh, were supported. The author was now chiefly employed in preparing these narratives for the new impression; but he nevertheless found time occasionally to produce original works. In November, 1828, he published the first part of a juvenile history of Scotland, under the title of *Tales of a Grandfather*, being addressed to his grandchild John Hugh Lockhart, whom he typified under the appellation of Hugh Littlejohn, Esq. In 1829 appeared the second, and in 1830 the third and concluding series of this charming book, which fairly fulfilled a half-sportive expression that had escaped him many years before, in the company of his children—that "he would yet make the history of Scotland as familiar in the nurseries of England as lullaby rhymes." In 1830 he also contributed a graver *History of Scotland*, in two volumes, to the periodical work called *Lardner's Cabinet Cyclopædia*. In the same year appeared his *Letters on Demonology and Witchcraft*, as a volume of Mr. Murray's *Family Library*; and in 1831 he added to his *Tales of a Grandfather* a uniform series on French history. In the same year, two sermons which he had written a considerable time before, for a young clerical friend, were published by that individual in London, and, as specimens of so great an author in an extraordinary line of composition, met with an extensive sale.

The profits of these various publications, but especially his share of the profits of the new edition of his novels, enabled him, towards the end of the year 1830, to pay a dividend of three shillings in the pound, which, but for the accumulation of interest, would have reduced his debts to nearly one-half. Of £54,000 which had now been paid, all except £6000 or £7000 had been produced by his own literary labours; a fact which fixes the revenue of his intellect for the last four or five years at nearly £10,000 a year. Besides this sum Sir Walter had also paid up the premium of the policy upon his life, which, as already mentioned, secured a *post-obit* interest of £22,000 to his creditors. On this occasion it was suggested by one of these gentlemen (Sir James Gibson Craig), and immediately assented to, that they should present to Sir Walter personally the library, manuscripts, curiosities, and plate which had once been his own, as an acknowledgment of the sense they entertained of his honourable conduct.

In November, 1830, he retired from his office of principal clerk of session, with the superannuation

allowance usually given after twenty-three years' service. Earl Grey offered to make up the allowance to the full salary; but, from motives of delicacy, Sir Walter firmly declined to accept of such a favour from one to whom he was opposed in politics.

His health, from his sixteenth year, had been very good, except during the years 1818 and 1819, when he suffered under an illness of such severity as to turn his hair quite gray, and send him out again to the world apparently ten years older than before. It may be mentioned, however, that this illness, though accompanied by very severe pain, did not materially interrupt or retard his intellectual labours. He was only reduced to the necessity of employing an amanuensis, to whom he dictated from his bed. The humorous character, Dugald Dalgetty, in the third series of the *Tales of my Landlord*, and the splendid scene of the siege of Torquilston in *Ivanhoe*, were created under these circumstances. Mr. William Laidlaw, his factor, who at one time performed the task of amanuensis, has described how he would sometimes be stopped in the midst of some of the most amusing or most elevated scenes by an attack of pain—which being past, he would recommence in the same tone at the point where he had left off, and so on for day after day till the novel was finished.

It happened very unfortunately that the severe task which he imposed upon himself for the purpose of discharging his obligations, came at a period of life when he was least able to accomplish it. It will hardly be believed that, even when so far occupied with his official duties in town, he seldom permitted a day to pass over his head without writing as much as to fill a sheet of print, or sixteen pages; and this, whether it was of a historical nature, with of course the duty of consulting documents, or of fictitious matter spun from the loom of his fancy. Although this labour was alleviated in the country by considerable exercise, it nevertheless must have pressed severely upon the powers of a man nearly sixty by years, and fully seventy by constitution. The reader may judge how strong must have been that principle of integrity which could command such a degree of exertion and self-denial, not so much to pay debts contracted by himself, as to discharge obligations in which he was involved by others. He can only be likened, indeed, to the generous elephant, which, being set to a task above its powers, performed it at the expense of life, and then fell dead at the feet of its master.

His retirement from official duty might have been expected to relieve in some measure the pains of intense mental application. It was now too late, however, to redeem the health that had fled. During the succeeding winter symptoms of gradual paralysis, a disease hereditary in his family, began to be manifested. His contracted limb became gradually weaker and more painful, and his tongue less readily obeyed the impulse of the will. In March, 1831, he attended a meeting of the freeholders of the county of Roxburgh, to aid in the expression of disapprobation with which a majority of those gentlemen designed to visit the contemplated reform bills. Sir Walter was, as already hinted, a zealous Tory, though more from sentiment perhaps than opinion, and he regarded those regenerating measures as only the commencement of the ruin of his country. Having avowed this conviction in very warm language, a few of the individuals present by courtesy expressed their dissent in the usual vulgar manner; whereupon he turned, with anger flashing in his eye—with him a most unwonted passion—and said, that he cared no more for such expressions of disapproval than he did for the hissing of geese or the braying

of asses. He was evidently, however, much chagrined at the reception his opinions had met with, and in returning home was observed to shed tears.

During the summer of 1831 the symptoms of his disorder became gradually more violent; and to add to the distress of those around him, his temper, formerly so benevolent, so imperturbable, became peevish and testy, inasmuch that his most familiar relatives could hardly venture, on some occasions, to address him. At this period, in writing to a literary acquaintance, he thus expressed himself:—

“Although it is said in the newspapers, I am actually far from well, and instead of being exercising (*sic*) on a brother novelist, Chateaubriand, my influence to decide him to raise an insurrection in France, which is the very probable employment allotted to me by some of the papers, I am keeping my head as cool as I can, and speaking with some difficulty.

“I have owed you a letter longer than I intended, but write with pain, and in general use the hand of a friend. I sign with my initials, *as enough to express the poor half of me that is left*. But I am still much yours, “W. S.”

Since the early part of the year he had, in a great measure, abandoned the pen for the purposes of authorship. This, however, he did with some difficulty, and it is to be feared that he resumed it more frequently than he ought to have done. “Dr. Abercromby,” says he, in a letter dated March 7, “threatens me with death if I write so much; and die, I suppose, I must, if I give it up suddenly. I must assist Lockhart a little, for you are aware of our connection, and he has always showed me the duties of a son; but, except that, and my own necessary work at the edition of the *Waverley Novels*, as they call them, I can hardly pretend to put pen to paper; for after all this same dying is a ceremony one would put off as long as possible.”

In the autumn his physicians recommended a residence in Italy as a means of delaying the approaches of his illness. To this scheme he felt the strongest repugnance, as he feared he should die on a foreign soil, far from the mountain-land which was so endeared to himself, and which he had done so much to endear to others; but by the intervention of some friends, whose advice he had been accustomed to respect from his earliest years, he was prevailed upon to comply. By the kind offices of Captain Basil Hall, liberty was obtained for him to sail in his majesty's ship the *Barham*, which was then fitting out for Malta.

He sailed in this vessel from Portsmouth on the 27th of October, and on the 27th of December landed at Naples, where he was received by the king and his court with a feeling approaching to homage. In April he proceeded to Rome, and was there received in the same manner. He inspected the remains of Roman grandeur with some show of interest, but was observed to mark with a keener feeling, and more minute care, the relics of the more barbarous middle ages; a circumstance, in our opinion, to have been predicated from the whole strain of his writings. He paid visits to Tivoli, Albani, and Frascati. If anything could have been effectual in re-illuming that lamp which was now beginning to pale its mighty lustre, it might have been expected that *this* would have been the ground on which the miracle was to take place. But he was himself conscious, even amidst the flatteries of his friends, that all hopes of this kind were at an end. Feeling that his strength was rapidly decaying, he determined upon returning with all possible speed to his native country, in order that his bones might not be laid

(to use the language of his own favourite minstrelsy) "far from the Tweed." His journey was performed too rapidly for his strength. For six days he travelled seventeen hours a day. The consequence was, that in passing down the Rhine he experienced a severe attack of his malady, which produced complete insensibility, and would have inevitably carried him off, but for the presence of mind of his servant, who bled him profusely. On his arrival in London he was conveyed to the St. James' Hotel, Jermyn Street, and immediately attended by Sir Henry Hallford and Dr. Holland, as well as by his son-in-law and daughter. All help was now, however, useless. The disease had reached nearly its most virulent stage, producing a total insensibility to the presence of even his most beloved relatives—

———"omni
Membrorum damno major, dementia, quæ nec
Nomina servorum, nec vultum agnoscit amici."

After residing for some weeks in London in the receipt of every attention which filial piety and medical skill could bestow, the expiring poet desired that, if possible, he might be removed to his native land—to his own home. As the case was reckoned quite desperate, it was resolved to gratify him in his dying wish, even at the hazard of accelerating his dissolution by the voyage. He accordingly left London on the 7th of July, and, arriving at New-haven on the evening of the 9th, was conveyed with all possible care to a hotel in his native city. After spending two nights and a day in Edinburgh, he was removed, on the morning of the 11th, to Abbotsford.

That intense love of home and of country which had urged his return from the Continent, here seemed to dispel for a moment the clouds of the mental atmosphere. In descending the vale of Gala, at the bottom of which the view of Abbotsford first opens, it was found difficult to keep him quiet in his carriage, so anxious was he to rear himself up in order to catch an early glimpse of the beloved scene. On arriving at his house he hardly recognized anybody or anything. He looked vacantly on all the objects that met his gaze, except the well-remembered visage of his friend Laidlaw, whose hand he affectionately pressed, murmuring, "that *now* he knew that he was at Abbotsford." He was here attended by most of the members of his family, including Mr. Lockhart, while the general superintendence of his deathbed (now too certainly such) was committed to Dr. Clarkson of Melrose. He was now arrived at that melancholy state when the friends of the patient can form no more affectionate wish than that death may step in to claim his own. Yet day after day did the remnants of a robust constitution continue to hold out against the gloomy foe of life, until, notwithstanding every effort to the contrary, mortification commenced at several parts of the body. This was about twelve days before his demise, which at length took place on the 21st of September (1832), the principles of life having been by that time so thoroughly worn out that nothing remained by which pain could be either experienced or expressed. On the 26th the illustrious deceased was buried in an aisle in Dryburgh Abbey, which had belonged to one of his ancestors, and which had been given to him by the Earl of Buchan.

Sir Walter Scott was in stature above six feet; but having been lame from an early period of life in the right limb, he sank a little on that side in walking. His person was, in latter life, bulky, but not corpulent, and made a graceful appearance on horseback. Of his features it is needless to give any particular description, as they must be familiar to

every reader through the medium of the innumerable portraits, busts, and medallions by which they have been commemorated. His complexion was fair and the natural colour of his hair sandy. The portrait by Raeburn, of which an engraving was prefixed to the *Lady of the Lake*, gives the best representation of the poet as he appeared in the prime of life. The bust of Chantry, taken in 1820, affords the most faithful delineation of his features as he was advancing into age. And his aspect in his sixtieth year, when age and reflection had more deeply marked his countenance, is most admirably preserved in Mr. Watson Gordon's portrait, of which an engraving accompanies the present memoir. There is likewise a very faithful portrait by Mr. Leslie, an American artist.

Sir Walter Scott possessed, in an eminent degree, the power of imagination with the gift of memory. If to this be added his strong tendency to venerate past things, we at once have the most obvious features of his intellectual character. A desultory course of reading had brought him into acquaintance with almost all the fictitious literature that existed before his own day, as well as the minutest points of British, and more particularly Scottish, history. His easy and familiar habits had also introduced him to an extensive observation of the varieties of human character. His immense memory retained the ideas thus acquired, and his splendid imagination gave them new shape and colour. Thus, his literary character rests almost exclusively upon his power of combining and embellishing past events, and his skill in delineating natural character. In early life accident threw his opinions into the shape of verse—in later life into prose; but in whatever form they appear, the powers are not much different. The same magician is still at work re-awaking the figures and events of history, or sketching the characters which we every day see around us, and investing the whole with the light of a most extraordinary fancy.

It is by far the greatest glory of Sir Walter Scott that he shone equally as a good and virtuous man as he did in his capacity of the first fictitious writer of the age. His behaviour through life was marked by undeviating integrity and purity. His character as a husband and father is altogether irreproachable. Indeed, in no single relation of life does he appear liable to blame, except in the facility with which he yielded his fortunes into the power of others, of whom he ought to have stood quite independent. Laying this imprudence out of view, his good sense and good feeling united, appear to have guided him aright through all the difficulties and temptations of life. Along with the most perfect uprightness of conduct, he was characterized by extraordinary simplicity of manners. He was invariably gracious and kind, and it was impossible ever to detect in his conversation a symptom of his grounding the slightest title to consideration upon his literary fame, or of his even being conscious of it.

By dint of almost incredible exertions Sir Walter Scott had reduced the amount of his debts, at the time of his decease, to about £20,000, exclusive of the accumulated interest. On the 29th of October a meeting of his creditors was called, when an offer was made by his family of that sum against the ensuing February, on condition of their obtaining a complete discharge. The meeting was very numerously attended, and the proposal was accepted without a dissentient voice. In addition to the resolution accepting the offer, and directing the trustees to see the acceptance carried into effect, the following resolution was moved and carried with a like unanimity:—

"And while the meeting state their anxious wish

that every creditor who is not present may adopt the same resolution, they think it a tribute justly due to the memory of Sir Walter Scott, to express, in the strongest manner, their deep sense of his most honourable conduct, and of the unparalleled benefits which they have derived from the extraordinary exertion of his unrivalled talents, under misfortunes and difficulties which would have paralyzed the exertions of any one else, but in him only proved the greatness of mind which enabled him to rise superior to them."

SCOUGAL, HENRY, a theological writer of considerable eminence, was born in the end of June, 1650. He was descended of the family of the Scougals of that ilk, and was the son of Patrick Scougal, Bishop of Aberdeen from 1664 to 1682, a man whose piety and learning have been commemorated by Bishop Burnet. His son Henry is said to have early displayed symptoms of those talents for which he was afterwards distinguished. We are told by Dr. George Garden, that "he was not taken up with the plays and little diversions of those of his age; but, upon such occasions, did usually retire from them, and that not out of sullenness of humour or dulness of spirit (the sweetness and serenity of whose temper did even then appear), but out of a stayedness of mind, going to some privacy, and employing his time in reading, prayer, and such serious thoughts as that age was capable of."¹ Tradition has asserted that Scougal was led to the study of theology, in the hope of finding in it a balm for disappointed affections; and this is in so far countenanced by the tenor of several passages of his writings. Another cause, however, has been assigned, and apparently on better authority. "Being once in a serious reflection what course of life he should take, he takes up the Bible to read a portion of it; and though he was always averse to the making a lottery of the Scriptures, yet he could not but take notice of the first words which he cast his eyes upon, and which made no small impression on his spirit: 'By what means shall a young man learn to purify his way? By taking heed thereto according to thy word.'" On his father's election to the see of Aberdeen, Scougal entered as a student at King's College there, of which university his father was chancellor. He seems to have taken the lead of his fellow-students in almost every department of science; and in addition to the usual branches of knowledge pursued in the university, to have acquired a knowledge of some of the oriental tongues. Immediately on taking his degree he was selected to assist one of the regents in the instruction of his class; and the next year, 1669, he was, at the early age of nineteen, appointed a professor. His immature age was probably incapable to preserve order in his class; at all events, tumults and insubordination broke forth among his students, of whom so many were expelled from the college that he scarce had a class to teach. His office of regent, which was thus inauspiciously commenced, he held but for four years, having at the end of that time accepted the pastoral charge of the parish of Auchterless, in Aberdeenshire. He retained this charge no longer than a twelvemonth, and in 1674 was appointed professor of divinity in the King's College; a chair which had shortly before been filled by the celebrated John Forbes of Corse, and more lately by William Douglas, the learned author of the *Academiarum Vindicta*, and other works. As was customary in that age, Scougal printed a thesis on his accession to the divinity chair: this tract, which is still preserved and highly prized, is entitled *De Objecto Cultus Religiosi*.

In 1677 appeared the "*Life of God in the Soul of Man*," or the Nature and Excellency of the Christian Religion." This work, to which Scougal's modesty would not permit him to prefix his name, was edited by Bishop Burnet, who appended to it a tract called *An Account of the Spiritual Life*, supposed to be written by himself. In the prefatory notice Burnet states of the author, "that the book is a transcript of those divine impressions that were upon his own heart, and that he has written nothing in it but what he himself did well feel and know." The work passed at once into that extensive popularity and high reputation it has ever since enjoyed. Before 1727 it had gone through five editions, the last under the superintendence of the Society for Promoting Christian Knowledge. In 1735 it was again reprinted, with the addition of *Nine Discourses on Important Subjects* and Dr. Garden's funeral sermon; and in 1740 another edition appeared, with some "Occasional Meditations," not previously published. Since that period editions have multiplied very rapidly. In 1722 it was translated into French, and published at the Hague. Scougal survived the publication of his work for no longer than a twelvemonth. At the early age of twenty-eight he died on the 13th of June, in the year 1678, and was interred on the north side of the chapel of King's College, where a tablet of black marble, bearing a simple Latin inscription, was erected to his memory. He bequeathed a sum of 5000 merks to augment the salary of the professor of divinity in the university, and left his books to the college library. A portrait of Scougal is preserved in the college hall, and the countenance breathes all that serene composure, benevolence, purity, and kindness which so strikingly mark his writings. Besides the works which have been mentioned, Scougal left behind him in manuscript various juvenile essays, and some Latin tracts, among which are *A Short System of Ethics or Moral Philosophy*; *A Preservative against the Artifices of the Romish Missionaries*, and a fragment *On the Pastoral Cure*. This last work was designed for the use of students in divinity and candidates for holy orders. None of the least beautiful or remarkable of his works is the *Morning and Evening Service*, which he composed for the cathedral of Aberdeen, and which is characterized by a spirit of fervid devotion, and a deep and singular elevation of thought and solemnity of diction.

SCRINGER, HENRY, a learned person of the sixteenth century, was the son of Walter Scringer of Glasswell, who traced his descent from the Scringers or Scringeurs of Dudhope, constables of Dundee, and hereditary standard-bearers of Scotland. The subject of this memoir was born at Dundee in 1506, and received the rudiments of his education in the grammar-school of that town, where he made singular proficiency both in the Latin and Greek languages. He afterwards went through a course of philosophy in the university of St. Andrews with great applause. From thence he proceeded to Paris to study civil law. He next removed to Bourges, where he studied for some time under Baro and Duaren, who were considered the two greatest lawyers of the age in which they lived. Here he formed an acquaintance with the celebrated Amiot, who at that time filled the Greek chair at Bourges, and through his recommendation was appointed tutor to the children of Secretary Boucherel. In this situation, which he filled to the entire satisfaction of his employers, Scringer became acquainted with Bernard Benetel, Bishop of Rennes, who, on being appointed ambassador from the court of France

¹ A Sermon Preached at the Funeral of the Rev. Henry Scougal, M.A. By G. G. (George Garden), D.D. P. 285.

to some of the states of Italy, made choice of him for his private secretary. With this dignitary he travelled through the greater part of that interesting country, and was introduced to a great many of its most eminent and learned men. While on a visit to Padua he had an opportunity of seeing the notorious apostate Francis Spira, of whose extraordinary case he wrote a narrative, which was published along with an account of the same case by Petrus Paulus Virgerus, Mattheus Gribaldus, and Sigismundus Gelous, under the following title: "*The History of Francisus Spira*, who fell into a dreadful state of despair, because, having once assumed a profession of evangelical truth, he had afterwards recanted and condemned the same, most faithfully written by four most excellent men, together with prefaces by these illustrious men Caelius S.C. and John Calvin, and an Apology by Petrus Paulus Virgerus, in all which many subjects worthy of examination in these times are most gravely handled. To which is added the Judgment of Martinus Borrahus on the improvement which may be made of Spira's example and doctrine, 2 Pet. ii. 'It had been better for them not to have known the way of life,'" &c. The book is written in Latin, but has neither the name of printer nor the place or date of printing. It was, however, probably printed at Basil in the year 1550 or 1551. Deeply affected with the case of Spira, Scrimger determined to sacrifice all the prospects, great as they were, which his present situation held out to him, and to retire into Switzerland, where he could profess the Reformed religion without danger. It appears that he shortly after this entertained the idea of returning to Scotland; but on his arrival in Geneva he was invited by the syndics and magistrates of the city to set up a profession of philosophy for the instruction of youth, for which they made a suitable provision. Here he continued to teach philosophy for some time. A fire, however, happening in the city, his house was burned to the ground with all that was in it, and he was in consequence reduced to great straits, though his two noble pupils, the Boucherels, no sooner heard of his misfortune than they sent him a considerable supply of money. It was at this time that Ulrich Fugger, a gentleman possessed of a princely fortune, and distinguished alike for his learning and for his virtues, invited him to come and live with him at Augsburg till his affairs could be put in order. This generous invitation Scrimger accepted, and he lived with his benefactor at Augsburg for a number of years, during which he employed himself chiefly in collecting books and manuscripts, many of them exceedingly curious and valuable. Under the patronage of this amiable person he appears also to have composed several of his treatises, which he returned to Geneva to have printed. On his arrival the magistrates of that city importuned him to resume his class for teaching philosophy. With this request he complied, and continued again in Geneva for two years, 1563 and 1564. In the year 1565 he opened a school for teaching civil law, of which he had the honour of being the first professor and founder in Geneva. This class he continued to teach till his death. In the year 1572 Alexander Young, his nephew, was sent to him to Geneva, with letters from the Regent Marr and George Buchanan, with the latter of whom he had been long in terms of intimacy, requesting him to return to his native country, and promising him every encouragement.

Buchanan had before repeatedly written to him, pressing his return to his native country in a manner that sufficiently evinced the high esteem he entertained for him. The venerable old scholar, however,

could not be prevailed on to leave the peaceful retreat of Geneva, for the stormy scenes which were now exhibiting in his native country; pleading, as an apology, his years and growing infirmities. But the letters of Buchanan were the means of awakening the ardour of Andrew Melville (who was at that time in Geneva, and in the habit of visiting Scrimger, whose sister was married to Melville's elder brother), and turning his attention to the state of learning in Scotland, of which, previously to this period, he does not seem to have taken any particular notice.

Though his life had not passed without some vicissitudes, the latter days of Scrimger appear to have been sufficiently easy as to circumstances. Besides the house which he possessed in the city, he had also a neat villa which he called the Violet, about a league from the town. At this latter place he spent the most of his time in his latter years, in the company of his wife and an only daughter. The period of his death seems to be somewhat uncertain. Thuanus says he died at Geneva in the year 1571; but an edition of his *Novels* in the Advocates' Library, with an inscription to his friend Edward Herrison, dated 1572, is sufficient evidence that this is a mistake. George Buchanan, however, in a letter to Christopher Plaintain, dated at Stirling in the month of November, 1573, speaks of him as certainly dead; so that his death must have happened either in the end of 1572 or the beginning of 1573.

The only work which Scrimger appears to have published, besides the account of Spira which we have already noticed, was an edition of the *Novelle Constitutions* of Justinian, in Greek; a work which was highly prized by the first lawyers of the time. He also enriched the editions of several of the classics, published by Henry Stephens, with various readings and remarks. From his preface to the Greek text of the *Novelle*, it is evident that Scrimger intended to publish a Latin translation of that work, accompanied with annotations; but, from some unknown cause, that design was never accomplished. Mackenzie informs us, that, though he came with the highest recommendations from Ulrich Fugger to Stephens, who was, like Scrimger, one of Fugger's pensioners, yet, from an apprehension on the part of Stephens that Scrimger intended to commence printer himself, there arose such a difference between them that the republic of letters was deprived of Scrimger's notes upon Athenæus, Strabo, Diogenes Laertius, the Basilics, Phormuthus, and Palephatus; all of which he designed that Stephens should have printed for him. The most of these, according to Stephens, after Scrimger's death, fell into the hands of Isaac Casaubon, who published many of them as his own. Casaubon, it would appear, obtained the use of his notes on Strabo, and applied for those on Polybius, when he published his editions of these writers. In his letters to Peter Young, who was Scrimger's nephew, and through whom he appears to have obtained the use of these papers, he speaks in high terms of their great merit; but he has not been candid enough in his printed works to own the extent of his obligations. Buchanan, in a letter to Christopher Plaintain, informs him that Scrimger had left notes and observations upon Demosthenes, Eusebius' *Ecclesiastical History*, and many other Greek authors; as likewise upon the philosophical works of Cicero: all which, he informs his correspondent, were in the hands of Scrimger's nephew, the learned Mr. Peter Young; and being well worth the printing, should be sent him, if he would undertake the publication. Plaintain seems to have declined the offer; so that the *Novelle* and the account

of Spira are all that remain of the learned labours of Scrimger, of whom it has been said, that no man of his age had a more acute knowledge, not only of the Latin and Greek, but also of the Oriental languages. His library, which was one of the most valuable in Europe, he left by testament to his nephew Peter Young, who was Buchanan's assistant in the education of James VI., and it was brought over to Scotland by the testator's brother, Alexander Scrimger, in the year 1573. Besides many valuable books this library contained MSS. of great value; but Young was not a very enthusiastic scholar; and as he was more intent upon advancing his personal interests in the world, and aggrandizing his family, than forwarding the progress of knowledge, they probably came to but small account.

The testimonies to Scrimger's worth and merits by his contemporaries are numerous. Thuanus, Casaubon, and Stephens, with many others, mention his name with the highest encomiums. Dempster says he was a man indefatigable in his reading, of a most exquisite judgment, and without the smallest particle of vainglory. And the great Cujanus was accustomed to say, that he never parted from the company of Henry Scrimger without having learned something that he never knew before.

SETON, LIEUTENANT-COLONEL ALEXANDER. It often happens that the most distinguished in talent are suddenly removed from us at the very entrance of their career. Rich in natural and acquired qualifications, every step of their progress is regarded with interest; and when they enter into life, no obstacle in their path is thought too difficult to surmount, or eminence which they may attain too high for their merits. But when nothing except time seems wanting to resolve these cherished visions into realities, death unexpectedly steps in, and this bright promise of the future is abruptly closed. Of the many victims of this description, Lieutenant-colonel Alexander Seton is an interesting example. More fortunate, however, than many of his class, he was not removed from us until he had given proof to the world of what he might have achieved, by an episode of heroism which, as long as Britain endures, British history will delight to record.

He was the second but eldest surviving son of Alexander Seton of Mounie, Esq., a deputy-lieutenant and justice of the peace, Aberdeenshire, and was born on the 4th of October, 1814. His early youth was marked by great talents, which were carefully cultivated by private education; but his prevailing bias was towards a military life, which he studied as a science, and to which all his acquirements were made subservient. When not quite fifteen years old he accompanied his parents to Italy, where he remained behind them to study mathematics and chemistry under Professor Ferdinando Foggia of Pisa, and there also he became a perfect Italian scholar, being previously well acquainted with the Latin, Greek, and French languages. On the 23d of November, 1832, he was gazetted as second lieutenant by purchase in the 21st Royal North British Fusiliers, and soon after sailed with a detachment of his regiment to the Australian colonies, where his principal station was Van Diemen's Land. Military service during a time of peace is always dull, but peculiarly so in our colonies, where idle men have so few of the attractions of fashionable life as a counterpoise; but the "mind is its own place," and Mr. Seton, wherever he went, could find in his studious disposition and love of knowledge, his books and his investigations, a busy and happy world of his own. After a few years of residence in our Australian colonies he returned

to England on leave of absence, and was promoted by purchase to a first lieutenantancy on the 2d of March, 1838. During the continuation of this leave he made a short tour in Germany, where he perfected his pronunciation of the language, which he had previously studied. In the meantime his regiment, the 21st Fusiliers, having been removed from Van Diemen's Land to India, Lieutenant Seton, who was appointed adjutant to the regiment, rejoined them when his leave of absence had expired. In India, his military services were of that harassing kind which have neither the excitement of military enterprise nor the reward of military glory to recommend them, and in which not the least was a long and trying march from Dinapore, where the 21st was stationed, to Kamptee near Nagpore. In this route, under a burning sun, Lieutenant Seton, as adjutant of the regiment, discharged his duties so ably as to secure the approbation of his commanding officer. Having been promoted to a company without purchase on the 14th of January, 1842, he returned to Europe and exchanged into the 74th Highlanders, at that time expected home from foreign service; and on their arrival he joined in 1844 the dépôt of that regiment at Chatham.

Such was the dreary peace routine of the soldier for years, but this long interval had not been misapplied by Captain Seton, for in addition to the satisfaction which the discharge of his duties had given, he omitted no opportunity of increasing his knowledge by such means as the localities in which he was stationed afforded. Such was the case during his sojourn in India, where he had made himself master of Hindoostanee, and laid the foundation of his acquaintance with other Oriental languages, including the Sanscrit and Persian. But the science of his profession was the chief object of his ambition, and to enlarge his knowledge of it, and the sciences with which it is more immediately connected, he obtained permission, in January, 1846, to become a student in the senior department of the Royal Military College at Sandhurst. After a two years' attendance at this college, his final examination took place in November, 1847, before the late Duke of Cambridge and the board of commissioners, and at the close of it he was honoured with a first-class certificate, and an "extra notice" of his superior attainments in military drawing and surveying—the highest description of certificate then given at the Royal Military College. In this examination which Captain Seton underwent with four officers, his own share of it was particularly onerous. Each officer has his own option as to the departments he has studied, and on which he chooses to be examined, and on this occasion Captain Seton "showed the stereographical construction of the problem for finding the sun's azimuth, and gave the trigonometrical formula for computing the azimuthal angle; he also explained the manner of finding the declination of the magnetic needle. He investigated a formula for expressing the strength of beams, with one for the centre of oscillation in a vibrating body; and he explained the practical method of finding the centre of gravity in the ballistic pendulum. He determined the curvatures of two lenses by which a nearly achromatic image may be formed; he explained the phenomena of vision and of the rainbow; and described the nature of the vibrations producing common and polarized light." He answered 350 questions proposed in other departments connected with natural philosophy, mechanics, and mathematics. And besides these, he sustained a searching and satisfactory examination along with the four other officers upon subjects more closely connected with his profession—the construc-

tion of fortresses with their attack and defence, and military surveying accompanied with drawings and sketches. When this long protracted ordeal was ended, "the board, on proceeding to award the certificates, was pleased to express its entire satisfaction at the progress which had been made by the students. Captain Seton, who was particularly distinguished for the talent displayed in the highest departments of mathematical science, and for the great extent of his acquirements, was presented with a certificate of the first class, on which was expressed the sense entertained by the board of his superior merit."¹ Nor was this his only commendation. After the examination was over he was commended personally by the Duke of Cambridge in the strongest manner for the talents and varied ability he had evinced. He was congratulated by Sir G. Brown, the deputy assistant-general, who declared that he had never heard anything like his examination. Even the highest authorities at the Horse Guards were moved to send for him, and commend him in the highest terms for the ability he had displayed, with assurances of their desire to serve him whenever it might be within their power.

Although the scientific acquirements displayed on this occasion by Captain Seton were so varied and profound, they by no means give the whole of his intellectual portrait. He knew a great deal more that did not fall within the range of their queries. He was familiar with the sciences of botany and geology. He had a thorough knowledge of music as a science; and was such a proficient in drawing, that although he cultivated it merely as an amusement, he might have become an eminent artist if he had not preferred to be a soldier. But his power of acquiring languages was particularly remarkable, being master of fifteen, besides several others which he knew less perfectly. Among those languages in which he was most proficient may be specified the following: Latin, Greek, Hebrew, Sanscrit, Hindue, Hindoostanee (or Ordoe), Persian, German, Italian, French, Spanish, Danish, Irish, &c. He also knew the character called Arrow-head as far as the discoveries had proceeded in it, and the same of Runic, the Egyptian hieroglyphics, &c. In this way a soldier of the nineteenth century, and especially devoted to the study of "war's vast art," in which he had made such progress, as his examination attested, had also obtained by persevering study an amount and variety of scholarship for which we may search most of our universities in vain, and which could scarcely be equalled by the manifold endowments attributed to the "Admirable Crichton."

At the close of 1847 Captain Seton rejoined his regiment, the 74th Highlanders, then stationed at Dublin; and in 1849, without any solicitation either by himself or his friends, he was appointed assistant deputy quarter-master general to the forces in Ireland. This appointment he held until his promotion by purchase to a majority in the 74th, in May 24, 1850, on which occasion he was under the necessity of resigning the office previously mentioned; and on tendering his resignation he was assured by Sir Willoughby Gordon, the quarter-master, that on any future opening occurring on the staff consistent with the rank of a field-officer, he would not be forgotten at the Horse Guards. In March, 1851, the 74th Highlanders, with their commander, Lieutenant-colonel John Fordyce, being ordered for foreign service at the Cape of Good Hope, embarked for that colony, while Major Seton was left at home in

command of the four-company depot, according to the usual custom of the service. A change, however, speedily occurred. Colonel Fordyce² having been killed in an encounter with the Kaffirs, Major Seton was promoted to the rank of lieutenant-colonel of the 74th, and sent to the Cape of Good Hope in January, 1852. The war with the Kaffirs having assumed a very serious aspect, drafts from ten different regiments, numbering about 470 men, were sent out under his command to reinforce the troops serving at the Cape. The vessel in which they embarked from the Cove of Cork on the 7th of January was called the *Birkenhead*, an iron paddle-wheel steam troop-ship of 1400 tons and 556 horse-power, and armed with four guns, having for master Commander Robert Salmond.

There was thus the prospect of commencing active service at last after such tedious delay, and of showing what all these years of study and preparation were worth. As time was of the utmost consequence, the vessel only touched at Madeira, Sierra Leone, and St. Helena for coals and provisions, and arrived at Simon's Bay in the neighbourhood of Cape Town on the 23d of February; but as it was necessary to be quickly at the seat of war, the farther destination of the vessel was Algoa Bay and the Buffalo River, in the neighbourhood of which the war was going on. Among his many endearing qualities Colonel Seton was distinguished by the virtues of domestic life that constituted a principal charm in his paternal home; and the letters which he wrote to his widowed mother during every brief halt of this voyage, formed a mournful solace to her subsequent regrets. In one of them he says, "I will, if possible, write again to you the last thing. I never felt leaving you so much before." In another, warning her of the uncertainties that must attend his correspondence, he writes, "I will of course always write when I can, but you must recollect that up country mails at the Cape are often lost, and if anything happened to me you would be sure to see it in the papers; therefore you must not construe not hearing from me into a bad sign." In this way at every stage of the voyage, and finally from the Cape only a day before his disastrous end, he endeavoured to alleviate her anxiety for his safety, while he sought to amuse her with an account of whatever he had seen at Madeira, Sierra Leone, St. Helena, and Simon's Bay.

To understand aright the narrative that follows, it is necessary to advert to Colonel Seton's character as an officer. In Britain, India, Australia, and Ireland, he had always maintained the character of a strict disciplinarian, so that no breach of duty could escape his notice or reprehension. But he was as strict with himself as with others, and whatever might be their labour or fatigue he was ready to bear his part in it. This combination of two opposite qualities so rare in military officers, attracted the admiration of his soldiers, and their usual remark was, "If he does not spare others, he does not spare himself." It was a union of qualities only belonging to those who are born to be the veritable leaders of men, and through which they convert their men into heroes. By the controlling might of such an example, wielded by a superior intellect, a captain may become a conqueror or a king; and all that such aptitudes require for the purpose is a proper field of action, which is not always to be found. These professional qualities of Colonel Seton during this voyage were called into full exercise. The men under his command, instead of composing a single regiment and possessing the usual regimental esprit-

¹ Report of the examination in Collinson's *United Service Magazine and Naval and Military Journal*, for January, 1848.

² For a biographical notice of COLONEL JOHN FORDYCE, our readers are referred to vol. ii. of this Work, page 58.

de-corps, were drafted from ten regiments, and therefore had no such bond of union; they were also a motley assemblage of Irish, English, and Scotch, who had never been under fire, and many of whom had never pulled a trigger even on parade, and most of their officers were young and unexperienced. How then in the hour of such fearful peril did they exhibit a courage, a firmness, a devotedness to which few veterans would have been found equal? It can only be attributed to the admirable discipline which their commander had established among them, and by which he acquired such marvellous power over them in the valley of the shadow of death. From what danger in the open field would an army shrink when conducted by such a leader?

After stopping only two days at Simon's Bay, the *Birkenhead* resumed her voyage for Algoa Bay on the evening of the 25th of February, and had rounded Cape Point, the extremity of the South African continent, nigh which was Point Danger, an appropriate name of warning to incautious navigators. A wide berth should have been allowed to the *Birkenhead* in such a neighbourhood, but instead of this, her course was laid too nigh the shore to shorten the circumnavigation, while the captain and first mate had retired to rest, leaving the vessel in charge of a junior officer. It was a tranquil starlight night, the surface of the sea was smooth with a long swell setting shoreward, and the vessel was proceeding at the rate of about $8\frac{1}{2}$ miles an hour, when she suddenly struck, before two o'clock in the morning, upon a sunken rock about three miles from the shore off Point Danger. The crash was so tremendous that all were instantly awoke, except some soldiers who slept on the lower troop-deck, who must have been drowned in their hammocks by the sudden rush of water. The main-deck was instantly crowded by the alarmed crew and passengers, who felt that their lives were hanging upon a thread; when Colonel Seton, calling his military officers round him, briefly announced the necessity of their preserving order among the soldiers, after which he turned to the commander, Salmond, and concerted with him the measures best fitted to preserve the ship and all on board. But a great error had already been committed, for Salmond, after the first shock, had ordered the engines to be backed, by which the rent of the ship's keel was widened, and several of her iron plates torn off. The evil was done and past and regret was useless. The colonel directed the horses to be thrown overboard, several of which were his own; he detached sixty men to the chain-pumps, and as many to the tackling of the paddle-box boats, while the rest he ordered aft as reliefs, and to lighten the fore-part of the vessel. As the *Birkenhead* was so damaged that she must soon go down, the only hope of safety was in the ship's boats; but with an imprudence too usual at sea the best of them, when the hour of need arrived, could not be cleared and hoisted out; only two, the cutters or quarter-boats, and a gig, could be made available. An instant rush to these sole hopes of safety might have been expected: it would have been nothing more than the instinctive impulse of self-preservation, which so often gets the start of more generous considerations: and apprehensive of some such event, Colonel Seton stood on the gangway with his sword drawn to prevent it—but, to the honour of his soldiers be it said, no such attempt was offered; on the contrary, they received his orders as coolly, and obeyed them as punctually, as if they had been drawn up on the parade ground, and put through a few manoeuvres. His first care was for the women and the children; and though the vessel was every moment

sinking, they were all conveyed safely into one of the cutters, himself superintending their removal. Being still apprehensive of a reaction and a sudden rush into the cutter, by which it would be swamped, he ordered a young cornet to bring him a table-knife from the cabin to cut the rope and cast the boat loose should the attempt be made; but still it was not offered, and the knife was useless. The women and children being safe, the second cutter was filled with its due complement of men, and also the gig, and the whole three were ordered to stand off at such a distance as to avoid the risk of being swamped by an additional crowding. Thus all were saved for whom there were means and room, and those who remained in the doomed *Birkenhead* must calmly await their fate.

And these brave devoted hearts had not long to wait. Only twenty minutes at the utmost after she struck the *Birkenhead* was a wreck. During the preceding events she had been rolling on the swell of the sea and grinding on the rock, and when the boats had set off in quest of a landing, she parted asunder at the foremast, crushing with the fall of the funnel several men who were on the starboard paddle-box, hopelessly attempting to loose and launch the paddle-box boats. Colonel Seton, who after he secured the safety of the women and children had gone to the poop, from which he issued orders for the subsequent operations, was thrown into the water when the poop went down, and in the convulsive struggle that ensued among the drowning men around him some unconscious clutch drew him under the water, and he was seen no more. Those in the boats had a better fate, as also those who were afterwards picked up, or who reached the shore by swimming or floating on spars, so that 193 lives were saved; but 438 men, most of whom were soldiers, perished in the wreck. Even more might have escaped but for a thick belt of tangled sea-weed near the shore, through which it was impossible to force a passage; and the sharks that prowled in numbers near the spot, and gathered to the wreck as to a banquet. But under such adverse circumstances would so many as 193 have been saved but for the coolness, intrepidity, and generous self-negation of their commander?

Such was the untimely end of Colonel Seton. It was at his first and last field, and a field such as few soldiers would desire to contemplate. The Crimean and Indian wars were also at hand, and imagination delights to picture the share he might have had in them, and the high distinction which, as an officer so endowed, he might have won in them. But to perish in a midnight ocean, and on an obscure portion of a barren coast! it becomes hard for human doubts to realize the truth that all things are ordered well and wisely. But his end was that of a noble soldier, and the meed of fame has followed it. When the news came home of the loss of the *Birkenhead*, and the circumstances attending it, not only Britain, but all Europe was astonished at the narrative. The heroism of the 300 at Thermopylae, or the 600 at Balaclava, is intelligible, where these daring handfuls went to death in the light of day, and with an admiring world looking on. But how much more heroic still to exhibit at least equal courage and self-devotedness where there was neither the hot excitement of the fight nor the knell of fame for the fallen. All wondered at the steadiness and promptness of raw recruits under such a terrible ordeal, their implicit obedience to orders when death was inevitable, and the resignation with which they submitted to their fate. And what a commander he must have been who could thus control them, and whom they

were so ready under such circumstances to obey! The story of the *Birkenhead* will be imperishable, and it will enshrine to all time the name of Colonel Alexander Seton.¹

SHARPE, CHARLES KIRKPATRICK, M.A., well known in the literary circles of Edinburgh during the last half-century, was descended from the ancient family of Closeburn. His father, Charles, was grandson of Sir Thomas Kirkpatrick, of Closeburn, Bart., and assumed the name of Sharpe on succeeding to the barony of Hoddam, or Hodholm, in Annandale, bequeathed to him by his kinsman Mathew Sharpe, of Hoddam, who died unmarried in 1769. By the mother's side Charles Kirkpatrick Sharpe was connected with the noble families of Cassillis and Eglington. Being a younger son (his elder brother was the late General Sharpe, of Hoddam, who long represented the Dumfries burghs in parliament) he was educated with a view to holy orders, and studied for a number of years at Christ Church, Oxford, where he was distinguished by his classical and other attainments in literature and arts.

Whether Mr. Sharpe ever seriously entertained the idea of adopting the clerical profession may be questioned. He seems to have early imbibed a taste for light literature, and "before he had attained his thirtieth year he had fixed himself in the position which he kept to the last—that of a man of fashion devoting his leisure hours to the successful cultivation of literature, music, and the fine arts." No small share of his attention was, at the same time, given to subjects of antiquarian interest; and his collection of the rare and curious belonging to days gone by, or to distant countries, rendered the house of Charles Kirkpatrick Sharpe, Drummond Street, Edinburgh, like that of Horace Walpole, Strawberry Hill, London, a treat of no ordinary description to the virtuoso. A peculiarity in personal appearance and in the style of his dress—which belonged to a past rather than the present age of fashion—claimed for him an individuality as singular as it might seem eccentric. His manners had all that gracefulness and ease—familiar yet polite—which distinguish the highly aristocratic school in which he had been brought up. In sentiment he was a Jacobite, and of course attached to the old *régime*. His education at Oxford had probably some influence upon him in this respect; but he had a poetical love of traditionary lore, and his deep veneration for antiquity no doubt tended to fix those elements upon which the old cavalier school of politicians so long maintained itself amidst the more utilitarian liberalism of modern times. Nor was his intercourse and correspondence, which embraced a wide circle of the literati (including Sir Walter Scott) of his own and other countries—men imbued with similar sympathies as himself—calculated to lessen the bias of his early years, when he listened with delight, as

he himself has expressed it, to songs sung by nurses, dairymaids, and tailors, while the latter were wont to reside in his father's castle, "mis-shaping clothes for the children and servants."

Mr. Sharpe first became known to the literary world in 1803, when he contributed to the *Minstrelsy of the Scottish Border*, edited by Sir Walter Scott, the well-known ballad entitled the "Tower of Repentance," a stronghold built by one of the former proprietors of his father's estate of Hoddam. In 1807 he gave a still more decided proof of the career he had entered upon by the publication of a volume entitled *Metrical Romances*. This little work was favourably noticed by Sir Walter Scott in the *Quarterly Review* some years afterwards. His muse, however, was not of a very high caste; nor does he seem to have been at the trouble of cultivating it to any great extent. To him it was a matter of pastime, not of labour or ambition. It was not till 1823 that anything in the same strain appeared from his pen. He then produced his *Ballad Book*, a small collection of Scottish ballads, inscribed to Sir Walter Scott. After an interval of eleven years, in 1834, he printed privately, "*The Wizard Peter*, a Song of the Solway," founded on a tradition formerly well known in Annandale. These long interregnums, at the same time, were not passed in idleness.

"Almost contemporaneously with his appearance as a poet," says a well-written obituary notice of him in the *Edinburgh Courant*, "Mr. Charles Kirkpatrick Sharpe gave proof of a much higher skill in the fine arts. Many of our readers must have seen, either in the copper etching or in the original drawing at Abbotsford, his 'Queen Elizabeth Dancing High and Disposedly' before the Scottish envoy Sir James Melville, who had excited her jealousy by commendations of the exquisite grace with which Mary Stuart led the dance at Holyrood or Linlithgow. On this admirable sketch Scott was accustomed to expatiate with a delight which will be shared by every one who is able to appreciate the humorous. A scarcely less felicitous effort of Mr. Sharpe's is his 'Marriage of Muckle-mou'd Meg,' illustrating a well-known incident in Border history, the subject of a ballad by Hogg. The original of Mr. Sharpe's sketch is at Abbotsford. It has been etched, like the 'Feast of Spurs' and many other things of the same kind which his ready pencil was ever throwing off. . . . Mr Sharpe was not only a successful amateur in art, but a highly accomplished musician. He has left, we hear, much that will be curious and interesting to the lovers of melody."

Mr. Sharpe, however, will be best known to posterity as a literary antiquary, as the editor of various interesting and curious works. Amongst these are Law's *Memorials*, a work repeatedly referred to by historical writers as a book of authority. In 1817 appeared Kirkon's *History of the Church of Scotland*, to which were appended a series of notes, "which, if not very appropriate to the covenanting gravity of the text, are at least irresistible in their piquancy." Scott felt much pleased with this work, so much in unison with his own sentiments, and honoured it with a long criticism in the *Quarterly Review* for January, 1818. In 1827 he edited the *Life of Lady Margaret Cuninghame* and "*A Memorial of the Conversion of Jean Livingstone, Lady Wariston, with an Account of her Carriage at her Execution, July, 1600.*" To this curious production, printed from a MS. of the Rev. R. Wodrow, is prefixed a very amusing introduction, which includes the trial of the lady, a daughter of the Laird of Dunipace, for the murder of her husband, from the jus-

¹ In the meantime government has done what it could for preserving the record of the event and the names of those who perished, by a mural tablet erected at Chelsea Hospital, bearing the following inscription:—"This monument is erected by command of Her Majesty Queen Victoria, to record the heroic constancy and unbroken discipline shown by Lieutenant-colonel Seton, 74th Highlanders, and the troops embarked under his command, on board the 'Birkenhead,' when that vessel was wrecked off the Cape of Good Hope, on the 26th February, 1852, and to preserve the memory of the Officers, Non-commissioned Officers, and Men, who perished on that Occasion. Their names were as follows:

"Lieutenant-colonel A. Seton, 74th Highlanders, commanding the Troops" (after which follow the names of the commissioned and non-commissioned officers).

"In all three-hundred and fifty-seven officers and men. The names of the Privates will be found inscribed on brass plates adjoining."

ticiary records. In 1828 he produced the *Letters of Lady Margaret Kennedy*; in 1829 the *Letters of Archibald, Earl of Argyle*; and in 1830 he superintended the printing of old Sir Richard Maitland's *Genealogy of the House of Setoun*. A small collection of his characteristic etchings appeared in 1833, under the title of *Portraits by an Amateur*. In 1837 he edited "*Minuets and Songs*," by Thomas, sixth Earl of Kelly; and "*Sargundo*, or the Valiant Christian," a Romanist song of triumph for the victory of the Popish earls at Glenlivet, in 1594. Of these works—which, if not forming a complete list, comprehend at least the greater part of his literary labours—small impressions only were printed, so that they are now scarce, and only to be found in possession of the antiquary or book-collector.

Though somewhat capricious in temper, Mr. Sharpe was usually very accessible and free in communicating such information as he could command, and of which a brother in letters might stand in need. As an instance of this, we may mention that the new edition of the *Poems of Hamilton of Bangour*, brought out by T. G. Stevenson, Edinburgh, so late as 1851, the same year in which he died, was enriched by notes from his pen, probably the very last of his contributions to the press. These notes had reference chiefly to the family connections of the ladies celebrated by the muse of Hamilton. In matters of genealogy he possessed an extraordinary fund of information, the result of great research and much domestic gossip, a characteristic of a bygone age more than the present. Sir Walter Scott, in the diary which he began to keep in November, 1825, remarks of him in regard to this peculiarity, that he "is a very complete genealogist, and has made many detections in *Douglas* and other books on pedigree which our nobles would do well to suppress if they had an opportunity. Strange that a man should be so curious after scandal of centuries old! Not but that Charles loves it fresh and fresh also; for being very much a fashionable man, he is always master of the reigning report, and he tells the anecdotes with such gusto that there is no helping sympathizing with him, a peculiarity of voice adding not a little to the general effect. My idea is, that Charles Kirkpatrick Sharpe, with his oddities, tastes, satire, and high aristocratic feelings, resembles Horace Walpole, perhaps in his person also in a general way."

Sir Walter Scott highly appreciated the literary talent of Mr. Sharpe, and was anxious to enroll him among the staff of contributors to the *Quarterly Review*. It is not known that he was successful in this; but Mr. Sharpe supplied several interesting papers, such as letters by David Hume and other literary gentlemen, from the family archives at Hoddam, to the *Annual Register*, another favourite speculation of Sir Walter.

On the death of his brother, in 1841, Mr. Sharpe succeeded to the family inheritance, and was thenceforth designed of Hoddam. He continued, notwithstanding, to reside chiefly in Edinburgh, and enjoyed himself to the last in the indulgence of his favourite pursuits. He died a bachelor, at his house in Drummond Place, on the 17th March, 1851, having passed, it is believed, his seventieth year. It is said that some time prior to his death, one of the great publishing houses in London offered him a large sum for his autobiography, but, as might have been expected, he scornfully declined the bribe.

Mr. Sharpe's vast collection of antiquities, paintings, prints, china, and books—the richest ever accumulated by a private individual in Scotland—was publicly disposed of by his heirs.

SHARP, JAMES, Archbishop of St. Andrews, was the son of William Sharp, sheriff-clerk of the shire of Banff, by his wife Isobel Lesly, daughter of Lesly of Kininvey, and was born in the castle of Banff, in the month of May, 1613. His parents seem to have been industrious and respectable in the class of society to which they belonged; his father following his calling with diligence, and his mother, though a gentlewoman by birth, assisting his means by setting up a respectable brewery at Dun, which she appears to have conducted creditably and profitably to the day of her death. The subject of this memoir, probably with a view to the church, where, through the patronage of the Earl of Findlater, which the family had long enjoyed, a good benefice might be supposed attainable, was sent to the university of Aberdeen. But the disputes between Charles I. and his parliament having commenced, and the prelatist form of the church being totally overthrown in Scotland, he took a journey into England; in the course of which he visited both the universities, where he was introduced to several persons of distinction. He had, however, no offers of preferment; but finding the Church of England ready to follow that of Scotland, he addressed himself to the celebrated Mr. Alexander Henderson, then in England as a commissioner from the Scottish church, and enjoying a very high degree of popularity, from whom he obtained a recommendation for a regent's place in the university of St. Andrews, to which he was accordingly admitted. Mr. James Guthrie was at this time also a regent in the college of St. Andrews, but whether suspecting the sincerity or undervaluing the talents of Mr. Sharp, he gave his whole favour to Mr. John Sinclair, an unsuccessful candidate for the regent's place which Sharp had obtained, and to whom, when called to the ministry, he afterwards demitted his professional chair. It was with this circumstance, not improbably, that the opposition began which continued between Mr. Guthrie and Sharp throughout the whole of their after-lives. With Mr. Sinclair, now his co-regent, Mr. Sharp seems also for some time to have lived on very bad terms, and even to have gone the length of striking him at the college table on the evening of a Lord's-day in the presence of the principal and the other regents. For this outrage, however, he appears to have made a most ample acknowledgment, and to have been sincerely repentant. Mr. Sharp's contrition attracted the notice and procured him the good graces of several of the most highly gifted and respected ministers of the Scottish church, particularly Mr. Robert Blair. Mr. Samuel Rutherford was so much struck with what had been related by some of the brethren respecting Mr. Sharp's exercises of soul, that, on his coming in to see him on his return from a distant mission, he embraced him most affectionately, saying, "he saw that out of the most rough and knotty timber Christ could make a vessel of mercy." With the brethren in general Mr. Sharp also was in high esteem, and at the request of Mr. James Bruce, minister of Kingsbarns, he was, by the Earl of Crawford, presented to the church and parish of Crail. On his appointment to this charge Mr. Sharp began to take a decided part in the management of the external affairs of the church, in which he displayed singular ability. His rapidly increasing popularity in a short time procured him a call to be one of the ministers of Edinburgh, but his transportation was refused both by the presbytery of St. Andrews and the synod of Fife. It was at length ordered, however, by an act of the General Assembly; but the invasion of the English under Cromwell prevented its being any further insisted in. In the disputes that agitated the Scottish church after the

unfortunate battle of Dunbar, the subject of this memoir, who was a staunch Resolutioner, was the main instrument, according to Mr. Robert Baillie, of carrying the question against the Protesters. His conduct on this occasion highly enhanced his talents and his piety, and was not improbably the foundation upon which his whole after-fortune was built. In the troubles which so speedily followed this event, Sharp, along with several other ministers and some of the nobility, was surprised at Elliot in Fife by a party of the English, and sent up a prisoner to London. In 1657 he was deputed by the Resolutioners to proceed to London to plead their cause with Cromwell in opposition to the Protesters, who had sent up Messrs. James Guthrie, Patrick Gillespie, and others, to represent the distressed state of the Scottish church, and to request that an Assembly might be indicted for determining the controversies in question, and composing the national disorders. From the state of parties both in Scotland and England, and from the conduct he had now adopted, Cromwell could not comply with this request, but he seems to have set a high value upon the commissioners; to have appreciated their good sense and fervent piety, and to have done everything but grant their petition to evince his good-will towards them. They, on the other hand, seem not to have been insensible either to his personal merits, though inimical to his government, or to that of some of the eminent men that were about him. This was terrifying to the Resolutioners, who saw in it nothing less than a coincidence of views and a union of purposes on the part of the whole protesting body with the abhorred and dreaded sectaries. "Their [the leading Protesters'] piety and zeal," says Baillie, "is very susceptible of schism and error. I am oft afraid of their apostasy;" and after mentioning with a kind of instinctive horror their praying both in public and private with Owen and Caryl, he adds with exultation, "the great instrument of God to cross their evil designs has been that very worthy, pious, wise, and diligent young man, Mr. James Sharp." It was part of the energetic policy of Cromwell, while he was not dependent on the party whom he favoured, not to offend the other, and the mission had little effect except that of preparing the way for Sharp to assume one which he made more advantageous to himself.

After the death of Oliver Cromwell, and while Monk was making his memorable march to England, the Presbyterians sent to him David Dickson and Robert Douglas, accompanied by a letter, in which, expressing their confidence in whatever measures he should propose regarding Scotland, they suggested the propriety of his having some one near his person to remind him of such matters as were necessary for their interest, and requested a pass for Sharp as a person qualified for the duty. Monk, who had in the meantime requested Sharp to come to him, wrote an answer, addressed to Messrs. Dickson and Douglas, from Ferry-bridge to the following effect:—"I do assure you the welfare of your church shall be a great part of my care, and that you shall not be more ready to propound than I shall be to promote any reasonable thing that may be for the advantage thereof, and to that end I have herewith sent you according to your desire a pass for Mr. Sharp, who the sooner he comes to me the more welcome he shall be, because he will give me an opportunity to show him how much I am a well-wisher to your church and to yourselves," &c. This was dated January 10th, 1660, and by the 6th of February Sharp was despatched with the following instructions: "1st. You are to use your utmost endeavours that the Kirk of Scotland may, without interruption

or encroachment, enjoy the freedom and privilege of her established judicatories ratified by the laws of the land. 2d. Whereas by the lax toleration that is established, a door is opened to a very many gross errors and loose practices in this church, you shall therefore use all lawful and prudent means to represent the sinfulness and offensiveness thereof, that it may be timeously remedied. 3d. You are to represent the prejudice this church doth suffer by the interverting of the vaiking stipends, which by law were dedicated to pious uses, and seriously endeavour that hereafter vaiking stipends may be intermitted with by presbyteries and such as shall be warranted by them, and no others, to be disposed of and applied to pious uses by presbyteries according to the twentieth act of the parliament 1644. 4th. You are to endeavour that ministers lawfully called and admitted by presbyteries to the ministry may have the benefit of the thirty-ninth act of the parliament, intituled Act anent abolishing patronages, for obtaining summarily, upon the act of their admission, decret, and letters conform, and other executiorials, to the effect they may get the right and possession of their stipends and other benefits without any other address or trouble. If you find that there will be any commission appointed in this nation for settling and augmenting stipends, then you are to use your utmost endeavours to have faithful men, well affected to the interests of Christ in this church, employed therein." As the judicatories of the church were not at this time allowed to sit, these instructions were signed by David Dickson, Robert Douglas, James Wood, John Smith, George Hutchison, and Andrew Ker, all leading men and all Resolutioners. He was at the same time furnished with a letter of recommendation to Monk, another to Colonel Witham, and a third to Messrs. Ash and Calamy, to be shown to Messrs. Manton and Cowper, and all others with whom they might think it proper to communicate, requesting them to afford him every assistance that might be in their power for procuring relief to the "enthralled and afflicted" Church of Scotland. Sharp arrived at London on the 13th of the month, and next day wrote his constituents a very favourable account of his reception by Monk, who had already introduced him to two parliament men, Mr. Weaver, and the afterwards celebrated Anthony Ashley Cowper, Earl of Shaftesbury. Monk himself also wrote the reverend gentlemen two days after, the 16th, in the most saintly style imaginable. Mr. Sharp, he says, is dear to him as his good friend, but much more having their recommendation, and he cannot but receive him as a minister of Christ and a messenger of his church; and he assures them that he will improve his interest to the utmost for the preservation of the rights of the Church of Scotland, and their afflicted country, which he professed to love as his own gospel ordinances, and the privileges of God's people he assured them it should be his care to establish; and he implores their prayers for God's blessing on their counsels and undertakings, entreating them to promote the peace and settlement of the nations, and do what in them lies to compose men's spirits, that with patience the fruit of hopes and prayers may be reaped, &c. This language answered the purpose for which it was uttered, and Robert Douglas in a few days acquainted Sharp with the receipt of his own and the general's letter, desiring him to encourage the general in his great work for the good of religion and peace of the three nations. "For yourself," he adds, "you know what have been my thoughts of this undertaking from the beginning, which I have signified to the general himself, though I was sparing to venture

my opinion in ticklish matters, yet I looked upon him as called of God in a strait to put a check to those who would have run down all our interests." Not satisfied with expressing his feelings to Sharp, Mr. Douglas wrote Monk, thanking him for his kind reception of Sharp, and encouraging him to go on with the great work he had in hand, adding in the simplicity of his heart, "I have been very much satisfied from time to time to hear what good opinion your lordship entertained of presbyterial government, and I am confident you shall never have just cause to think otherwise of it"—an expression suggested by the information of Sharp, who had represented Monk as favourable to a liberal Presbyterian government.

Sharp had, previously to all this, settled with Glencairn and others of the Scottish nobility, who hated the severity of the Presbyterian discipline, to overthrow that form of government, and to introduce Episcopacy in its place; in other words, he was disposed to assist whatever religious party offered the greatest bribe to his ambition. It was natural that he should conceal his intentions from his employers. Accordingly, in a series of letters to Mr. Douglas and the others from whom he derived his commission, written in the months of February, March, and April, he occasionally regrets, in suitable terms, the peril of the suffering church: at other times holds forth glimpses of hope; and at all times explains the utility and absolute necessity of his own interference in its behalf. During the course of this correspondence he declines becoming minister of Edinburgh (a situation to which there seem to have again been intentions of calling him), having perhaps previously secured a charge of more dignity. On the 27th of the month he again writes to Mr. Douglas, wishing to be recalled; and informing him that his sermon on the coronation of Charles II. at Scone, with the account of that ceremony, had been reprinted at London; and that it gave great offence to the Episcopal party, which, he says, does not much matter; but the declaration at Dunfermline, bearing the king's acknowledgment of the blood shed by his father's house, is what he knows not how to excuse. He and Lauderdale, however, are represented as endeavouring to vindicate Scotland for treating with the king upon the terms of the covenant, from the necessity which England now finds of treating with him upon terms before his return; and he says he is reported, both here and at Brussels, to be a rigid Scottish Presbyterian, making it his work to have Presbytery settled in England. He adds with matchless effrontery, "They sent to desire me to move nothing in prejudice of the Church of England, and they would do nothing in prejudice of our church. I bid tell them it was not my employment to move to the prejudice of any party; and I thought, did they really mind the peace of those churches, they would not start such propositions: but all who pretend to be for civil settlement would contribute their endeavours to restore it, and not meddle unseasonably with those remote causes. The fear of rigid Presbytery is talked much of here by all parties; but, for my part, I apprehend no ground for it. I am afraid that something else is like to take place in the church than rigid Presbytery. This nation is not fitted to bear that yoke of Christ; and for religion, I suspect it is made a stalking-horse still." In a letter previous to this, Mr. Douglas had informed him that those in Scotland who loved religion and liberty, had their fears that, if the king came not in upon the terms of the Solemn League and Covenant, his coming in would be disadvantageous to religion and the liberties of the three nations; and he ex-

horted Crawford, Lauderdale, and Sharp to deal with all earnestness that the league and covenant be settled as the only basis of the security and happiness of these nations. On the reception of the last we have quoted from Sharp, we find Douglas again addressing his treacherous messenger, and, in the purest simplicity, providing him with some of those arguments in defence of Presbytery which it is probable Sharp well knew. The deceiver answered that he found it at that time utterly impossible to return, as the general would communicate on Scottish affairs with no one but himself; and the Scots had nothing to do but be quiet, and their affairs would be done to their hand; he and Lauderdale having agreed, with ten Presbyterian ministers, on the necessity of bringing in the king upon covenant terms, and taking off the prejudices that lie upon some Presbyterians against them. Two days afterwards he says, "The Lord having opened a fair door of hope, we may look for a settlement upon the grounds of the covenant, and thereby a foundation laid for security against the prelate and fanatic assaults: but I am dubious if this shall be the result of the agitations now on foot." "We intend," he adds, "to publish some letters from the French Protestant ministers, vindicating the king from Popery and giving him a large character. The sectaries will not be able to do anything to prevent the king's coming in. Our honest Presbyterian brethren are cordial for him. I have been dealing with some of them to send some testimony of their affection for him; and yesternight five of them promised, within a week, to make a shift to send 1000 pieces of gold to him. I continue in my opinion that Scotland should make no applications till the king come in. I have received letters from Mr. Bruce at the Hague, and the king is satisfied that Scotland keep quiet." "No notice," he writes in another letter, "is taken of Scotland in the treaty: we shall be left to the king, which is best for us. God save us from divisions and self-seeking. I have acquainted Mr. Bruce how it is with you, and what you are doing; and advised him to guard against Middleton's designs, and those who sent that Murray over to the king. If our noblemen or others fall upon factious ways, and grasp after places, they will cast reproach upon their country, and fall short of their ends. I fear the interest of the Solemn League and Covenant shall be neglected; and, for religion, I smell that moderate Episcopacy is the fairest accommodation which moderate men, who wish well to religion, expect. Let our noble friends know what you think of it." This first decided breathing of his intentions was answered by Douglas with moderation and good sense. He wishes Monk might grant permission for him to go over to the king to give a true representation of the state of matters. "I fear," says he, "Mr. Bruce hath not sufficient credit for us. If the Solemn League and Covenant be neglected, it seems to me that the judgment on these nations is not yet at an end. The greatest security for the king and these nations were to come in upon that bottom." Before this could reach Sharp, however, it had been concerted, as he writes to Mr. Douglas, between him and Monk that he should go over to the king, "to deal with him, that he may write a letter to Mr. Calamy, to be communicated to the Presbyterian ministers, showing his resolution to own the godly sober party, and to stand for the true Protestant religion in the power of it, and, withal, he [Monk] thinks it fit I were there, were it but to acquaint the king with the passages of his undertaking known to Mr. Douglas and to me, and to tell him of matters in Scotland. He spoke to me three several

times this week; and now I am determined to go; I hope I shall do some service to the honest party here, and, indeed, to ours at home. If you think fit to write to the king, the sooner the better." On the 4th of May he writes that he could not go off to Breda till that day. "The Presbyterian ministers of the city," he adds, "after several meetings, have resolved to send over next week some ministers from the city, Oxford, and Cambridge, to congratulate the king; and I am desired to acquaint the king with their purpose, and dispose for their reception; or, if it be practicable that he would write to both houses, by way of prevention, that they would secure religion in regard to some points. Some particulars of secresy the general [Monk] hath recommended to me, and given orders to transport me in a frigate. I have got a large letter to the king, and another to his prime minister. Providence hath ordered it well that my going carries the face of some concernment in reference to England; but I shall have hereby the better access and opportunity to speak what the Lord shall direct as to our matters, and give a true information of the carriage of business. I think I need not stay ten days. It will be best to address the king by a letter. Presbyterians here are few, and all are Englishmen; and these will not endure us to do anything that may carry a resemblance to pressing uniformity. For my part, I shall not be accessory to anything prejudicial to the Presbyterian government; but to appear for it in any other way than is within my sphere is inconvenient, and may do harm and not good." Mr. Douglas lost no time in preparing instructions for Sharp and a letter to the king, which he forwarded on the 8th of the month, with the following letter:—"I perceive by all that you write that no respect will be had to the covenant in this great transaction, which, if neglected altogether, it fears me that the Lord will be greatly provoked to wrath. It will be the Presbyterians' fault if they get not as much settled, at least, as was agreed upon by the synod of divines, and ratified by parliament: for I perceive that the king will be most condescending to the desires offered by the parliament: but I leave that. However our desires may be for uniformity in doctrine, worship, discipline, and government, if they will not press it themselves we are free. Your great errand will be for this kirk. I am confident the king will not wrong our liberties, whereunto himself is engaged. He needs not declare any liberty to any tender consciences here, because the generality of the people, and whole ministry, have embraced the established religion by law, with his majesty's consent. It is known that in all the times of the prevailing of the late party in England, none petitioned here for a toleration, except some inconsiderable, naughty men. Whatever indulgence the king intends to persons who have failed under the late revolutions, yet he would be careful to do it so as they shall be in no capacity to trouble the peace of the land, as formerly they did. I doubt not but you will inform the king of the circumstances and condition of our kirk. It is left wholly upon you to do what you can for the benefit of this poor distracted kirk, that the king's coming may be refreshing to the honest party here, since no directions from us can well reach you before you come back to London." This letter inclosed a set of instructions for Sharp, similar to those he had already received, equally formal, though extending to *some things less particularly stated in the former*; and was accompanied by a letter to the king, which, after the usual formalities of congratulation, continued in these terms:—"But now since it hath pleased God to open a door (which we have long desired) for our brother

Mr. Sharp to come and wait upon your majesty, we could not any longer forbear to present, by him, this our humble address, in testimony of our loyal affection to your majesty, and our humble acknowledgment of the Lord's goodness to these your dominions in this comfortable revolution of affairs, making way for your majesty's reinstalment. If it had been expedient in this juncture of affairs, your majesty might have expected an address from the generality of the ministers of this church, who, we assure your majesty, have continued, and will continue, in their loyalty to authority, and the maintenance of your just rights, in their stations, according to those principles by which your majesty left them, walking in opposition both to enemies from without and disturbers from within; but doubting that such an application is not yet seasonable, we have desired Mr. Sharp to inform your majesty more fully of the true state of this church, whereby we trust your majesty will perceive our painfulness and fidelity in these trying times; and that the principles of the Church of Scotland are such, and so fixed for the preservation and maintenance of lawful authority, as your majesty needs never repent that you have entered into a covenant for maintaining thereof. So that we nothing doubt of your majesty's constant resolution to protect this church in her established privileges; and are no less confident (though we presume not to meddle without our sphere) that your majesty will not only hearken to the humble advices of those who are concerned, but will also, of your own royal inclination, appear to settle the house of God according to his word, in all your dominions. Now the Lord himself bless your majesty; let, his right hand settle and establish you upon the throne of your dominions, and replenish your royal heart with all those graces and endowments necessary for repairing the breaches of these so long distracted kingdoms, that religion and righteousness may flourish in your reign, the present generation may bless God for the mercies received by you, and the generations to come may reap the fruits of your royal pains. So pray, &c., Robert Douglas, David Dickson, James Hamilton, John Smith, and George Hutchison." This letter was dated May the 8th, the same day with Sharp's instructions, and a double of it was inclosed for himself; but he kept this, and a similar one sent him by the Earl of Rothes on the 10th, till after the king's arrival in England, when everything was settled, and Sharp assured of being Archbishop of St. Andrews. This indeed was the sole object of his journey to Breda, where he was recommended to the king by a letter from Monk as a fit person for establishing Episcopal government in Scotland; and by a letter from Lord Glencairn he was recommended in a similar manner to Hyde, afterwards Earl of Clarendon.

It is almost unnecessary to mention that, in the whole transaction, it does not fall to our lot to record any occasion in which Sharp performed the instructions of his mission, or the duty for which he was paid by those whose simple zeal exceeded either their means or their discernment. On the 2d of June Sharp writes Mr. Douglas that he had presented their letter; that the king, having read some part of it, and looked at the subscriptions, told him he was glad to see a letter under their hands; and that he would consider it, and return an answer at an after period. In this letter, which is long and desultory, he seems frequently to think, without absolutely deciding, that it is time to terminate his connection with his employers, by extinguishing their hopes. "I shall never," he tells them, "espouse the interest of any person or party; 'tis our common interest to

keep an equal way with all who mind the good of kirk and country. Cementing and prising will be our mercy, and dividing more our reproach than we are aware of. The king hath allowed the noblemen who are here to meet and consult what is proper to be offered for the good of the nation. They meet on Monday. It is in his heart to restore to us our liberties and privileges, if our folly do not mar it." "The influencing men of the Presbyterian judgment," he adds, "are content with Episcopacy of Bishop Usher's model, and a liturgy somewhat corrected. A knowing minister told me this day, that if a synod should be called, by a plurality of incumbents, they would infallibly carry Episcopacy. There are many nominal, few real Presbyterians. The cassock-men do swarm here; and such who seemed before to be for Presbytery, would be content of a moderate Episcopacy. We must leave this in the Lord's hand, who may be pleased to preserve to us what he hath wrought for us. I see not what use I can be any longer here. I wish my neck were out of the collar. Some of our countrymen go to the common prayer. All matters are devolved into the hands of the king, in whose power it is to do absolutely what he pleases in church and state. His heart is in his hand, upon whom are our eyes." The very same day he writes a letter to Mr. Douglas, upon whom there was a design at court to draw over by the bribe of a bishopric, that it were well if he would come up to London, where his presence might be of great utility; at the same time he forbids any other, and assures them, that if they come they will be discountenanced, and give suspicion of driving a disobliging design. "I find our Presbyterian friends quite taken off their feet; and what they talk of us, and our help, is merely for their own ends. They stick not to say that, had it not been for the vehemency of the Scots, Messrs. Henderson, Gillespie, &c., set forms had been continued; and they were never against them. The king and grandees are wholly for Episcopacy. The Episcopal men are very high. I beseech you, sir, decline not to come up. It will be necessary for you to come and speak with his majesty, for preventing of ill, and keeping our noblemen here right."

The consequence of his communication, which must have been alarming, was a more distinct direction as to his duties, which did not reach him at a time when he was much disposed to attend to such suggestions. In his answer he reproves his employers for their violence, and, still unwilling entirely to reveal himself, continues, "I apprehend it will come to nothing. However, the high carriage of the Episcopal men gives great dissatisfaction, the Lord may permit them thus to lift up themselves that thereby they may meet with a more effectual check. I hear Leighton is here in town in private." The answer of Douglas was in more distinct terms of suspicion, mentioning those circumstances of danger gathering round the church, the existence of which he to whom he wrote knew too well. Sharp still equivocated, and looked to Episcopacy as a thing to be dreaded, but which he feared could not be avoided. In his return in August he brought the king's celebrated letter to Douglas and the presbytery of Edinburgh, which, in conformity with the policy pursued by Sharp and his friends, bore, "We do also resolve to protect and preserve the government of the Church of Scotland, as it is settled by law, without violation, and to countenance in the due exercise of their functions all such ministers who shall behave themselves dutifully and peaceably as becomes men of their calling. We will also take care that the authority and acts of the General Assembly at St.

Andrews and Dundee, 1651, be owned and stand in force until we shall call another General Assembly (which we purpose to do as soon as our affairs will permit), and we do intend to send for Mr. Robert Douglas and some other ministers, that we may speak with them in what may further concern the affairs of that church. And as we are very well satisfied with your resolution not to meddle without your sphere, so we do expect that church judicatories in Scotland, and ministers there, will keep within the compass of their station, meddling only with matters ecclesiastic, and promoting our authority and interest with our subjects against all opposers; and that they will take special notice of such who by preachings or private conventicles, or any other way, transgress the limits of their calling, by endeavouring to corrupt the people or sow seeds of disaffection to us or our government." The simple enthusiasm with which this document was received by those who were accustomed to give plain meanings to ordinary words, is well known. In the synod of Fife, which met at Kirkcaldy, Mr. John Magill, Mr. Alexander Wedderburn, and some others, contended for introducing the covenant into their letter of thanks, "as the bond which, while it bound both king and subjects to God, did also tie them to one another." This drew from Sharp a long speech, in which he had many oblique reflections upon the covenant, which he with some truth alleged could not be mentioned to his majesty without exciting his displeasure. He further in justification of his majesty affirmed that "there was not a man in England would own that covenant save Mr. Ash, an old man whose one foot was already in the grave," and so great was his influence that he carried a plurality of the synod along with him, and the covenant of duty was set aside for the conventional one of good manners. A vote of thanks to Mr. Sharp was also carried in this synod for his faithfulness and painstaking in the affairs of the church. At the dismissal of the synod, Mr. William Row coming in contact with Sharp at the door, laid hold of his cloak, and inquired how he could affirm in the face of the synod that no man in England owned the covenant but Mr. Ash, when Mr. Crofton had just come forth in print in behalf of its perpetual obligation, to which Sharp made no other reply than that he knew Mr. Crofton a little *knuckity body*, just like Mr. Henry Williams. Though eminently successful in his endeavours, Sharp still kept the mantle of hypocrisy closely drawn around him, and was elected professor of theology in the college of St. Andrews, where he had formerly been professor of philosophy. He was keenly opposed by the principal, Mr. Samuel Rutherford, who had made an early discovery of his true character, and could never be brought to countenance him. Mr. Rutherford, however, was a Protester, his *Lex Rex* had been condemned to the flames by the committee of estates, and he was confined to his own house by sickness, and Sharp had the satisfaction of assisting at the burning of his book at the gate of his college. He died soon after, or he might have shared the fate of his book.

The committee of estates which sat down in August, 1660, and the parliament which followed, commenced the wild work of tyranny which so darkly characterizes the period. When Prelacy was established by royal proclamation in the month of August, 1661, Mr. Sharp, who had been the principal agent in this melancholy overturning, was now rewarded with the primacy of Scotland, and was called up to London, along with Fairfoul, appointed to the see of Glasgow, Hamilton to that of Galloway, and Leighton to that of Dunblane, to receive Episcopal ordination. Sharp

made some objections against being re-ordained, but yielded when he found it was to be insisted on, a circumstance which made Sheldon, Bishop of London, say, he followed the Scots' fashion, which was to scruple at everything and to swallow anything. The other three yielded at once, and they were all four, on the 16th day of December, 1661, before a great concourse of Scottish and English nobility in the chapel of Westminster, ordained preaching deacons, then presbyters, and lastly consecrated bishops. In the month of April they returned in great state to Scotland, where in the following month they proceeded to consecrate their ten brethren, the parliament having delayed to sit till they should be ready to take their seats. We might have remarked, that on the parliament passing the act rescissory, Sharp affected concern sufficient to qualify him for a new mission which afforded him an opportunity of perfecting what he had already so far advanced, and ended in his now exalted situation of primate of all Scotland. Well might Burnet say of the Scottish ministers, "Poor men, they were so struck with the ill state of their affairs that they had neither sense nor courage left them." Sharp, when made Archbishop of St. Andrews, affirmed that he had only accepted of it, seeing the king would establish Episcopacy, to keep it out of more violent hands, and that he might be able so to moderate matters that good men might be saved from a storm that otherwise could not have failed to break upon them. No sooner had he the reins of ecclesiastic government in his hands than a proclamation was issued forbidding any clergymen to meet in a presbyterial capacity till such time as the bishops had settled the order of procedure in them; and he was so very moderate in his measures, that of his co-presbyters of St. Andrews, he spared only three old men who were nonconformists, and these were spared not without great difficulty. Nor did his elevation, which he had attained with so much infamy, content him; besides the dignity of the church, he loved that of the state, and in the differences that fell out between Lauderdale and Middleton he narrowly escaped a fall with the latter. He had been prevailed on to write to the king that the standing or falling of Middleton would be the standing or falling of the church, and he went up to London to support him personally. When he came to London, however, and saw how much Middleton had fallen in the estimation of the king, he resolved to make great concessions to Lauderdale; and when the latter reproached him with his engagements with Middleton, he boldly avowed that he had never gone farther with him than what was decent, considering his post. That he had ever written to the king in his behalf he totally denied. But Charles had given Lauderdale the prelate's letter. When it was shown to the writer he fell a-weeping, and begged pardon in most abject manner, saying, "What could a company of poor men refuse to the Earl of Middleton, who had done so much for them, and had them so entirely in his power?" Lauderdale upon this said he would forgive them all that was past, and would serve them and the church at another rate than Middleton was capable of doing; and Sharp became wholly Lauderdale's. In 1663 he went up to court to complain of the chancellor Glencairn and the privy-council, when he said there was so much remissness and popularity on all occasions that, unless some more spirit was put into it, the church could not be preserved. On this occasion he obtained an order for establishing a kind of high-commission court, a useful instrument of oppression, and procured a letter to the council directing that in future the primate should take the place of the chancellor,

which so mortified Glencairn that he is said to have in consequence caught the fever of which he died. Sharp, who now longed for the chancellorship, wrote immediately to Sheldon, Bishop of London, that upon the disposal of this place the very being of the church depended, and begging that he would press the king to allow him to come up before he gave away the place. The king, who by this time had conceived a great dislike for Sharp, bade Sheldon assure him that he would take care the place should be properly filled, but that there was no occasion for his coming up. Sharp, however, could not restrain himself, but ventured up. The king received him coldly, and asked if he had not had the bishop's letter. He admitted that he had, but he chose rather to venture on his majesty's displeasure than see the church ruined through his caution or negligence. "In Scotland they had but few and cold friends, and many violent enemies. His majesty's protection and the execution of the law were all they had to depend on, and these depended so much upon the chancellor, that he could not answer to God and the church if he did not bestir himself in that matter. He knew many thought of him for that post, but he was so far from that thought, that if his majesty had any such intention he would rather choose to be sent to a plantation. He desired that he should be a churchman in heart, but not in habit, that should be called to that trust." From the king he went straight to Sheldon, and begged him to move the king to bestow it upon himself, furnishing him with many arguments in support of the proposal, one of which was that the late king had raised his predecessor, Spotswood, to that dignity. Sheldon moved the king accordingly with more than ordinary fervour; and the king, suspecting Sharp had set him on, charged him to tell the truth, which he did, though not without a great deal of hesitation. The king told him, in return, the whole affair. Sheldon prayed him to remember the archbishop and the church, whatever he might think of the man, which the king graciously assured him he would do. Sheldon told Sharp he saw the motion for himself would be ineffectual, and he must think of some one else. Sharp then nominated Rothes, who was appointed accordingly; and with a commission to prepare matters for a national synod, to settle a book of common prayer and a book of canons, Sharp returned to Scotland, having assured the king that now, if all went not well, either Rothes or Lauderdale must bear the blame.

In another visit to court, along with Rothes, he endeavoured to undermine the influence of Lauderdale; but that bold and unhesitating man did not flinch from his averments, whether true or false, and compelled him publicly to retract them. Nor was he more successful in an overture to join with Middleton in supplanting his rival. His terrors on the rising at Pentland rendering him anxious for an increase of troops, he recommended the fines to be applied that way, by which many of the cavaliers who looked to that fund were disappointed in their expectations, and became his mortal enemies. Lauderdale too, to complete his disgrace, procured a number of letters written to the Presbyterians after he had negotiated for the introduction of Episcopacy, and gave them to the king, who looked on him ever after as the worst of men. During the rising at Pentland Sharp was the principal administrator of the government; in which situation the cruelty of nature and insatiability in vengeance which he displayed are well known. After this period he was so much disliked at court (while he was a necessary instrument), that in 1667 he was ordered to confine himself to his own diocese, and come no more

to Edinburgh. With the indulgences, the comprehension, &c., Sharp had little connection, except in narrowing their effect. In the month of July, 1668, as he was going into his coach in daylight, he was fired at with a pistol loaded with a brace of bullets: but his life was saved by Honeymann, Bishop of Orkney, who, lifting up his hand to step into the coach after him at the time, received the shot in his wrist, which caused his death a few years afterwards, the wound never having healed. So universally was Sharp hated, that when the cry was made that a man had been shot in the street, the reply was instantly made, that it was only a bishop, and not a single individual offered to lay hold on the perpetrator of the deed. The court, however, took some compassion on him in this extremity, and he was repaid for his fears by a little gleam of favour. The person who committed the daring act, Mr. James Mitchel, was afterwards seized, and, upon a promise of life, confessed what it was impossible for his enemies to prove, he having no associates in the affair. That promise, however, was violated,¹ and Mitchel suffered.

We now approach the violent end of this man, whose life was spent in violence. It was characteristic of the excess of the iniquity of the period; for in the whole course of national discord which preceded, an action of political assassination, without the colour of any human law, does not stand on record. A few of the more zealous and uncompromising Presbyterians, wandering on Magus Moor, near St. Andrews, on the 3d of May, 1679, in search of the sheriff of Fife, whose activity as a servant to the archbishop had roused them to violent intentions, fell in with the master instead of the servant; and their passions dictating to them that they had what was termed a call from God to put him to death, they followed the suggestion with circumstances of considerable barbarity. Having cut the traces of his carriage, they, in the most cool and deliberate manner, commanded him to come out of his coach, or they would do harm to his daughter, who was along with him; and that his days were now numbered, as they were to take vengeance upon him for a betrayed church, and for so many of their murdered brethren, particularly for the life of Mr. James Mitchel, to whom he had sworn so perfidiously, and for keeping up the king's pardon after Pentland. After repeatedly assuring him of their purpose, and exhorting him to repentance and prayer, in which he could not be persuaded to engage, they fired upon him, and afterwards slashed his head with their swords, leaving him a lifeless corpse on the king's highway. A particular account of this affair, exaggerated probably in its details, was speedily published, and large rewards offered for the perpetrators; not one of whom was ever brought to trial, Hackston of Rathillet excepted, who was one of the party, but who had refused to have any hand in the work of death, from the circumstance of his having had some personal quarrel with the bishop. Sharp was buried with great pomp, and a splendid monument erected over him at St. Andrews, which, though it attracts little respect, is still to be seen as one of the curiosities of that city.

SHORT, JAMES, an eminent optician and constructor of reflecting telescopes, was the son of William Short, a joiner in Edinburgh, where he was born on the 10th of June, 1710. The Christian name James was conferred upon him in consequence of his having

thus been ushered into the world on the birth-day of the Pretender. Having lost his parents in early life, he was entered, at the age of ten, on the foundation of George Heriot, where he rendered himself a favourite among his companions by his talent for fabricating little articles in joinery. At twelve years old he began to attend the high-school for classical literature, in which he distinguished himself so greatly, that a pious grandmother determined to devote him to the church. He actually commenced a course of attendance at the university for this purpose, in 1726 took his degree of Master of Arts, attended the divinity hall, and in 1731 passed the usual trials preparatory to his being licensed as a preacher of the gospel, when his natural taste for mechanics, receiving excitement from an attendance at Mr. Maclaurin's mathematical class, induced him to turn back from the very threshold of the church, and apply himself to a different profession. He very quickly attracted the favourable attention of the illustrious expositor of Newton, who invited him frequently to his house in order to observe his capacity more narrowly, and encouraged him to proceed in the new line of life which he had embraced. In 1732 Maclaurin permitted Short to use his rooms in the college for his apparatus, and kindly superintended all his proceedings. Two years after, in a letter to Dr. Turin, he takes notice of the proficiency of Mr. Short in the casting and polishing of the metallic specula of reflecting telescopes. The young mathematician had already improved greatly upon the construction of the Gregorian telescope. The figure which he gave to his great specula was parabolic; not, however, by any rule or canon, but by practice and mechanical devices, joined to an exact knowledge of the principles of optics. The improvement had been pointed out by Newton as the most necessary attainment for the perfection of those instruments. In 1736 he had obtained so much distinction by his acquirements as to be called by Queen Caroline to give instructions in mathematics to her second son, the Duke of Cumberland. On leaving Edinburgh for this purpose he deposited £500, which he had already saved from his gains, in the Bank of Scotland. In London he was elected a fellow of the Royal Society, and was much patronized by the Earls of Morton and Macclesfield. Towards the end of the year he returned to Edinburgh, and resumed the usual course of his profession. Three years afterwards he accompanied the Earl of Morton on a progress to his lordship's possessions in Orkney, for the purpose of adjusting the geography of that remote archipelago; while the laird of Macfarlane accompanied the party as a surveyor of antiquities. After that business had been concluded, Mr. Short accompanied the earl to London, where he finally settled, and for some years carried on an extensive practice in the construction of telescopes and other optical instruments. One of the former, containing a reflector of twelve feet focus, was made for Lord Thomas Spencer at 600 guineas; another of still greater extent, and the largest which had till then been constructed, was made for the King of Spain at £1200. Mr. Short died, June 15, 1768, of mortification in the bowels, leaving a fortune of £20,000.

SIBBALD, JAMES, an ingenious inquirer into Scottish literary antiquities, was the son of Mr. John Sibbald, farmer at Whitlaw, in Roxburghshire, where he was born in the year 1747, or early in 1748. He was educated at the grammar-school of Selkirk, from which Whitlaw is only a few miles distant. He commenced life by leasing the farm of

¹ On this subject see the mem. of SIR GEORGE LOCKHART, Mitchel's counsel.

Newton from Sir Gilbert Elliot, of Stobs. Here he pursued various studies, each of which for the time seemed to him the most important in the world; till another succeeded, and in its turn absorbed his whole attention. One of his favourite pursuits was botany, then little studied by any class of people in Scotland, and particularly by farmers. Owing to the depression which the American war produced in the value of farm-stock, Mr. Sibbald found his affairs by no means in a prosperous condition; and accordingly, in May, 1779, he disposed of the whole by auction, and giving up his lease to the landlord, repaired to Edinburgh, with about £100 in his pocket, in order to commence a new line of life. A taste for literature, and an acquaintance with Mr. Charles Elliot, who was a native of the same district, induced him to enter as a kind of volunteer shopman into the employment of that eminent publisher, with whom he continued about a year. He then purchased the circulating library which had formerly belonged to Allan Ramsay, and in 1780 or 1781 commenced business as a bookseller in the Parliament Square. It is not unworthy of notice that Mr. Sibbald conducted the library at the time when Sir Walter Scott, then a boy, devoured its contents with the ardour described in one of his autobiographical prefaces. Mr. Sibbald carried on business with a degree of spirit and enterprise beyond the most of his brethren. He was the first to introduce the better order of engravings into Edinburgh, in which department of trade he was for a considerable time eminently successful. Many of these prints were of the mezzotinto kind, and were coloured to resemble paintings. Being viewed in the Scottish capital as altogether the production of metropolitan genius, they were exceedingly well received, and extensively purchased. At length Mr. Sibbald was detected one day in the act of colouring some of them himself, and from that time his trade experienced an evident decline. He had not been long in business when his talents and acquired knowledge sought an appropriate field of display in a monthly literary miscellany which he established (1783), under the name of the *Edinburgh Magazine*. This was the first time that a rival to the ancient *Scots Magazine* met with decided success. The *Edinburgh Magazine* was of a somewhat more ambitious and attractive character than its predecessor; contained more original matter, and that of a livelier kind; and was ornamented by engraved frontispieces, representing mansions, castles, and other remarkable objects. Mr. Sibbald was himself the editor and chief contributor; and it is said that his articles, though not marked by any signature, were generally distinguished as superior to the ordinary papers then admitted into magazines. His lucubrations on Scottish antiquities were of so much merit as to secure to their author the friendship of Lord Hailes and other eminent literary characters, who became occasional contributors to his miscellany. Early in 1791, with the view of devoting himself more to literary pursuits, Mr. Sibbald made an arrangement for giving up the management of his business to two young men, Messrs. Laurie and Symington, the property of the stock and of the magazine continuing in his own hands, while those individuals paid him an allowance for both out of the profits. From this period till late in 1792 the magazine professes on the title-page to be printed for him, but sold by Laurie and Symington. At the date last mentioned his name disappears entirely from the work, which, however, was still carried on for his benefit, the sale being generally about 600 or 700 copies.

In 1792 Mr. Sibbald conducted a newspaper, which was then started under the name of the *Edinburgh Herald*, and which did not continue long in existence. It is worth mentioning that, in this paper, he commenced the practice of giving an original leading article, similar to what was presented in the London prints, though it has only been in recent times that such a plan became general in Scotland. According to the notes of an agreement formed in July, 1793, between Mr. Sibbald and Mr. Laurie, the temporary direction and profits of the Edinburgh circulating library were conveyed to the latter for ten years, from the ensuing January, in consideration of a rent of, it is believed, £200 per annum, to be paid quarterly to Mr. Sibbald, but subject to a deduction for the purchase of new books to be added to the library. Mr. Sibbald now went to London, where he resided for some years, in the enjoyment of literary society and the prosecution of various literary speculations, being supported by the small independency which he had thus secured for himself. Here he composed a work entitled "*Record of the Public Ministry of Jesus Christ*; comprehending all that is related by the Four Evangelists in one regular narrative, without repetition or omission, arranged with strict attention to the Chronology and to their own Words, according to the most esteemed translation; with Preliminary Observations." This work was published at Edinburgh in 1798, and was chiefly remarkable for the view which it took respecting the space of time occupied by the public ministrations of Christ, which former writers had supposed to be three or four years, but was represented by Mr. Sibbald as comprehended within twelve months. While in London his Scottish relations altogether lost sight of him; they neither knew where he lived, nor how he lived. At length his brother William, a merchant in Leith, made a particular inquiry into these circumstances by a letter which he sent through such a channel as to be sure of reaching him. The answer was comprised in the following words:—"My lodging is in Soho, and my business is so so." Having subsequently returned to Edinburgh, he there edited, in 1797, a work entitled the "*Vocal Magazine*; a Selection of the most esteemed English, Scots, and Irish Airs, Ancient and Modern, adapted for the Harpsichord or Violin." For such an employment he was qualified by a general acquaintance with music. In 1799 Mr. Sibbald revised his agreement with Mr. Laurie, who undertook to lease the business for twenty-one years, after January, 1800, at the rent of 100 guineas, himself supplying the new books, which were to remain his own property. Finding, however, that even at this low rental he did not prosper in his undertaking, Laurie soon after gave up the business into the hands of Mr. Sibbald, by whom it was carried on till his death.¹

The latter years of this ingenious man were chiefly

¹ The history of the Edinburgh circulating library may here be briefly narrated. Established by Allan Ramsay in 1725, by whom it was conducted till near the period of his death, in 1757, when it was sold to a Mr. Yair, whose widow carried it on till 1780, when it was sold to Mr. Sibbald. A daughter of Mrs. Yair was married to Dr. Bell, author of the *Madras System of Education*. By Mr. Sibbald, who greatly increased the collection, it was conducted, under various circumstances, as above stated, till 1803, when his brother and executor, William Sibbald, merchant in Leith, endeavoured to carry it on under the superintendence of a Mr. Stevenson. Finding it by no means prosperous, and the latter gentleman having died, Mr. Sibbald disposed of it in 1806 to Mr. Alexander Mackay (afterwards of Blackcastle), who conducted it until 1831, when it was broken up and sold off by auction. It does not appear to have thriven in any remarkable degree till the accession of Mr. Mackay, who retired from it with a competency.

spent in the compilation of his well-known *Chronicle of Scottish Poetry, and Glossary of the Scottish Language*, four volumes, 8vo; a work of taste and erudition, which will perpetuate his name among those who have illustrated our national literature. The three first volumes exhibit a regular chronological series of extracts from the writings of the Scottish poets to the reign of James VI.; illustrated by biographical, critical, and archaeological notices: the fourth contains a vocabulary of the language, only inferior in amplitude and general value to the more voluminous work of Dr. Jamieson. The *Chronicle* appeared in 1802.

This ingenious writer died in April, 1803, at his lodgings in Leith Walk. Two portraits of him have been given by Kay; one representing him as he daily walked up the centre of the High Street of Edinburgh, with his hand behind his back and an umbrella under his arm; another places him amidst a group of connoisseurs, who are inspecting a picture. He was a man of eccentric but benevolent and amiable character. The same exclusiveness which actuated his studies governed him in domestic life; even in food he used to give his whole favour for a time to one object, and then change it for some other, to which he was in turn as fondly devoted. He belonged to a great number of convivial clubs, and was so much beloved by many of his associates in those fraternities, that, for some years after his death, they celebrated his birth-day by a social meeting.

SIBBALD, SIR ROBERT, an eminent physician, naturalist, and antiquary, was descended of the ancient family of the Sibbalds of Balgonie in Fife, and was born at Edinburgh, 15th April, 1641. His father was David Sibbald, a brother of Sir James Sibbald, Bart., of Rankellor, and was keeper of the great seal during the time that the Earl of Kinnoul was chancellor of Scotland, after which he retired into private life. His mother was Margaret Boyd, eldest daughter of Robert Boyd of Kippis, advocate. He received the principal part of his education, particularly in philosophy and the languages, at the university of Edinburgh. Having completed himself in these branches of learning he went to Leyden to study medicine, where he remained for a year and a half, up to September, 1661. In the summer of this year he published a dissertation *De Variis Tabis Speciebus*. On leaving Leyden Sir Robert proceeded to Paris, and remained there nine months, studying botany and medicine under the most famous teachers of the day. From Paris he went to Angers, stayed there a month, and after an examination obtained his doctor's degree. Passing through Paris and taking ship at Dieppe he next visited London, and after a stay of three months there returned to his native country, and took up his residence in Edinburgh, 30th October, 1662.

He immediately began to practise medicine, and soon became widely known. Some years after his return, with the co-operation of his friend Dr. Andrew Balfour, an ardent naturalist like himself, and some other physicians, he managed to establish a small botanical garden at Edinburgh, for the cultivation of rare and exotic plants. This garden occupied a good deal of his time, and seems to have given him great pleasure. In 1670 he left Edinburgh and went with his mother to live on the estate of Kippis, which had belonged to his grandfather, and at his death had fallen to his mother, after a lawsuit with her sister's husband. His mother died in 1672.

In 1677 Sir Robert married Anna, sister of Mr.

James Lowes, of Merchistoun, who lived with him only two years, dying of fever in 1678. About this time began his intimacy with the Earl of Perth, who employed him as physician to his family, and through whose influence he was appointed in 1682 physician in ordinary to King Charles II., and geographer-royal for Scotland. In this capacity he received his majesty's commands to write an account of the natural history of Scotland as well as a geographical description of the same, including a particular history of the different counties. This undertaking led him into much expense in buying books and procuring information, and though allowed a salary of £100 by King James, he got only one year's payment. In 1683 he published in Latin the *Nuntius Scoto-Britannus, sive Admonitio de Descriptione Scotie*, a pamphlet describing the plan of the projected work, the sections into which it was to be divided, and the headings of the different chapters. The same year he published a pamphlet of similar tenor in English. The great work was never completed. The *History, Ancient and Modern, of the Sherifdoms of Linlithgow and Stirling*, and the *History of Fife and Kinross*, both published in 1710, formed part of it. These works are of considerable interest, and are replete with curious antiquarian information. A new edition of the latter, which had become exceedingly scarce, edited by Dr. Adamson, was published at Cupar-Fife in 1803.

In 1681 the Royal College of Physicians was established at Edinburgh, mainly through the instrumentality of Sibbald and his friends Drs. Balfour and Stevenson. The following year he received the honour of knighthood, and married his second wife, Anna Orrock, youngest daughter of the laird of Orrock. Two years after he was elected president of the College of Physicians, and the same year he published a learned and elaborate work, entitled *Scotia Illustrata, sive Prodromus Historiæ Naturalis Scotiæ*, folio. A second edition of this valuable work, also in folio, was published in 1696. One part of the *Scotia Illustrata* is devoted to the indigenous plants of Scotland, and amongst these there appear some rare species, one of which was subsequently called Sibbaldia by Linneus, in honour of its discoverer. For some of the opinions expressed in this work on the mathematical principles of physics Sir Robert was violently attacked by Dr. Pitcairne, in a tract more remarkable for the severity of its satire than the fairness or solidity of its arguments, entitled *De Legibus Historiæ Naturalis*, Edinburgh, 1696.

We now come to what Sir Robert in his autobiography calls "the difficultest passage of my life." In 1686 the Earl of Perth, with whom he had long been intimate, was chancellor of Scotland, and having himself joined the Roman Catholic church about two months before, he pressed Sir Robert with much urgency and perseverance to take the same step. For some time, Sir Robert says, he resisted all his grace's arguments and entreaties, but at length found himself all at once convinced by the reasoning of the chancellor. Under this sudden sense of error, and in the fulness of his new-born contrition, he rushed, with tears in his eyes, into the arms of his converter, and formally embraced his religion. Soon afterwards, remaining still steady in the faith, he accompanied his lordship to London, and resided there for several months. The long and frequent fastings, however, and extremely rigid discipline to which he was now subjected, induced him to reconsider the points of controversy between Catholicism and Protestantism; and the result was that he discovered he had done wrong in deserting the latter, and with

a heart once more filled with contrition he returned to his original faith, and made public acknowledgment of his error. It may not be without its effect on those who shall consider this circumstance as an instance of weakness in Sir Robert Sibbald's character, to learn that Dr. Johnson entertained a very different opinion of it. The great moralist considered it as an honest picture of human nature, and exclaimed, when the subject was discussed in his presence, "How often are the primary motives of our greatest actions as small as Sibbald's for his reconversion." While in London Sir Robert was admitted an honorary fellow of the Royal College of Physicians there.

In 1692 this ingenious and versatile author published an interesting work on zoology, entitled "*Phalainologia Nova*, or Observations on some Animals of the Whale Genus lately thrown on the Shores of Scotland." This was followed by the *Liberty and Independency of the Kingdom and Church of Scotland asserted from Ancient Records*, in 3 parts, 4to, 1702; and in the same year in which his *History of Fife* appeared he published another work, entitled *Miscellanea quædam Erudite Antiquitatis*.

Besides these works, Sir Robert wrote a great number of learned and highly ingenious treatises and essays, chiefly on subjects connected with the antiquities of his native country. Some of these were collected and reprinted in one volume after his death under the title of "*A Collection of Several Treatises in folio, concerning Scotland*," as it was of Old, and also in *Later Times*," by Sir Robert Sibbald, M.D., Edinburgh, 1739. In his antiquarian researches he was greatly assisted by the previous labours of Sir Robert Gordon of Straloch, the first native of Scotland who turned his attention to the illustration of the antiquities of his native country. The subject of this memoir was the next. No further particulars of Sir Robert Sibbald's life are known. Even the year of his death is uncertain; though it is generally believed to have taken place in 1722, as in that year a catalogue was printed in Edinburgh of "the library of the late learned and ingenious Sir Robert Sibbald of Kipps; to be sold by way of auction." The sale brought in all £342, 17s. sterling—a large amount for those times.

SIMSON, DR. ROBERT, a mathematician, was the eldest son of Mr. John Simson of Kirton-hall, in Ayrshire, and was born on the 14th October, 1687. He was educated at the university of Glasgow, which he first entered as a student in 1701. Being intended for the church, his studies were at first directed chiefly to theological learning, in which, as well as in the classics, he made great progress. He distinguished himself also by his historical knowledge, and was accounted one of the best botanists of his years. At this time no mathematical lectures were given in the college; but having amused himself in his leisure hours by a few exercises in *Euclid*, a copy of which he found in the hands of a companion, he quickly found that the bent of his taste and genius lay in that direction. The farther he advanced in the study of mathematics the more engaging it appeared; and as a prospect opened up to him of making it his profession for life, he at last gave himself up to it entirely. While still very young he conceived a strong predilection for the analysis of the ancient geometers; which increased as he proceeded, till it was at last carried almost to devotion. While he, therefore, comparatively neglected the works of the modern mathematicians, he exerted himself, through life, in an uncommon manner, to restore the works of the ancient geometers. The

noble inventions of fluxions and logarithms, by means of which so much progress has been made in the mathematics, attracted his notice; but he was satisfied with demonstrating their truth on the pure principles of the ancient geometry. He was, however, well acquainted with all the modern discoveries; and left, among his papers, investigations according to the Cartesian method, which show that he made himself completely master of it. While devoting himself chiefly to geometry, he also acquired a vast fund of general information, which gave a charm to his conversation throughout all the subsequent years of life. On arriving at his twenty-second year his reputation as a mathematician was so high as to induce the members of the college to offer him the mathematical chair, in which a vacancy was soon expected to take place. With all that natural modesty which ever accompanies true genius, he respectfully declined the high honour, feeling reluctant, at so early an age, to advance abruptly from the state of student to that of professor in the same college, and therefore requested permission to spend one year at least in London. Leave being granted to him, without further delay he proceeded to the metropolis, and there diligently employed himself in extending and improving his mathematical knowledge. He now had the good fortune to be introduced to some of the most illustrious mathematicians of the day, particularly Mr. Jones, Mr. Caswell, Dr. Jurin, and Mr. Ditton. With the last, indeed, who was then mathematical master of Christ's Hospital, and highly esteemed for his erudition, he was very intimately connected. It appears from Mr. Simson's own account, in a letter dated London, 17th November, 1710, that he expected to have an assistant in his studies, chosen by Mr. Caswell; but from some mistake it was omitted, and Mr. Simson himself applied to Mr. Ditton. "He went to him, not as a scholar" (his own words), "but to have general information and advice about his mathematical studies." Mr. Caswell afterwards mentioned to Mr. Simson that he meant to have procured Mr. Jones' assistance if he had not been engaged.

In the following year the vacancy in the professorship of mathematics at Glasgow did occur, by the resignation of Dr. Robert Sinclair or Sinclare; and Mr. Simson, who was still in London, was appointed to the vacant chair. The minute of election, which is dated March 11, 1711, concluded with this very nice condition: "That they will admit the said Mr. Robert Simson, providing always that he give satisfactory proof of his skill in mathematics previous to his admission." Before the ensuing session at college he returned to Glasgow; and having submitted to the mere form of a trial, by solving a geometrical problem proposed to him, and also by giving "a satisfactory specimen of his skill in mathematics, and dexterity in teaching geometry and algebra;" having produced also respectable certificates of his knowledge of the science from Mr. Caswell and others, he was duly admitted professor of mathematics on the 20th of November of that year. The first occupation of Mr. Simson was to arrange a proper course of instruction for the students who attended his lectures, in two distinct classes; accordingly, he prepared elementary sketches of some branches, on which there were not suitable treatises in general use. But from an innate love for the science, and a deep sense of duty, he now devoted the whole of his attention to the study of mathematics; and though he had a decided preference for geometry, he did not confine himself to it, to the exclusion of the other branches of mathematical study, in most of which there is abundant evidence of his being well skilled.

From 1711 he continued for nearly half a century to teach mathematics to two separate classes, at different hours, for five days in the week, during a continued session of seven months. His lectures were given with such perspicuity of method and language, and his demonstrations were so clear and successful, that among his scholars several rose to distinction as mathematicians; among whom may be mentioned the celebrated names of Colin Maclaurin, Dr. Matthew Stewart, professor of mathematics at Edinburgh; the two Rev. Drs. Williamson, one of whom succeeded Dr. Simson at Glasgow; the Rev. Dr. Trail, formerly professor of mathematics at Aberdeen; Dr. James Moor, Greek professor at Glasgow; and Professor Robison of Edinburgh, with many others of distinguished merit.

In 1758 Dr. Simson, having arrived at the advanced age of seventy-one years, found it expedient to employ an assistant in teaching; and in 1761, on his recommendation, the Rev. Dr. Williamson was made his assistant and successor. For the last remaining ten years of his life he enjoyed a share of good health, and was chiefly occupied in correcting and arranging some of his mathematical papers; and sometimes, for amusement, in the solution of problems and demonstrations of theorems which had occurred from his own studies, or from the suggestions of others. Though to those most familiar with him his conversation on every subject seemed clear and accurate, yet he frequently complained of the decline of his memory, which no doubt protracted and eventually prevented him from undertaking the publication of many of his works, which were in an advanced state, and might with little exertion be made ready for the press. So that his only publication, after resigning his office, was a new and improved edition of Euclid's *Data*, which, in 1762, was annexed to the second edition of the *Elements*. From that period he firmly resisted all solicitations to bring forward any of his other works on ancient geometry, though he was well aware how much it was desired from the universal curiosity excited respecting his discovery of Euclid's *Porisms*. It is a matter of regret, that out of the extensive correspondence which he carried on through life with many distinguished mathematicians, a very limited portion only is preserved. Through Dr. Jurin, then secretary to the Royal Society, he had some intercourse with Dr. Halley and other celebrated men; he had also frequent correspondence with Mr. Maclaurin, with Mr. James Stirling, Dr. James Moor, Dr. Matthew Stewart, Dr. William Trail, and Mr. Williamson of Lisbon. In the latter part of his life his mathematical correspondence was chiefly with that eminent geometer the Earl of Stanhope, and with George Lewis Scott, Esq.

A life like Dr. Simson's, so uniform and regular, spent for the most part within the walls of a college, affords but little that is entertaining for the biographer. His mathematical researches and inventions form the important part of his history; and, with reference to these, there are abundant materials to be found in his printed works and MSS., which latter, by the direction of his executor, are deposited in the college of Glasgow.

Dr. Simson never was married; he devoted his life purely to scientific pursuits. His hours of study, of exercise, and amusement were all regulated with the most unerring precision. "The very walks in the squares or gardens of the college were all measured by his steps; and he took his exercises by the hundred of paces, according to his time or inclination." His disposition was by no means of a saturnine cast: when in company with his friends his con-

versation was remarkably animated, enriched with much anecdote, and enlivened also by a certain degree of natural humour; even the slight fits of absence to which he was sometimes liable contributed to the amusement of those around him, without in the slightest degree diminishing their affection and reverence which his noble qualities were calculated to inspire. At a tavern in the neighbourhood of his college he established a club, the members of which were, for the most part, selected by himself. They met once a week (Friday); and the first part of the evening was devoted to the game of whist, of which Dr. Simson was particularly fond; but though he took some pains in estimating chances, it was remarked that he was by no means fortunate in his play. The rest of the evening was spent in social conversation; and as he had naturally a good taste for music, he did not scruple to amuse his company with a song: and, it is said, he was rather fond of singing some *Greek odes*, to which modern music had been adapted. On Saturdays he usually dined at the village of Anderston, then about a mile distant from Glasgow, with some of the members of his regular club, and with other respectable visitors, who wished to cultivate the acquaintance and enjoy the society of so eminent a person. In the progress of time, from his age and high character, the company respectfully wished that everything in these meetings should be directed by him; and although his authority was somewhat absolute, yet the good humour and urbanity with which it was administered rendered it pleasing to everybody. He had his own chair and particular place at the table; he ordered the entertainment, adjusted the expense, and regulated the time for breaking up. These happy parties, in the years of his severe application to study, were useful relaxations to his mind, and they continued to amuse him till within a few months of his death. A mind so richly endowed by nature and education, and a life of strict integrity and pure moral worth, gave a correspondent dignity to his character, that even in the gayest hours of social intercourse the doctor's presence was a sufficient guarantee for attention and decorum. He had serious and just impressions of religion, but he was uniformly reserved in expressing particular opinions about it; he never introduced that solemn subject in mixed society; and all attempts to do so in his clubs were checked with gravity and decision. His personal appearance was highly prepossessing; tall and erect in his carriage, with a countenance decidedly handsome, and conveying a pleasing expression of the superior character of his mind. His manner was somewhat tinged with the fashion which prevailed in the early part of his life, but was exceedingly graceful. He enjoyed a uniform state of good health, and was only severely indisposed for a few weeks before his death, which took place on the 1st of October, 1768, in his eighty-first year. He bequeathed a small paternal estate in Ayrshire to the eldest son of his next brother, probably his brother Thomas, who was professor of medicine in the university of St. Andrews, and who was known by some works of reputation.

"The writings and publications of Dr. Robert Simson were almost exclusively of the pure geometrical kind, after the genuine manner of the ancients; but from his liberal education he acquired a considerable knowledge of other sciences, which he preserved through life, from occasional study and a constant intercourse with some of the most learned men of the age. In the Latin prefaces prefixed to his works, in which there are some history and discussion, the purity of the language has been generally approved." And many scholars have regretted that

he had not an opportunity, while in the full vigour of his intellect, and deeply conversant in Greek and mathematical learning, to favour the world with an edition of Pappus in the original language. He has only two pieces printed in the volumes of the *Philosophical Transactions*, viz.:—1. "Two General Propositions of Pappus, in which many of Euclid's Porisms are included," vol. xxxii. ann. 1723. These two propositions were afterwards incorporated into the author's posthumous works, published by Earl Stanhope.—2. "On the Extraction of the Approximate Roots of Numbers of Infinite Series," vol. xlviii. ann. 1753. His separate publications in his lifetime were:—3. *Conic Sections*, 1735, 4to. 4. *The Loci Plani of Apollonius Restored*, 1749, 4to. 5. *Euclid's Elements*, 1756, 4to, of which there have been since many editions in 8vo, with the addition of Euclid's *Data*. In 1776 Earl Stanhope printed, at his own expense, several of Dr. Simson's posthumous pieces. 1. *Apollonius' Determinate Section*. 2. *A Treatise on Porisms*. 3. *A Tract on Logarithms*. 4. *On the Limits of Quantities and Ratios*; and 5. *Some Geometrical Problems*. Besides these, Dr. Simson's MSS. contained a great variety of geometrical propositions, and other interesting observations on different parts of mathematics, but not in a state fit for publication. Among other designs was an edition of the works of Pappus, in a state of considerable advancement, and which, had he lived, he might perhaps have published. What he wrote is in the library of the college of Glasgow; and a transcript was obtained by the delegates of the Clarendon Press. To this university he left his collection of mathematical books, supposed to be the most complete in the kingdom, and which is kept apart from the rest of the library.

SINCLAIR, MISS CATHERINE. This lady, equally distinguished by her numerous writings and deeds of benevolence, was a daughter of the late Right Hon. Sir John Sinclair of Ulbster, Bart., and was born at Edinburgh in 1800. A pleasing picture has been given of the domestic education of Sir John's family, in which the delights of home and college life were happily blended together, and where each member advanced and animated the rest by intellectual trials and competitions. It was a course of home training in which their acquirements at the public school were developed and matured, and the mutual affection of the pupils strengthened. Under these circumstances Miss Catherine Sinclair naturally grew up into an authoress, and the first productions by which she distinguished herself were two volumes, the one entitled *Modern Accomplishments*, and the other *Modern Society*. In the first of these works she exposed with much wit and good humour and strong powers of delineation the prevalent absurdities of female education; and in the latter the characteristic sentiments and conversation among the circles of fashionable life. In these exposures of a vitiated taste which had effected a lodgment in the upper classes of society she could speak as one having authority, seeing she was a member of the community which she thus strove to enlighten. Both works were favourably received, and enjoyed an extensive circulation.

Having thus made a favourable commencement, Miss Sinclair's pen did not lie idle; and her other works followed as rapidly as if she had been an author by profession and from necessity, instead of writing with the sole desire of elevating and improving society. Her works were too numerous even to give their titles, they followed each other in rapid succession, and when collected they formed thirty-

seven volumes. We can only mention her *Hill and Valley*, *Scotland and the Scotch*, *Shetland and the Shetlanders*, *Modern Flirtations*, *Beatrice*, and *Holiday House*, the last being a work written for children, with whom it soon became a distinguished favourite, as it described in a truthful manner, and in language which they could understand, the feelings, tastes, and habits with which they are most conversant; and it now holds among them the same honoured place which Day's *Sandford and Merton* occupied among the children of the preceding generation. A proof of the popularity of Miss Catherine Sinclair's works in general was given by the fact, that they were as well known and as much in demand in the United States of America as in Britain, where they were sold not in thousands, but in tens of thousands. It has also been stated by the publishers, that the popularity of her *Beatrice* was even greater than that of *Uncle Tom's Cabin* in England, and that above 100,000 copies of it were sold in a few weeks. It is pleasing to add, that this universal welcome accorded to her productions was obtained without any such sacrifices as are too often made to conciliate the popular favour. "The main object of Miss Sinclair's writings," the narrative states from which we derive this short notice, "was not fame or profit, but usefulness. She adopted as her motto the saying of Sir William Temple, 'Of all the paper I have blotted, I have written nothing without the intention of some good.' Among her numerous publications there is not a single line which, on religious or moral grounds, she could have desired to obliterate."

But with all this amount of work, it was not merely, nor even chiefly, as an authoress that the useful life of Miss Sinclair was spent. She was essentially a woman of action as well as of studious habits, and her spirit of enterprise went out into fields from which the more fastidious of her sex would have turned away. While she therefore contributed to the charitable purposes of the day, she particularly devoted herself to those works of public utility which were greatly needed, but which as yet were uncared for, and for which her native Edinburgh afforded ample scope. She was the first to introduce cooking-dépôts into the city, where, for sums varying from 7d. to 3½d., the tradesman can obtain a comfortable dinner, and the poorest artisan an abundant meal; and thither many a poor student resorts whose narrow finances cannot obtain the luxury of regular cooking in his scantily-fitted attic. She erected the first public fountain in Edinburgh, at which both horse and driver can conveniently quench their thirst, and on which the graces of architecture added beauty to usefulness. She exerted herself in the erection of cab-stands, where drivers of cabs, while waiting for a fare, might stand under comfortable shelter, instead of shivering in the open-air, or having recourse to the dangerous refuge of the tap-room. And going higher still in her benevolent aspirations, she established a mission-station in a populous but neglected suburb of Edinburgh. These were but a few of her many endeavours to better the physical and social condition of the poor and the industrious. Some of them might appear sufficiently original or *outré*; but a glance at Miss Catherine Sinclair was enough to show that she would be no mere copyist, or afraid to follow out any plan of which her conscience approved.

After a long life of literary honour and public usefulness, this benevolent lady died at Kensington on the 6th of August, 1864.

SINCLAIR, GEORGE, a well-known mathematical writer, was professor of philosophy in the

university of Glasgow in the latter part of the seventeenth century. No particulars of his early life have been ascertained. He was admitted a professor of Glasgow university April 18, 1654,¹ and was ejected in 1662 for declining to comply with the Episcopal form of church government then thrust upon the people of Scotland. He had in the previous year published at Glasgow his first known work, "*Tyrolina Mathematica*, in Novem Tractatus, viz. Mathematicum, Sphericum, Geographicum, et Echometricum, Divisa," 12mo. After his ejection he betook himself to the business of a mineral surveyor and practical engineer, and was employed in that profession by several proprietors of mines in the southern parts of Scotland, and particularly by Sir James Hope, who, having sat in Barebones' parliament, was probably nowise averse to his Presbyterian principles. In 1669 he published at Rotterdam, *Ars Nova et Magna Gravitatis et Levitatis*, 4to. He was employed by the magistrates of Edinburgh about 1670 to superintend the introduction of water from Cormiston into the city—a convenience with which the capital of Scotland had not previously been furnished. Considerable attention seems to have been paid by him to such branches of hydrostatics as were of a practical nature; and it has been said that he was the first person who suggested the proper method of draining the water from the numerous coal-mines in the south-west of Scotland. In 1672 he published at Edinburgh a quarto, entitled "*Hydrostatics*; or, the Force, Weight, and Pressure of Fluid Bodies made evident by Physical and Sensible Experiments, together with some Miscellany Observations, the last whereof is a short History of Coal." And in 1680 he published at the same place, in 8vo, what appears to have been a modification of the same work, "*Hydrostatical Experiments*, with Miscellany Observations, and a Relation of an Evil Spirit; also a Discourse concerning Coal." Sinclair's writings, in the opinion of a very able judge, are not destitute of ingenuity and research, though they may contain some erroneous and eccentric views. The work last named contained a rather strange accompaniment to a scientific treatise—an account of the witches of Glenluce—which, if there had been no other evidence of the fact, shows the author to have not been elevated by his acquaintance with the exact sciences above the vulgar delusions of his age. It must be recollected, however, that other learned men of that age were guilty of like follies. The self-complacency of Sinclair and his Presbyterian principles provoked the celebrated James Gregory, then a professor at St. Andrews, to attack his *Hydrostatics* in a pamphlet published with the quaint title of the *Art of Weighing Vanity*, and under the thin disguise of Patrick Mather, archdeacon of the university of St. Andrews. It is curious to observe, that with all his eagerness to heap ridicule on his antagonist, Gregory never once touches on what would now appear the most vulnerable point—the episode about the witches. After a long interval Sinclair wrote an answer to Gregory, entitled "*Cacus pulled out of his Den by the Heels*, or the Pamphlet entitled the New and Great Art of Weighing Vanity examined, and found to be a New and Great Act of Vanity." But this production was never published: it remains in manuscript in the university library at Glasgow, to which the author appears, from an inscription, to have presented it in 1692. Sinclair was among the first in Britain who attempted to measure the heights of mountains by the barometer. It is said that Hartfell, near Moffat, was the first hill in Scot-

land of which the height was thus ascertained. In the years 1668 and 1670 he observed the altitudes of Arthur's Seat, Leadhills, and Tinto, above the adjacent plains. He followed the original mode of carrying a sealed tube to the top of the mountain, where, filling it with quicksilver, and inverting it in a basin, he marked the elevation of the suspended column, and repeated the same experiment below—a very rude method certainly—but no better was practised in England for more than thirty years afterwards. To the instrument fitted up in a frame Sinclair first gave the name *baroscope*, or *indicator of weight*—a term afterwards changed for *barometer*, or *measurer of weight*. In these rude attempts at measuring weights by the mercurial column the atmosphere was regarded simply as a homogeneous fluid, and possessing the same density throughout its whole mass—a supposition which, it is needless to point out, must have led the observer wide of the truth where the elevation was considerable.

The work by which Sinclair is now best remembered is his *Satan's Invisible Works Discovered*, which was published about the year 1685, and has since been frequently reprinted. This is a treatise on witches, ghosts, and diablerie, full of instances ancient and modern, and altogether forming a curious record of the popular notions on those subjects at the period when it appeared: it was for a long time a constituent part of every cottage library in Scotland. In Lee's *Memorials for Bible Societies in Scotland* is given the following decree of the privy-council in favour of Mr. Sinclair's copyright in this precious production: "Apud Edinburgh, 26 Feb. 1685. The lords of his majesties privy council considered an address made to them by Mr. George Sinclair, late professor of philosophie at the college of Glasgow, and author of the book entitled *Satan's Invisible Works Discovered*, &c., doe hereby prohibit and discharge all persons whatsoever from printing, reprinting, or importing into the kingdome any copy or copies of the said book, during the space of eleven years after the date hereof without licence of the author or his order, under the pain of confiscation thereof to the said author, besydes what further punishment we shall think fitt to inflict upon the contraveners." The first edition contains a very curious dedication to the Earl of Winton, not to be found in the rest, but which has been republished in the *Historie of the Hous and Name of Scoun*, printed by the Maitland Club.

It is curious to find science and superstition so intimately mingled in the life of this extraordinary person. In 1688 he published at Edinburgh, in 12mo, the *Principles of Astronomy and Navigation*. The only other publication attributed to him is a translation of David Dickson's *Truth's Victory over Error*. It is hardly possible to censure delusions which seem to have been entertained with so much sincerity, and in company with such a zeal for the propagation of real knowledge.

Mr. Sinclair was recalled at the Revolution to the charge from which he was expelled twenty-six years before. On the 3d of March, 1691, the faculty of the college revived the professorship of mathematics, which had been suppressed for want of funds; and at the same time appointed Mr. Sinclair to that chair. He died in 1696.

SINCLAIR, SIR JOHN, Bart. of Ulbster. Among the many benefactors of Scotland, whose labours were devoted to its agricultural improvement, we know of none who has surpassed, or even equalled, the subject of our present notice.

Sir John was born at Thurso Castle, in the county

¹ Records of the University.

of Caithness, on the 10th of May, 1754. He was the eldest son of George Sinclair of Ulbster, by his wife Lady Janet Sutherland, daughter of William Lord Strathnaver. George, the father, having died suddenly at Edinburgh in 1770, John Sinclair, then in his sixteenth year, succeeded to the family property, which, until he was of age, was superintended by his mother. Having received his early education at the high-school of Edinburgh, and under the direction of Logan, his tutor, afterwards author of *Runnymede*, he studied successively at the universities of Edinburgh, Glasgow, and Oxford. At Glasgow he was so fortunate as to be a pupil of Adam Smith, at that time professor of moral philosophy in the university, with whose acquaintanceship he was also honoured at this early period—and it may be that the bias of the future father of Scottish agriculture received its first impulses from his conversations with the author of the *Wealth of Nations*. The intellectual ambition of the young student's mind was also manifested at the age of fifteen among the printed columns of our periodicals. After he had completed his studies at Oxford, he turned his attention to law, not, however, to follow it as a profession, but to be aided by the light it threw on our national institutions. In 1775 he became a member of the faculty of advocates, and was afterwards called to the English bar. In the following year he married Sarah, only daughter and heiress of Alexander Maitland, Esq., of Stoke-Newington, Middlesex, by whom he had two daughters, one of them being Miss Hannah Sinclair, authoress of the excellent letters *On the Principles of the Christian Faith*; the other, Janet, who was married to Sir James Colquhoun, of Luss, Bart. In 1780 Mr. Sinclair was elected member of parliament for the county of Caithness, an honour which was repeated in the years 1790, 1802, and 1807. But as this county enjoyed the privilege of only an alternate representation, he was elected during the intervals for the boroughs of Lostwithiel in Cornwall, and Petersfield in Hampshire.

Mr. Sinclair had not been long in parliament when he began to take an active part in the important questions of the day. It was not, however, by mere forensic eloquence, for his strength did not lie in oratory; his reflective mind and profound calculations were better suited for the silence of the press than the arena of parliamentary debate. Accordingly, in 1782, he published a tract, entitled "*Lucubrations during a Short Recess; with some Thoughts on the Means of Improving the Representation of the People*." This work, upon a theme at that time so dreaded, excited great attention, and called forth not a few replies, among which especially was one from Lord Camelford. In the same year he published another pamphlet, entitled "*Thoughts on the Naval Strength of the British Empire*", in answer to the late Lord Mulgrave, one of the Lords of the Admiralty." At this time our warfare by sea was carried on with such timid caution, and our naval victories were so few, that the national faith in our "wooden walls" was sorely depressed; while Lord Mulgrave had predicted that, in the event of a continental peace, the united navies of France and Spain would be more than a match for that of Britain. Mr. Sinclair endeavoured to prove the superiority of our fleets above those of the enemy, and to explain the causes of that superiority; while the subsequent victories of Nelson showed that the argument was a sound one. Another tract which he published about the same period bore the title of *Considerations on Militias and Standing Armies*, and was the substance of those considerations upon the subject which he had brought before the ministers of the day. His

suggestions were favourably received, and some of the more important adopted. His last published production, during this stage of his authorship, was the *Propriety of Retaining Gibraltar impartially Considered*. This, like the foregoing tracts, was published without the author's name, and had the honour of being attributed to the first Lord Camelford.

It was not, however, with political authorship alone that Mr. Sinclair was wholly occupied at this season; for in 1782 a public emergency occurred that called forth the utmost of his philanthropic care. This was a season of famine in Scotland, on account of the lateness of the summer, so that, at the close of September, the oats and barley were still green, while, at the commencement of next month, the winter began with such sudden intensity, that both field and garden produce was blighted as in an instant; one night often sufficed to annihilate the subsistence of whole districts. In some parishes the oats were reaped or rather excavated from ice and snow in the middle of November, and in others so late as the following February. The consequence was, that many were obliged to kill their cattle, and eat the flesh without bread; many, who had no such resource, lived on soup made of nettles and snails, which were salted for winter sustenance; while the poor along the coasts were reduced to the insufficient diet of whelks, limpets, and other such shell-fish. This calamity, which bore hardest upon the north of Scotland, extended over several counties, and included a population of 110,000 souls. It was here that Mr. Sinclair bestirred himself; and not content with appeals to private philanthropy, he brought the subject before the House of Commons, by whom it was referred to a committee. No precedent as yet existed in the annals of the house for a parliamentary grant made upon such an occasion, but the emergency was unprecedented also. Accordingly, forms were waived, and a grant of money decreed in favour of the sufferers, by which their present wants were supplied, and the pestilential diseases attendant upon famine arrested. The obtaining of such relief for his suffering countrymen constituted a happy era in the public life of Mr. Sinclair; and he was often afterwards heard to declare, that no part of his parliamentary career had ever afforded him such intense satisfaction.

Having distinguished himself as an author upon miscellaneous questions of public interest, Mr. Sinclair was now to obtain reputation as a writer on the difficult subject of finance. The close of our war with America had been followed in Britain, as is usual at the close of all our wars, with a fit of economical calculation. The nation sat down to count the cost, and found itself of course on the brink of bankruptcy; and the murmur that rose was all the louder, as there was neither glory nor success as an offset to the expenditure. It was now demonstrated for the one hundred and fiftieth time, that Britain was ruined beyond recovery, and not a few of these gloomy reasoners were something better than mere political grumblers. While the public despondency was at the height, Mr. Sinclair's *Hints on the State of our Finances* appeared in 1783. The accurate calculations and masterly reasoning of this production convinced the reflective and cheered the despondent at home; while abroad, it disabused both friend and enemy of the conclusions they had formed upon the coming national insolvency. But it did more than this; it established his character so completely as a sound financier, that his advice was taken upon those measures by which the real evils of the present crisis were to be effectually averted. Such was especially the case when the extension of the banking

system in England was the subject of consideration. On this occasion he was consulted by Sir James Eisdale, the eminent London banker, to whom he recommended the system of the Scottish country banks, the nature and principles of which he fully and clearly explained. Sir James, on finding these so completely accordant with his own views, adopted them into his plan, and the result was, the establishment of twenty branch banks in the country in connection with his own house. The example was speedily multiplied, and banks were established in every part of England. But still, one important part of the Scottish system was omitted; this was the security which country banks are obliged to give for the paper money they issue—a wholesome check, by which dishonest speculation is cut short, and the risk of bankruptcy avoided. This part, so essential to public confidence in banking, was strangely dispensed with in the English system, notwithstanding Sinclair's earnest remonstrances with Mr. Pitt upon the subject; and hence the difference in the stability and efficacy of these English banks as contrasted with those of Scotland. An application which he soon after made on his own account to Mr. Pitt was better attended to: this was for the rank of baronet, to which he had a hereditary claim, as heir and representative of Sir George Sinclair of Clyth. The application was made in 1784, and in 1786 it was gratified more largely than he had expected; for not only was the title of baronet conferred upon him, but a reservation made of it in favour of the heirs-male of the daughters of his first wife, in the event of his dying without a direct representative.

The inquiries of Sir John Sinclair upon the subject of political economy, which he had hitherto turned to such useful account, were still continued, and in 1785 he published an essay *On the Public Revenue of the British Empire*. This was but the first and second parts of a series, of which a third appeared in 1790. But during the same year in which the first portion of the work was published, he sustained a heavy domestic affliction by the death of his wife, to whom he had been married eight years. So intense was his sorrow at this bereavement, that he had serious thoughts of resigning his seat in the House of Commons for Lostwithiel, and retiring into private life. Fortunately for his country he was persuaded to try the effects of travel, and accordingly he went over to Paris during the Christmas recess, where the society of this gay and intellectual capital not only tended to console his sorrow, but to animate him for fresh public exertion. It was no ordinary good fortune that led him to a city where a mind like his could associate in daily intercourse with such distinguished characters as Necker, Madame de Stael, and Madame de Genlis, of Joseph Montgolfier, Argand, and Reveillon. While he thus associated with the master-spirits of the practical and useful, he never lost sight of the welfare of his own country. In this way, having studied the machines for coinage invented by M. Droz, and used by the French government, he suggested their adoption to Mr. Bolton of Birmingham, by whom they were introduced into the British mint. Having learned from M. Clouet, the superintendent of the gunpowder manufactory of France, the mode of distilling that article in cylinders, by which a superior commodity was produced at less expense than the gunpowder in common use, he communicated the improvement to our own government, and soon had the satisfaction of seeing it adopted by the board of ordnance.

From France Sir John continued his route through Holland, Denmark, Sweden, Russia, Poland, Austria, and Prussia, where he had personal interviews

with the crowned heads of an age that has departed, but whose influence we still experience. Among these the most distinguished were the Emperor Joseph, the most hasty of reformers; Catherine, the Semiramis of the north; Stanislaus, the unfortunate minion-king of Poland; and the chivalrous but evildestined Gustavus III. of Sweden. But the men of those several dominions who most promoted the improvement of their respective countries were the principal objects of his solicitude; and with several of these he established a permanent correspondence, the chief subject of which was the improvement of European agriculture and commerce, and the extension of the comforts of life. In Germany his attention was especially directed to the manufactures of that country, and the causes of their success, by which he was enabled, at his return, to impart very valuable suggestions to the heads of our manufacturing departments. This long tour, comprising nearly 8000 miles, and accomplished without the aid of steam, was terminated in 1787. The fruits of his observations during these travels were afterwards fully communicated to the public in 1830, when, during his old days, he published, in two volumes, the interesting correspondence that had originated in his northern tour.

On his return to Britain, the first object of Sir John was the improvement of our national agriculture. It was not, however, by propounding theories and publishing books that this work in the first instance was to be accomplished. Instead of this, the barren waste must be reclaimed, the hard soil overturned with the ploughshare, and an expenditure of time, labour, and capital patiently endured, until the obstinacy of nature as well as the indolence of man were compelled into full activity, and the sterile surface covered with a profitable harvest. No one knew this better than Sir John Sinclair, and accordingly he had turned himself in good earnest, even at the early age of eighteen, to the self-denying labour of a practical teacher, by showing what could be done upon his own property. And, verily, this was no easy or hopeful task! His estate, consisting of 100,000 acres, comprised about a sixth of the county of Caithness. On these, besides a few large farms, there were about 800 or 900 small ones, cultivated according to the most unproductive modes of the Scottish husbandry of the day, and yielding a miserable rent, of which but a small part was money, while the rest was in grain, lamb, poultry, and other such produce. An English holder of Scottish acres thus surrounded on his first rent-day would have fled across the Tweed, and made no halt until he had reached the shelter of Middlesex. This fashion of rent payment, which had prevailed for centuries among a people the most tenacious of ancient usages, must be torn up root and branch before a step in advance could be won. Here, then, Sir John commenced with the improvement of agriculture in Caithness—and not only in Caithness, but Scotland at large, and finally in England also. Large farms were established, to which skill and capital were attracted by the prospect of a profitable return; and to set the example to their occupants, he took one of them, originally consisting of eight small farms, into his own hands. This, when brought into cultivation, he let at a moderate rent, after having allotted it into cottage-farms, where the tenants were induced to build comfortable houses, and carry out the improvements that had been already commenced. In this way the example was begun that soon gathered a population together, while villages and hamlets gradually rose up in those cultivated localities where subsistence and comfort were thus provided as the

reward of industry. Every tenant was bound down to a regular rotation of crops, to a certain annual amount of marling and liming, and to a certain amount as well as mode of occupation in the improvement of his farm. Every facility was also afforded to industry, by furnishing the small farmers with marl and lime at the cheapest rate, and the best seeds, especially of turnip, clover, and rye-grass; while instructions upon farming were readily communicated, and a spirit of active competition excited by the distribution of small premiums. Thus the old-established drawbacks in our agriculture were one by one removed. Each farmer was required to start with a capital, however small, instead of commencing on credit; to confine his cultivation to the extent he could manage, and do it well; to economize his labour so as to produce results with the least expenditure; and to aim continually at raising the best grain, and keeping the best stock. The old system of thirlage, also, or restriction to particular mills, as well as the other feudal services, were abolished, and the casting and drying of peats for fuel, which diverted the attention of farmers from their work, was superseded by the general introduction of coal. Such are but a few of those important principles which Sir John introduced into his system of land cultivation; and such an improvement of his Caithness property ensued as was enough to awaken the attention of the whole country. One specimen of this was afforded in the estate of Langwell, which he purchased for £8000, and improved so greatly, that he afterwards sold it for £40,000. But far beyond the benefit of a doubled or trebled rental was that of active industry and honourable enterprise, and intellectual and moral improvement, which were introduced among his numerous tenantry, who, though at first they went doggedly to work, were gradually animated with the conviction that work is the greatest of pleasure when something worth working for is to be gained. Produce being thus created, roads were needed for its conveyance as an article of traffic; but to make these in Caithness was a task of peculiar difficulty, as the soil chiefly consisted of peat or clay, while the materials for road-making were of too soft a quality. As no private fortune could have sustained the necessary outlay, and as the undertaking was a public benefit, Sir John invoked the aid of government, which was readily granted, and to such an extent, that in one day six miles of road were laid down along the side of Bennichiel Hill. In this manner highways were constructed for the heaviest waggons in places where hitherto every article, down to manure itself, had been conveyed upon the backs of horses.

It was not enough, however, that agriculture alone should be encouraged. Even the most active and industrious, if they find no outlet for their surplus produce, will labour for nothing more than the mere necessities of life, and thus speedily relapse into laziness. This Sir John knew well, and therefore the commercial as well as the agricultural prosperity of Caithness was the subject of his solicitude. The seas that begirt two-thirds of the promontory which is formed by the county, had hitherto hemmed in the people, and made the adjacent land rocky and sterile; but they abounded in fish for home or foreign consumption, and thus the water might be made as profitable as the land. Here, then, was another standing-place for his philanthropy. He obtained the re-establishment of the cod-fishery, which for many years had been almost abandoned. He supplied capital for the commencement of a herring-fishery upon the east coast of Caithness. He applied to government for aid in harbour extension, through

which the harbour of Wick was completed, and that of Thurso commenced. In this way the commerce of Caithness, hitherto unnoticed, now rose into distinction, and sent the produce of its agriculture and fisheries to the shores of the Baltic and the West Indies. A nucleus was needed for all this enterprise—a strong heart to concentrate and send forth this new circulation of vitality—and therefore a town adequate to such a task was forthwith in demand. For this purpose Sir John Sinclair selected the old town of Thurso as the germ of a new. In point of population it was little better than a third-rate English village, while its wretched houses were so irregular, and so huddled together, as to be too often mere receptacles for filth, discomfort, and sickness. But the locality was not only excellent for the fisheries, but for commerce, being within a few hours' sail of the German and Atlantic Oceans, with the communication of an excellent river. Sir John drew out the plan of the new town of Thurso. And there it stands, with its churches and schools, its market-places and warehouses, its shops and houses, and throngs of living beings—a something better far as a monument of departed worth, than the silent mausoleum, however stately its construction, or however flattering its epitaph.

In the agricultural improvements which Sir John Sinclair commenced in Caithness, the subject of sheep-farming occupied much of his thoughts. The greater part of his property was unfitted for the plough; but he had traversed too many mountainous countries not to know that mere surface can always be turned to some account. "Of all the means," he said, "of bringing a mountainous district to a profitable state, none is so peculiarly well calculated for that purpose as the rearing of a valuable breed of sheep. A small proportion alone," he added, "of such a description of country can be fit for grain; and in regard to cattle, for every pound of beef that can be produced in a hilly district, three pounds of mutton can be obtained, and there is the wool into the bargain." This plan he therefore introduced into his cottage farms, to which only two acres of arable land could be allotted, and with such success, that the spinning-wheel soon set those arms in motion that had hitherto rested a-kimbo; while good store of warm clothing in every cottage superseded the rags or the threadbare garments in which indolence had hitherto been fain to ensconce itself. But still, it was not enough for Sir John that the sheep naturalized among his people should possess the usual weight of fleece and nothing more, as long as one kind of wool was better than another. Could not the Cheviot sheep be made to live and thrive even in the hyperborean climate of Caithness? He propounded the idea and was laughed at for his pains. But of most men he was the least liable to be convinced or refuted by laughing, and therefore he commenced the experiment, and commenced it, as was necessary, on an ample scale. He sent a flock of 500 Cheviots to Caithness, under the care of experienced shepherds; and although the winter that followed was a severe one, they thrived even better than upon their native hills, so that his flock at length increased to 6000 sheep. After such success, Sir John turned his attention to the improvement of British wool in general. He saw that the wool of Britain had been gradually deteriorating, and that the importation of foreign sheep had yearly become more necessary, so that our national manufactures laboured under serious detriment. But why should the Shetland Islands the while produce fleeces of such soft and delicate texture? Surely this tempest-beaten Colchos of the north was not more highly favoured in soil or

climate than the hills of Lothian or the downs of Lancashire. Was not the evil we endured to be traced to our injudicious modes of feeding sheep upon turnips and other coarse articles of food, which had lately obtained among us? He must study, and obtain information at every point. So earnest was he, that he carried his inquiries into the General Assembly itself, to which he went as a lay member in 1791, and where he found a Shetland minister thoroughly conversant with the whole theory and practice of the growing of wool, by whom his conjectures were confirmed, and his views enlightened. He had previously laid his proposals before the Highland Society; but finding that they could not second his views from want of funds, he had resolved to institute a new society, that should have the improvement of British wool for its object. This was done accordingly at the beginning of the year; and to announce the purposes of the institution, and enlist the interest of the public in its behalf, a great inaugural meeting, called the Sheep-shearing Festival, was held at New Hall Inn, near Queensferry, on the 1st of July, 1791, at which seventy gentlemen and fifty ladies were present, attired in rich and gay costume, of which wool formed the principal ornament, while the grass plot of a neighbouring garden was covered with fleeces from different breeds and sheep of various countries; and to wind up the business of the day, this national gala was terminated with a due amount of eating, drinking, firing of guns, and dancing. It was a grand patriarchal festival of the primitive ages, with the usages and costume of the eighteenth century ingrafted upon it; and, as such, it was well calculated to pass off with *délat*, and be long remembered with pleasure by all who had shared in it or witnessed it.¹ And most diligently had the infant society already worked to deserve such a holiday; for, besides sending out inquiries into every district of the island respecting its woollen produce, and ascertaining the qualities of the different breeds of sheep, it had distributed throughout Scotland the choicest specimens of the Cheviot, and imported valuable additions from England, from France, and Italy, and even from Iceland, the East Indies, and Abyssinia.

The important objects of such an institution, and its results, suggested another, for a different but still more important department. This was the well-known Board of Agriculture. No one who has witnessed the relics of agricultural barbarism that still survive in Scotland, and more especially in England, can fail to be struck with the clamant necessity of its reform; in the one country an excess, and in the other a deficiency of means, was used to produce the same effect, from the slim wooden Scottish plough, drawn by a sheltie and held by a woman, to the huge earth-crusher of the fat fields of England, managed by a whole string of elephantine horses, superintended by two or more farm-servants. It was full time that a bold innovator should step forward; and from his past labours no one had a better right to assume such a dangerous office, or was better qualified to carry it into effect, than Sir John Sinclair. After much thought he published and circulated his plan, and on the 15th of May, 1793, he brought it, in the form of a motion, before the British parliament. The advantages to be derived from an agri-

cultural board were the following:—It would form a reservoir of agricultural intelligence, to which every inquirer might have access. By its surveys it would collect every fact or observation connected with the improvement of soil and live-stock. By its foreign correspondence it would gather and diffuse over the country a knowledge of those foreign improvements to which our untravelling yeomen and peasantry had no access. And, finally, it would be the means of obtaining a full statistical account of England, a work that had hitherto been attended with insuperable difficulties. These advantages he stated in bringing the measure before the house, and he suggested that the experiment should at least be tried for five years, with a grant from parliament of only £3000 per annum to defray its necessary expenditure, while the members of the board should give their services gratuitously. It was well that such a plan, which many stigmatized as utopian, was backed by all the influence of Mr. Pitt, without which it would probably have been unsuccessful. Perhaps it was equally fortunate that George III. was on the throne, that most agricultural of sovereigns, than whom, the poet tells us,

“A better farmer ne'er brush'd dew from lawn.”

The proposal for the establishment of the Agricultural Society was passed in the house by a majority of seventy-five, and the board was appointed and chartered by his majesty, Sir John himself being nominated its first president. As the society was composed of the highest in rank, wealth, talent, and enterprise, it commenced its operations with spirit and success. In a twelvemonth the agricultural survey of the country was completed. The waste lands and common fields were reported and marked out, an immense circulation of papers on the subject of agriculture effected, and a general interest kindled upon the subject, manifested by a new demand for every published work connected with farm and field operations. The results of this important movement constitute an essential chapter in the modern history of Britain. Such had been the zeal for manufactures and commerce, that the agricultural interests of the country, without which the former would soon lose half their value, had gradually been falling into neglect. But now, the one as well as the other was made the subject of parliamentary legislation and national interest. And even independently of the vast improvement effected upon every kind of husbandry, and increase of the means of subsistence, under the agency of this new institution, the survey of the country alone, which it had accomplished, would have been a national boon, well worth a greater amount of labour and expenditure. This estimate, upon the correctness of which the welfare and progress of a country so greatly depend, but which has always been attended with such difficulties as to make it in former times incorrect and unsatisfactory, even when persevered in to the close, was made by the society, under the directions of Sir John, so thoroughly, that at last the survey of the whole of Great Britain had been twice gone over, and was published in seventy octavo volumes.

We must now turn to a similar department in the labours of Sir John Sinclair, with which his and our own country of Scotland is more exclusively connected. It will at once be seen that we advert to his *Statistical Account of Scotland*. It was in May, 1790, the year previous to the establishment of the Society for the Improvement of British Wool, that he contemplated this great work. He was then a lay member of the General Assembly of the Kirk of Scotland. Such an account as he desired—so often

¹ The following characteristic incident is related by Miss Catherine Sinclair:—“In subsequent years Sir John, always desirous of exemplifying what energy can achieve in accelerating labour, caused one of his own sheep to be publicly shorn at a cattle show, after which the wool was spun, dyed, woven, and made into a coat, which he wore the same evening at a rural fête, which he gave to the assembled farmers and their families.”

attempted in other kingdoms, but hitherto so imperfectly—he saw could only be accomplished by hundreds of learned and talented men united in one aim, and working under the direction of one presiding mind. And where in Scotland could he find these so readily and so fully as in the General Assembly? Each of these men, too, was located in a particular district, with which he had better opportunities of being acquainted than any other resident; and thus the precise state of every parish throughout the length and breadth of Scotland could be obtained from its own minister. After having carefully deliberated his plan, Sir John, as was his wont, began the work in earnest. He drew up, in the form of a circular, a long list of queries upon the geography, natural history, productions, and population of the parish. These were followed by a copious addenda, in which every minute particular that a parish could possess was specified, and everything connected with its changes, history, and present condition. The towns were queried with the same minuteness, while the questions were adapted to the civic character and condition of each. These he transmitted to the ministers, and awaited their replies. The answers dropped in according to the readiness of the writers, and some of these were so regular and so full, that out of them he extracted and published a specimen volume, containing the account of four parishes, a copy of which he sent to the other clergymen, by way of directing and stimulating them in the work. This was in the beginning of 1791, and by the middle of the year his materials had so much increased, that he was enabled, although with great personal study and exertion, to publish, by the middle of the year, the first volume of the *Statistical Account of Scotland*. Even this, though but a commencement, was a great achievement. When he first proposed his plan, men were astonished that he should undertake, and that too with the hope of success, a work which the wealth of kings, the decrees of senates, and even the authority of despots, had hitherto failed to effect; and prophecies of utter discomfiture, mingled with ridicule of the attempt, were loud and frequent from every quarter. But the volume which now appeared, so superior to every former undertaking of the kind, quickly drowned their murmur in universal approbation; and the appearance of the second, which soon followed, increased the public feeling, on account of the greater interest of the materials with which it was filled.

But let no man say that in every case the beginning is more than the half: in those bold and generous undertakings that transcend the spirit of the age the undertaker often finds that the beginning is less than nothing, from the failure and disappointment that follow. With this Sir John was soon threatened, in consequence of the shortcomings of his assistants. The most enthusiastic had been first in the field, and had already tendered their contributions: but these were few compared with the hundreds that still hung back. Many of the clergymen having, in the first instance, predicted that such a work could never go on, were unwilling to falsify their vaticinations. Many were but new entrants into their parishes, while not a few were old men, ready to leave them, and willing to spend the remainder of their days in quiet. Besides, the task of collecting information was not always pleasant in districts where such queries were suspected as the prelude of a rise of rent from their landlords or a fresh tax from government. Where an unpleasant work is extended over a whole class of men, and where the performance is wholly voluntary, we know with what adroitness each individual can find an excuse for withholding

his expected quota. This Sir John experienced when, after waiting a twelvemonth in expectation, he found, by the middle of 1792, that he was still 413 parishes short of the mark. But “despair” was not a word in his vocabulary. About the period of commencement a plan had been formed in Scotland to establish the “Society for the Benefit of the Sons of the Clergy,” and Sir John had arranged that the profits of the *Statistical Account* should be devoted to that purpose, while his application, through Lord Melville, in behalf of the society, obtained for it a royal grant of £2000, by which it was enabled to commence its operations much sooner than had been anticipated. He also obtained a recommendation of his undertaking from the General Assembly at large, while its most eminent leaders, Principal Robertson, Sir Henry Moncreiff Wellwood, Dr. Blair, and Dr. Hardie, bestirred themselves personally with their brethren in its behalf. And yet it flagged—for it was now the residue that had to be spurred into action, after the bold and brave had done their duty. Finding at last that better might not be, he appointed five statistical missionaries over as many of the more remiss districts, including the Western and Orkney Islands, and by these means twenty-five parishes were added to the list. And now all his material was in readiness; the whole of Scotland lay piled up in his study in the form of a mountain of manuscript, upon which he commenced his beloved work of arranging, classifying, and editing. But, lo! twelve whole parishes had disappeared! He had received them, as he thought, but now they were nowhere to be found. The omission of twelve such links reduced the whole chain to as many fragments. After he recovered from his consternation—and it was such as he had never experienced during the whole of this Herculean labour—he set to work anew, and gave himself no rest till the deficiency was repaired. The task was finished on the 1st of January, 1798, seven years and a half from the period of its commencement, and was comprised in twenty thick volumes octavo, to which another was subsequently added. Had he done nothing more, the toil he endured and the difficulties he had surmounted in such an undertaking, would have insured him the testimony of a well-spent life, both from contemporaries and posterity.

It would be difficult to describe the wonder and delight with which the *Statistical Account of Scotland* was hailed at its completion. How one man—and he a private individual—should have achieved such a task, and achieved it so thoroughly, appeared a miracle. His simple but admirable plan of engaging the whole national clergy in the work, the happy adaptation they had shown for it, and his untiring energy as well as skill in procuring, arranging, and adapting the materials, were each made the subject of congratulation and applause. It was not alone to Britain that these feelings were confined; it was regarded as a MODEL BOOK OF THE NATION for every country in Europe, and as such it was lauded by their most distinguished statesmen and rulers. The 900 ministers, also, by whom, with but a few exceptions, the labours of Sir John Sinclair had been so ably seconded, were not neglected; for besides the honour which this great national production reflected upon them as a body, not only in England but throughout Europe, and the royal grant by which the Society for the Sons of the Clergy had been so highly benefited, it went far, also, to procure for them that parliamentary assistance by which the many miserably small livings in the church were raised into charges of comfort and respectability. Attention was also called by the *Statistical Account* to the scanty

salaries of schoolmasters, which in many cases were improved, and to several oppressive feudal rights, which were speedily abolished.

The year 1793 will always be remembered in the mercantile history of Great Britain as a season of panic. Failures were frequent, public confidence was at a pause, and national bankruptcy apprehended even by the least despondent. To avert this emergency by the restoration of mercantile credit, Sir John Sinclair suggested to Mr. Pitt the issue of exchequer bills—and in a happy moment the suggestion was adopted. By this remedy the panic was stilled, and our great mercantile institutions restored to full activity. In the transmission of this government relief for Scotland, it was of great importance to Glasgow that its share should reach the city before a certain day; and aware of this important fact, Sir John plied the exchequer agents so urgently, that, contrary to all expectation, the money was sent within the critical period. On the same evening he repaired to the House of Commons, and meeting with Pitt, he intended to explain to him how it had been accomplished; but the premier, mistaking his drift, interrupted him with "No, no, you are too late for Glasgow; the money cannot go for two days." "It is gone already," was Sir John's laughing reply; "it went by the mail this afternoon." Glasgow can well comprehend the mercantile value of time in such a case, and the debt of gratitude it owes to the memory of Sir John Sinclair. But he was not contented with suggesting a relief merely for the crisis; his wish was to prevent a reaction, by compelling bankers to find security for their notes, and thus to limit the issue within the power of payment. To this, however, the minister would not, or perhaps we might say more correctly *could* not, accede, as he had the whole banking interest against the measure. Matters went on as before, and thus the calamity, which Sir John foresaw, and had striven to prevent, returned in 1797, when the country was compelled to impose restrictions on cash payments. Sir John once more interposed to establish the system of licensing country bankers, but was again defeated, through the selfishness of those whose interests were bound up in the old system of unlimited banking.

In looking back upon the preceding events of Sir John Sinclair's life, it is impossible not to be struck with the energy that could plan, and activity that could execute, such a variety of important undertakings. He was the Napoleon of peace—if such an epithet may be permitted—incessantly daring, doing, and succeeding, and always advancing in his career, but leaving at every step a token of his progress in the amelioration of some general evil or the extension of a public benefit. The welfare of his numerous tenantry in Caithness, the improvement of British wool, the improvement of agriculture, the drawing up of the *Statistical Account of Scotland*—all these labours pressing upon him at one and the same time, and each sufficient to bear most men to the earth, he confronted, controlled, and carried onward to a prosperous issue. And with all these duties his senatorial avocations were never remitted, so that his attendance upon the House of Commons was punctual, and his support of no little weight to the leading statesmen of the day. He had to add to his many avocations that of a soldier also. In 1794, when the wars of the French revolution were shaking Europe with a universal earthquake, and when Britain was summoned to rally against the menaces of invasion, it was necessary that every one who could raise a recruit should bring him to the muster. Sir John's influence in this way as a Highland landlord was justly calculated, and accordingly it was

proposed to him by Mr. Pitt to raise a regiment of fencibles among his tenantry for the defence of Scotland. Sir John acceded at once, and agreed to raise, not a regiment, but a battalion, and that too, not for service in Scotland only, but in England also. He accordingly raised, in the first instance, a regiment of 600 strong, consisting of the tall and powerful peasantry of Caithness, clothed in the full Highland costume, and headed by officers, nineteen of whom were above six feet high, and therefore called among their countrymen the *Thier-nan-more*, or "Great Chiefs," with himself for their colonel. This was the first regiment of the kind that served in England, such services having hitherto been confined to Scotland alone. In the spring of the following year he raised a still larger regiment, consisting of 1000 men, equally well appointed, who were destined for service in Ireland. Sir John's post was Aberdeen, in command of the encampment raised there in 1795 for the purpose of defending the town against the threatened invasion from Holland. A camp life is idle work at the best; but Sir John contrived to find in it the materials of activity, by the care which he took of the health, comfort, and efficiency of his soldiers. After studying the modes of living in his own encampment, and making these the data of his arguments, he also drew up a tract suggesting improvements in the mode of camp-living in general. The alarm of invasion passed away, but owing to the dearth by the failure of the crops in 1795, the services of Sir John and his agricultural board, in their proper capacity, were called into full exercise in the following year. He recommended in parliament the cultivation of waste and unimproved lands, and procured the passing of a bill by which linseed or oil-cake and rape-cakes were allowed to be imported in British vessels free of duty. This last appeared but a paltry permission at the time, the articles in question being little known in our husbandry; but a far different opinion now prevails, from their extensive use in British agriculture.

After this period we find Sir John fully occupied with the commercial, financial, and agricultural interests of the country, and always upon the alert for their improvement. One of his proposals was such as no mere hunter after political popularity would have ventured. From the surveys of the board of agriculture he had found that nearly 7,000,000 of acres lay as yet uncultivated in England; and he brought before parliament a "general bill of inclosure," by which these lands, held in common, should be inclosed for cultivation. But against this measure there was such an opposition among all classes, from the tourist to the tinker, that although the bill passed through the House of Commons it was thrown out by the Lords. Still, the discussion had awakened general attention, and prepared the way for private enterprise. Another subject that again occupied his attention was our national finance, upon which he had already written a work in two separate parts, to which a third was added in 1790. The whole, with many additions and improvements, was finally published in three octavo volumes, under the title of a "*History of the Public Revenue of the British Empire*, containing an Account of the Public Income and Expenditure, from the Remotest Periods recorded in History to Michaelmas, 1802." In two years this work passed through three editions, and was regarded as an authority and text-book in both houses of parliament. The income-tax, and the redemption of the land-tax, two questions at this period under discussion, also occupied Sir John's attention; and in parliament he strongly advocated the necessity of a paper instead of a metal currency.

He was also opposed to free-trade, already a great popular question; and held—as many still do with all the advantages of practical experience—that “no country can be happy at home, or powerful abroad, unless it be independent of other countries for circulation and sustenance.”

After so much labour, it is not to be wondered at that, toward the close of the century, Sir John's health began to decay. Already he had only reached the prime of manhood, and was distinguished by temperate and active habits; but he felt as if the shadows of a premature old age were coming upon him while his sun had scarcely passed the hour of noon. Most people in such cases resign themselves as to a dire necessity, and forsake the bustle of public life for the charms of an easy chair and home enjoyment. But Sir John had no idea of such selfish resignation; and though he knew as well as any man that he “owed Heaven a death,” still he also felt that “it was not due yet,” and that he was bound to work on until his Master called him home. The subject therefore of health, in relation to longevity, occupied his researches; and the result, in the first instance, was a pamphlet, which he published in 1803, entitled *Hints on Longevity*. His strict attention to the rules which he recommended in this production seems to have renewed his lease of life, so that he started upon a fresh occupancy of more than thirty years. At the close of this century, also, his reputation was so completely European, that the fellowships of societies and diplomas of universities had been sent to him from almost every country, while the general sense entertained of him abroad was thus aptly stated by Bottinger, in the *Jena Universal Literary Gazette* of June, 1801: “To whom is Scotland indebted for the attempt to purify her language? Who has exhibited the English finances in the clearest manner and on the surest basis? Who has erected for Europe a model of statistical information, and carried it the length of twenty volumes in the face of all difficulties? Who has created a centre for Great Britain's best and dearest interests—her agricultural produce? Who has provided the means of improvement for a chief staple of England—her wool? Who has toiled most earnestly for converting waste land into fertile fields and inclosing dreary commons? And who has essentially opposed the inveteracy of bad habits, and the indolence of traditional customs, even among our farmers? To whom do we owe this, and more? All this, we must own, we owe to Sir John Sinclair, and almost to him alone.”

The investigations of Sir John on the subject of health, with reference in the first case to himself, had been so beneficial to others, by the publication of his pamphlet on *Longevity*, as farther to interest his benevolence; and he resolved to continue his inquiries into the subject. The result was his *Code of Health and Longevity*—a work in four volumes octavo, which was published at Edinburgh in 1807. It comprised an enormous amount of reading, subjected to his favourite processes of analysis and arrangement. His friends were alarmed at this new adventure, and thought that after obtaining such distinction in other departments, he should have left the physicians in possession of their own field. The latter also were wroth at his entrance, and rose in a body to drive the intruder from their premises. It is a grievous offence in their eyes that one even of their own order should betray the sacred mysteries of healing to the uninitiated; but that it should be done by a knight, statesman, financier, and agriculturist, who ought therefore to know little or nothing of the matter, was a monstrous trespass, for which

no punishment could be too great. The faculty took up their pens, and few medical prescriptions could be more bitter than the criticisms they emitted as an antidote to the *Code*. But it was an excellent code notwithstanding, and the rules of health which he had gathered from every quarter were founded upon the principles of temperance and active exertion, and tested by common sense and long-confirmed experience. Not only individuals but communities were considered, and not one, but every class, could find in it directions, not merely for the recovery, but the preservation of a sound, healthy temperament. To sedentary persons of every kind, to students, and to hypochondriacs, this work was especially useful; and such, by attending to his simple directions, could not only hold despondency and dyspepsia in defiance, but retain that *mens sana in corpore sano* which is so often sacrificed as the price of their occupation.

The *Code of Longevity* was followed by another of a different description: this was the *Code of Agriculture*, which Sir John published in 1819. For this, in truth, there was much need. The Agricultural Society had done much, in multiplying, to an almost indefinite extent, the results of their inquiries and discoveries in the cultivation of the soil and improvement of live-stock; but these were scattered over such a vast extent of publication as to be inaccessible to those who most needed such instruction. Few farmers, few even of our country gentlemen “who live at home at ease,” could be expected to pursue their researches in agricultural improvements through forty-seven octavo volumes, in which the English county reports were comprised, and the thirty which contained those of Scotland, besides seven volumes more of communications from correspondents. It was necessary that the pith of this huge mass should be so concentrated as to be both accessible and intelligible to general readers. This was suggested by Sir Joseph Banks, who, in writing to Sir John Sinclair upon the subject, stated “that an account of the systems of husbandry adopted in the more improved districts of Scotland would be of the greatest advantage to the agricultural interests of the United Kingdom; and that it was incumbent upon a native of Scotland, while presiding at the board of agriculture, and possessing all the means of information which that situation afforded, to undertake the task.” All this was true—but what a task! This was fully explained by Sir John in his excuse for declining the attempt: but Sir Joseph Banks would not be thus satisfied; and he returned to the charge, declaring “that agriculture has derived, is deriving, and will derive more benefit from Scottish industry and skill, than has been accumulated since the days when Adam first wielded the spade.” Having allowed himself to be persuaded, Sir John Sinclair went to work, and not content with the voluminous materials already on hand, he visited every district noted for the cultivation both of heavy and light soils, and scattered queries in all directions among the farmers respecting their best processes of cultivation. It was no wonder that this labour occupied as long a period as the siege of Troy; so that, although it commenced in 1809, it was not finished until 1819. Three editions of the *Code of Agriculture* have since appeared; it was also published in America, and translated into the French, German, and Danish languages. One of these translators, M. Mathieu Dombasle, of Lorraine, the most distinguished agriculturist of his nation, thus correctly characterized the work in a letter to Sir John:—“I have been for some time occupied in translating your excellent *Code of Agriculture*. If anything can contribute to raise agriculture in France to the rank of a science, which we

could not till now pretend to do, it will certainly be the publication of this work in France, being the most systematic, the most concise, and, in my opinion, the most perfect which has hitherto been written in any language."

From the foregoing account, in which we have endeavoured to present the beneficent and most valuable exertions of Sir John Sinclair in an unbroken series, it must not be thought that his career was without interruption. Had he escaped, indeed, the obloquy and opposition that have ever requited the great benefactors of mankind, he would have formed a singular exception to that universal rule which has prevailed from the days of Triptolemus to our own. His first annoyance was from Pitt himself, once his attached friend, but finally alienated from him upon certain great political questions of the day. It was strange that this should react upon him as president of the agricultural board, from which all political resentments ought to have been excluded. But his sentiments upon such questions as the Warren Hastings trial, the government of Ireland, and the Westminster scrutiny, were destined to unseat him from a chair which he had so nobly filled, and that too of a society that owed its very existence to himself. And where was another to be found that could occupy his room? But upon such a question political resentment seldom condescends to pause; and after he had been for five years chairman of the board of agriculture, another was proposed, and chosen by a majority of one. This new election was made in favour of Lord Sommerville, who assumed the appointment with reluctance, while the public were indignant at the movement. Thus matters continued for eight years, when Sir John was restored to his proper office—an unsalaried office, that not only involved much labour, but personal expense to boot. This Sir John felt in weary days of anxiety and toil, and such a diminution of his private fortune, that in 1813 he was obliged to resign it. Two years before this took place he was appointed cashier of excise for Scotland, in consequence of which he resigned his seat in parliament. He had previously, in 1810, been raised to the rank of a privy-councillor. On his resignation of the presidency of the board of agriculture, an event justly deemed of the highest national importance, in consequence of his great public services during forty years, many a grateful survey of his past life was made, and the worth by which it had been distinguished was affectionately commemorated.

Although the remainder of Sir John Sinclair's life was equally distinguished by active enterprising usefulness, our limits permit nothing more than a hasty summary of its chief events. In 1814 he made an excursion to the Netherlands, being his fourth visit to the Continent, and on this occasion his object was to examine the comparative prices of grain in Great Britain and the continental countries, and ascertain the best means of putting a stop to inequality of price for the future. He then passed over to Holland, to investigate the management of the Dutch dairies, so superior in their produce to those of other countries. The escape of Napoleon from Elba interrupted his farther progress, and on returning to England he published his *Hints on the Agricultural State of the Netherlands compared with that of Great Britain*; in which he explained at full the improvements of foreign agriculture, for the imitation of British farmers. After the battle of Waterloo Sir John revisited Holland and the Netherlands, and afterwards France, where he made a close agricultural inspection of its provinces; but the minute subdivision of landed property in that country gave him

little hope of the improvement of French agriculture. On his return to England he saw, with much anxiety, the sudden recoil which peace had produced in our trade, commerce, and agriculture, and carefully sought for a remedy. The result of his speculations was a pamphlet, which he published in October, 1815, entitled "*Thoughts on the Agricultural and Financial State of the Country, and on the Means of Rescuing the Landed Farming Interests from their Present Depressed State.*" These evils he traced to the return of peace prices of produce, while war taxes were continued; and the remedy he proposed was an increase in the currency, a bounty on exportation, and public loans for the benefit of landlord and tenant.

In passing on to 1819 we find Sir John Sinclair as busy as ever, and employed in the way most congenial to his intellectual character. This was the task of code-making, which he was anxious to apply to matters still more important than those that had hitherto been subjected to his industry. He contemplated a great work, to be entitled *A Code or Digest of Religion*, in which the mind of the reader was to be led, step by step, from the first simple principles of natural religion, to the last and most profound of revelation. This plan, of which he sketched the first portion, and printed for private distribution among his friends, he was obliged to lay aside, in consequence of the more secular public questions that were daily growing and pressing upon his notice. His theory, however, was afterwards realized in part by other agencies in the *Bridgewater Treatises*. Another printed paper which he circulated among his friends, was *On the Superior Advantages of the Codean System of Knowledge*. It was his wish that every department of learning, science, and literature, hitherto spread over such a boundless field, and so much beyond the reach of common minds, should be collected, condensed, and simplified for the purposes of general instruction—and for this purpose to associate the learned and talented of every country "for the collection and diffusion of useful knowledge." We know how ably this plan was afterwards taken up, and realized by a mind well fitted for such a task. From these theories for the elevation of human character, Sir John again turned to the improvement of sheep and oxen, of which he had never lost sight since his great sheep-shearing festival of 1792; and in 1821 he proposed the plan of sheep and cattle shows to the Highland Society. This time the proposal was favourably received, and forthwith put into practice, so that the first annual show of this society was held in Edinburgh at the close of 1822, while the prizes, appointed according to his suggestion, for the best specimens of sheep, cattle, breeding-stocks, seeds, and agricultural implements, excited a spirit of ardent industrious competition over the whole kingdom. So great a machinery having thus received such an impetus as secured the easy continuance of its motion, Sir John returned to the other manifold subjects of his solicitude, and with such diligence, that after the year 1821 thirty pamphlets and tracts issued from his pen, besides many others whose authorship has not been traced. These, as might be expected, were chiefly connected with finance and agriculture. The proof-sheet of the last of these tracts, bearing the date of 1835, contains additions and corrections written in his own hand, but so tremulous and indistinct as to be almost illegible. The brain that had never rested, the hand that never was folded in idleness, the heart that had never been weary of well-doing, were all alike to be stilled; and these were the tokens of the final effort; the last throb, after which

all was to be the wondrous change of motionless silence and repose.

The last illness of Sir John occurred on the 15th of December, 1835, when he was in the eighty-second year of his age. Its approach was sudden, as only the day previous he had taken a long drive, and conversed cheerfully with his friends. It was the rapid collapse of a healthy old age, in which our patriarchs are frequently removed from the world without sickness or suffering, rather than a regularly formed disease; and in this way Sir John lingered for a few days, and expired on the 21st.

Sir John Sinclair was twice married. By his first wife, as has been already mentioned, he had two daughters. By his second marriage, in 1788, to Diana, daughter of Alexander Lord Macdonald, he had thirteen children, of whom seven were sons. He was succeeded in the baronetcy by his eldest son, Sir George Sinclair, the late member for the shire of Caithness.

SKINNER, REV. JOHN, the well-known author of several popular poems, and of an ecclesiastical history of Scotland, was born at Balfour, in the parish of Birse, Aberdeenshire, October 3, 1721. His father was schoolmaster of that parish, and his mother was the widow of Donald Farquharson, Esq., of Balfour. Having in boyhood displayed many marks of talent, he was placed at thirteen years of age in Marischal College, Aberdeen, where his superior scholarship obtained for him a considerable bursary. After completing his academical education, he became assistant to the schoolmaster of Kenmay, and subsequently to the same official at Monymusk, where he was so fortunate as to gain the friendship of the lady of Sir Archibald Grant. The library at Monymusk House, consisting of several thousands of well-selected works, in every department of literature, was placed by Lady Grant at his command, and afforded him better means of intellectual improvement than he could have hoped for in any other situation. He now found reason to forsake the Presbyterian Establishment, in which he had been reared, and to adopt the principles of the Scottish Episcopal Church, of which he was destined to be so distinguished an ornament. After spending a short time in Shetland as tutor to the son of Mr. Sinclair of Scalloway, and marrying the daughter of Mr. Hunter, the only Episcopal clergyman in that remote region, he commenced his studies for the church; and, having been ordained by Bishop Dunbar of Peterhead, was appointed, in November, 1742, to the charge of the congregation at Longside, over which he presided for sixty-five years, probably without a wish to "change his place." Of the severities with which the Episcopal clergy were visited after the rebellion of 1745 Mr. Skinner bore his full share. His chapel was one of those which were burned by the ruthless soldiers of Cumberland. After that period, in order to evade an abominable statute, he officiated to his own family within his own house, while the people stood without, and listened through the open windows. Nevertheless, he fell under the ban of the government for having officiated to more than four persons, and was confined for that offence in Aberdeen jail, from May 26th to November 26th, 1753. This was the more hard, as Mr. Skinner was by no means a partisan of the Stuart family.

Mr. Skinner's first publication was a pamphlet, entitled *A Preservative against Presbytery*, which he published in 1746, to reassure the minds of his people under the alarming apprehension of the total extirpation of Scottish Episcopacy. In 1757 he published at London a *Dissertation on Job's Prophecy*,

which received the high approbation of Bishop Sherlock. In 1767 he published a pamphlet, vindicating his church against the aspersions of Mr. Sieve-wright of Brechin. The life of this good and ingenious man passed on in humble usefulness, cheered by study and by the cultivation of the domestic affections. His home was a small cottage at Lins-hart, near Longside, consisting simply of a kitchen and parlour, the whole appearance of which was, in the highest degree, primitive. Here, upon an income resembling that of Goldsmith's parson, he reared a large family, the eldest of whom he had the satisfaction to see become his own bishop long before his decease. His profound biblical and theological knowledge is evinced by his various works, as collected into two volumes, and published by his family. The livelier graces of his genius are shown in his familiar songs—"Tullochgorum;" "The Ewie wi' the Crookit Horn;" "O why should Old Age so much wound us, O?" &c. In 1788 he published his *Ecclesiastical History of Scotland*, in which an ample account is given of the affairs of the Episcopal church from the time of the Reformation till its ministers at length consented, on the death of Charles Stuart, to acknowledge the existing dynasty. This work, consisting of two volumes octavo, is dedicated *Ad Filium et Episcopum*, to his son and bishop. It may be remarked that he wrote Latin, both in prose and verse, with remarkable purity.

In 1799 Mr. Skinner sustained a heavy loss in the death of Mrs. Skinner, who for nearly fifty-eight years had been his affectionate partner in the world's warfare. On this occasion he evinced the poignancy of his grief, and the depth of the attachment with which he clung to the remembrance of her, in some beautiful Latin lines, both tenderly descriptive of the qualities which she possessed, and, at the same time, mournfully expressive of the desolation which her departure had caused. Till the year 1807 the even tenor of the old man's course was unbroken by any other event of importance. In the spring of that year, however, the scarcely healed wound in his heart was opened by the death of his daughter-in-law, who expired at Aberdeen, after a very short but severe illness. Each by a widowed hearth, the father and son were now mutually anxious that what remained of the days of the former should be spent together. It was accordingly resolved that he should remove from Lins-hart, and take up his abode with the bishop and his bereaved family. To meet him, his grandson, the Rev. John Skinner, minister at Forfar, afterwards Dean of Dunblane, repaired, with all his offspring, to Aberdeen. This was in unison with a wish which himself had expressed. To use his own affecting language, it was his desire to see once more his children's grand-children, and peace upon Israel.

On the 4th of June he bade adieu to Lins-hart for ever. We may easily conceive the profound sorrow which, on either side, accompanied his separation from a flock among whom he had ministered for sixty-five years. He had baptized them all; and there was not one among them who did not look up to him as a father. After his arrival in Aberdeen, he was, for a week or ten days, in the enjoyment of his usual health. Surrounded by his numerous friends, he took a lively interest in the common topics of conversation; sometimes amusing them with old stories, and retailing to them anecdotes of men and things belonging to a past generation. Twelve days after his arrival he was taken ill at the dinner-table, and almost immediately expired. He was buried in the churchyard of Longside, where his congregation have erected a monument to his

memory. On a handsome tablet of statuary marble is to be seen the simple but faithful record of his talents, his acquirements, and his virtues.

SMELLIE, WILLIAM, an eminent naturalist and useful miscellaneous writer, was born in Edinburgh about the year 1740, being the son of Mr. Alexander Smellie, a builder, who belonged to the stricter order of Presbyterians, and was the constructor of the martyrs' tomb in the Grayfriars' Churchyard. William Smellie received the rudiments of his education at the parish school of Duddingston, and, though destined for a handicraft profession, was afterwards for some time at the high-school of Edinburgh. His father at first wished to apprentice him to a stay-maker, but the business of a printer was ultimately preferred, and he was indentured to Messrs. Hamilton, Balfour, and Neil, then eminent professors of that art in the Scottish capital. While yet very young, he had the misfortune to lose his father; but the exemplary conduct of the young printer soon placed him above the necessity of depending upon others for his subsistence. Every leisure moment was devoted to study or literary pursuits; and only a few years of his apprenticeship had elapsed when he was appointed by his employers to the responsible office of corrector of the press, with a weekly allowance of ten shillings, instead of his stipulated wages of three shillings. Instead of wasting his earnings on frivolity or dissipation, young Smellie took the opportunity of attending a regular course of the university classes. The result of this was soon evidenced by his producing an edition of *Terence*, in duodecimo, wholly set up and corrected by himself; which Harwood, the philologist, declares to be "an immaculate edition;" and which gained to his masters an honorary prize, offered by the Edinburgh Philosophical Society, for the best edition of a Latin classic. Upon the expiry of his indentures, Mr. Smellie, then only nineteen years of age, accepted employment from Messrs. Murray and Cochrane, printers in Edinburgh, as corrector of their press, and conductor of the *Scots Magazine*, a work published by them, and which, begun in 1739, kept a conspicuous station in the literary world for a long time. For these duties, besides setting types and keeping accounts "in cases of hurry," Mr. Smellie at first received the sum of sixteen shillings per week. Notwithstanding, however, his severe professional labours, he still prosecuted his classical studies with great ardour; and nothing perhaps can better illustrate the self-tasking nature of Mr. Smellie's mind than the fact that he instructed himself in the Hebrew language, solely that he might be thereby fitted for superintending the printing of a grammar of that tongue, then about to be published by Professor Robertson. It appears that about this time he was strongly disposed to renounce his mechanical employment, and adopt one of the learned professions, having already almost fitted himself either for that of medicine or theology. But prudential motives, induced by the certainty of a fixed source of emolument, determined him to adhere to the business of a printer, which he did throughout life. It is here worthy of notice, that, during his engagement with Messrs. Murray and Cochrane, a dispute having arisen between the masters and journeymen printers of Edinburgh respecting the proper mode of calculating the value of manual labour by the latter, Mr. Smellie devised a plan for regulating the prices of setting up types, on fixed principles, being in proportion to the number of letters, of differently sized types, in a certain space. This useful plan has since been almost universally adopted throughout the kingdom.

Mr. Smellie continued in the employment of the above gentlemen for six years; that is to say, until the year 1765, during which time we find him steadily advancing himself in life, extending his acquaintance amongst the *literati* of the day, and improving himself by every means within his reach. One plan for the latter purpose which he adopted was that of entering largely into an epistolary correspondence with his acquaintances, with the view of giving him freedom and facility in committing his thoughts to paper. He likewise co-operated with a number of young men of similar habits and pursuits to his own in establishing a weekly club, which they termed the Newtonian Society, and which included the names of President Blair, Dr. Hunter, Dr. Blacklock, Dr. Buchan (author of the *Domestic Medicine*), Dr. Adam, and many others who afterwards became celebrated in their respective walks in life. After the discontinuance of this society, another was instituted in 1778, called the Newtonian Club, of which Mr. Smellie was unanimously chosen secretary. This latter institution comprised the names of Dr. Duncan, Dr. Gregory, Dugald Stewart, Professor Russell, Dr. Wardrope—in short, the whole senatus of the university, with many other illustrious individuals. Mr. Smellie had a decided preference for the study of natural history, especially of botany, and about the year 1760 collected an extensive *Hortus Sicus* from the fields around Edinburgh, which he afterwards presented to Dr. Hope, professor of botany in the university. He likewise in the same year gained the honorary gold medal given by the professor for the best botanical dissertation; and soon afterwards wrote various other discourses on vegetation, generation, &c., all of which were subsequently published in a large work solely written by himself, entitled the *Philosophy of Natural History*. He was besides no mean chemist, at a time when chemistry had scarcely been reduced to a science, and was generally held as alike visionary and vain. Upon the publication of the essays of the celebrated David Hume, printed by Mr. Smellie, an extended correspondence took place between them, in which the latter contested, with great logical force and acumen, many of the heterodox doctrines advanced by the former, particularly that respecting the credibility of miracles. Mr. Smellie afterwards drew up, in a masterly manner, an abstract of the arguments for and against that principle of our religious faith, for the *Encyclopædia Britannica*, and which was published in the first edition of that work.

Mr. Smellie lived in terms of great intimacy with Dr. William Buchan, author of the well-known *Domestic Medicine*. That work passed through the press in Messrs. Murray and Cochrane's printing-office, and entirely under Mr. Smellie's superintendence, Dr. Buchan himself then residing in England. It is well ascertained that Mr. Smellie contributed materially, both by his medical and philological knowledge, to the value and celebrity of the publication; and from the fact, indeed, of his having rewritten the whole of it for the printers, he was very generally considered at the time, in Edinburgh, to be the sole author of it. The work has now naturally become almost obsolete from the rapid progress in the medical and other sciences therewith connected since its composition; but the fact of its having passed through between twenty and thirty editions, ere superseded, fully establishes the claim of the author, or rather authors, to a reputation of no mean note. It appears, by their correspondence, that Dr. Buchan was particularly anxious that Mr. Smellie should qualify himself as M.D., and share his for-

tunes in England, in the capacity of assistant; but, with his constitutional prudence, the latter declined the invitation. The correspondence, however, induced him to give a marked attention to the practice and theory of medicine, as well as to stimulate him in his favourite study of natural history; thus qualifying himself for the excellent translation of Buffon, which he subsequently executed.

In 1763, being then only twenty-three years of age, Mr. Smellie married a Miss Robertson, who was very respectably connected. By this marriage he had thirteen children, many of whom he lost by death. In 1765, upon the conclusion of his engagement with Messrs. Murray and Cochrane, he commenced business as a master printer, in conjunction with a Mr. Auld, Mr. Smellie's pecuniary proportion of the copartnership being advanced for him by Dr. Hope and Dr. Fergusson, professors in the university. In 1767 a new copartnership was formed by the introduction of Mr. Balfour, bookseller, who brought along with him the property of a newspaper called the *Weekly Journal*, which had for a considerable time previously been established. The management of the latter was solely intrusted to Mr. Smellie; but as it happened to be a losing concern, he shortly afterwards insisted on its discontinuance. This led to disputes which finally terminated in a dissolution of the copartnership in 1771; when a new contract was entered into between Mr. Balfour and Mr. Smellie only. About the same time he appears to have been on terms with the eminent Mr. William Strahan, to undertake the management of the vast printing concern carried on by him in London; but from some cause not clearly explained the treaty was broken off. It is worthy of mention, as showing the respect in which Mr. Smellie was at this time held, that upon his entering on this new copartnership, Lord Kames became security for a bank credit in favour of the younger printer to the amount of £300. His lordship appears to have had a particular regard for Mr. Smellie, and at his suggestion the latter commenced the composition of a series of lectures on the philosophy of natural history. About the same time the professorship of natural history in the Edinburgh university fell vacant, and great exertions were made to procure Mr. Smellie's appointment to it; but the political interest of his rival, Dr. Walker, prevailed, and was even strong enough to prevent him from delivering his lectures publicly, although the Antiquarian Society, of whose museum he was keeper, offered him the use of their hall for that purpose.

Mr. Smellie's acquaintance with Lord Kames originated in his venturing to send, anonymously however, some animadversions on his lordship's *Elements of Criticism*, whilst that work was going through the press of Messrs. Murray and Cochrane in 1764. Lord Kames replied by thanking the young critic, and requesting him to reveal himself. The result was a strict and intimate friendship during their lives; Lord Kames uniformly submitting all his subsequent works to the critical judgment of Mr. Smellie, who, after the death of Lord Kames, wrote the life of his illustrious friend for the *Encyclopædia Britannica*, in the third edition of which it appeared in 1800.

Amongst Mr. Smellie's many literary undertakings one of the earliest was the compilation and entire management of the first edition of the work just named, which began to appear in numbers at Edinburgh in 1771, and was completed in three volumes in quarto. The plan and all the principal articles were devised and written or compiled by him, and he prepared and superintended the whole of that work, for which he only received the sum of £200 from its proprietors, Mr. Andrew Bell, engraver,

and Mr. Colin Macfarquhar, printer. Had Mr. Smellie adhered to this literary project there is little doubt that he would thereby ultimately have realized an ample fortune, as both the proprietors died in great affluence, arising solely from the labours of Mr. Smellie in the original construction of the work.

Unfortunately, however, when applied to by the proprietors to undertake the second edition, he fastidiously refused to meddle with it on account of their desiring to introduce a plan of biography into it, which Mr. Smellie imagined would detract from its dignity as a dictionary of arts and sciences.

It will, we should think, be interesting to our readers to learn something of the early history of a work which has latterly swelled out into such bulk and importance. Of the original edition—the entire work, as we have said, of Mr. Smellie—it is not exactly known how many copies were thrown off. The second edition, which consisted of 1500 copies, extended to ten volumes quarto. A third edition in eighteen volumes was commenced in 1786, and extended to 10,000 copies. By this edition the proprietors are said to have netted £42,000 of clear profit, besides being paid for their respective work as tradesmen—the one as printer, and the other as engraver. The fourth edition extended to twenty quarto volumes, and 3500 copies. In the fifth and sixth editions only part of the work was printed anew; and to these a supplement in six volumes was added by Mr. Archibald Constable, after the property of the work had fallen into his hands. An eighth edition, under the editorship of Professor Traill, has been lately finished.

In the year 1773 Mr. Smellie, in conjunction with Dr. Gilbert Stuart, commenced a new monthly publication, the *Edinburgh Magazine and Review*, which was conducted for some years with great spirit and talent, but was dropped in 1776 after the production of forty-seven numbers, forming five octavo volumes. Its downfall was attributed to a continued series of harsh and wanton attacks from the pen of Dr. Stuart on the writings of Lord Monboddo, which disgusted the public mind. Edinburgh did not at that time afford such ample scope for literary stricture as at the present day. Lord Monboddo, nevertheless, continued to be warmly attached to Mr. Smellie, and they lived on terms of the strictest intimacy till his lordship's death.

In the year 1780, on the suggestion of the Earl of Buchan, a society for collecting and investigating the antiquities of Scotland was instituted at Edinburgh. Of this society Mr. Smellie was personally invited by his lordship to become a member; which he did, and was appointed printer of their journals and transactions. Next year he was elected keeper of their museum of natural history; and in 1793 he was elected secretary, which office he held till his death.

It is not, we believe, generally known, that with Mr. Smellie originated that admirable scheme of a statistical account of all the parishes of Scotland, which was afterwards brought to maturity by Sir John Sinclair. At the desire of the Antiquarian Society, Mr. Smellie, in 1781, drew up a regular plan of the undertaking, which was printed and circulated; but the individuals to whom the circular was addressed do not seem to have understood the important nature of the application, and only a very few complied with the directions given in it.

In 1780 Mr. Smellie commenced the publication of his *Translation of Buffon's Natural History*; a work which has ever stood deservedly high in the opinion of naturalists, being illustrated with numerous notes and illustrations of the French author,

besides a considerable number of new observations. It is worthy of notice that Mr. Smellie's knowledge of the French tongue, which is acknowledged to have been profound, was entirely acquired by himself, without the aid of a master; and it is a curious fact, that of a language he so thoroughly understood, he could scarcely pronounce one word. This fact gave unbounded surprise to a friend of Buffon, who came to Edinburgh on a visit, and waited on Mr. Smellie. The stranger noted it down as one of the greatest wonders of his travels, intending, he said, to astonish the French naturalist by relating it to him. It is perhaps the best of all tests as regards the merits of Mr. Smellie's translation, that Buffon himself was highly pleased with it, and even requested him to translate some of his other works; but this, from prudent motives, Mr. Smellie declined.

In the year 1780 the partnership between Mr. Smellie and Mr. Balfour was dissolved, when the former entered into partnership with Mr. William Creech, bookseller. This connection continued to the end of 1789, when Mr. Smellie commenced and ever afterwards carried on business entirely on his own account.

In 1790 Mr. Smellie published the first volume of his *Philosophy of Natural History*, the origin of which has been already noticed. The copyright was at the same time purchased by Mr. Elliot, bookseller, Edinburgh, for 1000 guineas. The second and concluding volume was not published until four years after his death. Besides this and the other larger works which we have before adverted to, as the production of Mr. Smellie, we have seen a list of upwards of forty miscellaneous essays, upon almost all subjects—from politics to poetry, from optics to divinity—which he composed at different times, and under various circumstances; and from his indefatigable industry and wonderful facility of writing, it is supposed that these are scarcely a moiety of his literary effusions.

Mr. Smellie's acquaintance with Robert Burns commenced in the year 1787, upon the occasion of the poet's coming to Edinburgh to publish his poems, which were printed by Mr. Smellie. From their similarly social dispositions and mutual relish of each other's wit, an immediate and permanent intimacy took place betwixt them. After Burns' departure from Edinburgh they corresponded frequently; but the greater part of the communications were afterwards destroyed by Mr. Smellie, equally, perhaps, on the bard's account and his own. Of the high opinion which the latter entertained, however, of his friend—and it is well known how fastidious was his taste on the score of talent, honesty, and real friendship amongst his fellow-creatures—we have sufficient evidence in the poetical sketch published in the works of Burns, commencing—

———“To Crochallan came
The old cock'd hat, the brown surtout, the same,” &c.

Mr. Smellie expired, after a long illness, on the 24th June, 1795, in his fifty-fifth year; and we regret to add his name to the long list of men of genius who have terminated a career of labour, anxiety, and usefulness, amid the pressure of pecuniary difficulties. Some years after his death a small volume was published under the care of his son, containing memoirs of three distinguished men with whom he had been acquainted—Lord Kames, Dr. John Gregory, and Mr. David Hume: it formed part of a more extended design which Mr. Smellie had sketched out, but found not time to execute. A memoir of Mr. Smellie himself was published by Mr. Robert Kerr,

in two volumes octavo; a work, perhaps, disproportioned to the subject, but containing many curious anecdotes.

SMETON, THOMAS, an eminent clergyman of the sixteenth century, was born at the little village of Gask, near Perth, about 1536. Nothing satisfactory seems to be known respecting his parentage: Wodrow conjectures it to have been mean, but upon no better ground than the fact of his having been born at an obscure place. It is certain, however, that he enjoyed the advantages of the best instructors that his country then afforded. He received his elementary education at the celebrated school of Perth, then taught by Mr. A. Simson, and no less famous under some of its subsequent masters. Smeton is believed to have had, as his schoolfellows, James Lawson and Alexander Arbuthnot, both of whom afterwards acted a conspicuous part in the ecclesiastical transactions of their country. The thorough knowledge of the Latin language displayed by our author leaves little room to doubt that he profited by the honourable emulation which was doubtless excited among such scholars. At the age of seventeen (1553) he was incorporated a student in St. Salvator's College, St. Andrews; and here he had the satisfaction of joining Arbuthnot, who had entered St. Mary's two years earlier.¹ Smeton is believed to have studied philosophy under the provost of his college, Mr. William Cranstoun; but how far he prosecuted his studies none of his biographers mention. He ultimately became one of the regents in the college, and continued in that situation till the doctrines of the Reformation began to be warmly agitated in the university. When the Protestant party at length gained the ascendancy, Smeton, still zealously attached to the Popish system, left his native country, and resided for many years with his continental brethren. The history of his life for about twenty years is most fortunately preserved, as related by himself, in the *Diary* of Mr. James Melville; a work, as we have already mentioned (see article JAMES MELVILLE), of so interesting a character, that we feel gratified by every opportunity of quoting from it. Luckily the narrative, while it is perfectly distinct, is so much condensed as to be completely suited to our limits; and we therefore make no apology for its introduction.

“At the reformation of religion, Mr. Smeton, being put from the auld college of S. Andros, past to France, whare in Paris he thought mikle vpon the trew way of saluation; and be dealling of diwers of his acquaintance, namlie, Mr. Thomas Matteland, a young gentilman of guid literature and knowlage in the treuthe of religion, was brought to ken and be inclynde to the best way: whar also he was acquentit with my vncle, Mr. Andro and Mr. Gilbert Moncreiff. Yit lothe to alter his mynd wherin he was brought vpe, and fand himself sum tyme fullie perswadit in the mater of his fathe and saluation. He thought he wald leaue na thing vntryed and esseyit pertening herto; and, vnderstanding that the ordour of the jesuists was maist lerned, halie, and exquisit in the papistrie, he resolut to enter in thair ordour during the yeirs of probation; at the end wharof, giff he fand himself satted in his auld fathe, he wald continow a jesuist; and, giff he fand nocht amangs tham that might remoue all the douttes he was cast into, it was bot folie to seik fardar, he wald yeild vnto that light that God be the earnest delling of his lowing frinds and companions haid enterit him into. And sa he enterit in the Jesuists

¹ Records of the University of St Andrews.

college at Paris, whar he fand Mr. Edmont Hay, a verie lowing frind, to whom he communicat all his mynd. Mr. Edmont, seing him worthie to be win to tham, and giffen to lerning and light, directes him to Rome; and be the way he cam to Geneu, whar Mr. Andro Meluill and Mr. Gilbert Moncreiff being for the tyme, he communicat with tham his purpose, and cravit thair prayers. Of his purpose they could gie na guid warand; but thair prayers they promissit hartlie. Sa making na stey ther, he past fordward to Rome, whar he was receavit in the Jesuist's collage gladlie. In the quihilk collage was a father, hauldin of best lerning and prudence, wha was ordeanit to trauell with sic as wer deteinit in pressone for religion, to convert tham: of him he cravit that he might accompanie him at sic tymes when he went to deal with these presoners, quihilk was granted to him. Be the way as they cam from the presoners to the collage, quihilk was neir a myle, Mr. Thomas wald tak the argument of the presoners, and mentein it against the jesuist, for reasoning's cause, and indeid to be resolut; and the more he enisisted he fand the treuthe the strangar, and the jesuist's answers never to satisfie him. This way he continowit about a yeir and a half in Rome, till at last he becam suspitiu, and therfor was remitted back to Paris throw all the collages of the jesuists be the way, in all the quihilks he endeworit mair and mair to haiff his douttes resolut, bot fand himself ay fordar and fordar confirmid in the veritie. Coming to Paris again, he abaid ther a space verie lowingly interteined be Mr. Edmont; till at last he could nocht bot discover himself to Mr. Edmont, to whom he says he was als mikle behauldin as to anie man in the warld; for, nochtwithstanding that he perceavit his mynd turned away from thair ourdour and religion, yit he ceased nocht to counsall him frindlie and fatherlie, and suffered him to want na thing. And being a verie wyse man, he thinks to keipe Mr. Thomas quyet, and nocht to suffer him to kythe an aduersar against them. Perceaving, therfor, the young man giffen to his buik, he giffes him this counsall, to go to a quyet collage, situat in a welthie and pleasant part in Lorain, whair he sould haiff na thing to do, but attend vpon his buiks; whair he sould haiff all the antient doctors, and sic buiks as yie [he] pleisit to reid; he sould leak na necessaris; thair he sould keip him quyet, till God wrought fordar with him, vtherwayes he wald cast himself in grait danger. Thair was na thing that could allure Mr. Thomas mair nor this, and therfor he resolved to follow his counsall; and, taking jorney, went towards Lorain, whair be the way the Lord leyes his hand vpon him, and visites him with an extream fever, casting him in vttermaist pean and perplexitie of body and mynd. Thair he focht a maist strang and ferfull battelle in his conscience: bot God at last prevealling, he determines to schaw himself, abandone that damnable societie, and vtter, in plean professon, the treuthe of God, and his enemies' falsheids, hypocrisie, and craft. Sa coming bak to Paris again, he takes his leiuie of Mr. Edmont, wha yit, nochtwithstanding, kythes na thing bot lowing frindschipe to him; and at his parting, giffes thrie counsalls:—1. To reid and studie the antient doctors of the kirk, and nocht to trow the ministers. 2. To go ham to his awin country. And, thridly, To marie a wyff.—From that he manifested himself amangs the professors of religion, till the tyme of the massacre, quihilk schortlie ensewit; at the quihilk, being narrowlie

sought, he cam to the Engliss ambassador, Mr. Secretarie Walsingham, in whase house, lyand at Paris for the tyme, as in a comoun girthe, he, with manie ma, war seaff. With whome also he cam to Eeingland soone efter, whar he remeaned schoolmaister at Colchester, till his coming to Scotland.

"At his coming to Scotland he was gladlie content to be in companie with my vnclie, Mr. Andro [Melville], and sa agreit to be minister at Pasley, in place of Mr. Andro Pulwart, wha enterit to the subdeanrie of Glasgw, when Mr. David Cuninghame was bishopit in Aberdein. A little efter his placing, Mr. Andro, principall of the collage, put in his hand Mr. Archibald Hamiltone's apostats' buik, *De Confusione Calviniane Secte apud Scotos*; and efter conference theranent, movit him to mak answer to the sam, quihilk was published in print the yeir following, to the grit contentment of all the godlie and lernit. Mr. Thomas was verie wacryff and peanfull, and skarslie tuk tyme to refreche nature. I haiff sein him oft find fault with lang denners and suppers at general assemblies; and when vthers wer therat, he wald abstain, and be about the penning of things (wherin he excellit, bathe in langage and form of letter), and yit was nocht rustic nor auster, bot sweit and affable in companie, with a modest and naive grautie; verie frugal in fude and reymtent; and walked maist on fuf, whom I was verie glad to accompanie, whylis to Sterling, and now and then to his kirk, for my instruction and comfort. He louit me exceiding weill, and wald at parting thrust my head into his bosom, and kis me.

"He being weill acquainted with the practizes of papists, namelie, jesuists, and their deuyces for subuerting the kirk of Scotland, bathe publiclie and privatlie, ceasit nocht to cry and warn ministers and schollars to be diligent vpon ther charges and buiks, to studie the controuersies, and to tak head they neglected nocht the tyme, for ther wald be a strang vnseatt of Papists. Also, he was careful to know the religion and affection of noble men, insinuating him in thair companie, in a wyse and graue maner; and warning tham to be war of euill companie, and nocht to send thair berns to dangerus partes. And, finalie, Mr. Andro and he marvelouslie conspyring in purposes and iudgments, war the first motioners of an anti-seminarie to be erected in St. Andros to the jesuist seminaries, for the course of theologie, and cessit never at assemblies and court, till that wark was begun and sett fordward."

There perhaps never was a period more calculated to bring forth the talents of our countrymen, than that of the Reformation. Accordingly, Mr. Smeton was soon required by his brethren to take an active part in the more public transactions of the church. In October, 1578, he was nominated one of the assessors to the moderator of the General Assembly; an appointment conferred at that time upon the most learned and judicious of the members. But his talents were considered as fitting him for the performance of functions still more important. He was chosen moderator of the next assembly, which met in July, 1579, and which was called to the consideration of many important questions. Among these may be mentioned the finishing of the first Scottish edition of the Bible. In 1580 he became the opponent of Nicol Burn, a professor of philosophy in the university of St. Andrews, who had turned Papist.² Of this controversy Dr. Mackenzie promised an account in his *Life of Burn*, but his biographical work never reached that point.

James Melville has alluded, in the passage we have

¹ According to Dempster, Smeton taught humanity in the university of Paris, and afterwards in the college of Clermont, with great applause. (See M'Crie's *Melville*, 2d. edit. p. 380, note.)

² Mackenzie's *Lives of Scots Writers*, iii.

quoted from his *Diary*, to the anxiety of his uncle and Smeton that the young noblemen and gentlemen of Scotland should be educated at home, and to the measures which they proposed for the attainment of that object. They had at length the satisfaction of seeing their new constitution of the university of St. Andrews approved by the church and ratified by parliament. Melville was chosen principal of St. Mary's, or the New College, and after much opposition, arising, however, from no other motive than a conviction of his usefulness as minister of Paisley, Smeton was appointed his successor by letters under the privy-seal, dated the 3d of January, 1580. Most unfortunately the records of the university of Glasgow are almost wholly lost for the period during which this excellent man presided over it. His duties, however, are known to have been of no light description; he was the sole professor of divinity, and had also the charge of the religious instruction of the parish of Govan. Besides the mere literary department, as it may be termed, of his duties, he had the general superintendence of the university, in which was included the by no means pleasant office of inflicting corporal punishment on unruly boys. Almost equally little has been preserved respecting Smeton's share in the ecclesiastical transactions during the remainder of his life. He was chosen moderator of the General Assembly held in April, 1583. We have already alluded in the life of Mr. ROBERT PONT to the removal of that learned man for a short period to St. Andrews, and to the reasons which obliged him to relinquish that charge. Andrew Melville was anxious that his place should be supplied by Smeton, and, it is not improbable, intended to adopt some measures for bringing the state of that town under the notice of this Assembly. But it was the policy of the prior and his dependants to frustrate the settlement, whatever might be the merits of the intended minister, that they might spend in extravagance or debauchery the funds which were destined for his support. The king, therefore, probably instigated by that ecclesiastic (the Earl of March), but under the specious pretext of a fatherly care over the university of Glasgow, forbade the Assembly to "meddle with the removing of any of the members thereof, and especially of the principal." Smeton's old schoolfellow, Arbutnot, now principal of King's College, Aberdeen, was soon afterwards chosen by the kirk-session of St. Andrews; but this election produced no more favourable result.

Principal Smeton attended the following General Assembly (October, 1583), and was again employed in some of its most important business. But the course of honour and usefulness on which he had now entered was destined to be of very short duration. Soon after his return to Glasgow he was seized with a high fever, and died, after only eight days' illness, on the 13th of December, 1583. About six weeks earlier his friend Arbutnot, with whom he had been so long and intimately connected, had been cut off in his forty-sixth year, and thus was the country at once bereaved of two of its greatest lights at a period of no common difficulty. That was indeed "a dark and heavie wintar to the kirk of Scotland."

The habits and acquirements of Smeton must have peculiarly adapted him for the charge of a literary, and, more particularly, of a theological seminary. While the latter were unquestionably inferior to those of his predecessor in the principalship of Glasgow College, his manners were of a milder and more conciliatory character. Yet even his learning was greatly beyond that of the mass of his brethren. He wrote Latin with elegance and facility, and was a

Greek and Hebrew scholar. Nor had he, like many of our travelled countrymen, neglected the study of his native tongue, in which he wrote with great propriety. His knowledge of controversial divinity, derived most probably from the circumstances attending his conversion to the Protestant faith, is represented as superior to that of almost any of his contemporaries. Of the works which he has left behind him the best known is his reply to Hamilton, which was published at Edinburgh in 1579, with the following title: "*Ad Virulentum Archibaldi Hamiltonii Apostata Dialogum de Confusione Calvinianæ Sectæ apud Scotos impie conceptum Orthodoxa Responsio Thomæ Smetonio Scoto Auctore, in qua celebris illa Quæstio de Ecclesia, de Universalitate, Successione, et Romani Episcopi Primatu brevitè, dilucide, et accurate, tractatur: Adjecta est Vera Historia extremæ Vitæ et Obitus eximii Viri Joannæ Knoxii Ecclesiæ Scotticane Instauratoris Fidelissimi*," 8vo. The General Assembly held in April, 1581, ordered the method of preaching and prophesying by . . . "to be put in Scottish be their brother Mr. Thomas Smetone;" but if this supposed translation of Hyperius *De Formandis Concionibus* was ever printed, it has escaped the researches of all our bibliographers. The Dictates of Principal Smeton—that is, the notes which he dictated to his students—were preserved in Archbishop Spotswood's time, and are said by that author to have been highly esteemed. Dempster also ascribes to Smeton *Épithaphium Metallani*, lib. i.

Principal Smeton adopted the advice of his excellent friend Edmond Hay, and "married a wyff," but at what time is uncertain. We are equally uncertain whether he left any children behind him. The name of Smeton, and in one or two instances that of Thomas Smeton, occur in the records of the university of Glasgow in the early part of the seventeenth century, and as the name was by no means common, these persons were not improbably his descendants.¹

SMIBERT, JOHN. This Scottish artist of an early period, when art was still in its infancy in Scotland, was born in the Grassmarket, Edinburgh, and, as is supposed, about A.D. 1684, for the precise year has not been ascertained. He was of lowly origin, being the son of a dyer, and in early life was apprenticed to a common house-painter. Ambitious, however, of higher occupation than the decoration of Edinburgh houses, he went to London; but instead of finding occupation for his talents there, he was forced to content himself with working for coach-painters, and subsisting for a time upon such inferior employment. After this he gained a step in advance, by being employed in copying for picture-dealers, when he learned to draw the figure by designing after casts. Still ardent to improve himself he went to Italy, where he spent three years in copying portraits by Titian, Vandyck, and Rubens, and with such success, that he obtained considerable employment as a portrait-painter on his return to England. While he was thus prospering in his profession, the illustrious, amiable, and somewhat eccentric Dean Berkely, afterwards Bishop of Cloyne, found for him a new sphere. Having conceived the benevolent design of establishing a college in the Bermuda islands to train pastors for the colonies and missionaries for the American Indians, the dean's eloquence and enthusiasm engaged both sovereign

¹ Abridged from Wodrow's *Life of Smeton*, inter *MSS.* in Bibl. Acad. Glasg. vol. i. See also James Melville's *Diss.*, p. 56-58; and M'Crie's *Life of Melville*, second edition, i. 158, ii. 379-383.

and court in favour of his scheme; and in Smibert he recognized the qualifications that are best fitted to instruct a barbarous people, and by his artistic skill he hoped to lay a good foundation for a school of art in America. Smibert, as great an enthusiast in art as the dean in philanthropy, was persuaded to embark in the scheme, and against the remonstrances of his friends he set sail for that land of promise, the beauty and amenity of which had been described to him in such glowing colours. With the dean he resided for two years at Newport, Rhode Island; and there is shown in Yale College a painting by which Smibert commemorated this landing in America. It consists of portraits grouped of Dean Berkely and his family, and other members of the expedition, among whom is the painter himself. This is believed to have been the first picture of more than a single figure ever painted in the United States.

The project of the establishment of the university at Bermuda having been destroyed by the death of the king, and the failure of promised aid from home, the dean was compelled to return to England. Smibert, instead of following the example, made America the land of his adoption; but instead of passing onward to Bermuda, as professor of drawing, painting, and architecture, he settled at Boston in New England. Here he married a daughter of Dr. Williams, the Latin schoolmaster of that town, was successful as a painter, and lived at Boston from 1725 to 1751, the year of his death, leaving a widow and two children. It does not appear that he attempted anything beyond portraiture; but his portrait-painting secured him both fame and fortune in the growing states of America, and the best portraits of eminent magistrates and divines of New England and New York who lived between 1725 and 1751 are attributed to his pencil. It appears also that he had a son named Nathaniel, whom he brought up to his own profession, but who died young, after giving promise of great excellence. After Smibert had settled in America, he kept up his correspondence with his acquaintances at home, the chief of whom was Allan Ramsay, author of the *Gentle Shepherd*. Considering the distinction which the United States are attaining in art, it is gratifying to the pride of Scotsmen to be told that the two founders of painting as an art in America were Scots. The first was John Watson, who settled in the capital of New Jersey, Perth Amboy, in 1715; the other was John Smibert, the subject of this memoir.

SMITH, ADAM, LL.D. and F.R.S. both of London and Edinburgh, one of the brightest ornaments of the literature of Scotland, was born on the 5th of June, 1723, at the town of Kirkcaldy, in the county of Fife. He was the only child of Adam Smith, comptroller of the customs at Kirkcaldy, and Margaret Douglas, daughter of Mr. Douglas of Strathenny. His father having died some months before his birth, the duty of superintending his early education devolved entirely upon his mother.

A singular accident happened to him when he was about three years of age. As he was amusing himself one day at the door of his uncle Mr. Douglas's house in Strathenny, he was carried off by a party of gipsies. The vagrants, however, being pursued by Mr. Douglas, were overtaken in Leslie Wood, and his uncle, as Mr. Stewart remarks, was thus the happy instrument of preserving to the world a genius which was destined not only to extend the boundaries of science, but to enlighten and reform the commercial policy of Europe.

The constitution of Dr. Smith during infancy was infirm and sickly, and required all the delicate

attentions of his surviving parent. Though she treated him with the utmost indulgence, this did not produce any unfavourable effect either on his dispositions or temper, and he repaid her affectionate solicitude by every attention that filial gratitude could dictate during the long period of sixty years.

He received the first rudiments of his education at the grammar-school of Kirkcaldy, which was then taught by Mr. David Miller, a teacher, in his day, of considerable reputation. He soon attracted notice by his passion for books, and the extraordinary powers of his memory. Even at this early period, too, he seems to have contracted those habits of speaking to himself, and of absence in company, for which through life he was so remarkable. The weakness of Dr. Smith's constitution prevented him from engaging in the sports and pastimes of his school-companions, yet he was much beloved by them on account of his friendly and generous dispositions. Having remained at Kirkcaldy till he had completed his fourteenth year, he was sent in 1737 to the university of Glasgow, where he prosecuted his studies during three years. Mr. Stewart mentions, on the authority of one of Smith's fellow-students, Dr. MacLaine of the Hague, that his favourite pursuits while attending that university were mathematics and natural philosophy. He attended, however, during his residence in Glasgow, the lectures of the celebrated Dr. Hutcheson on moral philosophy; and it is probable that they had a considerable effect in afterwards directing his attention to those branches of science in which he was to become so distinguished.

Dr. Smith's friends having directed his views towards the English church, he went, in 1740, to Balliol College, Oxford, as an exhibitor on Snell's foundation, where he remained seven years. At this celebrated seat of classical learning he cultivated with the greatest assiduity and success the study both of the ancient and modern languages, and became intimately acquainted with the works of the Roman, Greek, French, and Italian poets, as well as with those of his own country. With the view of improving his style, he used frequently to employ himself in the practice of translation, particularly from the French, as he was of opinion that such exercises were extremely useful to those who wished to cultivate the art of composition. But Dr. Smith's obligations to the university of Oxford seem to have been confined to his proficiency in classical learning, and a critical acquaintance with the niceties and delicacies of the English tongue. Very little could be learned from the public lectures on philosophy, the logic of Aristotle still maintaining its influence in both the English universities. A circumstance, however, which, upon good authority, is related to have occurred during his residence at Oxford, shows that in his private studies Dr. Smith did not confine his reading in philosophy to the works of Aristotle and the schoolmen. Something having excited the suspicion of his superiors with regard to the nature of his studies in private, the heads of his college entered his apartment one day without any previous notice, and unluckily found the young philosopher engaged in reading Hume's *Treatise of Human Nature*. The offender was of course severely reprimanded, and the objectionable work seized and carried off.

Dr. Smith, having found that the ecclesiastical profession was not suitable to his taste, resolved at last to renounce every prospect of rising to eminence by church preferment. He accordingly returned, in 1747, against the wishes of his friends, to Kirkcaldy, and without having determined on any fixed plan of life, resided there nearly two years with his mother.

In the end of the year 1748 Dr. Smith fixed his residence in Edinburgh, and, under the patronage of Lord Kames, delivered lectures during three years on rhetoric and belles-lettres. These lectures were never published, but it appears that the substance of them was communicated to Dr. Blair, who began his celebrated course on the same subject in 1755, and that that gentleman had a high opinion of their merits. In a note to his eighteenth lecture, Dr. Blair thus notices them:—"On this head, of the general character of style, particularly the plain and the simple, and the characters of those English authors who are classed under them in this and the following lecture, several ideas have been taken from a MS. treatise on *Rhetoric*, part of which was shown to me many years ago by the learned and ingenious author, Dr. Adam Smith; and which, it is hoped, will be given by him to the public."

It appears to have been during the residence of Mr. Smith at this time in Edinburgh that his acquaintance with Mr. David Hume commenced, which lasted without the slightest interruption till the death of the latter in 1776. It was a friendship, Mr. Stewart remarks, on both sides founded on the admiration of genius and the love of simplicity; and which forms an interesting circumstance in the history of each of these eminent men from the ambition which both have shown to record it to posterity.

The literary reputation of Dr. Smith being now well established, he was elected in 1751 professor of logic in the university of Glasgow, and in the year following he was removed to the chair of moral philosophy in the same university, vacant by the death of Mr. Thomas Craigie, who was the immediate successor of Dr. Hutcheson. In this situation he remained during thirteen years, a period which he used to consider as the happiest of his life, the studies and inquiries in which his academical duties led him to engage being those which were most agreeable to his taste. It is highly probable that his appointment to the professorship of moral philosophy was the means of inducing him to mature his speculations in ethics and political economy, and to undertake those great works which have immortalized his name in the literature of Scotland. No part of the lectures which Dr. Smith delivered either as professor of logic or of moral philosophy has been preserved, except what has been published in the *Theory of Moral Sentiments* and the *Wealth of Nations*. The following account of them, however, has been given by Mr. Miller, the celebrated author of the *Historical View of the English Government*, and professor of law in the university of Glasgow, who had the advantage of being one of Mr. Smith's pupils.

"In the professorship of logic, to which Mr. Smith was appointed on his first introduction into this university, he soon saw the necessity of departing widely from the plan that had been followed by his predecessors, and of directing the attention of his pupils to studies of a more interesting and useful nature than the logic and metaphysics of the schools. Accordingly, after exhibiting a general view of the powers of the mind, and explaining as much of the ancient logic as was requisite to gratify curiosity with respect to an artificial method of reasoning which had once occupied the universal attention of the learned, he dedicated all the rest of his time to the delivering of a system of rhetoric and belles-lettres. The best method of explaining and illustrating the various powers of the human mind, the most useful part of metaphysics, arises from an examination of the several ways of communicating our thoughts by speech, and from an attention to the principles of those literary compositions which contribute to per-

suasion or entertainment. By these arts everything that we perceive or feel, every operation of our minds, is expressed and delineated in such a manner, that it may be clearly distinguished and remembered. There is at the same time no branch of literature more suited to youth at their first entrance upon philosophy than this, which lays hold of their taste and their feelings.

"It is much to be regretted that the manuscript, containing Mr. Smith's lectures on this subject, was destroyed before his death. The first part, in point of composition, was highly finished; and the whole discovered strong marks of taste and original genius. From the permission given to students of taking notes, many observations and opinions contained in these lectures have either been detailed in separate dissertations, or engrossed in general collections, which have since been given to the public. But these, as might be expected, have lost the air of originality, and the distinctive character which they received from their first author, and are often obscured by that multiplicity of commonplace matter in which they are sunk and involved.

"About a year after his appointment to the professorship of logic, Mr. Smith was elected to the chair of moral philosophy. His course of lectures on this subject was divided into four parts. The first contained natural theology; in which he considered the proofs of the being and attributes of God, and those principles of the human mind upon which religion is founded. The second comprehended ethics, strictly so called, and consisted chiefly of the doctrines which he afterwards published in his *Theory of Moral Sentiments*. In the third part he treated at more length of that branch of morality which relates to justice, and which being susceptible of precise and accurate rules, is for that reason capable of a full and particular explanation.

"Upon this subject he followed the plan that seems to be suggested by Montesquieu; endeavouring to trace the gradual progress of jurisprudence, both public and private, from the rudest to the most refined ages, and to point out the effects of those arts which contribute to subsistence, and to the accumulation of property, in producing correspondent improvements or alterations in law and government. This important branch of his labours he also intended to give to the public; but this intention, which is mentioned in the conclusion of the *Theory of Moral Sentiments*, he did not live to fulfil.

"In the last part of his lectures he examined those political regulations which are founded, not upon the principle of justice, but that of expediency, and which are calculated to increase the riches, the power, and the prosperity of a state. Under this view, he considered the political institutions relating to commerce, to finances, to ecclesiastical and military establishments. What he delivered on these subjects contained the substance of the work he afterwards published under the title of *An Inquiry into the Nature and Sources of the Wealth of Nations*.

"There was no situation in which the abilities of Mr. Smith appeared to greater advantage than as a professor. In delivering his lectures, he trusted almost entirely to extemporary elocution. His manner, though not graceful, was plain and unaffected; and as he seemed to be always interested in the subject, he never failed to interest his hearers. Each discourse consisted commonly of several distinct propositions, which he successively endeavoured to prove and illustrate. These propositions, when announced in general terms, had, from their extent, not unfrequently something of the air of a paradox. In his attempts to explain them he often appeared at first

not to be sufficiently possessed of the subject, and spoke with some hesitation. As he advanced, however, the matter seemed to crowd upon him; his manner became warm and animated, and his expression easy and fluent. In points susceptible of controversy, you could easily discern that he secretly conceived an opposition to his opinions, and that he was led upon this account to support them with greater energy and vehemence. By the fulness and variety of his illustrations the subject gradually swelled in his hands, and acquired a dimension which, without a tedious repetition of the same views, was calculated to seize the attention of his audience, and to afford them pleasure as well as instruction, in following the same subject through all the diversity of shades and aspects in which it was presented, and afterwards in tracing it backwards to that original proposition, or general truth, from which this beautiful train of speculation had proceeded.

"His reputation as a professor was accordingly raised very high; and a multitude of students from a great distance resorted to the university merely upon his account. Those branches of science which he taught became fashionable at this place, and his opinions were the chief topics of discussion in clubs and literary societies. Even the small peculiarities in his pronunciation or manner of speaking became frequently the objects of imitation."

The first publications of Mr. Smith, it is understood, were two articles which he contributed anonymously to a work called the *Edinburgh Review*, begun in 1755 by some literary gentlemen, but of which only two numbers ever appeared. The first of these articles was a review of Dr. Johnson's *Dictionary of the English Language*, which displays considerable acuteness; and the other contained some general observations on the state of literature in the different countries of Europe.

In 1759 his great ethical work, entitled "*Theory of Moral Sentiments*, or an Essay towards an Analysis of the Principles by which Men naturally Judge concerning the Conduct and Character, first of their Neighbour, and afterwards of Themselves," made its appearance. This work contributed greatly to extend the fame and reputation of the author; and is unquestionably entitled to a place in the very first rank in the science of morals. Dr. Brown, in his eighteenth lecture, thus speaks of it: "Profound in thought, it exhibits, even when it is most profound, an example of the graces with which a sage imagination knows how to adorn the simple and majestic form of science; that it is severe and cold only to those who are themselves cold and severe, as in these very graces it exhibits in like manner an example of the reciprocal embellishment which imagination receives from the sober dignity of truth. In its minor details and illustrations, indeed, it may be considered as presenting a model of philosophic beauty of which all must acknowledge the power who are not disqualified by their very nature for the admiration and enjoyment of intellectual excellence; so dull of understanding as to shrink with a painful consciousness of incapacity at the very appearance of refined analysis; or so dull and cold of heart, as to feel no charm in the delightful varieties of an eloquence, that, in the illustration and embellishment of the noblest truths, seems itself to live and harmonize with those noble sentiments which it adorns." But it is chiefly in its minor analysis that the work of Dr. Smith possesses such excellence. Its leading doctrine has been often shown to be erroneous, and by none with more acuteness than by Dr. Brown. We shall very shortly explain the nature of that leading doctrine, and endeavour to show how it has been refuted.

It is impossible for us to contemplate certain actions performed by others, or to perform such actions ourselves, without an emotion of moral approbation or disapprobation arising in our minds; without being immediately impressed with a vivid feeling, that the agent is virtuous or vicious, worthy or unworthy of esteem. An inquiry regarding such moral emotions must form the most interesting department of the philosophy of the mind, as it comprehends the whole of our duty to God, our fellow-creatures, and ourselves. This department of science is termed ethics, and is sometimes, though not very correctly, divided into two parts: the one comprehending the theory of morals, and the other its practical doctrines. The most important question to be considered in the theoretical part of ethics is the following:—What is essential to virtue and vice—that is to say, what is common, and invariably to be found in all those actions of which we morally approve, and what is in the same way peculiar to those which we morally condemn? Philosophers have formed various opinions upon this subject. Hobbes and his followers contended that all merit and demerit depends upon political regulations: that the only thing essential to a virtuous or vicious action, is its being sanctioned or discountenanced by the association of men among whom it is performed. Mr. Hume and others have supported the more plausible theory, that what is utility to the human race, unavoidably makes itself the measure of virtue: that actions are virtuous or vicious, according as they are generally acknowledged to be, in their final effects, beneficial or injurious to society in general. These, and many other theories of morals, have been often shown to be erroneous; and it would be out of place here to enter into any discussion regarding them. We pass on to notice the theory of Dr. Smith.

According to him all moral feelings arise from sympathy. It is a mistake to suppose that we approve or disapprove of an action immediately on becoming acquainted with the intention of the agent, and the consequences of what he has done. Before any moral emotion can arise in the mind, we must imagine ourselves to be placed in the situation of the person who has acted, and of those to whom his action related. If, on considering all the circumstances in which the agent is placed, we feel a complete sympathy with the feelings that occupied his mind, and with the gratitude of the person who was the object of the action, we then approve of the action as right, and feel the merit of the person who performed it, our sense of the propriety of the action depending on our sympathy with the agent; our sense of the merit of the agent on our sympathy with the object of the action. If our sympathies be of an opposite kind, we disapprove of the action, and ascribe demerit to the agent.

In estimating the propriety or merit of our own actions, on the other hand, we, in some measure, reverse this process, and consider how our conduct would appear to an impartial spectator. We approve or disapprove of it according as we feel from the experience of our own former emotions, when we imagined ourselves to be placed in similar circumstances, estimating the actions of others, that it would excite his approval or disapprobation. Our moral judgments with respect to our own conduct are, in short, only applications to ourselves of decisions which we have already passed on the conduct of others.

But in this theory of Dr. Smith, the previous existence of those moral feelings which he supposes to flow from sympathy, is in reality assumed; for the most exact accordance of sentiment between two

individuals is not sufficient to give rise to any moral sentiment. In the very striking emotions of taste, for example, Dr. Brown remarks, we may feel, on the perusal of the same poem, the performance of the same musical air, the sight of the same picture or statue, a rapture or disgust, accordant with the rapture or disgust expressed by another reader, or listener, or spectator; a sympathy far more complete than takes place in our consideration of the circumstances in which he may have had to regulate his conduct in any of the common affairs of life. If mere accordance of emotion, then, imply the feeling of moral excellence of any sort, we should certainly feel a moral regard for all whose taste coincides with ours; yet however gratifying the sympathy in such a case may be, we do not feel, in consequence of this sympathy, any morality in the taste that is most exactly accordant with our own. There is an agreement of emotions, but nothing more; and if we had not a principle of moral approbation, by which, independently of sympathy, and previously to it, we regard actions as right, the most exact sympathy of passion would, in like manner, have been a proof to us of an agreement of feelings, but of nothing more. It proves to us more; because the emotions which we compare with our own are recognized by us as moral feelings, independently of the agreement.

But though the leading doctrine of Dr. Smith's theory be considered by many, apparently on just grounds, as erroneous, his work is still unquestionably one of the most interesting which have been produced on moral science. It abounds in faithful delineations of characters and manners, and contains the purest and most elevated maxims for the practical regulation of human life. The style, though perhaps not sufficiently precise for the subject, is throughout eloquent, and serves, by the richness of its colouring, to relieve the dryness of some of the more abstract discussions.

Dr. Smith's *Dissertation on the Origin of Languages*, which is now generally bound up with the *Theory of Moral Sentiments*, made its first appearance with the second edition of that work. In this ingenious and beautiful tract the author gives a theoretical history of the formation of languages, in which he endeavours to ascertain the different steps by which they would gradually arrive at their present so artificial and complicated state.

As the *Theory of Moral Sentiments* contains the most important part of Dr. Smith's ethical doctrines, he was enabled, after the publication of that work, to devote a larger part of his course of lectures, than he had previously done, to the elucidation of the principles of jurisprudence and political economy. From a statement which he drew up in 1755, in order to vindicate his claim to certain political and literary opinions, it appears that, from the time when he obtained a chair in the university of Glasgow, and even while he was delivering private lectures in Edinburgh, he had been in the habit of teaching the same liberal system of policy, with respect to the freedom of trade, which he afterwards published in the *Wealth of Nations*. His residence in one of the largest commercial towns in the island must have been of considerable advantage to him, by enabling him to acquire correct practical information on many points connected with the subject of his favourite studies; and Mr. Stewart states, as a circumstance very honourable to the liberality of the merchants of Glasgow, that, notwithstanding the reluctance so common among men of business to listen to the conclusions of mere speculation, and the direct opposition of Dr. Smith's leading principles to all the old maxims of trade, he was able, before leaving the

university, to rank some of the most eminent merchants of the city among the number of his proselytes.

The publication of the *Theory of Moral Sentiments* served greatly to increase the reputation of its author. In 1762 the Senatus Academicus of the university of Glasgow unanimously conferred on him the honorary degree of Doctor of Laws, in testimony, as expressed in the minutes of the meeting, of their respect for his universally acknowledged talents, and of the advantage that had resulted to the university from the ability with which he had, for many years, expounded the principles of jurisprudence.

Towards the end of 1763 an important event occurred in Dr. Smith's life. Having received an invitation from Mr. Charles Townsend, husband of the Duchess of Buccleuch, to accompany the young duke, her grace's son, on his travels, he was induced, from the liberal terms in which the proposal was made, and the strong desire he entertained of visiting the Continent, to resign his chair at Glasgow, and accept of the offer. "With the connection which he was led to form, in consequence of this change in his situation," Mr. Stewart remarks, "he had reason to be satisfied in an uncommon degree; and he always spoke of it with pleasure and gratitude. To the public it was not, perhaps, a change equally fortunate, as it interrupted that studious leisure for which nature seems to have destined him, and in which alone he could have hoped to accomplish those literary projects which had flattered the ambition of his youthful genius."

Dr. Smith having joined the Duke of Buccleuch at London in the early part of the year 1764, they set out for the Continent in the month of March. After remaining only ten or twelve days in the capital of France, they proceeded to Toulouse, where they resided during eighteen months. Toulouse was at that time the seat of a parliament; and the intimacy in which he lived with some of its principal members afforded him an opportunity of acquiring the most correct information in regard to the internal policy of France.

After leaving Toulouse they proceeded through the southern provinces to Geneva; and having spent two months in that city, returned to Paris about Christmas, 1765, where they remained nearly a year. During their abode in Paris Dr. Smith, through the recommendation of Mr. Hume and his own celebrity, lived on the most intimate terms with the best society in the city. Turgot (afterwards comptroller-general of finance), Quesnay, Necker, d'Alembert, Helvetius, Marmontel, the Duc de la Rochefoucault, and Madame Ricaboni, were among the number of his acquaintances; and some of them he continued ever afterwards to reckon among his friends. It is highly probable that he derived considerable advantage from his intercourse with Quesnay, the celebrated founder of the sect of Economists. Of this profound and ingenious man Dr. Smith entertained the highest opinion; and he has pronounced his work upon *Political Economy*, with all its imperfections, to be the nearest approximation to the truth that had then been published on the principles of that very important science. Dr. Smith intended to have dedicated to Quesnay the *Wealth of Nations*, but was prevented by his death.

Although Dr. Smith had made some very severe remarks in his *Theory of Moral Sentiments* on the celebrated *Maxims* of the Duke of Rochefoucault, this did not prevent him from receiving the utmost kindness and attention from the author's grandson. A short time before Dr. Smith left Paris he received a flattering letter from the Duke of Rochefoucault, with a copy of a new edition of the *Maxims* of his

grandfather; and informing Dr. Smith, at the same time, that he had been prevented from finishing a translation of his *Theory of Morals* into French, only by the knowledge of having been anticipated in the design.

Dr. Smith returned with his pupil to London, in October, 1766; and soon after took up his residence with his mother at Kirkcaldy, where, with the exception of a few occasional visits to London and Edinburgh, he resided constantly during the next ten years, engaged habitually in intense study. Mr. Hume, who considered the town as the proper scene for a man of letters, made many ineffectual attempts to prevail upon him to leave his retirement. During this residence of Dr. Smith at Kirkcaldy, he was engaged chiefly in maturing his speculations upon economical science. At length, in 1776, the *Inquiry into the Nature and Causes of the Wealth of Nations* made its appearance: a work which holds nearly the same rank in political economy, that Locke's *Essay on the Human Understanding* does in the philosophy of the mind, or the *Principia* of Newton in astronomy.

Our limits prevent us from giving anything like a particular analysis of this great work, but we shall endeavour to give some brief account of it. We shall notice very shortly the state of the science at the time when Dr. Smith wrote, the different leading principles which the illustrious author endeavours to establish, and the principal merits and defects of the work.

The object of political economy is to point out the means by which the industry of man may be rendered most productive of the necessities, conveniences, and luxuries of life; and to ascertain the laws which regulate the distribution of the various products which constitute wealth among the different classes of society. Though these inquiries be in the highest degree interesting and important, the science of political economy is comparatively of recent origin. It was not to be expected that, among the Greeks and Romans, who considered it degrading to be engaged in manufactures or commerce, and among whom such employments were left to slaves—where moralists considered the indulgence of luxury to be an evil of the first magnitude—that the science which treats of the best methods of acquiring wealth should be much attended to. At the revival of letters, these ancient prejudices still maintained a powerful influence, and, combined with other causes, long prevented philosophers from turning their attention to the subject.

The first inquirers in political economy were led away by a prejudice, which is perhaps one of the most deeply rooted in the human mind; namely, that wealth consists solely in gold and silver. From this mistake grew up that system of commercial policy which has been denominated the mercantile system, according to the principles laid down in which the commerce of Europe was, in a great measure, regulated at the time when Dr. Smith's work appeared. The leading doctrine of the commercial system was, that the policy of a country should be directed solely to the multiplication of the precious metals. Hence the internal commerce of a nation came to be entirely overlooked, or viewed only as subsidiary to the foreign: and the advantage derived from foreign trade was estimated by the excess of the value of the goods exported above that of those which were imported; it being supposed that the balance must be brought to the country in specie. To the radical mistake upon which the mercantile system was founded, may be traced those restrictions upon the importation, and the encouragement given

to the exportation of manufactures, which till lately distinguished the commercial policy of all the nations in Europe. It was imagined that, by such regulations, the excess of the value of exports over imports, to be paid in gold, would be increased.

During the seventeenth, and the earlier part of the eighteenth century, various pamphlets had appeared, in which some of the fundamental principles of political economy were distinctly enough laid down, and which had a tendency to show the futility of the mercantile theory. For a particular account of these publications, and their various merits, we must refer to Mr. M'Culloch's able introductory discourse to his edition of the *Wealth of Nations*. We shall here only remark, that though several of these treatises contain the germs of some of the truths to be found in the *Wealth of Nations*, yet the principles laid down in them are often stated only in a cursory and incidental manner. Their authors frequently appear not to be aware of the importance of the truths which they have discovered; and in none of them is anything like a connected view of political economy to be found.

The only work that was given to the world before the *Wealth of Nations*, in which an attempt was made to expound the principles of political economy in a logical and systematic manner, was the *Economical Table* of the celebrated Quesnay, a French physician, which was published in 1758: but the theory of this distinguished economist is very erroneous. Having been educated in the country he was naturally inclined to regard agriculture with partiality; and he had come to the conclusion that it was the only species of industry which could possibly contribute to increase the wealth of a nation. Everything which ministers to the wants of man must be originally derived from the earth; and the earth, therefore, Quesnay contended, must be the only source of wealth. As manufacturers and merchants do not realize any surplus in the shape of rent, he conceived that their operations, though highly useful, could not add any greater value to commodities than the value of the capital consumed by them. Into this erroneous theory he seems to have been led, from being unable to explain the nature of rent; and from being unacquainted with that fundamental principle in political economy, that labour is the cause of exchangeable value.

But though Quesnay conceived agriculture to be the only source of wealth, the principles of his system fortunately did not lead him to solicit for it any exclusive protection. On the contrary, he contended that the interest of all the different classes of society would be best promoted by the establishment of a system of perfect freedom. It must, he conceived, be advantageous to the cultivators of the soil, that the industry of manufacturers and merchants should not be fettered; for the more liberty they enjoyed, the greater would be their competition, and in consequence the cheaper would their services be rendered to the agriculturists. On the other hand, it was the interest of the manufacturers, that the cultivators of the soil should also have perfect freedom; for the greater liberty they enjoyed the more would their industry increase that surplus fund from which, according to his theory, the whole national revenue was ultimately derived.

It was in the work of Dr. Smith that the sources of the wealth and prosperity of nations were first fully and correctly explored, and, in a systematic manner, distinctly explained; and that the advantages to be derived from commercial freedom were first satisfactorily established. In opposition to the principles of the commercial system, Dr. Smith

showed that wealth does not consist in gold and silver, but in the abundance of the various necessities, conveniences, and luxuries of life; that labour is the only source of wealth; and, in opposition to the French economists, that labour is productive when employed in manufactures and commerce, as well as in agriculture. He has investigated the various causes by which labour may be rendered most productive; and has shown how immensely its powers are increased by being divided among different individuals or nations. He has proved, with great power of reasoning, that all restrictions upon either the internal or external commerce of a country are in the highest degree absurd and pernicious; and that the progress of real opulence will be most rapidly accelerated, when the industry of every individual and nation is employed in the production of those articles for which, either from natural or artificial causes, they are best adapted, and when the most unlimited freedom of making exchanges is everywhere allowed. "It is the maxim of every prudent master of a family," he remarks, b. iv. c. 2, "never to attempt to make at home what it will cost him more to make than to buy. The tailor does not attempt to make his own shoes, but buys them of the shoemaker; the shoemaker does not attempt to make his own clothes, but employs a tailor. The farmer attempts to make neither the one nor the other, but employs those different artificers; all of them find it for their interest to employ their whole industry in a way in which they have some advantage over their neighbours, and to purchase with a part of its produce whatever else they have occasion for." "What is prudence in the conduct of any private family, can scarce be folly in that of a great kingdom. If a foreign country can supply us with a commodity cheaper than we ourselves can make it, better buy it of them with some part of the produce of our own industry, employed in a way in which we have some advantage." "The natural advantages which one country has over another in producing particular commodities are sometimes so great, that it is acknowledged by all the world to be in vain to struggle with them. By means of glasses, hot-beds, and hot-walls, very good grapes can be raised in Scotland, and very good wine can be made of them, at about thirty times the expense for which at least equally good can be brought from foreign countries. Would it be a reasonable law to prohibit the importation of all foreign wines, merely to encourage the making of claret and burgundy in Scotland? But if there would be a manifest absurdity in turning towards any employment thirty times more of the capital and industry of the country than would be necessary to purchase from foreign countries an equal quantity of the commodities wanted; there must be an absurdity, though not altogether so glaring yet exactly of the same kind, in turning towards any such employment a thirtieth, or even a three-hundredth part more of either."

But though Dr. Smith contended upon correct principles for unlimited freedom of trade and commerce, and conceived that all the different branches of industry must be advantageous to society, he was of opinion that all were not *equally* advantageous. Agriculture he conceived to be the most productive employment in which capital could be engaged; the home trade to be more productive than the foreign; and the foreign than the carrying trade. But these distinctions are evidently erroneous. The self-interest of individuals will always prevent them from employing their capital in manufactures or in commerce, unless they yield as large profits as they would have done if they had been employed in agri-

culture: and a state being only a collection of individuals, whatever is most beneficial to them must also be most advantageous to the society. Dr. Smith has made another mistake in regard to the productiveness of labour. He divides all labourers into two classes, the productive and the unproductive; and he limits the class of productive labourers to those whose labour is immediately fixed, and realized in some vendible commodity. But certainly all labour ought to be reckoned productive, which, either directly or *indirectly*, contributes to augment the wealth of a society. It is impossible to hold that the labour of an Arkwright or a Watt was unproductive.

Few chapters in the *Wealth of Nations* are more valuable than that in which the illustrious author explains the causes of the apparent inequality in the wages and profits derived from different employments. He has shown, in the fullest and most satisfactory manner, that when allowance is made for all the advantages and disadvantages attending the different employments of labour and stock, wages and profits must, in the same neighbourhood, be either perfectly equal, or continually tending to equality. The circumstances which he enumerates as making up for a low state of wages in some employments, and counterbalancing a high one in others, are five in number. First, the agreeableness or disagreeableness of the employments themselves; secondly, the easiness and cheapness, or the difficulty and expense, of learning them; thirdly, the constancy or inconstancy of employment in them; fourthly, the small or great trust which must be reposed in those who exercise them; and, fifthly, the probability or improbability of success in them. Differences in the rate of profit seem to be occasioned chiefly from the risk to which capital is exposed, being greater in some employments than in others.

One of the most important inquiries in political economy is the investigation of the laws which regulate the exchangeable value of the different productions of industry; and the disquisitions of Dr. Smith on this subject are extremely valuable. He has shown, in opposition to the opinion commonly before entertained on the subject, that the price of commodities, the quantity of which may be indefinitely increased, does not depend upon their scarcity or abundance, but upon the cost of their production; that although variations in the supply of any article, or in the demand for it, may occasion temporary variations in its exchangeable value, the market price is permanently regulated by the natural price, and on an average corresponds with it. In estimating the elements, however, which form the necessary price of commodities, he has fallen into some very important errors, particularly with regard to rent, which, from being unacquainted with the causes that produce it, he considered to be one of the component parts of price. It was subsequently suggested by Dr. Anderson, and more specifically laid down by Ricardo and others, that rent is the difference between the product of the fruitful soil of a country (in comparison with the amount of labour and capital expended on it), and the product of such less fruitful soil as the pressure of population renders it necessary to bring into cultivation; and that rent being the difference between returns from an equal amount of capital applied to superior soils, and to that which is the most unproductive, is the effect, and not the cause, of the dearthness of agricultural products; and cannot therefore form an element in their natural price.

The error which Dr. Smith has fallen into with regard to rent is certainly the most important mis-

take in the *Wealth of Nations*, and has vitiated a considerable part of the work.¹ Among other mistakes it has led him into error in regard to the ultimate incidence of different taxes, and the circumstances which determine the rate of wages and profits. Had the illustrious author, too, been acquainted with the true theory of rent, he would not have contended that corn, upon an average, was the most invariable of all commodities in its value.

Many other important subjects besides those we have so briefly noticed are discussed by Dr. Smith; but we cannot farther extend our remarks. With all its defects the *Wealth of Nations* will ever remain a great standard work in the science of political economy, and an illustrious monument of the genius and talents of its author. The publication raised him to the highest rank in the literary world; and he enjoyed, during fifteen years, the fame which he had so justly acquired. His work soon after being published was translated into all the languages of Europe; his opinions were referred to in the House of Commons, and he himself consulted by the minister. Before his death, too, he had the satisfaction of seeing that the principles of commercial freedom which he had so ably advocated were beginning to influence the councils of Great Britain and other European states.

A few months after the publication of the *Wealth of Nations* Dr. Smith lost his highly esteemed friend Mr. Hume, who died upon the 25th of August, 1776. Dr. Smith was most assiduous in his attentions during the last illness of this illustrious man; and gives an interesting account, in a letter to Mr. Strahan of London, of the circumstances attending his death, and an eulogium upon his character. To those who are acquainted with Mr. Hume's religious opinions, some parts of this eulogium must certainly appear too high; and the author was accordingly attacked on the subject by Dr. Horne, Bishop of Norwich, who rashly ascribed to him, without any evidence, the same sceptical opinions which had been entertained by his illustrious friend.

Dr. Smith resided chiefly in London for about two years after his great work had been given to the public, during which time his society was courted by the most distinguished persons in the metropolis. In 1778 he was appointed one of the commissioners of customs in Scotland, through the unsolicited application of his friend and former pupil the Duke of Buccleuch. Upon obtaining this appointment he removed to Edinburgh, where he spent the remaining years of his life, enjoying comparative affluence, and the society of his earliest and most esteemed friends. His mother, who was then in extreme old age, accompanied him to town; and his cousin, Miss Jane Douglas, who had formerly been a member of his family in Glasgow, undertook the superintendence of his domestic arrangements.

The accession to his income which he had now obtained enabled him to gratify, to a much greater extent than formerly, the natural generosity of his disposition. "The state of his funds at the time of his death," Mr. Stewart remarks, "compared with his very moderate establishment, confirmed beyond a doubt, what his intimate acquaintances had often suspected, that a large proportion of his savings was allotted to offices of secret charity."

In 1787 Dr. Smith was elected lord-rector of the university of Glasgow. A letter addressed to the principal of the university on the occasion shows the high sense he felt of this honour. "No preferment," he writes, "could have given me so much real satis-

faction. No man can owe greater obligations to a society than I do to the university of Glasgow. They educated me: they sent me to Oxford. Soon after my return to Scotland they elected me one of their own members; and afterwards preferred me to another office, to which the abilities and virtues of the never-to-be-forgotten Dr. Hutcheson had given a superior degree of illustration. The period of thirteen years which I spent as a member of that society I remember as by far the most useful, and therefore as by far the happiest and most honourable, period of my life: and now, after three and twenty years' absence, to be remembered in so very agreeable a manner by my old friends and protectors, gives me a heartfelt joy which I cannot easily express to you."

During the last residence of Dr. Smith in Edinburgh his studies appear to have been almost entirely suspended. The petty routine duties of his office, though requiring little exertion of thought, were sufficient to occupy a considerable portion of his time and attention; and it is deeply to be regretted, that, in all probability, these duties alone prevented him from giving that "Account of the General Principles of Law and Government, and of the Different Revolutions they have undergone in the different Ages and Periods of Society," which he had stated in the concluding paragraph of the *Theory of Moral Sentiments* it was his intention to do.

In 1784 Dr. Smith lost his mother, to whom he had been most tenderly attached; and her death was followed, four years afterwards, by that of Miss Douglas. These domestic afflictions contributed to hasten the decline of his health. His constitution had never been robust, and began early to give way. His last illness, which arose from a chronic obstruction of the bowels, was lingering and painful. He had the consolation, however, of receiving the tenderest sympathy of his friends; and he bore his affliction with the most perfect resignation. His death took place in July, 1790.

A few days before his death, when Dr. Smith found his end rapidly approaching, he caused all his manuscripts to be destroyed excepting a few essays, which he intrusted to the care of his executors, Dr. Black and Dr. Hutton. The intention of destroying all those of his manuscripts which he did not think worthy of publication he had long entertained, and seems to have proceeded from a laudable anxiety in regard to his literary reputation. It is not exactly known what were the contents of the manuscripts which were destroyed, but there is every reason to believe that they consisted in part of the lectures on rhetoric and belles-lettres which he had delivered at Edinburgh in 1748, and of the lectures on natural religion and jurisprudence, which formed an important part of the course he had delivered at Glasgow. Of the essays which were left to the care of his friends six were published a few years after his death by his illustrious executors. Three of them are fragments of a great work which he at one time intended to write on the principles which lead and direct philosophical inquiries, but which he had long abandoned as far too extensive. The first contains the history of astronomy, which seems to be the most complete of the three; the second contains the history of ancient physics; and the third gives the history of the ancient logics and metaphysics. To these essays, which are all written upon the plan of his *Essay on the Formation of the Languages*, are subjoined other three, which treat, 1st. Of the nature of that imitation which takes place in what are called the imitative arts. 2d. Of the affinity between certain English and Italian verses; and 3d. Of the external senses.

¹ Dr. Smith's theory of rent, however, is not without its defenders. See, in particular, the *Westminster Review*.

As to the merits of these essays the distinguished editors express their hopes "that the reader would find in them that happy connection, that full and accurate expression, and that clear illustration which are conspicuous in the rest of the author's works; and that though it is difficult to add much to the great fame he so justly acquired by his other writings, these would be read with satisfaction and pleasure." The library which Dr. Smith had collected during his life, though small, was valuable. The books were well selected, and he was particularly careful that the bijoux which he admitted into his collection should be in excellent order. Mr. Smellie, in his life of Dr. Smith, says, "The first time I happened to be in his library, observing me looking at the books with some degree of curiosity and perhaps surprise, for most of the volumes were elegantly, and some of them superbly bound,—'You must have remarked,' said he, 'that I am a beau in nothing but my books.'" This valuable library, together with the rest of his property, Dr. Smith bequeathed to Mr. David Douglas, advocate, his cousin.

We shall close this sketch of Dr. Smith's life with a few observations on his habits and private character, extracted from the valuable account of his life and writings given by Mr. Stewart.

"To his private worth the most certain of all testimonies may be found in that confidence, respect, and attachment which followed him through all the various relations of life; the serenity and gaiety he enjoyed under the pressure of his growing infirmities, and the warm interest he felt to the last in everything connected with the welfare of his friends will be long remembered by a small circle, with whom, as long as his strength permitted, he regularly spent an evening in the week; and to whom the recollection of his worth still forms a pleasing though melancholy bond of union.

"The more delicate and characteristic features of his mind it is perhaps impossible to trace. That there were many peculiarities both in his manners and in his intellectual habits was manifest to the most superficial observer; but although, to those who knew him, these peculiarities detracted nothing from the respect which his abilities commanded; and although to his intimate friends they added an inexpressible charm to his conversation, while they displayed in the most interesting light the artless simplicity of his heart; yet it would require a very skilful pencil to present them to the public eye. He was certainly not fitted for the general commerce of the world, or for the business of active life. The comprehensive speculations with which he had been occupied from his youth, and the variety of materials which his own invention continually supplied to his thoughts, rendered him habitually inattentive to familiar objects and to common occurrences; and he frequently exhibited instances of absence which have scarcely been surpassed by the fancy of *La Bruyère*. Even in company he was apt to be engrossed with his studies; and appeared, at times, by the motion of his lips as well as by his looks and gestures, to be in the fervour of composition. I have often, however, been struck at the distance of years, with his accurate memory of the most trifling particulars, and am inclined to believe, from this and some other circumstances, that he possessed a power, not perhaps uncommon among absent men, of recollecting, in consequence of subsequent efforts of reflection, many occurrences which at the time when they happened did not seem to have sensibly attracted his notice.

"To the defect now mentioned it was probably owing that he did not fall in easily with the common

dialogue of conversation, and that he was somewhat apt to convey his own ideas in the form of a lecture. When he did so, however, it never proceeded from a wish to engross the discourse or to gratify his vanity. His own inclination disposed him so strongly to enjoy in silence the gaiety of those around him, that his friends were often led to concert little schemes in order to engage him in the discussions most likely to interest him. Nor do I think I shall be accused of going too far when I say, that he was scarcely ever known to start a new topic himself, or to appear unprepared upon those topics that were introduced by others. Indeed, his conversation was never more amusing than when he gave a loose to his genius upon the very few branches of knowledge of which he only possessed the outlines.

"The opinions he formed of men upon a slight acquaintance were frequently erroneous; but the tendency of his nature inclined him much more to blind partiality than to ill-founded prejudices. The enlarged views of human affairs on which his mind habitually dwelt, left him neither time nor inclination to study in detail the uninteresting peculiarities of ordinary characters, and accordingly, though intimately acquainted with the capacities of the intellect and the workings of the heart, and accustomed in his theories to mark with the most delicate hand the nicest shades both of genius and of the passions; yet in judging of individuals it sometimes happened that his estimates were in a surprising degree wide of the truth.

"The opinions too, which, in the thoughtlessness and confidence of his social hours, he was accustomed to hazard on books and on questions of speculation, were not uniformly such as might have been expected from the superiority of his understanding, and the singular consistency of his philosophical principles. They were liable to be influenced by accidental circumstances, and by the humour of the moment: and when retailed by those who only saw him occasionally, suggested false and contradictory ideas of his real sentiments. On these, however, as on most other occasions, there was always much truth as well as ingenuity in his remarks; and if the different opinions which at different times he pronounced upon the same subject had been all combined together, so as to modify and limit each other, they would probably have afforded materials for a decision equally comprehensive and just. But, in the society of his friends, he had no disposition to form those qualified conclusions that we admire in his writings; and he generally contented himself with a bold and masterly sketch of the object from the first point of view in which his temper or his fancy presented it. Something of the same kind might be remarked when he attempted in the flow of his spirits to delineate those characters which from long intimacy he might have been disposed to understand thoroughly. The picture was always lively and expressive, and commonly bore a strong and amusing resemblance to the original, when viewed under one particular aspect; but seldom, perhaps, conveyed a just and complete conception of it in all its dimensions and proportions. In a word, it was the fault of his unpremeditated judgments to be systematical and too much in extremes.

"But in whatever way these trifling peculiarities in his manners may be explained, there can be no doubt that they were intimately connected with the genuine artlessness of his mind. In this amiable quality he often recalled to his friends the accounts that are given of good *La Fontaine*; a quality which in him derived a peculiar grace from the singularity of its combination with those powers of reason and

of eloquence which in his political and moral writings have long engaged the admiration of Europe.

"In his external form and appearance there was nothing uncommon. When perfectly at ease, and when warmed with conversation, his gestures were animated, and not ungraceful; and in the society of those he loved his features were often brightened with a smile of inexpressible benignity. In the company of strangers his tendency to absence, and perhaps still more his consciousness of this tendency, rendered his manner somewhat embarrassed—an effect which was probably not a little heightened by those speculative ideas of propriety which his recluse habits tended at once to perfect in his conception, and to diminish his power of realizing. He never sat for his picture; but the medallion of Tassie conveys an exact idea of his profile, and of the general expression of his countenance."

SMITH, ALEXANDER. After the great poets of the nineteenth century had passed away, and when Wordsworth, the earliest and latest of the illustrious throng, was silent, a change occurred similar to that which succeeded the poetical eras of Elizabeth and Anne in the history of British literature. It was thought that the tuneless interval had commenced which generally interposes as a law of nature betwixt the setting of the old constellation of poets and the rise of a new, while the practical and scientific studies of the present utilitarian generation confirmed the suspicion. The present interval, however, as in the preceding instances, has not been wholly a void, and solitary voices have succeeded the chorus, by which the anthem is continued until it shall burst again into full swell. Of these poets who have succeeded the demise of Scott, Southey, Byron, Moore, Campbell, Wordsworth, and their scarcely illustrious contemporaries, and whose touches upon the British harp still "tell that yet it lives," there are two whose memory will not be consigned to the oblivion that may await the rest. Of these two the distinguished name of Tennyson will at once occur to the reader. The other, who evinced a similar spirit, but whom adverse circumstances and a premature death prevented from ripening into the maturity of which he gave so fair a promise, was Alexander Smith, the subject of our present memoir.

This amiable and distinguished poet was born at Kilmarnock on the 31st of December, 1830. His father, of whom he was the eldest son, was a designer of patterns; his mother, whose maiden name was Murray, was of a respectable Highland family. With the usual education of Scottish boyhood Alexander Smith combined a remarkable love of poetry, and his early attention and extensive reading of the works of our best poets already indicated the direction in which his tendencies lay. The notice he attracted as a diligent and apt scholar suggested to his parents the idea of devoting him to the church, and his studies were accordingly directed to his ultimate education for the ministry; but in consequence of a severe illness, his literary studies for the clerical profession were first interrupted, and finally abandoned. Turning his attention to his father's occupation of a pattern-designer, his good taste and natural quickness soon made him a master in this artistic department of trade, while he still continued to cling to his poetical studies; and on removing to Glasgow, it was with the double object of finding employment among its manufacturers, and intellectual improvement among its literary society. In the latter and more important aim he was especially successful; and by the society of J. P. Nichol, professor of astronomy in the university of Glasgow, Mr. James

Hedderwick, and Mr. Hugh Macdonald, the talented conductors of the *Glasgow Citizen*, and other men of literary standing in the capital of the west, his sphere of information was extended, his taste regulated, and his first attempts in authorship encouraged and patronized.

Under this irregular but still effective training of a poet, the time had arrived when this divided allegiance between business must be severed, and the choice of a life occupation adopted. He must wholly become a pattern-designer, in which he had already manifested great proficiency, or wholly abandon this comfortable calling for the precarious chances of literature. The choice was made, and made at an early period: he would be a poet in spite of all the ills that poetry is heir to. It was at an early period of his life also that the die was cast. Before he had reached his twentieth year he had written, and in 1851-2 he published his *Life Drama*, a wonderful poem, especially when the youth of the author is taken into account. Ambitious as the attempt was, it was recognized as a poem of the highest order, while its faults were excused as the youthful redundancies of a great genius which a few years would suffice to correct. Accordingly every review and newspaper, from the highest metropolitan to the humblest provincial, caught and re-echoed the prevalent commendation, and announced, that after so many disappointments, a true poet had at length appeared. The effect of this sudden outburst of popularity was, that edition after edition of the volume was published with unprecedented rapidity, and admiration, instead of being pallid, was increased by each repetition. To the *Life Drama* were also appended a collection of sonnets; and these, tried by the severe standard allotted to such productions, were declared to be noble specimens of poetical sentiment, expressed in the purest and happiest style. Such criticisms, however, in many cases overcharged, were not always correct, and in not a few instances the overstrained language and descriptions of the youthful poet were selected as beauties to be admired and commended. A reaction of dissent was the consequence among a party of the severely critical, headed by Professor Aytoun, author of *Lays of the Cavaliers*, who produced on this occasion a burlesque tragedy, called *Firmilian*, in which Smith and his chief laudator, Gilfillan, were held up to ridicule, and their style of poetry nicknamed the "Spasmodic School." But the satire was too severe to be mischievous, and Aytoun himself, on the return of better thoughts, found cause to revoke his judgment. In the meantime, amidst such instant and overwhelming popularity, it was well that the young poet was not carried off his feet and borne away. Moved indeed he must have been, and not a little giddy with his sudden elevation to so high a rank; but the feeling found in him no correspondent vanity to cherish it, so that it quickly died out, and left him as he was before. This is attested by one of his friends, who knew him well, and knew him to the last. "Rarely, indeed," he says, "has such an example been found in the annals of literature, of a nature so richly gifted with the elements of poetry and passion, and yet so firmly tempered by natural piety and common sense. In this respect alone the life and character of Alexander Smith have been full of precious instruction to young literary aspirants. The brilliancy of his first appearance before the world, and the flattering testimonies that greeted his entrance into the charmed circle of poets, had no effect whatever in disturbing the serene balance of his nature, or perverting the simplicity of his belief in faithful and honest work as the true avocation of every man, and the ulti-

mate test of his worth. If he had been capable of being spoiled, he had every opportunity for being so. But he was too good for that; and amid all our sorrow for the untimely shortening of his promising career, it is a deep satisfaction to think that his was not a wasted and fruitless life—that already, before the mid-time of his days, which were destined to have no decline, he had proved to the world how well he knew the right exercise, and faithfully employed them to the last.”

When Burns had fully established his reputation as the best poet of Scotland, public gratitude could devise no higher reward than to save him from absolute starvation by making him a gauger. The present age is improved in that respect, and Alexander Smith was to reap the benefit of the improvement. To place the young poet not only in a position of independence, but of literary respectability, was thought to be nothing more than a duty, and he was accordingly appointed secretary of the university of Edinburgh in 1854. Feeling that he could now afford to write poetry as his appointed work, instead of a chance recreation, and partaking in the universal stir occasioned by the breaking out of the Crimean war, Smith in 1855, and in conjunction with Dobell, a brother poet of the Spasmodic School, produced a volume of sonnets. Even already, however, a reaction had occurred in the public estimation: a suspicion arose that the poet had been rated too highly, and the recoil was of that indignant nature which men are apt to exhibit when their suffrage has been stolen from them they know not how. Severely was Smith now to learn the value of popularity. Earnestly and faithfully he had been labouring to improve himself in poetry since the appearance of his much-praised *Drama*—and this was the requital that awaited him! Such was especially the case on the appearance of his *City Poems* in 1857, and the welcome that had been received by his first production was now delivered grudgingly, and with bated breath. And yet these poems were greatly in advance upon his earliest, and showed how sedulously, and also how successfully, he had laboured in the duty of self-improvement. This was especially conspicuous in some of the minor pieces, particularly those entitled “Barbara” and “Glasgow;” the former of which contains some passages of his own history. Animated rather than deterred by the abatement of the popular favour, and resolute to vindicate his claims to poetic excellence, Smith addressed himself anew to the task, and after two years of labour produced his best and largest poetical work, and also his most ambitious, called *Edwin of Deira*. This production, by which his poetical powers have been and will continue to be the most especially judged and estimated, had to contend with unfavourable circumstances. The wonderful history of this amiable heptarchon, Edwin the King of Deira, has been so beautifully and touchingly told by the venerable Bede, that few poets would have cared to disturb it, and a repetition, however excellent, of the tale would always be deemed inferior to the original. At the same time also with the appearance of Smith’s poem, Tennyson published his *Idyls of the King*, and this greatly superior production was thought, although erroneously, to have served as the model of the other. As it was, Edwin with his nobles, knechts, and huscarles, had little chance against Arthur and his knights of the round table, and as a poem it was thrown into the shade by the other. Public opinion even went in some cases to allege that because Tennyson was so much the superior as a poet, therefore Smith was no poet at all. It is needless to dwell upon the absurdity of this conclusion. Alexander Smith was

still under his probation, and the progress he had already made was such as to warrant the hope that all he had hitherto produced would be greatly surpassed by his subsequent efforts. By more than one or two long strides he was still behind the more talented laureate; but with every year the distance would be lessened in the aim to reach his more fortunate brother. Alas that time was wanting for the experiment, and that the only termination of the trial was to be Alexander Smith’s premature grave!

We must now turn to the everyday life and prosaic history of the poet. Although as secretary of the university of Edinburgh he occupied apparently a high literary position, his salary, which was only £150 per annum, only equalled that of the college janitor. His duties also continued to be increased, while the remuneration remained stationary. He received, indeed, an additional £40 as registrar, and £10 as secretary to the university council; but even with these additions, his salary was small for a literary man, and for the performance of duties which kept him closely occupied from ten o’clock in the morning until four in the afternoon. The necessity of improving his limited resources was also increased by his marriage in 1854 to Flora M’Donald, eldest daughter of Captain M’Donald of Ord, in the isle of Skye. He must accordingly devote his evenings to literary occupation, and such occupation as would be remunerative. But he had already experience that poetry did not fall under this description, the whole sum derived from his *Edwin of Deira* being less than twelve pounds. A poet from choice, he must become a prose-writer from necessity, and his beloved vocation must be kept in the back-ground. With a sigh he yielded to the prevalent demand, and the same genius that made him a superior poet enabled him to produce good, popular, prose articles, which he threw off with a ready pen for the principal journals of the day. In this way he became an active contributor to *Blackwood’s* and *Macmillan’s Magazines*, to the *North British Review*, the *Museum*, the *West of Scotland Magazine*, *Good Words*, and latterly the *Argosy* and *Quiver*. At the same time he contributed several articles to the new edition of the *Encyclopædia Britannica*, and a great many to Chambers’ *Encyclopædia*. For several years also he wrote one or two papers weekly for the newspaper press. The merits of the articles so hastily produced are various; but while not a few of them attained to high reputation, all of them were more or less impressed with the stamp of original genius. Of these we would particularly refer to his biographical articles in the *Encyclopædia Britannica*; his series of papers under the title of “Alfred Hagart’s Household,” which appeared in *Good Words*; and his collection of papers called *Dreamthorpe*, published in 1862. In 1865 he published his excellent and painstaking edition of Burns, with a memoir of the poet and a glossary. During the same year appeared his *Summer in Skye*, in two volumes, a work of brilliant character, which has allured many a tourist to that long-forgotten island. It gives us a high idea of Smith’s industry, when we find that in the years 1865 and 1866 his literary labours would fill seven volumes. But much as he wrote, he could not meet the demands of publishers that poured in upon him, especially after the appearance of *Dreamthorpe* in 1862, for most of the new magazines were eager to commence with an article from the popular pen of Alexander Smith. But even already, and in the full flush of this growing celebrity, his task was ended. In the summer of 1865 he exhibited symptoms of an exhausted constitution, the effect of over-work, but an autumn of holidays in the High-

lands seemed to restore him to his wonted health and vigour. He still, however, seemed to feel a premonition of evil, and the flattering promise turned out a delusion. Shortly after the opening of the winter session of 1866, his college duties were found too much for him, a severe and alarming illness succeeded, and he died in his house at Wardie, on the 5th of January, 1867, having just entered his thirty-seventh year.

Thus died this overtaken son of genius before his day, and before he had completed the rich promise of his fame. But a stronger promise of perpetuity is attached to his works than usually falls to the lot of those who die so early. To this brief sketch of Alexander Smith's life we can only add this picture of his character and everyday life, from a friend who knew him well and loved him dearly:—"Those only who knew him intimately—in the seclusion of his study, at his own fireside, in the companionship of a summer-day's ramble—can adequately feel what a justness and generosity of sentiment, what a nobleness of nature, what a perennial stream of kindness and geniality, have vanished with Alexander Smith. Never shall we forget the rare and tender delight which his presence gave to many a genial gathering of literary friends, or the poetic grace which he unconsciously threw around many a joyous symposium commemorative of some 'guest of the evening.' Never shall we forget the happy flow of ideas, the elastic good humour, the bright flashes of true poetic wit with which his company would enliven the long summer-day's excursion! Never shall we forget the quiet felicity with which he would discuss controverted points of ethics or of art in his own quaint and hospitable student-room! For us his favourite walks, his favourite places of resort, will ever be sad with his memory; and, like the thorn that flourishes at mid-winter, will perennially return to us the melancholy morning on which this good and gifted Scotchman went down to his rest."

SMITH, JAMES, Esq., of Jordanhill, F.R.S., F.R.S.E., F.R.G.S., M.W.S., &c. &c., born in Glasgow on the 15th August, 1782, was the eldest son of Archibald Smith of Jordanhill, an eminent West India merchant, who died in 1821, and Isabella Ewing, known to many as the friend and correspondent of Mrs. Grant of Laggan, to whom many of the *Letters from the Mountains* were addressed, and whose great powers of mind and warm affections continued unimpaired till her death in 1855, in her 101st year.

Mr. Smith was educated at the university of Glasgow, where he was the contemporary and friend of John Wilson (Christopher North), Dr. Alexander Blair, John Richardson. He afterwards served for some years in the Renfrewshire militia, then chiefly quartered in the south of England, the dread of invasion not having entirely passed away. In 1809 he married Mary Wilson (who died in 1847), granddaughter of Dr. Alexander Wilson, professor of astronomy in the university of Glasgow, whose reputation as an original thinker has recently been revived, from the now very general acquiescence in his speculations on the nature of the solar spots. In 1812 Mr. Smith retired from the militia, and resided, till his father's death, in the then remains of the old castle of Roseneath. The greater part of the stately residence of the Duke of Argyll had been burned down ten years before, and the present castle had not been built. And in this charming residence, in the most beautiful spot of the west of Scotland, he spent the next ten happiest years of his life, indulging in that strong taste or passion for yachting which

with him was lifelong, and for which Roseneath afforded unequalled facilities. In 1821 Mr. Smith's father died, and he shortly afterwards removed to Jordanhill, where he principally resided, and where he died on the 17th of January, 1867, in his eighty-fifth year. In early life Mr. Smith's attention was chiefly given to literature and the fine arts. He was also an ardent cultivator of geographical science. He was an enthusiastic book-collector, particularly in the department of early voyages of discovery, of which he has left a large and valuable collection. He was keenly interested in the Arctic voyages, which excited so much interest at that time, and was the warm personal friend of several of the distinguished officers engaged in them, particularly the lamented Captain Douglas Clavering, R.N., and General Sabine, R.A., the present president of the Royal Society. It may be interesting to mention that it was by a Dutch chart cut from a volume in Mr. Smith's library that Captain Clavering steered to the coast of Greenland and found Gael Hamke's Inlet in the exact situation there laid down, in memory of which he gave the two capes at its entrance the names Cape James and Cape Mary, and to the island at its head the name of Jordanhill. And it is in fact on a MS. copy of Captain Clavering's original chart which Mr. Smith had made for his own use that the geography of East Greenland from latitude 72° to 76° depends, the original having been unfortunately lost. Mr. Smith was also an accomplished linguist, reading with facility most of the Roman and Teutonic languages; and he was a practical as well as theoretical architect; and was a zealous student of family and historical antiquities. Later in life Mr. Smith devoted himself principally to the science of geology, and particularly to that part of it for which the possession of a yacht offered peculiar facilities, viz. the comparison of the shells in the most recent geological deposits with those existing in the present seas. This comparison, originally suggested to him by Sir Charles Lyell, was commenced about the year 1834, and continued with unflagging zeal for many years. The results of his researches were remarkable, and form an era in the history of post-tertiary geology. The deposits which he examined are those of finely laminated clay, with marine remains, which occur at many places and at different elevations, up to several hundred feet, on the west of Scotland. By far the greater proportion of shells in these deposits still inhabit the British seas, but many are no longer to be found. The missing shells are generally of an Arctic type, and most of them have been found in the Arctic seas. From this Mr. Smith drew the conclusion announced by him to the Geological Society in 1839 of the existence before the present geological epoch of a period of greater cold. This conclusion, which was contrary to the general opinion of geologists, is now generally accepted, and the epoch in question is now known as the glacial epoch.

From 1839 to 1847 the health of members of his family caused Mr. Smith to reside successively at Madeira, Gibraltar, Lisbon, and Malta, and he published interesting papers on the geology of each of these localities. Mr. Smith's residence at Malta was the occasion and commencement of the remarkable series of researches connected with the writings of the three earliest Christian writers, by which he is now best known. The first results of these researches were published in 1848, under the title "*The Voyage and Shipwreck of St. Paul*, with Dissertations on the Life and Writings of St. Luke, and the Ships and Navigation of the Ancients." The primary object of the work was to examine the nar-

rative contained in the 27th chapter of Acts, and the method of investigation and the results may be stated in his own words: "I do not even assume the authenticity of the narrative of the voyage and shipwreck contained in the Acts of the Apostles, but scrutinise St. Luke's account of the voyage as I would those of Baffin and Middleton, or of any antient voyage of doubtful authority or involving points on which controversies have been raised. A searching comparison of the narrative with the localities where the events so circumstantially related are said to have taken place, with the aids which recent advances in our knowledge of the geography and the navigation of the eastern part of the Mediterranean supply, accounts for every transaction, clears up every difficulty, and exhibits an agreement so perfect in all its parts as to admit but of one explanation, namely, that it is a narrative of real events, written by one personally engaged in them, and that the tradition respecting the locality is true" (Introduction).

The reader of this sketch will easily see how many qualifications united to fit Mr. Smith for this important subject. The work was at once received by the unanimous verdict of all critics and theologians, both English and foreign, as finally settling all disputed questions as to the narrative of the voyage and the locality of the shipwreck. The minute study of the writings of St. Luke required for this work led Mr. Smith to a view of the much contested question of the connection of the first three Gospels, which was first published in the *Dissertation on the Life and Writings of St. Luke* above referred to, afterwards with much more detail in a separate *Dissertation on the Origin and Connection of the Gospels* (Blackwood, 1853). The conclusions to which Mr. Smith was led are—1st, That the Gospel of St. Mark (Marcus interpres Petri) is almost entirely a translation made by St. Mark of a contemporary memoir made by St. Peter in Hebrew (Aramaic). 2d. That St. Matthew composed and published his Gospel in both languages, Greek and Aramaic, making use as an authority of St. Peter's memoir. 3d. That St. Luke composed his Gospel, making use, among other authorities, of St. Peter's memoir and of St. Matthew's Greek as well as Aramaic Gospel. These conclusions arrived at by Mr. Smith in 1848 were supported by him with wonderful ingenuity and sagacity, and received remarkable confirmation from the subsequent publication of Dr. Cureton of his translation of the lately discovered Syriac version of the Gospel of St. Matthew, which Mr. Smith, as well as Dr. Cureton, considered as being the representative not of the Greek but of the original Aramaic edition of St. Matthew's Gospel.

The publication of the lately discovered Codex Sinaiticus likewise confirmed in many important particulars the conclusions at which Mr. Smith had arrived in both his works.

Mr. Smith was in politics a Conservative, but inclining to the liberal side. He contested the burgh of Greenock at the general election in 1837, but unsuccessfully, and made no other attempt to enter parliament.

In all that concerned the Church of Scotland he took a deep interest. He was for many years a member of the General Assembly as elder for the parish of Renfrew, and at his death was the senior lay member of that body. He deeply deplored the Disruption in the Church of Scotland, and was one of those who were most anxious to remove every ground for it.

Mr. Smith enjoyed vigorous health till the spring of 1866, when a slight stroke of paralysis enfeebled

his body without affecting his mind. A great part of the last summer of his life was spent in his yacht in the quiet waters of the Frith of Clyde, and the lochs and kyles which branch from it. A second attack, in November, 1866, was followed by his death at Jordanhill on the 17th of January, 1867.

Mr. Smith was succeeded by his only son, Archibald Smith, Esq., M.A., F.R.S., barrister-at-law, late fellow of Trinity College, Cambridge. Married in 1853 to Susan Emma, youngest daughter of the late Vice-chancellor Sir James Parker.

SMITH, JAMES. This distinguished agriculturist, who was so successful in propagating the system of deep ploughing and thorough draining, was born at Glasgow on the 3d of January, 1789. His father, who had been in business in that city, died when James was only two months old, so that the infant was left to the charge of his mother, who was a daughter of Mr. Buchanan of Carston in Stirlingshire. After her husband's death Mrs. Smith resided with her brother, the manager of an extensive cotton manufactory at Deanston, near Stirling, and James, after being educated at home, was sent to the university of Glasgow. Whether he distinguished himself as a student we are unable to learn, but his future excellence lay in those departments with which the universities of his day had little connection. After his course of education at college was finished he returned to his uncle, who had removed to the Catrine works in Ayrshire; and being desirous of attaining a complete knowledge of the trade, he became a workman through all its different grades, labouring for the purpose twelve hours a day. Such commendable perseverance was worthily rewarded, as he was intrusted at the early age of eighteen with the entire management of the works at Deanston, and into these he introduced such improvements for promoting the health of the operatives employed in it, that they were mentioned with commendation by Mr. Chadwick in 1841, when he drew up "Report on the Sanitary Condition of the Labouring Population in Great Britain."

It was not, however, to improved processes in manufacturing that the energies of James Smith were to be confined. Agriculture had from an early period occupied his attention; while his training in the factory and acquaintanceship with its machinery, had taught him the best means of compelling the soil to yield its produce. During the war, when labour was very scarce, the Dalkeith Farmers' Club offered a prize of £500 for an effective reaping-machine. This was a fit competition for Mr. Smith, who produced one; and although it did not obtain the prize, the committee were so greatly pleased with it that they requested him to attempt another. This he did in 1813, and though still the prize was not awarded to him, chiefly owing, it is said, to accident, its merits were not the less appreciated. This was shown by a prize which he received from the Dalkeith Farmers' Club of a splendid piece of plate valued at fifty guineas; from the Highland Society of Scotland another piece of plate; from the Gargunnoch Farmers' Club in his own neighbourhood a pair of silver cups; and from the Imperial Agricultural Society of St. Petersburg a massive gold medal, transmitted through the Russian ambassador at the British court. To add to the merit of these achievements, both manufacturing and agricultural, they were effected before he had passed his twenty-fourth year.

Until 1823 Mr. Smith had the management of his uncle's farm, in which he introduced several successful experiments, although his attempts were generally

discountenanced by his kinsman, who was of the old agricultural school, and hated or despised all changes. But in the year we have last mentioned the farm of Deanstoun came into his own hands, and he was free to try upon it what experiments he pleased. There was full need too for change, as the property consisted of about 200 acres of very poor, unproductive land, with a soil not averaging more than four inches in depth, with a subsoil partly of sandy clay and partly of a compact soil with stones, and the whole producing little but rushes in the watery hollows and broom on the dryer portions. It was a field of action well fitted to task the energy and resources of any agricultural projector. To work, however, he went with a will, and intersected the whole farm with drains at distances of twenty-one feet, and at a depth of thirty inches; and these, with the operation of a subsoil plough to stir the ground deeply, without raising the subsoil to the surface, soon changed the whole character and aspect of the place, so that good crops succeeded to the rushes, pools of water, and stone boulders, that had formerly been the chief produce of the land. Encouraged by his success, and desirous that others should partake in it, he published in 1831 a pamphlet on *Thorough Draining and Deep Ploughing*, which secured the attention and awoke the imitation of his immediate neighbourhood; and although a considerable time elapsed before his recommendations were adopted, they at length came into general practice, and Mr. Smith is now recognized with grateful remembrance as the inventor of the system of deep draining.

His success having made him be regarded as an authority upon this and other cognate subjects, he was in 1846 appointed by government one of a commission to inquire into the health and sanitary condition of our manufacturing towns; and one of his recommendations was the removal of the sewage for agricultural purposes, with suggestions of plans to effect the process, which were characterized by great mechanical simplicity and skill. These proposals at first occasioned great demur, and stirred up much opposition in parliament; but an act was finally passed, authorizing large towns to adopt his scheme wherever it was practicable. He also suggested several valuable improvements to the Agricultural Society of Ireland, of which he was a highly honoured member; and to the Glasgow Philosophical Society, in whose *Transactions* several of his contributions appeared. After a life of remarkable activity, in which every hour was turned to account, Mr. Smith's end was sudden and unexpected. On the evening of the 9th of June, 1850, he retired to bed in his usual health, but in the morning was found dead. This occurred at Kingencleugh, Ayrshire, in the sixty-first year of his age.

SMOLLETT, TOBIAS, or, to give him his full name, as it appears in the baptismal record, **TOBIAS GEORGE SMOLLETT**, a celebrated novelist, poet, and miscellaneous writer, was born in the old house of Dalquhurn, near the modern village of Renton, in the parish of Cardross, Dumbartonshire, in the year 1721. His family had held considerable local rank for several centuries. His grandfather, Sir James Smollett, of Bonhill, served as commissioner for Dumbarton in the Scottish parliaments between the Revolution and the Union; in the latter negotiation he was chosen a commissioner on the Scottish side. Archibald, the fourth son of this gentleman, by Jane, daughter of Sir Aulay M'Aulay of Ardincaple, received a liberal education, but was bred to no profession. Without previously consulting his father, he married Barbara Cunningham, daughter

of Mr. Cunningham, of Gilbertfield, near Glasgow—a woman of distinguished understanding, taste, and elegance, but no fortune. Sir James, though displeased with the match, as having been entered into without his knowledge, provided for his son by giving him a liferent of his farm of Dalquhurn; which, with an annuity, made his income about £300 a year.

Archibald Smollett had three children. Soon after the birth of the youngest, the subject of this memoir, he died, leaving his family entirely dependent on the bounty of his father. Tobias very early gave promising indications of a lively wit and vigorous understanding, which were cultivated, not only by the fond partiality of his mother, but by a frequent intercourse with his venerable grandfather, whose long experience “in courts and great affairs” conspired with his natural inclination in directing his attention to the study of the conduct and characters of men, and the science of life. He received the rudiments of education at the neighbouring school of Dumbarton, which was then taught by Mr. John Love, a distinguished grammarian, well known for his controversies with Kuddiman.

The scene of Smollett's childhood was the most favourable that could be conceived for nursing an infant poet; and this circumstance, combined with his romantic disposition, made him wish to be a soldier. He was thwarted, however, in this predilection by his grandfather, who, having already permitted the elder brother, James, to engage in a military career, thought he could better advance the prospects of the younger in a different course of life. Tobias was therefore sent to study at Glasgow College, with a view to some of the learned professions. There he was led, by the intimacy he formed with some of the medical students, to embrace the profession of physic, which he forthwith studied, along with anatomy, under the proper professors, at the same time that he served an apprenticeship in town to a surgeon named Gordon, whom he is supposed to have afterwards caricatured in *Roderick Random*, under the title of *Potion*. His talent for satire and poignant remark was here gradually developed in favour of such specimens of affectation, hypocrisy, and meanness as fell under his observation. He was also given to what are called practical jokes. One winter evening, when the streets were covered with snow, he was engaged in a snow-ball fight with some boys of his own age, among whom was the apprentice of a surgeon, whom he is supposed to have delineated under the name of *Crab* in *Roderick Random*. The master of this apprentice having entered his shop while the youth was in the heat of the engagement, rebuked him very severely on his return for having quitted the shop. The boy excused himself by saying that, while engaged in making up a prescription, a fellow had hit him with a snow-ball, and he had gone in pursuit of the delinquent. “A mighty probable story, truly,” said the master in an ironical tone; “I wonder how long I should stand here before it would enter into any mortal's head to throw a snow-ball at me.” Just as he pronounced these words, Smollett, who had overheard them at the door, gave him a most unexpected answer by throwing a snow-ball, which hit him a very severe blow on the face, and extricated his companion.

But the early years of Smollett were devoted to better pursuits than these. While still studying medicine at the college, he composed a tragedy on the death of James I. of Scotland, entitled the *Régicide*; and which, though not calculated for the stage, certainly displayed considerable ability.

While in his eighteenth year, he had the misfortune to lose his grandfather, who died without making any provision for either him or any of the rest of his father's family. He therefore resolved to seek his fortune in London; while his sister, having married Mr. Telfer, a respectable and wealthy gentleman of Lanarkshire, was able to afford an asylum to his mother. His elder brother, James, who had before this entered the army and reached the rank of captain, was lost at sea off the coast of America.

The stock with which Smollett, at nineteen, entered upon London life, consisted of a small sum of money, a large assortment of letters of introduction, a mind stored with professional knowledge and general literature, a rich vein of humour, and an engaging person and address. He tried, at first, to get his tragedy brought upon the stage; but the attempt only ended in disappointment and chagrin. His friends, however, were able to procure him an appointment as surgeon's mate to a ship of the line; in which capacity he sailed, in 1741, in the unfortunate expedition to Carthage, under Admiral Vernon and General Wentworth. Of this blundering affair he published a most faithful and spirited account in his *Compendium of Voyages and Travels*, seven volumes octavo, 1756; as also, what may be styled a personal narrative, in *Roderick Random*. He was so much disgusted with his situation, that, though he had the prospect of promotion, he quitted the service at Jamaica, where he resided for some time. On his return to Britain, in 1746, he was met by accounts of the barbarities exercised by the Duke of Cumberland's army in the north of Scotland; which, notwithstanding that his political principles were Whiggish, drew from him an indignant burst of patriotic eloquence, in the well-known ode, beginning—

"Mourn, hapless Caledonia, mourn
Thy banished peace, thy laurels torn!"

He is said to have originally finished this production in six stanzas; but some individuals having represented to him that such an expression of sentiment might give offence, and retard his progress in life, he sat down in a fit of still more vehement indignation, and almost instantaneously produced the seventh stanza, beginning—

"While the warm blood bedews my veins,
And unimpaired remembrance reigns,
Remembrance of my country's fate
Within my filial breast shall be."

An anecdote which shows that Smollett, like many other men of distinguished genius, was

"Too fond of the right, to pursue the expedient."

The above anecdote is taken from Dr. Anderson's accurate life of Smollett; but that the subject of our memoir was in London between 1741 and 1746 is abundantly clear from the following letter, which is here for the first time committed to print:—

"Dear Sir,—I am this minute happy in yours, which affords me all the satisfaction of hearing from you, without the anxiety naturally flowing from its melancholy occasion; for I was informed of the decease of our late friend by a letter from Mr. Gordon,¹ dated the day after his death.

"All those (as well as my dear Barclay) who knew the intimacy betwixt us, must imagine that no stroke of fate could make a deeper impression on my soul than that which severs me for ever from one I so entirely loved! from one who merited universal esteem; and who, had he not been cut off in the very blossom of his being, would have been an ornament to society, the pride and joy of his parents, and a most inestimable jewel to such as were attached to him, as we

were, by the sacred ties of love and friendship. O my dear Ritchie, little did I think, at our last parting, we should never meet again! How many hours, days, nay years, of enjoyment did I promise myself on the prospect of seeing thee again! How has my heart throbbed at thy imaginary presence! And how oft have I conversed with thee by the indulgence of a dream! Even when I waked to my disappointment, I flew to pleasing hope for refuge, and reflected on the probability of real gratification! But now, alas! even that forsakes me. Hope itself lies buried with its object, and remembrance strives to soothe itself by recalling the delightful scenes of past intercourse! Dear brother, this is a theme I can scarce quit; my imagination broods o'er my melancholy, and teems with endless sentiments of grief and tenderness. My weeping muse would fain pay a tribute to his manes; and were I vain enough to think my verse would last, I would perpetuate his friendship and his virtue.

"As for the particulars you expect from me, you must wait until I shall be better informed myself: for, to tell you an extraordinary truth, I do not know, as yet, whether you had better congratulate or condole with me. I wish I was near you, that I might pour forth my heart before you, and make you judge of its dictates, and the several steps I have lately taken; in which case, I am confident you and all honest men would acquit my principles, howsoever my prudentials might be condemned. However, I have moved into the house where the late John Douglas, surgeon, died, and you may henceforth direct for Mr. Smollett, surgeon, in Downing Street, West. My respects wait on Mr. John Gordon and family; and please let my condolence and best wishes be made acceptable to the parents of my much lamented friend. At the same time, receive yourself the additional portion of affection he possessed in the heart of

"Your own,
"T^S. SMOLLETT.

"London, May 22d, 1744.

"Willy Wood, who is just now drinking a glass with me, offers you his good wishes, and desires you to present his compliments to Miss Becky Bogle,
"T. S."

In 1746 Smollett published a satirical poem in the manner of Juvenal, entitled *Advice*, and aimed at some of the chief political characters of the day. In the beginning of 1747 appeared a continuation of the same production, under the title of *Reproof*, which attacked all kinds of odious characters, military cowards, army-contractors, usurers, gamblers, poets, &c. The keen and energetic expressions of those poems caused the author to be respected, dreaded, and detested—the usual fate of satirists.

During his residence in Jamaica, Smollett had formed an attachment to Miss Lascelles, an elegant and accomplished young lady of respectable connections in that island, and who had the expectation of a fortune of £3000. He now married Miss Lascelles, and setting up an elegant domestic establishment in London, indulged in a style of life suitable to his own generous disposition and the taste and education of his wife. Being disappointed, however, of the expected fortune of Mrs. Smollett, which cost him an expensive and vexatious lawsuit, without ever being realized, he was obliged to have recourse to his pen for subsistence, and produced his novel of *Roderick Random*, in two volumes (1748); a work founded partly upon the incidents of his own life, though in no very decided manner. The singular humour of this work, its amazing truth to nature, and the entertainment which it is calculated to afford

¹ Probably his former master at Glasgow.

to minds of all orders, secured it a most extensive sale, and raised both the fortune and the fame of the author. It was followed by the publication of the *Regicide*, which was also profitable; and in 1750 Smollett paid a visit to Paris.

In 1751, when as yet only thirty years of age, he produced *Peregrine Pickle*, in four volumes; a more regular, and perhaps more elaborate, novel than *Roderick Random*, but hardly so entertaining, and certainly much more obnoxious than its predecessor to the charge of licentiousness and coarseness in some of its passages. It is somewhat remarkable, that neither in this novel nor in *Roderick Random* does he make his hero a perfect gentleman: in both characters, the mixture of selfishness and want of principle is very great. It is further remarkable, that, while the humour of the two works is beyond all parallel in the English language, there is hardly a single dash of pathos, or even of pure and virtuous feeling. It must be concluded, indeed, from these and all the other productions of Smollett, that though himself an honourable and generous man, he cherished no notions of high and abstract goodness: the fidelity and kindness of Strap and Bowling, though sometimes touching, are too evidently referable to the simplicity of their respective classes to counter-vail against our observations. The fine passage also in *Peregrine Pickle*, where the exiled Jacobites bewail from the quay of Boulogne the land they can still see, but must never again tread, is only an accidental narration of a real anecdote. The chief person alluded to was a Mr. Hunter of Burnside, whom Smollett had met at Boulogne under the circumstances described, when engaged in his French tour.

After a vain attempt to get into practice as a physician—for which purpose he published a medical pamphlet, and obtained the degree of Doctor of Physic—he assumed the character of an author by profession, and retired to a small house at Chelsea, where he lived for some years. The unmerciful manner in which he had lashed the ministry precluded all court patronage, even if it had been the fashion of the court of George II. to extend it. He depended solely on the booksellers, for whom he wrought in the various departments of compilations, translations, criticisms, and miscellaneous essays. In 1753 he produced his novel entitled the *Adventures of Ferdinand Count Fathom*; a work which appears to be founded upon a mistake both in morals and metaphysics. To exhibit the details of a life spent in one uninterrupted series of base and fraudulent transactions cannot be favourable to the morals of the world in any case; but the greatest objection is that such a work is a monstrosity, because no such character ever existed or can exist. In every view of the case it were better for the literary and moral reputation of Smollett that this work had never been written. In the beginning of 1755 he published his translation of *Don Quixote*, which, though esteemed less faithful than others previously given to the English public, conveys more perfectly, because more freely, the humour of the author. This work was very profitable to the translator.

Smollett now revisited his native country, from which he had been absent fifteen years. On arriving at Scotston, in Peeblesshire, where his mother resided with her daughter Mrs. Telfer, it was arranged that he should be introduced to the old lady as a gentleman from the West Indies who was intimately acquainted with her son. The better to support his assumed character, he endeavoured to preserve a very serious countenance, approaching to a frown; but while his mother's eyes were rivetted with the instinct of affection upon his countenance, he could

not refrain from smiling: she immediately sprang from her chair, and, throwing her arms around his neck, exclaimed "Ah! my son, my son!" She afterwards told him that, if he had kept his austere looks and continued to *gloom*, she might have perhaps been deceived; but "your old roguish smile," she added, "betrayed you at once."

After a little tour through the circle of his Scottish acquaintance, he returned to London, and commenced in 1756 the *Critical Review*, which professed to maintain Tory principles against the Whig work called the *Monthly Review*. His contributions to this periodical were numerous and excellent, though sometimes disgraced by intemperance of language. He soon after published his large collection of *Voyages* formerly alluded to.

Passing over a farce entitled the *Reprisal*, which was acted with success in 1757, Smollett's next work was his "*Complete History of England*, deduced from the descent of Julius Cæsar to the treaty of Aix-la-Chapelle, 1748," which appeared in 1758, in 4 vols. 4to. As only a part of Hume's *History* had hitherto appeared, this work was the first of the kind in which any large share of ability or any considerable elegance of composition had been displayed. The judgments of the writer upon political characters and transactions are by no means in the most popular strain, nor are they even consistent; but, nevertheless, the spirit and sprightliness of the narrative secured it approbation. It met with so extensive a sale, that, with the continuation afterwards published in two similar quarto volumes, it brought him £2000, while half as much was made by the bookseller to whom he sold the *Continuation*, from a mere transference of the copyright of that part of the work. It has been declared, and never contradicted, that the four quarto volumes, embracing a period of 1300 years, were composed and finished for the press in fourteen months; an effort to which nothing but the greatest abilities and the most vigorous application could have been equal. The shortness of time bestowed on the *Complete History of England*, joined to the merit of the performance, and the consideration of the infinite pains and perseverance it must have cost him to form and digest a proper plan, compile materials, compare different accounts, collate authorities, and compose, polish, and finish the work, will make it be regarded as one of the most striking instances of facility in writing that is to be found in literary history. The work, in its entire shape, has long been superseded; but it has always been customary to supply the defect of Hume's work with a continuation from Smollett, embracing the period between the Revolution and the accession of George III.

The one grand defect of Smollett's character was his propensity to satire. According to the report of an early companion, his conversation in company was a continued string of epigrammatic sarcasms against one or other of those present; a practice so disagreeable that no degree of talent could excuse it. When he wrote satirically, it was generally in reference to something mean, cowardly, selfish, or otherwise odious to his own upright and generous feelings. It did not occur to him—nor has it properly been considered either by satirists or those who delight in satire—that for a private individual to set himself up in judgment upon a fellow-being, and, without examining any evidence or hearing any defence, to condemn him at once and irremediably to the pillory of the press, is an invasion of the rights of the subject just as wicked as it would be to take away from an ordinary culprit the trial by jury and the privilege of being heard by counsel. Smollett was in the habit of indulging his propensity very frequently

in the *Critical Review*, and, as a natural result of his warm and hasty temper, he often censured and ridiculed without a proper cause. Hence he was perpetually subject to counter-assaults from provoked authors, and occasionally to legal prosecutions, the effect of which was so severe that he is found, September 28, 1758, describing himself to Dr. Moore as sick both of praise and blame, and praying to his God that circumstances might permit him to consign his pen to oblivion! In the end of this year, in consequence of some severe expressions he had used in the *Review* regarding Admiral Knowles, a prosecution was raised against the printer, chiefly for the purpose of ascertaining the author of the offensive article, from whom, in the event of his proving a gentleman, the complainant threatened to demand the usual satisfaction. After every attempt to soften Admiral Knowles had failed, Smollett came boldly forward and screened the printer by avowing himself the author of the article, and offering any satisfaction that might be required. Knowles, who had sailed as a captain in the expedition to Carthage, probably thought it beneath him to fight a man who had been a surgeon's mate in the same fleet, even though that surgeon's mate boasted of some good Caledonian blood, and was besides booked for immortality in the scrolls of fame. The penalty paid by Smollett for his rashness was a fine of £100, and an imprisonment for three months in the King's Bench prison. Yet, in this misfortune, he was not without consolation. His conduct was generally pronounced very magnanimous, and his friends continued to visit him in prison the same as in his neat villa at Chelsea.

To beguile the tedium of confinement, he wrote a fantastic novel, entitled the *Adventures of Sir Launcelot Greaves*, which appeared in detached portions through the successive numbers of the *British Magazine* for 1760 and 1761. This is deservedly ranked among the least happy of Smollett's performances. The drollery entirely lies in the adventures of a crazy English gentleman, who sets out armed cap-à-pie, in the character of a knight-errant, and roams through modern England, to attack vice wherever it can be found, to protect defenceless virtue, and remedy the evils which the law cannot reach. While some amusement is afforded by the contrast of such a character with the modern commonplace beings amongst whom he moves, it is only the imperfect amusement yielded by the exhibition of natural madness: the adventures of an imaginary sovereign broken loose from a mad-house could hardly be less drearily entertaining. Smollett, in the haste with which he wrote his novel, has evidently proceeded upon the idea of an English Don Quixote, without recollecting that the work of the illustrious Cervantes had a rational aim, in proposing to counteract the rage of the Spanish people for tales of knightly adventure. His own work, having no such object, labours under the imputation of being an imitation, without any countervailing advantage. Yet, strange to say, such was the *prestige* of Smollett's name and example, that the work not only sold to a great extent as a separate publication, but was followed by many sub-imitations, such as the *Spiritual Quixote*, the *Amicable Quixote*, the *Female Quixote*, &c.

In 1760 Smollett became engaged, with other literary adventurers, in a large and important work, which was finished in 1764, in 42 volumes, under the title of the *Modern Part of an Universal History*. He is supposed to have contributed the histories of France, Italy, and Germany to this work, and to have received altogether, for his share of the labour, no less a sum than £1575. Throughout the

same period he was engaged in his *Continuation of the History of England, from 1748 to 1765*, which first appeared in five successive octavo volumes, and finally in 2 vols. 4to, 1766. It has been already mentioned that for this work he is supposed to have received such a price as enabled the purchaser to sell it to a bookseller at a profit of £1000.

Smollett had been originally a Whig, but he gradually became something very like a Tory. A diffusive philanthropy by which he was inspired, with perhaps some impressions from early education, had made him the first; a disgust at the conduct of some of his party appears to have inclined him to the second. The accession of a Scottish prime minister in the Earl of Bute, as it excited much opposition among the English, so it attracted a proportionate degree of support from the Scotch, who now very generally became adherents of the government, from a motive of nationality, without regard to their former political sentiments. Smollett went into this enthusiasm, and on the very day of the Earl of Bute's elevation, May 29th, 1762, he started a newspaper entitled the *Briton*, in which he laboured to break down the prejudices of the English against a Scottish premier, and undertook the defence of the new administration upon its own merits. Within a week after this event an opposition journal was started by Wilkes, with whom Smollett had previously lived on the most intimate terms of friendship, but who now became his political antagonist. The *North Briton* (so was this paper called), supported by the overpowering national feelings of England, very soon proved too much for its rival; and on the 12th February, 1763, Smollett abandoned the publication. He did not shine as a party writer, wanting that coolness which is necessary in forming replies and repartees to all the paragraphs with which he was assailed: like the most of professed satirists, he could endure nothing so ill as satire. Lord Bute, who resigned in the April following, is said to have never sufficiently acknowledged the services of Smollett.

Among the publications with which Smollett was connected about this time were a translation of the works of Voltaire in twenty-seven volumes, and a work in eight volumes, entitled the *Present State of all Nations*. In the first his name was associated with that of the Rev. T. Francklin, translator of Sophocles; but in neither is it probable that much was written by his own hand.

He had now for many years prosecuted the sedentary and laborious employment of an author by profession. Though little more than forty years of age, and possessed originally of a most robust frame, he began to suffer from ill health. His life, which ought to have been rendered comfortable by the large sums he procured for his works, was embittered by "the slings and arrows" which his own satirical disposition had caused to be directed against himself, and by the loss of friends, which he was perpetually suffering, either from that cause, or from political differences. To add to his other miseries, he had the misfortune at this time to lose his daughter and only child, Elizabeth, a girl of fifteen, whose amiable disposition and elegant accomplishments had become the solace of his life, and promised to be in future a still more precious blessing. Under this accumulation of distresses he was prevailed upon by his wife to seek consolation in travel; and accordingly, in June, 1763, he went abroad, and continued in France about two years.

In the course of his travels Smollett seems to have laboured under a constant fit of ill-humour, the result of morbid feelings and a distempered bodily

system. This is amply visible in the work which he published on his return, entitled *Travels through France and Italy*, 2 vols. 8vo, of which two passages may be here extracted.

"With respect to the famous Venus Pontia, commonly called *de Medicis*, I believe I ought to be entirely silent, or at least conceal my real sentiments, which will otherwise appear equally absurd and presumptuous. It must be want of taste that prevents my feeling that enthusiastic admiration with which others are inspired at sight of this statue. I cannot help thinking there is no beauty in the features of Venus, and that the attitude is awkward and out of character.

"I was much disappointed at sight of the Pantheon, which, after all that has been said of it, looks like a huge cock-pit, open at the top."

These observations upon works of art that had been the subject of universal admiration for centuries could not be attributed to an original and native want of taste in such a man as Smollett: they must therefore be ascribed altogether to the distempered light which disease threw around every object that claimed his attention. The morose style of his *Travels* called forth universal remark; but nothing excited more surprise than what he had said regarding Venus and the Pantheon. His observations upon these subjects drew down upon him the following sarcastic notice from Sterne:—

"The learned Smelfungus travelled from Boulogne to Paris—from Paris to Rome—and so on; but he set out with the spleen and the jaundice, and every object he passed by was discoloured and distorted. He wrote an account of them, but it was nothing but an account of his miserable feelings. I met Smelfungus in the grand portico of the Pantheon; he was just coming out of it; 'It is nothing but a huge cock-pit,' said he; 'I wish you had said nothing worse of the Venus Medicis,' I replied; for, in passing through Florence, I had heard he had fallen foul upon the goddess, and used her worse than a common strumpet, without the least provocation in nature. I popped upon Smelfungus again at Turin, in his return home; and a sad and sorrowful tale of adventures he had to tell, wherein he spoke of moving accidents by flood and field, and of the cannibals which each other eat—the Anthropophagi. He had been flayed alive, and bedeviled, and worse used than St. Bartholomew at every stage he had come at. 'I'll tell it,' said Smelfungus, 'to the world.' 'You had better tell it,' said I, 'to your physician.'"¹

A continental tour having failed to restore health and spirits, he now resolved to try the effect of native air and native scenery. About the beginning of June, 1766, he arrived in Edinburgh, where he passed some time with his mother, who retained, at an advanced age, a strong understanding and an uncommon share of humour, and whom he loved with all the warmth of filial affection.² He then proceeded with his sister, Mrs. Telfer, and his nephew, a young officer in the army, to Glasgow; whence, after a brief stay, they went, accompanied by Dr. Moore, to Cameron, the residence of his cousin Mr. Smollett of Bonhill, on the banks of Lochlomond. During the whole time of his stay he was afflicted with severe rheumatic pains, and with a neglected ulcer in his arm, which almost unfitted him for enjoying society. He afterwards commemorated the impressions, and some of the adventures which he

experienced in his tour, in his last and best novel, *Humphrey Clinker*, which was published in 1771, while he resided in Italy. In the account which he gives in this novel of some branches of Edinburgh society he had real characters and real customs in his eye. The "Mr. M——," at whose house his characters are represented as having seen a *haggis* at table, was Mr. Mitchelson, a writer to the signet, connected with the family of Sir Walter Scott. The "beautiful Miss E—— R——," whom Jerry Melford signalizes at a ball, was Miss Eleonora Renton, daughter of John Renton, Esq., of Lamerton, by Lady Susan, daughter of Alexander ninth Earl of Eglintoun. Her eldest sister became the wife of Mr. Telfer, nephew of Smollett, and communicated the name of Renton to a large manufacturing village, now situated at Dalquhurn, the birthplace of the novelist. The young lady whose elegant person attracted the notice of Smollett in 1766 was the late dowager Mrs. Sharpe of Hoddam, and mother of the ingenious historical antiquary the late Mr. Charles Kilpatrick Sharpe.³

It may perhaps surprise those who have enjoyed the exquisite humour of the Scottish scenes in *Humphrey Clinker*, that, during the whole tour which he has commemorated under that fictitious shape, he suffered so much pain from his arm as to be, in some measure, *mentally affected*: he acknowledges himself, that, from April till November, 1766, he had a kind of *coma vigil*; and that his Scottish journey, therefore, which ended in August, "produced only misery and disgust."⁴

He spent the winter of 1766–7 in Bath, where he was so fortunate as to get quit of his ulcer, and recover a considerable portion of his original health. In 1766 he published his *Adventures of an Atom*, two vols. 12mo; a political romance, or *jeu d'esprit*, exhibiting, under Japanese names, the characters and conduct of the leaders of party, from the commencement of the French war, in 1756, to the dissolution of Lord Chatham's administration, in 1767–8. Soon afterwards, his ailments having recurred with violence, he was recommended to try once more the genial climate of Italy; but his circumstances being inadequate to the expense of the journey, and of his remaining free from all care but what concerned his health, application was made to obtain for him the office of consul at Nice, Naples, or Leghorn. This application was unsuccessful, because the government, as usual, could not spare any patronage, except for its friends. Smollett had therefore to set out for Italy in 1770, under circumstances far from easy, and which must have no doubt materially increased his personal distress. He chose for his residence a cottage near Leghorn, situated on a mountain side overlooking the sea, and surrounded by some of the fairest scenery in Tuscany. While residing here he published, in 1771, the *Adventures of Humphrey Clinker*, in which his own character, as it appeared in later life under the pressure of bodily disease, is delineated in the person of Matthew Bramble. During the summer of 1774 he declined very rapidly; and at length, on the 21st of October, death put a period to his sufferings.

³ The adventures of Lesmahago among the Indians were perhaps suggested by the real story of a Lieutenant Kennedy, who, in the Seven Years' war, married an Indian squaw, and was made a king by her tribe. "General Abercromby gave him a party of Highlanders," says a newspaper of the day, "joined with a party of Indians, to GO A-SCALPING, in which he had some success. He had learned the language; paints and dresses like an Indian; and it is thought will be of service by his new alliance. His wife goes with him, and carries his provisions on her back." Such was the enlightened warfare carried on in those times, notwithstanding the eloquent denunciations of a Chatham! ⁴ Letter to Dr. Moore.

¹ *Sentimental Journey*, vol. i.

² During his residence in Edinburgh he lived in his mother's house, or rather his sister's, at the head of St. John Street, in the Canongate.

Smollett, who thus died prematurely in the fifty-first year of his age, and the bloom of his mental faculties, was tall and handsome, with a most prepossessing carriage and address, and all the marks and manners of a gentleman. His character, laying aside the unhappy propensity to sarcasm and epigram, was of an elevated and generous cast, humane and benevolent; and he only practised virtue too rigorously, and abhorred vice too vehemently, for his own comfort in a world of inferior morality. An irritable and impatient temper, and a proud, improvident disposition, were his greatest, and almost his only, failings. Of his genius as a delineator of human character, his novels form an imperishable monument, though certainly not undeformed by considerable impurity of taste. So long as his *Ode to Leven Water* and his *Ode to Independence* exist, he can never fail to be admired as a poet.

Three years after Smollett's death a round column, of the Tuscan order, with an urn on its entablature, was erected to his memory near the house in which he was born, by his cousin, Mr. Smollett of Bonhill, who is said to have never manifested any kindness towards him while he was alive. For this memorial an inscription was furnished by the united labours of Professor George Stuart of Edinburgh, Mr. Ramsay of Ochertyre, and Dr. Samuel Johnson. Lord Kames also wrote an English epitaph, which was lost to the learned world till it appeared in the work entitled *Traditions of Edinburgh*. A plainer monument was erected over Smollett's grave at Leghorn, by his friend and countryman, Dr. Armstrong, who added a very elegant inscription.

The widow of Smollett—the *Narcissa* of *Roderick Random*—was left a poor widow in a foreign land. The small remains of her husband's fortune had been settled upon her under the trust of Mr. Graham of Gartmore, and Mr. Bontine, his tried and faithful friends. The sum, however, was so little, that this elegant woman was soon involved in great distress. It must have added not a little to the poignancy of Mrs. Smollett's feelings, that, had her husband lived a few years longer, he would have succeeded his cousin of Bonhill as heir of entail in the possession of an estate of a thousand a year, besides perhaps the private wealth of that individual, worth as much more; all of which descended to his sister, Mrs. Telfer. It is alleged by Dr. Anderson that neither Mr. Smollett nor Mrs. Telfer ever thought of extending any relief to the widow of their distinguished relative, the man whose genius has consecrated their family name to all posterity. It is known, however, that Mr. Smollett, almost immediately after his cousin's death, gave a considerable sum to the widow, under pretence of purchasing her husband's books, few of which ever reached the purchaser. We certainly cannot but regret that Mrs. Telfer afterwards permitted an act of public charity to be resorted to for the relief of her kinswoman. On the 3d of March, 1784, probably through the exertions of Mr. Graham of Gartmore, a benefit was procured for her in the Theatre Royal, Edinburgh; on which occasion the play of *Venice Preserved* was acted, with a prologue written by Mr. Graham. The money, amounting, with private donations, to £366, was remitted to Italy; and this was all that Scotland ever sacrificed for the sake of one of the most illustrious of her sons.

SOMERVILLE, DR. THOMAS, an eminent historian, was born at Hawick, in Roxburghshire, in the spring of 1741.¹ By the early death of his father,

who was minister of the parish of Hawick, he was left an orphan, along with two sisters, his mother having predeceased her husband. His father left the care of his early education to the Rev. Mr. Cranstoun of Ancrum and another member of the presbytery of Jedburgh, whose kindness and attention are evidenced by the affection afterwards exhibited towards them by their pupil. Having obtained the education derivable from a provincial grammar-school, he became a student in the university of Edinburgh. He is said not to have exhibited in his acquisitions the precocity of talent generally recorded of men who have become eminent in any branch of literature; and indeed the branch in which he distinguished himself, when qualified by the manner in which he treated it, is more dependent on a general development of sound ordinary abilities, than on the existence of that genius which shines before the judgment is matured. Nothing seems to be known of his early habits, except his having fallen from a horse and hurt his head; a circumstance which, not unnaturally, gave him a partiality for pedestrian exercises during the remainder of his life. The accident happened in Edinburgh close to the residence of the Rev. Mr. Bain, an eminent clergyman of the Relief church. "In his family the patient was attended for several months with a kindness and humanity which made a lasting impression on his mind. Often has the present writer," continues the memoir above referred to, "heard him express the pleasure and improvement he had reaped from the enlightened conversation of his worthy host during a long and tedious convalescence." Somerville was licensed as a preacher about the year 1762. He shortly after this event returned to Roxburghshire, and became tutor to the son of Sir Gilbert Elliott, afterwards Lord Minto, and governor-general of India. In 1767 Sir Gilbert presented him with the living of Minto; and in 1772 the same friend procured his promotion to the more lucrative living of Jedburgh. At that period opposition to the right of patronage in Scotland was still warm in the feelings of the people, if it might not be said to have revived. There is no doubt that the right was well exercised, and in the midst of so much scrutiny and opposition it would have been singular had it not been so; but the very circumstance which produced the election of such men as Mr. Somerville was naturally the cause of objection to the persons chosen: and the subject of our memoir entered on his charge in direct opposition to a great majority of his parishioners. It may be predicated of a man of good feeling and sense, that he would hesitate to be the teacher of the conscience of persons who contemned and disliked him; but it was part of Somerville's political opinion to think otherwise; and biography affords many instances in which persons so swayed have been excellent men, and might have despised the action had it been set before them divested of its political bearings. The appointment was followed by repeated protests, but its legality was confirmed. "Whatever," says the memoir, "might be the cause of the reverend presentee's extreme unpopularity—whatever objections were alleged against the orthodoxy of his creed, or his mode of public teaching—his most strenuous opponents were compelled to admit the correctness of his moral character; and several of the most discontented having seceded to the *Relief meeting*, tranquillity was gradually restored."

Somerville commenced authorship by a pamphlet

¹ Memoir in the *Annual Obituary* for 1831. As this memoir is written by a personal friend of Dr. Somerville, and is both

better written and more liberal in its views than such productions generally happen to be, we shall take the liberty of making some quotations from it.

entitled *Candid Thoughts on American Independence*, which appeared soon after the commencement of the American war. Like Campbell and other members of the Church of Scotland, he maintained those opinions against the claims of the colonists, which were so much opposed to the principles on which the Church of Scotland struggled into existence, however much they might accord with those of its pastors after it was firmly established. In 1792 appeared his "*History of Political Transactions and of Parties*, from the Restoration of Charles II. to the Death of King William." In his treatment of this subject, he showed himself a member of that class of politicians whose doctrines are generally founded on either or both of two opinions connected with the times. 1st, A dislike of Popery and all persons connected with it; and, consequently, a love of all measures termed Protestant; secondly, An affection for the state of things existing at the period of writing, and such a respect for the persons who, by operating great changes, have brought about that existing state, as the writer would have been the last person to feel when the change was about to be made. Hence Somerville is, on all occasions, not only the admirer but the vindicator of William, and a supporter of what are called "the principles of the Revolution," or those of the future permanency of the country in the position in which the Revolution left it. Owing to the other eminent histories of the same period, this work is not so valuable as the author's *History of Queen Anne*, which appeared in 1798, with the title "*The History of Great Britain during the Reign of Queen Anne*; with a Dissertation concerning the Danger of the Protestant Succession: and an Appendix, containing Original Papers." This work was a valuable accession to the literature of the period at which it was published; and it must still be allowed to be the most ample and accurate, if not also the most impartial, history of the times of which it treats. In the interval between the production of his two great historical works (1793), he wrote a pamphlet on the *Constitution and State of Great Britain*. About the same time he was chosen one of the chaplains in ordinary to his majesty for Scotland, and elected a member of the Royal Society of Edinburgh. He also received the degree of Doctor of Divinity from the university of Edinburgh, at what period of his life we are not aware.

At the period of the publication of his *History of Queen Anne*, Dr. Somerville visited London, and presented a copy of his work to the king, at an introduction at St. James'. A whimsical circumstance happened to him during his visit, thus told by his biographer:—"On the day subsequent to his arrival, while in the lobby of the House of Commons, Dr. Somerville was arrested and taken to Bow Street, on a charge of felony. Thunderstruck, and utterly incapable of accounting for the strange predicament in which he was placed, our bewildered divine could scarcely avail himself of the polite advice of the magistrate to apprise his friends of the circumstance. Meanwhile, the late Lord Melville, then Sir Henry Dundas, who had witnessed his seizure, entered the office, and having satisfied the magistrate of the respectability of his countryman, indulged in a hearty laugh at his expense. A notorious and specious swindler had been, it should seem, a passenger on board the packet in which Dr. Somerville came to London; and being seen in the company of this man on their landing, led to his arrest as an accomplice. This anecdote the writer has often heard Dr. Somerville relate with much pleasantry."

Besides his political and historical works, Dr.

Somerville wrote two sermons, communicated to the *Scotch Preacher*; a *Collection of Sermons*, published in 1815; and a sermon "On the Nature and Obligation of an Oath," which appeared in the *Scottish Pulpit*. He died, after a few days' illness, at Jedburgh, on the 16th May, 1830, at the good old age of ninety, and in the sixty-fourth year of his ministry. His faculties were fresh to the last; and on the Sunday previous to his death he had preached and administered the sacrament. Of his opinions and domestic character the following paragraphs from the memoir above referred to are descriptive:—"Political science having long been the favourite study of Dr. Somerville, it may readily be supposed that he took a deep interest in all that concerned the French revolution. But he was not one of those who hailed the dawn of liberty in that enslaved and benighted land; on the contrary, he beheld it as the harbinger of evil to the whole of civilized Europe; while, from the dissensions to which this event gave rise in his own country, he augured the downfall of that constitution, in church and state, which he had so ably vindicated in his writings, and which he regarded as the *ne plus ultra* of perfection. An alarmist on principle, he involved in one sweeping condemnation all who entertained views different from his own on this subject; and the wild impracticable theorist—the temperate and philosophical advocate for reform—were with him equally objects of reprobation. . . . Devoted through a long life to the pursuits of literature, Dr. Somerville numbered among his friends many of the eminent scholars and divines of his native Scotland, and during his occasional visits to the British metropolis, he was introduced to several of the distinguished literati of the south. Superior to the mean jealousy and petty envy which too often prevail among the votaries of science and learning, Dr. Somerville was at all times, and on every occasion, eager to do justice to the talents and merits of his gifted contemporaries. No man could be more enthusiastically alive to the transcendent genius of Burns, or more feelingly deplore the moral aberrations of that inspired bard. In the dark hour of John Logan's eventful life he stretched towards him the supporting hand of friendship, and shielded him in some measure from the attacks of bigotry and illiberality, by the weight and influence of his own pure and unimpeachable character. A gold-headed cane, the parting gift of the grateful poet when he bade a lasting adieu to Scotland, Dr. Somerville highly prized and always carried in his hand when walking."

SPOTSWOOD, JOHN, superintendent of Lothian, was descended of the ancient Merse family of Spotswood of that ilk, and was born in the year 1510. His father, William Spotswood, was killed at the battle of Flodden, leaving him an orphan at little more than three years of age. The place at which he was educated, and the person who taught him in his early years, are equally unknown to us. We have, indeed, discovered no further notice of him till 1534 (June 27), when, at the very late age of four-and-twenty, he was entered a student in the university of Glasgow. There was perhaps, however, some peculiarity in his case, for he became bachelor in the very next year (February 8, 1535); a circumstance which we can only account for on the supposition that he had either made very remarkable proficiency in his studies, or attended some of the other universities previously. Spotswood, it is believed, intended to prosecute the study of divinity; but he became disgusted with the cruelty of the Catholic clergy, manifested most probably in the condemnation of Russell and Kennedy,

who were burned for heresy at Glasgow about 1538. In that year he left his native country, apparently horrified at the spectacle he had witnessed, and at other instances of barbarity which he must have heard of, and retired into England. At London he became acquainted with Archbishop Cranmer, to whose kindness and encouragement many of our countrymen were indebted; and from whose eagerness in the dissemination of truth the benefit derived by Scotland cannot be easily estimated. Mr. Spotswood remained in the south for nearly five years, that is, from 1538 till 1543, when Henry VIII. restored the prisoners taken at the disgraceful rout of Solway Moss. He then returned to Scotland in company with the Earl of Glencairn, a nobleman well known for his attachment to Protestant principles, and resided with him for several years. Through that nobleman he became acquainted with the Earl of Lennox, and was by him employed in a private negotiation with the English court in 1544. After residing there for some months he returned to Scotland, but little is known respecting him for some years following. In 1548 he was presented to the parsonage of Calder by Sir James Sandelands; and, as a constant residence at his cure was not required, he lived for about ten years with that gentleman and with Lord James Stewart, then prior of St. Andrews, and afterwards better known as the Regent Murray. When commissioners were appointed by parliament, in 1558, to be present at the marriage of the young Queen of Scotland to the dauphin of France, Lord James was included in the number, and Spotswood accompanied him. Luckily, both returned in safety from this expedition, so fatal to many of their companions.

On the establishment of the Reformation, the first care of the Protestant party was to distribute the very few ministers who held their sentiments into different parts of the country. The scarcity of qualified persons gave rise to some temporary arrangements, which were, however, afterwards abandoned when the circumstances which produced them ceased to exist. One of these was, the establishment of superintendents over different districts—an office which has been brought forward, with but little justice we think, by some writers, to prove that the constitution of the Scottish church was originally Episcopal. Mr. Spotswood had the honour of being first elected, having been appointed to the oversight of the district of Lothian, in March, 1560-1. The proceedings on this occasion were conducted by John Knox; and the pledges required by that zealous reformer must have impressed both the superintendent and the people with a deep sense of the importance of his office, while it could not fail to be favourably contrasted with the system which had recently been abolished.

The proceedings of the church-courts, after the stimulus created by the events immediately connected with the Reformation had somewhat subsided, could not be supposed to excite much interest in the mind of a general reader, unless we should enter into much more minute particulars than our limits permit. If we cannot, therefore, excite very deeply our reader's sympathies, we shall not tax his patience more than is necessary to give a very brief outline of the more important transactions with which Mr. Spotswood's name is connected.

Mr. Spotswood appears to have retained the charge of his flock at Calder after he became superintendent of Lothian; but it cannot be supposed that the variety and extent of his duties permitted anything more than a very loose and occasional attention to their interests. Of this the parishioners com-

plained more than once to the General Assembly, but without success; the means of supporting a superintendent being quite inadequate without the benefice of a parish. The mere visitation of a district seems to have been but a part of the labours of a superintendent: there were many occasions on which these officials were called upon to expend their time in behalf of the general interests of the church. Spotswood appears to have been frequently deputed by the General Assembly to confer with Queen Mary, with whom he was a favourite, upon the important subject of an improvement in the provision for their maintenance. On the interesting occasion of the birth of her son, in June, 1566, the General Assembly sent him "to testify their gladness for the prince's birth, and to desire he might be baptized according to the form used in the Reformed church." He did not succeed in obtaining a favourable, or indeed any, reply to the latter part of his commission, but the manner in which he conducted himself obtained for him a most gracious reception. Deeply sensible how intimately the nation's welfare was connected with the education of the child, he took him in his arms, and falling on his knees, implored for him the divine blessing and protection. This exhibition of unaffected piety was well calculated to touch the finest feelings of the soul. It was listened to with reverential attention by the queen, and procured for him the respect and reverence of the prince in his maturer years.

But Mr. Spotswood's feelings towards the queen were soon to undergo a most painful change. He was too conscientious to sacrifice his principles for the favour of a queen, and too sensible of the tendencies of her subsequent conduct and that of her party to neglect to warn the people over whom he had the spiritual oversight. No sooner had Mary escaped from Lochleven Castle, and prepared for hostilities, than, under the liveliest convictions of the responsibility of the watchman "that seeth the sword coming and doth not blow the trumpet," he addressed a solemn admonition to the people within his diocese, warned the unsettled, and exhorted those who had "communicated with her odious impietys" to consider their fearful defection from God, and by public confession of their guilt and folly to testify their unfeigned repentance.

After this period there is hardly a single fact recorded respecting Mr. Spotswood of general interest. His disposition, as well as his feeble state of health, disposed him to retirement, and he seems to have preferred attending to his duties as a clergyman, and thus giving an example of the peaceful doctrines which the Christian religion inculcates, to taking part with either of the factions in the struggle which succeeded. Yet in the performance of these duties he did not come up to the expectations of some of the more zealous ministers within his district. We find him accused of "slackness in visitation of kirks" at the General Assemblies on several occasions. On some of these, the accusation, if it is merely intended to assert that he had not visited the whole churches, does not seem to have been made without ground; nor will his apparent negligence be considered wonderful when we mention that the district of Lothian comprehended the metropolis, Stirling, Berwick, Linlithgow, and other considerable towns; and that, of course, it contained a greater number of churches than any other. Spotswood's health had also become impaired, and we must add to this list of extenuating circumstances, that for at least nine years previous to 1580 he had received no emolument in consideration of his labours. In that year, however, he obtained (December 16th) a pension for himself and

his second son for three years of £45, 9s. 6d., besides an allowance of grain for "the thankfull service done to his hienes and his predecessouris," and this grant was renewed, November 26, 1583, for five years, but he did not live to enjoy its full benefit. He died, December 5, 1585, in the seventy-sixth year of his age, leaving by his wife, Beatrix Crichton, two sons, John and James, both of whom attained a high rank in the Episcopal church; and one daughter. "He was a man," says his son, "well esteemed for his piety and wisdom, loving and beloved of all persons, charitable to the poor, and careful above all things to give no man offence."

The same writer has represented him as having in his last years changed his sentiments respecting church government, and as having become an Episcopalian; but this assertion carries along with it the suspicion that the archbishop was more anxious to obtain for his own conduct a partial sanction in his father's opinions than to represent them as they really stood.

We are not aware that Mr. Spotswood is the author of any distinct or individual work. Such papers as he may have written, arising out of the business of the church-courts, certainly do not deserve that name.¹

SPOTSWOOD, JOHN, Archbishop of St. Andrews, and author of the *History of the Church and State of Scotland*, was one of the two sons of the subject of the preceding article. He was born in the year 1565, while his father, besides serving as parish minister at Calder, acted as superintendent of Lothian, Merse, and Teviotdale. Being a child of "pregnant wit, great spirit, and good memory," he was early taught his letters, and sent to the university of Glasgow, of which Andrew Melville was at that time principal. He studied languages and philosophy under James Melville, and divinity under his more celebrated uncle; but the opinions of these men respecting church government seem to have made no impression on their pupil. At the early age of sixteen he took his degrees, and when only about twenty he was appointed to succeed his father in the church of Calder. In the various agitating disputes between King James and the majority of the Scottish clergy respecting the settlement of the church, the gentle and courtly character of Spotswood induced him to lean to the views espoused by the king, which were in favour of a moderate Episcopacy, supposed to be more suitable than Presbytery to the genius of a monarchical government.

In 1601 the parson of Calder was selected by the court to accompany the Duke of Lennox as chaplain on his embassy to Henry IV.; and it is said by the Presbyterian historians that he marked the looseness of his principles on this occasion by attending mass in France along with his principal. In returning through England Spotswood had an interview with Queen Elizabeth. When James proceeded to London in 1603 Spotswood was one of five untitled clergymen whom he selected to accompany him. On reaching Burleigh House, the king received intelligence of the decease of James Beaton, Archbishop of Glasgow, who had lived in France since the Reformation; and he immediately nominated Spotswood to the vacant see. The new archbishop was at the same time directed to return to Scotland, in order to accompany the queen on her journey to London, and to act as her eleemosynar or almoner; an office, his biographer remarks, "which could not confi-

dently be credited but to clean hands and an uncorrupt heart, such as his really was."

Holding as he did the second episcopal dignity in the kingdom, Spotswood naturally lent himself with great willingness to aid the policy of the king for the gradual reconstruction of that system in the kingdom. The measures adopted were cautious and prudent, but nevertheless highly unpopular; and for several years the Archbishop of Glasgow was obliged to appear obedient to the ordinary church-courts. At length, in 1610, the power of the bishops *ex jure postliminii* was restored; and the subject of this memoir, with the Bishops of Brechin and Galloway, repaired to London to receive the solemnities of consecration, which were conferred upon them by the Bishops of London, Bath, and Ely. About the same time Spotswood became the head of one of the two courts of high-commission erected by James in Scotland for the trial of offences against the church. He had previously, in 1609, been appointed an extraordinary lord of session, in accordance with the policy adopted by the king for giving influence and dignity to his ecclesiastical office, though it afterwards was manifest that the holding of lay offices by the bishops injured the interests of their church.

In the month of October, 1614, Spotswood apprehended John Ogilvie, a Jesuit, at Glasgow, where he had several times said mass, and converted several young people of the better class. He was brought to trial about the end of February, and denying the king and his council to be competent judges on some points of his religious belief, he was condemned and executed. On the death of Archbishop Gladstones in 1615, Spotswood was removed from Glasgow to be primate and metropolitan of all Scotland, and the same year the two courts of high-commission for Scotland were, under him, united into one. In the year 1616 he presided in an assembly at Aberdeen, in virtue of his primacy, without any election. There was much seeming zeal in this assembly against Popery, and the Archbishop of Glasgow, and Mr. William Struthers, minister at Edinburgh, were appointed to form a book of ecclesiastical canons for the purpose of establishing uniformity of discipline throughout all the kirks of the kingdom. A commission was also appointed to draw up a new liturgy, a new catechism, and a new Confession of Faith. His majesty visited his native kingdom in the succeeding year. On this occasion twelve apostles and four evangelists, curiously wrought in wood, were prepared to be set up in his royal chapel, but were not made use of. The English service, however, was introduced, with its appurtenances of organs, choristers, and surplices. The sacrament was also administered upon Whitsunday, after the English fashion. The consequence was only more violent opposition to these innovations. Nothing, however, could deter James from pressing his own peculiar views of ecclesiastical polity. At another assembly, held at St. Andrews in the month of October, 1617, his five favourite articles were again brought forward, but could not be carried, even with all the zeal of the bishops to back his written requests. Disappointed by this result, the king ordered Spotswood to convocate the bishops and the ministers that were in Edinburgh for the time, and to procure their approval of them, and, if they refused, to suspend them from their ministry. This also failed, and the articles were enjoined by a royal proclamation, to which but little deference was paid. Another assembly was again suddenly and unexpectedly indicted, by royal proclamation, to be held at Perth, August 25, 1618, where, by the aid of a long letter from his majesty, and the assistance of Dr.

¹ Abridged from a memoir of Mr. John Spotswood in Wodrow's *Biographical Collections*, printed by the Maitland Club.

Peter Young, who was now dean of Winchester, Spotswood at length carried the five articles: kneeling at the sacrament; private communion; private baptism; confirmation of children; and observation of festivals. All the archbishop's authority, however, could not command obedience to them, though he continued to enforce them before the high-commission court for a number of years. Among those of the clergy whom he deprived of their livings for non-compliance were Mr. Richard Dickson, Mr. Andrew Duncan, Mr. John Scrimger, Mr. Alexander Simpson, Mr. John Murray, Mr. George Dunbar, Mr. David Dickson, and Mr. George Johnston. For all this severity he had certainly King James' warrant, and had he been even more severe, would probably have raised himself still higher in his majesty's favour. At the coronation of Charles I., which took place in Edinburgh on the 18th of June, 1633, Spotswood placed the crown upon his head, assisted by the Bishops of Ross, Murray, Dunkeld, Dunblane, and Brechin, arrayed in robes of blue silk, richly embroidered, reaching down to their feet, over which they had white rockets with lawn sleeves, and loops of gold. The Archbishop of Glasgow and other bishops, having refused to appear in this costume, were not allowed to take any active part in the ceremony. Laud, who accompanied the monarch and was master of the ceremonies on the occasion, had introduced an altar into the church, on which stood two blind books, two wax-candles lighted, and an empty basin. "Behind the altar there was an rich tapestry wherein the crucifix was curiously wrought, and, as their bishops who were on service past by this crucifix, they were seen to bow their knee and beck, which with their habit was noted, and bred great fear of inbringing of Popery." Charles by these means rendered his visit disagreeable to the people, and he left them in a more dissatisfied state than even that in which he found them. A copy of a protestation, or statement of grievances, which had been drawn up to be presented to the parliament held by the king in 1633, but which circumstances had prevented its framers from presenting, having been shown in confidence by Lord Balmerino, was surreptitiously carried to Spotswood, who hastened with it to court, where it was represented as a crime of no common kind. Balmerino was immediately brought to trial under the statute of *leasing making*, and, chiefly through the influence of the primate, who was himself an extraordinary lord of session, of which his second son, Robert, was president, condemned to die. This measure gave so much offence that it was found necessary to pardon Balmerino—a concession which did not at all satisfy the people, or remove their aversion to the prelates, upon whom the whole odium of these despotic proceedings was laid. That aversion was still heightened by the zeal displayed by the primate in enlarging the revenues of his see, which had, both in Glasgow and St. Andrews, been a principal object with him, and in prosecuting which, his biographer affirms, he made not fewer than fifty journeys between Scotland and the court of London. He had also about this time, on the death of Lord Kinnoul, obtained the first office of the state, that of chancellor. He was labouring to revive the order of mitred abbots to be substituted in parliament in place of the lords of erection, whose impropriated livings and tithes he intended should go to their endowments. A book of canons, and a liturgy imposed upon the church by the sole authority of the king and the bishops in 1637, filled up the measure of court imprudence. Spotswood, whose gentle character probably revolted at the strong measures adopted by the king, ex-

claimed, on hearing of the intention to meet these innovations with a renewal of the covenant, that the labours of an age had been undone in a day. Scotland, in consequence of their own intolerant conduct, was now no agreeable place for bishops and the upholders of a semi-Popish Episcopacy; and Spotswood retired, with a depressed mind and a diseased frame, to Newcastle, where he was confined for some time by sickness. On recovering a little he proceeded to London, where he died, November 26, 1639, in the seventy-fourth year of his age, just in time to escape witnessing the total overthrow of his favourite church polity in Scotland. By his wife, Rachel Lindsay, daughter of the Bishop of Ross, he had a numerous family, though only three of them survived him, two sons and a daughter. Spotswood was unquestionably a man of excellent abilities, but, though a clergyman, he was also a man of the world, and probably somewhat more ambitious than became his sacred profession. He was, however, neither sanguinary nor cruel, but, on the contrary, seems to have been desirous of accomplishing all his purposes by the gentlest means. As a historian he is entitled to very high praise. He certainly leans to the side of his own party; but his statements, like his general character, are for the most part marked by moderation. In richness and variety of materials, his history perhaps is not equal to several contemporary, or perhaps earlier productions of the same class, but in point of style and arrangement it is inferior to none.

SPOTSWOOD, SIR ROBERT, president of the Court of Session, was the second son of Archbishop Spotswood, and was born in the year 1596. He was educated at the grammar-school of Glasgow, and, at the age of thirteen, was sent to the university of that city, where, four years afterwards, he obtained the degree of Master of Arts. From Glasgow he was removed to Exeter College, Oxford, and studied under the celebrated Dr. Prideaux. Honourable mention is made of Sir Robert in the *Athenæ Oxonienses*. On the completion of his studies he made the tour of France, Italy, and Germany, studying the laws of those countries, as well as the civil and canon law, and also theology, in which last he was deeply versed. When King James commanded Archbishop Spotswood to write the history of his native kingdom, he procured, through Sir Robert's exertions, the ancient MSS. and records of the church, but especially the famous *Black Book of Paisley*, which he recovered at Rome. Sir Robert was also able to redeem a number of other manuscripts, which had been carried abroad from Scottish monasteries at the Reformation; but unfortunately they were destroyed by the Covenanters. On his return from the Continent, after an absence of nine years, Sir Robert was most graciously received at the court of England by King James, to whom he gave such a good account of the laws, customs, and manners of the countries where he had been travelling, that the king appointed him one of the extraordinary judges of the Court of Session. On his receiving this appointment, the archbishop purchased and bestowed on him the barony of Newabbey in Galloway, and he assumed the title of Lord Newabbey. He continued to be an extraordinary lord during James' reign; but on the accession of Charles I., who deprived the judges of their commissions, and reappointed some of them, Sir Robert was nominated an ordinary lord of session, or judge, on the 14th of February, 1626. On the death of Sir James Skene, in November, 1633, he was chosen president of the College of Justice.

He disposed of the lands of Newabbey to King Charles, who bestowed it on the newly erected bishopric of Edinburgh, and assumed the title of Lord Dunipace, from an estate he had purchased in Stirlingshire.

As the father now occupied the highest office in the state, and the primacy in the church, while the son filled the first judicial station in the country, no greatness under that of monarchy itself could have appeared more enviable than that which was enjoyed by the family of Spotswood. It was greatness, however, dependent on mere court favour, and altogether wanting the only firm basis for official elevation—the concurrence and good-will of the nation. On the contrary, the Spotswoods had risen in consequence of their address in rendering up the liberties of their country into the hands of the king; and, however endeared to him, were detested by the great mass of their fellow-citizens. Hence, when the Scots came to the point of resistance in 1637, and assumed the entire control of their own concerns, the Spotswoods vanished from before the face of their indignant countrymen, leaving no trace of their greatness behind, except in the important offices which they had left vacant.

Sir Robert Spotswood now became a close adherent of the king's person; and, with other obnoxious individuals in the same situation, proved the means of preventing that confidence in the sincerity of the monarch's concessions which operated so much to his disadvantage. When Charles was in Scotland, in 1641, the estates presented him with an address, in which they beseeched that the late president of the Court of Session might be moved from his person and councils; and with this request the king was obliged to comply. At a late period in the civil war (1645), Charles recalled Sir Robert, and appointed him secretary of state for Scotland, in place of the Earl of Lanark. In this character Sir Robert signed the commission of the Marquis of Montrose as commander-in-chief of the forces in Scotland; and being appointed to convey this to the victorious general, he took shipping in the island of Anglesey, and landing in Lochaber, joined the marquis in Athole. He marched southward with the army, maintaining, however, a strictly civil character, and was taken prisoner at Philiphaugh, where, it is said, he had only his walking-cane in his hand. He was carried, along with some other prisoners of distinction, to St. Andrews, and tried before the parliament on a charge of high-treason. His defence was allowed to have been masterly, but a conviction was inevitable. He was condemned to be beheaded by the maiden, which was brought from Dundee for the purpose. "In his railing discourse to the people on the scaffold," says Row in his life of Robert Blair, "among other things he said, that the saddest judgment of God upon people at this time was, that the Lord had sent out a lying spirit in the mouths of the prophets, and that their ministers, that should lead them to heaven, were leading them the highway to hell. Mr. Blair standing by him, as he was appointed by the commission of the kirk, in answer to this only said, 'It's no wonder to hear the son of a false prophet speak so of the faithful and honest servants of Jesus Christ;' which did so enrage the proud and impenitent spirit of Spotswood, that he died raging and railing against Christ's honest and faithful ministers, and his covenanted people." It was in declining the offer of Blair to pray for his soul that Sir Robert used the language which provoked the Covenanter's stern rebuke, pointed with a sarcasm which might certainly have been spared on such an occasion. But the reproach and the retali-

tion illustrate the spirit of the times. Spotswood's biographer says his last words were—"Merciful Jesu, gather my soul unto thy saints and martyrs, who have run before me in this race." This writer accuses "the fanatical minister of the place" of having incited the provost to prevent Sir Robert from addressing the people on the scaffold. A similar story is repeated in the *Spotswood Miscellany*, where, however, it is stated that Sir Robert "inveighed much against the parliament of England," which is not consistent with the assertion that he was prevented from speaking to the spectators. The execution took place at the cross of St. Andrews, January 17, 1646. Other two prisoners suffered along with Spotswood, namely, Nathaniel Gordon, who recanted his Episcopacy and died as a member of the kirk, and Andrew Guthrie, "who died stupidly and impenitently." Of Spotswood and Guthrie Row observes characteristically, "These two were bishops' sons; *malis corvi malum ovum*."

Sir Robert Spotswood was well skilled in the Hebrew, Chaldaic, Syriac, and Arabic languages, besides his acquaintance with most of the modern European tongues. He was a profound lawyer and an upright judge. Piety was a conspicuous feature in his character; though, according to the spirit of his age, it was debased by the exclusive and bigoted feelings of a partisan. He was the author of the *Practicks of the Law of Scotland*, a work which was only superseded by the more elaborate work of Stair.

His remains were honourably interred in the parish church of St. Andrews, by Sir Robert Murray of Melgun and other friends, among whom was Hugh Scrimgeour, a wealthy citizen of St. Andrews, who had formerly been one of Archbishop Spotswood's servants, and who took the execution of his old master's son so much to heart, that seeing the bloody scaffold still standing some days afterwards, he fainted on the spot; and, being carried home, died on the threshold of his own door.

STAIR, EARL OF. *See* DALRYMPLE (JOHN).

STAIR, VISCOUNT. *See* DALRYMPLE (JAMES).

STEUART, SIR JAMES, of Coltness, Baronet, the father of political economy in Britain, was born on the 10th of October, 1713. He was the son of Sir James Steuart, Bart., solicitor-general for Scotland under Queen Anne and George I., by Anne, daughter of Sir Hugh Dalrymple, president of the Court of Session. The father of the solicitor-general was Sir James Steuart, lord-advocate under William III., whose father was Sir James Steuart, provost of Edinburgh from 1648 to 1660, a descendant of the Bonhill branch of the family of Stewart.

The subject of this article spent his earliest years at Goodtrees, now Moredun, a seat of his father, near Edinburgh. At the school of North Berwick he received the elementary part of his education, and it was afterwards completed at the university of Edinburgh, whither he went at the age of fourteen. At that institution, after going through a complete course of languages and sciences, he studied the civil law, with the occasional assistance of Mr. Hercules Lindsay, an eminent civilian, and subsequently professor of that department in the university of Glasgow. From his earliest years his abilities appeared rather of a solid and permanent than of a dazzling nature. At the early age just mentioned he succeeded his father in the baronetcy and estates connected with it, which were of moderate extent and value.

On the completion of his legal studies at the university of Edinburgh, Sir James went to the bar

(1734), but without any intention of prosecuting the law as a profession. He soon after set out upon a tour of the Continent, where he formed an acquaintance with the Duke of Ormond, the earl-marischal, and other exiled Jacobite chiefs. The family from which he descended had been conspicuous for its attachment to the popular cause for a century; but Sir James appears to have been converted by these nobles from his original Whig principles. Having permitted himself to be introduced by them to Prince Charles Stuart at Rome, he received such civilities from that scion of expatriated royalty as had a material effect upon the tenor of his future life. He returned to his native country in 1740, with many accomplishments, which added brilliancy to his character, but an unsettled tone of mind, which he afterwards greatly regretted.

Among the intimate friends of Sir James at this period of his life was Mr. Alexander Trotter, whose son was afterwards a landed proprietor in Midlothian. Mr. Trotter was cut off in early life; and during his last illness made a promise to Sir James, that if possible he would come to him after his death in an inclosure near the house of Coltness, which in summer had been frequently their place of study. It was agreed, in order to prevent mistake or misapprehension, that the hour of meeting should be noon; that Mr. Trotter should appear in the dress he usually wore, and that every other circumstance should be exactly conformable to what had commonly happened when they met together. Sir James laid greater stress on this engagement than sound reason will warrant. Both before and after his exile he never failed, when it was in his power, to attend at the place of appointment, even when the debility arising from gout rendered him hardly able to walk. Every day at noon, while residing at Coltness, he went to challenge the promise of Mr. Trotter, and always returned extremely disappointed that his expectation of his friend's appearance had not been gratified. When rallied on the subject, he always observed seriously, that we do not know enough of "the other world" to entitle us to assume that such an event as the reappearance of Mr. Trotter was impossible. We fear, however, that the most of those who peruse this narrative will be inclined to class this anecdote with the "follies of the wise."

In the course of his travels Sir James had formed an intimacy with Lord Elcho, who, conceiving in the warmth of youthful friendship, that the young baronet would be able to gain the affections of his sister, Lady Frances Wemyss, carried him to Cedar Hall, in the north of Scotland, where that young lady was residing with the Countess of Sutherland. As Elcho expected, Sir James gained the heart of Lady Frances; and after some scruples on the part of her relations had been overcome, they were married in October, 1743, at Dunrobin Castle, the lady bringing her husband what was then considered a very handsome fortune, namely, £6000. A pair more elegant, more amiable, and more accomplished is rarely seen. Their union was blessed in August, 1744, by the birth of their son, Sir James Steuart, who was for many years the principal object of their care.

The subject of our memoir had joined the opposition party, and in the year last named he had an unpleasant collision with the family of Dundas, which was then beginning to take a leading part in Scottish politics. A claim preferred by him to be enrolled amongst the freeholders of Midlothian was refused; and for this he raised an action against Dundas of Arniston, then one of the senators of the College of

Justice. In the course of the judicial proceedings Sir James pleaded his own cause in so masterly a manner that Lord Arniston descended from the bench, and defended himself at the bar. The cause was given against the young advocate; and this, no doubt, conspired with other circumstances to prepare him for the step he took in the subsequent year.

Sir James was residing in Edinburgh, in attendance upon Lady Frances, who was then in a state of ill health, when Prince Charles, at the head of his Highland army, took possession of the city. Among the principal adherents of the young adventurer was Lord Elcho, the brother-in-law and bosom friend of Sir James Steuart. The latter, with the Earl of Buchan, who had married one of his sisters, formed the wish of being introduced to Prince Charles, but without pledging themselves to join his standard. They therefore induced Lord Elcho to seize them at the cross of Edinburgh, and conduct them, apparently as prisoners, into the presence of the prince. Being brought into an ante-chamber in Holyrood House, their friend proceeded to inform his royal highness of their arrival, and of the circumstances under which they approached him; when Charles, with great dignity, refused to see them in any other character than as avowed adherents of his cause. When Elcho returned with this intelligence the Earl of Buchan took his leave; while Sir James, a man greatly excelling that nobleman in intellect, proceeded to offer his services to the young Chevalier. He was fortunately saved from the ultimate perils of the campaign by being immediately despatched on a mission to the French court, where he was at the time of the battle of Culloden. The penalty of his rashness was an exile of nearly twenty years, being, though not attained, among the exceptions from the act of indemnity.

Till the year 1763, when George III. permitted him to return home, Sir James Steuart resided abroad with his family, employing his leisure in those studies which he afterwards embodied in his works. He spent the greater part of the period of his exile in the town of Angoulême, where he became intimately acquainted with the French finance system, through a body of counsellors of the parliament of Paris, who were banished to that town for nearly the space of two years. Sir James also spent some time at Frankfort, at Spa, at Venice, and at Padua. When in Germany, he and his lady were received with extraordinary marks of favour at the courts of Wirtemberg, Baden-dourlach, and Hohenzollern. At Venice, in 1758, he and Lady Frances had the good fortune to form a friendship with the celebrated Lady Mary Wortley Montagu, who till the end of her life corresponded frequently with both, and gave them and their son many proofs of her affection. A series of her ladyship's letters to Sir James and Lady Frances were printed at Greenock, under the care of their son Sir James in 1818. Though exiled from Britain on account of disloyalty to the Hanover dynasty, Sir James Steuart never entertained a disloyal feeling towards his country. On the contrary, the enthusiasm with which he rejoiced in the successes of the British arms during the Seven Years' war led to his falling under the suspicion of the French court; and while residing at Spa in a neutral territory, a large body of troops was sent to apprehend him and convey him to prison in the duchy of Luxemburg. It was not for many months that he succeeded in convincing the French government of its error, or regained his liberty.

The first work published by Sir James was a volume which appeared at Frankfort-sur-le-Main, in 1758, under the title of "*Apologie du Sentiment*

de Monsieur le Chevalier Newton sur l'Ancienne Chronologie des Grecs, contenant des Réponses à toutes les Objections qui y ont été faites jusqu'à Présent." In the same year, while settled at Tubingen, in Germany, he produced his *Treatise on German Coins*, in the German language. It was followed in 1761 by *A Dissertation on the Doctrine and Principles of Money, as applied to the German Coin*; and in the same year he so far made his peace with the British government as to obtain a cornetcy in the Royal or 1st regiment of dragoons. At the peace of Paris, in 1763, he was tacitly permitted to return home and resume possession of his estates. It was in retirement at Coltness that he probably put the last hand to his *Inquiry into the Principles of Political Economy*, which was published in 1767, in two volumes quarto. Messrs. Miller and Cadell gave £500 for the copyright of this work, the merits of which were at the time a subject of considerable dispute. It has at least the merit of having been the first considerable work on this subject published in Britain, being about nine years antecedent to the work of Dr. Smith. In 1769 Sir James published, under the assumed name of Robert Frame, *Considerations on the Interests of the County of Lanark*. By the interest of his friends he now obtained a full pardon, which passed the great seal in 1771; and in the year following he printed the *Principles of Money applied to the Present State of the Coin of Bengal*. He also wrote *A Plan for Introducing an Uniformity of Weights and Measures*, which was published after his death. He likewise published, *Observations on Beattie's Essay on Truth; Critical Remarks on the Atheistical Falsehoods of Mirabaud's System of Nature; and A Dissertation concerning the Motive of Obedience to the Law of God*. It is supposed that the ardour and assiduity with which he pursued his studies proved detrimental to his health. An inflammation, commencing with a toe-nail too nearly cut, put an end to his valuable life on the 26th of November, 1780. His remains were interred in the family vault at Cambusnethan Church, and a monument has been erected to his memory in Westminster Abbey.

Sir James Steuart was a man of extensive and varied powers of mind; cheerful and animated in conversation; amiable in all the domestic relations of life; and, unlike several other eminent men of that age, was able to prosecute philosophical inquiries without abandoning the faith of a Christian. His works were published, with a memoir by his son, in 1806, occupying six volumes.

STEVENSON, ALAN, M.A., F.R.S., &c. This amiable and talented civil engineer was the eldest son of Robert Stevenson, whose renown is imperishably connected with the Bell Rock lighthouse. Alan was born at Edinburgh in 1807, and was educated first at the high-school, and afterwards at the university, where he distinguished himself as a youth of excellent classical attainments. It was in the sciences, however, connected with his future profession that his proficiency was most remarkable as well as of highest importance, and as a student of the class of Professor Leslie he won the Fellowes prize for excellence in natural philosophy. At college he also took the degree of Master of Arts. After having finished his curriculum at the university of Edinburgh, he went to England, continued his studies there under the direction of a clergyman, and received the degree of Bachelor of Laws from the university of Glasgow.

In prosecuting his education, the original wish of Alan Stevenson was to study for the church; but living as he had done from childhood among the

maps, plans, and models of his father's profession, and evincing an aptitude for their study, he was at last induced to become a civil engineer. He followed the paternal footsteps, distinguished himself by remarkable ability in his profession, and in 1842 succeeded his father as engineer to the Commissioners of Northern Lights. And in this responsible situation the high talents of his predecessor were nobly replaced by one who inherited his name, and had been reared amidst his instructions. The improvements introduced by Alan Stevenson in the dioptric system of illuminating, and the erection of numerous lighthouses on our coasts, will long perpetuate his professional skill, a detail of which, however, would be too extensive for our limits. We can only find space for his Skerryvore lighthouse, the most difficult and stupendous of all his enterprises as an engineer.

The Skerryvore is a huge rock, the largest of a broken reef nearly seven miles in extent, lying in an irregular semicircular sea inclosed by the southern extremity of the Hebrides, the rugged shores of Argyllshire, and the northern coast of Ireland on one side, but open on the other to the Atlantic. It had long been a terror to the mariner, and with good reason, for from 1790 to 1844 thirty-one vessels, some of them of large tonnage, were enumerated among the wrecks of the Skerryvore. On this account, after the Bell Rock edifice was completed, the Commissioners of Northern Lights were desirous of having a lighthouse on the Skerryvore; but from the difficulty of its access, the almost perpetual surf with which it is surrounded, and the smallness and ruggedness of the surface on which the pharos could be erected, these obstacles were considered too dangerous and trying to surmount. The rock was visited by Sir Walter Scott when he accompanied the commissioners in 1814; and while describing its horrors, he thus speaks of it in his diary:—"It will be a most desolate position for a lighthouse—the Bell Rock and Eddystone a joke to it, for the nearest land is the wild island of Tyree, at fourteen miles' distance. So much for the Skerry Vhor." In consequence of these obstacles the commissioners deferred the enterprise until 1838, when, after having caused a survey to be taken of the spot, Alan Stevenson was commissioned to begin the work in good earnest. The plan of the tower which he devised to resist the incessant and terrible war of the elements to which it was exposed, the difficulty of securing a foundation and erecting the superstructure, the perils of encampment upon such a dismal rock, and the privations encountered in a region where sustenance was always scanty and often precarious—these composed an amount of trial that required the most devoted courage to encounter and overcome. As for the scientific difficulties in the erection of the building, and the skilful manner in which they were met and surmounted, these can only be understood from Mr. Stevenson's admirable *Account of the Skerryvore Lighthouse*. Although he had the Eddystone and Bell Rock lighthouses for his patterns, yet there were difficulties both in the site and construction of the Skerryvore pharos from which the former two had been exempt. Step by step the building struggled its way upward in spite of the opposition of the elements, and the following description of it when completed is best given in his own words:—"The ascent to the outside door is by a ladder or trap of gun-metal 26 feet high. The first apartment on the level of the entrance-door is chiefly appropriated to the reception of iron water-tanks capable of holding a supply of 1251 gallons. The next story is set apart for coals, which are stowed in

large iron boxes. The third apartment is a workshop; the fourth is the provision store; and the fifth is the kitchen. Above are two stories, each divided into two sleeping apartments, for the four light-keepers. Over them is the room for the visiting officers; then follows the oil-store, and lastly comes the light-room, making in all twelve apartments. . . . The passage from story to story is by oaken trap ladders, passing through hatches in each floor, and partitioned off from each apartment, in order to prevent accidents and to check cold draughts." It is only necessary to add, that it is the giant of British lighthouses; for while the Eddystone is 68, and the Bell Rock 100 feet above the first entire course, the Skerryvore is 138·5 feet. It also differs from the others in form, approaching more nearly a conic frustum, by which it is better fitted to resist the violence of wind and sea. The whole building was completed and the light of Skerryvore kindled on the night of February 1st, 1844.

The suspense occasioned by such a daring undertaking as that of the erection of a lighthouse on the rock of Skerryvore, the responsibility and the risk, the hardships, toils, and privations of this bleak, barren, and stormy northern solitude, were enough to have exhausted the patience and worn out the nerves of the strongest constitutions. And still more was this the case with the delicate frame and susceptible temperament of Alan Stevenson. But he bravely battled out through days of study and nights of watching and danger upon that lonely rock, until the stupendous structure was complete, and its light kindled as the beacon-star to direct the course of the midnight mariner. Not until the work was done did he find that his health was broken, and broken too beyond the hope of recovery; and although he continued his professional duties, it was with a strength that was always decaying, so that in 1852 he bade adieu to his profession and society, and retired to tranquil life in Portobello, where he died on the 23d of December, 1865, in the fifty-ninth year of his age. His merits in lighthouse engineering were recognized not only at home but abroad, and he had medals presented him by the Emperor of Russia and the Kings of Prussia and Holland. When his health gave way, he resigned his membership as a fellow of the Royal Society of Edinburgh, but this resignation, in consequence of the respect in which he was held, the society declined to receive, and continued to him the privileges of his fellowship.

It is seldom that a person devoted to the exact sciences is also to be found in the walks of elegant literature, and a mathematician is forgiven if he is a mathematician and nothing more. But the genius of Mr. Stevenson was not confined to the erection of lighthouses. He was also an accomplished classical scholar, who knew Homer by heart, and could read the comedies of Aristophanes almost as easily as the plays of Shakspeare; and he was thoroughly conversant with Italian and Spanish, and the works of the best authors in these languages. But more than this, he was an excellent poet—one who showed that he could "build the lofty rhyme," and might have constructed an epic, had he foregone the equally arduous task of rearing lighthouses. These refined tastes formed the solace of his professional toils, and afterwards the occupations of his retirement. In proof of this, while he was alone for months on the Skerryvore rock, he read Don Quixote, Aristophanes, and Dante twice through, besides composing occasional verses; and when he was laid aside by his last illness, which was both painful and lingering, he translated the "Ten Hymns" of Synesius, Bishop of Cyrene, which were printed

for private circulation. Among these were also several original pieces, of which the following sonnet "To the Ringing-stone at Kalaphetrish, in the island of Tyree," from which the materials of the building at Skerryvore were taken, is a specimen:

"Mysterious stone! rude, shapeless as thou art,
Thou seem'st unconscious of the ocean's rage,
Or winter-tempests that for many an age
Have howled around thee: say, hast thou a heart
Deep prison'd in thy mass, that feels the smart
Of others' woes—woes of the gentler kind,
Which spring up easily in woman's mind?
For, touched by maiden's hand, with gentle art,
Thou givest sighs that tremble on the breeze
Which sweeps around the western Hebrides;
Such as Andromeda, from ocean's cave,
Might breathe responsive to some sorrowing maid,
Whom slighted vows or dear hopes long delayed,
Have driven to seek near thee a lonely ocean grave."

The following specimen, of a more lively character, is his welcome to the music of a thawing wind, as it entered his northern solitude bearing spring upon its wings:—

"So we mused, and thankful laid us down to take the gift of sleep
(Many weary hearts are breaking, many waking eyes now weep;
Soon we heard the mighty cadence of the blast that sweeps along—
Not the moan of surly winter—'tis beneficent as strong.
Rude its voice, yet somewhat kindly does it burst upon my ear,
Straightway green fields, buds, and blossoms to my fancy's eye appear;
All things by God's hand are temper'd, and a holy end fulfil;
Troubles cast the shades which give us resting-places calm and still.
Rightly had I deem'd: at morning, when I went to meet the sun,
On the slopes the green earth saw I, for the snow was past and gone;
From the glowing south the tempest, over Afric's burning sands,
Thirsty came and drank the ice-cold fountains of the snowy lands."

Of Mr. Stevenson's works of a professional character, the most important is "*Account of the Skerryvore Lighthouse*," with Notes on the Illumination of Lighthouses," 1848; *History, Construction, and Illumination of Lighthouses*, 1850; and a biographical sketch of his father, the late Robert Stevenson, 1861. He was also a contributor to the *Encyclopædia Britannica* and the *Edinburgh Philosophical Journal*.

STEVENSON, ROBERT. This eminent engineer, whose great professional talents are so signally attested by that wondrous structure the Bell Rock lighthouse, was born at Glasgow, on the 8th of June, 1772. He was the only son of Allan Stevenson, merchant in Glasgow, partner in an establishment connected with St. Christopher, West Indies, in which island he died, while on a visit to his brother, who managed the business there. By this event Robert was left an orphan while still in infancy; and to add to the difficulties that beset his early life, his uncle in St. Christopher died soon after his father, leaving the mercantile affairs of their establishment involved in such embarrassment as must always ensue on the want of superintendence. In this way the mother of Robert Stevenson, whose name was Jane Lillie, was obliged, in the management of her household, to depend mainly upon her own unaided energies. She, however, discharged her task with that ability which so often compensates for the want of paternal superintendence; and Robert, who was at first designed for the ministry, received the earlier part of his education with a view to that sacred profession. Circumstances, however, soon altered this destination; for when he had finished his fifteenth year his mother

was married to Mr. Thomas Smith, a widower, originally a tinsmith in Edinburgh, but whose studies were devoted to engineering, and chiefly to the construction and improvement of lighthouses. In this department he had the merit of substituting oil-lamps with parabolic mirrors for the open coal-fires that had hitherto lighted our naval beacons—an improvement so justly appreciated, that after the Lighthouse Board was established in 1786, Mr. Smith was appointed its engineer.

It is easy to guess how quickly such a relationship must have changed the whole current of Mr. Stevenson's studies. No stranger who conversed with him, no phrenologist who looked at him, could have failed to perceive at once that he was born an engineer, and the new parental superintendence to which he was consigned was well fitted to develop his latent talents in this department. Accordingly, he made such proficiency that at the age of nineteen he was intrusted by Mr. Smith with the erection of a lighthouse which the latter had planned for the island of Little Cumbrae, and been commissioned to construct by the trustees of the Clyde navigation. This task Mr. Stevenson executed with such ability, and showed such talent in his new vocation, that soon after he was adopted by Mr. Smith as his partner in the business. In 1799 he married the eldest daughter of Mr. Smith, whom he succeeded as engineer and superintendent of lighthouses, and continued to hold this office until he resigned it in 1843.

This change of occupation, and the success that crowned it, required a correspondent change of study; and accordingly Mr. Stevenson, throwing aside his Latin, which he had only half mastered, and turning away from Greek, which he had not yet entered, began to devote himself to the exact sciences. Opportunities, indeed, there were comparatively few, on account of the active life which he had commenced at an early period; but such as he possessed he improved to the uttermost. In this way, while superintending the erection of the lighthouse at Cumbrae, he availed himself of the cessation of the work during the winter months, by attending the Andersonian Institution at Glasgow, where he studied the mathematical and mechanical sciences connected with his profession. Here he had for his preceptor Dr. Anderson himself, the honoured founder of the institution, of whose valuable instructions Mr. Stevenson ever afterwards retained an affectionate remembrance. He pursued the same course of improvement in his education while employed by Mr. Smith in the erection of lighthouses on the Pentland Skerries in Orkney, so that as soon as the labours of each summer were ended, the winter months found him in close attendance at the classes of the university of Edinburgh. In this way he completed, during the course of several sessions, a curriculum that comprised mathematics, natural philosophy, chemistry, and natural history, to which he added logic, moral philosophy, and agriculture. It was the same perseverance at work which struggled for a foundation upon the living rock amidst the battling of waves and tempests, and having found it, persisted in adding stone to stone, until a stately tower was erected, and a guiding light kindled upon its summit. He thus became not only an accomplished scientific scholar, but also a student of considerable literary attainments, while he was employed the greater part of each year in contending with the stormy seas of the Orkneys, and dwelling upon their bleak islets and solitary shores. His first tour of inspection as superintendent of lighthouses was made in 1797, for which year he drew up the annual report for the Board of Commissioners;

and during his long tenure of office, that extended over half a century, twenty-three lighthouses in the district of the commission, which he designed and executed, attested his unwearied diligence as well as professional skill. Many of these were constructed in situations that tasked the utmost of scientific knowledge and anxious study, while the successive steps of improvement which they exhibited evinced the fresh ardour with which he had advanced to every undertaking, and the earnestness he had felt that each should prove the fittest and the best.

But the great work of Mr. Stevenson's life, and the durable monument of his professional attainments and success, is to be found in the Bell Rock lighthouse, of which he published such a full and interesting account in 1824, in one volume quarto. This rock, a sunken reef in the Firth of Forth, situated in west longitude from Greenwich $2^{\circ} 22'$, and in north latitude $56^{\circ} 29'$, and composed of red sandstone, was found so dangerous to navigation that attention had been called to it at an early period, and according to tradition a remedy was adopted to warn mariners from the dangerous spot by a humane abbot of Aberbrothock. This was a bell erected upon the rock, and so connected with a floating apparatus that the action of the winds and seas caused the bell to toll over the uproar of the waves amidst the darkest weather. And thus, as the well-known ballad of Southey informs us—

"When the rock was hid by the surge's swell,
The mariners heard the warning bell;
And then they knew the perilous rock,
And blest the abbot of Aberbrothock."

The popular legend adds, that a pestilent pirate, the enemy of God and man, in a mere spirit of wanton mischief, silenced the ocean monitor by taking down the bell and throwing it into the sea. But poetical justice was not long in overtaking him; for only a year after, while pursuing his vocation in the same dangerous sea, his ship in the dark drifted upon the now silent rock, and went down with the captain and all hands on board; while,

"Even in his dying fear,
One dreadful sound could the Rover hear,
A sound as if with the Inch-cape bell
The devil below was ringing his knell."

After not only bell and pirate, but abbot and abbey, had passed away, the rock still retained its place, and its wonted dangers, to the great annoyance as well as heavy loss of our shipping. This was so much the case, especially in a great storm that occurred in December, 1799, that it was ascertained not less than seventy vessels had been stranded or lost upon the coast of Scotland alone, most of which, it was supposed, would have found safety by running into the Firth of Forth, had there been a lighthouse on the rock to direct them. This, however, was not all, for it was supposed that the *York*, a ship of 74 guns, of which no tidings could be heard, had been wrecked there, with the loss of the whole crew. While the cry now became general for the erection of a lighthouse on the Bell Rock, government, moved by the calamity that had befallen the *York*, of which timbers were still floating for many miles upon the coast, began to listen to the appeal. But the obstacles to be overcome were of such a nature as had been hitherto untried in engineering; for while the Eddystone lighthouse, which was proposed as the model, occupied a site that was barely covered by the tide at *high-water*, the Bell Rock was barely uncovered at *low-water*. These difficulties made the corporation of the Trinity House of Leith advertise for plans that might lead to the construction of a suitable edifice; and not less than three temporary experimental beacons were succes-

sively erected upon the rock, which were all speedily carried away. Fortunately it happened that the only man of the day who seemed capable of overcoming such a combination of obstacles from winds, and waves, and sunken rock, had long been brooding silently upon the enterprise, and devising the means of success. Even before the storm of 1799 Mr. Stevenson had prepared a pillar-formed model of a lighthouse, which he hoped might be available for the Bell Rock; and in the summer of 1800 he visited the rock in person, that he might judge of its applicability. He soon saw that his pillar-shaped model would not suit the situation; but he also saw that it was practicable to erect a solid stone edifice instead, upon the plan of the Eddystone lighthouse. To work, therefore, he went, in the construction of a new model, where massive blocks of stone were to be dovetailed into each other, so as to resist every pressure, both laterally and perpendicularly, and so connected with iron cased in lead as to be proof against disruption; while the building itself, high enough to surmount the waves at their wildest, was to occupy to the best advantage the narrow foundation which the rock afforded, and present the smallest front to the force of the tempest. These plans and models being finished, were submitted to the Light-house Board, with estimates of the expense of such a building, which amounted to £42,685, &c. After much demur, arising from the expense of the undertaking, his proposal was duly sanctioned by act of parliament, and Mr. Stevenson was empowered to commence operations. Now it was, however, that a full sense of his new responsibility, hitherto viewed from a distance, assumed, when looked fully in the face, a very formidable aspect. "The erection," he thus wrote in a MS. which he kept for his own use, "on a rock about twelve miles from land, and so low in the water that the foundation course must be at least on a level with the lowest tide, was an enterprise so full of uncertainty and hazard, that it could not fail to press on my mind. I felt regret that I had not had the opportunity of a greater range of practice to fit me for such an undertaking. But I was fortified by an expression of my friend Mr. Clerk [of Eldin, the improver of naval tactics], in one of our conversations upon its difficulties. 'This work,' said he, 'is unique, and can be little forwarded by experience of ordinary masonic operations. In this case Smeaton's *Narrative* must be the text-book, and energy and perseverance the *pratique*.'"

The work was commenced by searching for such a vessel as would serve for a temporary lighthouse, as well as a habitation for the workmen. This was soon found in a Prussian fishing-vessel of 82 tons, one of the captures of the war, which being rounded off both at stem and stern, was best adapted by its form for the new service in which it was to be employed. After having been suitably fitted up and rigged, this *Pharos*, as it was now named, was furnished with a large copper lantern for each of its three masts, and moored near the Bell Rock. Another vessel, expressly built for the purpose, called the *Smeaton*, of 40 tons, was employed in bringing the stones for the building, that were hewn in the quarries of Rubeslaw near Aberdeen, and Mylnfield near Dundee, and conveyed to Arbroath, the nearest harbour to the rock. The work itself was commenced on the 18th of August, 1807; and such was the clink and bang of hammers, the hurrying of feet, and the din of human voices that now took possession of the solitude, that the affrighted seals, which had hitherto regarded the Bell Rock as their own exclusive property, went off in shoals in quest of new settlements. It is not our purpose to detail the daily and almost

hourly difficulties with which Mr. Stevenson had to contend in a task of seven years' duration, and the dangers to which he was exposed, while he had to battle with an almost impracticable foundation, and the continual war and shifting of elements that opposed every step of his progress. On one occasion, when the *Smeaton* was drifted out to sea, he was left with thirty-two workmen upon the rock, which, by the progress of the flood-tide, would soon be submerged at least twelve feet, while the two boats which they had at hand could have carried off little more than half of the company—after perhaps a life-and-death struggle with their less fortunate companions. At this critical moment he thus describes their situation, in the third person: "The writer had all along been considering various schemes, providing the men could be kept under command, which might be put in practice for the general safety, in hopes that the *Smeaton* might be able to pick up the boats to leeward when they were obliged to leave the rock. He was, accordingly, about to address the artificers on the perilous nature of their circumstances, and to propose that all hands should unstrip their upper clothing when the higher parts of the rock were laid under water; that the seamen should remove every unnecessary weight and incumbrance from the boats; that a specified number of men should go into each boat, and that the remainder should hang by the gunwales, while the boats were to be rowed gently towards the *Smeaton*, as the course to the *Pharos*, or floating light, lay rather to windward of the rock. But when he attempted to speak his mouth was so parched that his tongue refused utterance, and he now learned by experience that the saliva is as necessary as the tongue itself for speech. He then turned to one of the pools on the rock, and lapped a little water, which produced an immediate relief. But what was his happiness, when, on rising from this unpleasant beverage, some one called out, 'A boat! a boat!' and on looking around, at no great distance, a large boat was seen through the haze making towards the rock. This at once enlivened and rejoiced every heart. The timeous visitor proved to be James Spink, the Bell Rock pilot, who had come express from Arbroath with letters. Every one felt the most perfect happiness at leaving the Bell Rock this morning, though a very hard and even dangerous passage to the floating light still awaited us, as the wind by this time had increased to a pretty hard gale, accompanied with a considerable swell of sea. The boats left the rock about nine, but did not reach the vessel till twelve o'clock noon, after a most disagreeable and fatiguing passage of three hours. Every one was as completely drenched in water as if he had been dragged astern of the boats." During the two first seasons occupied on the Bell Rock, Mr. Stevenson's abode was the *Pharos* or floating light, as uncomfortable as well as perilous a home as the worst hulks which justice could have devised for the taming of a sturdy malefactor. Sometimes they had to ride out a gale, and endure all the horrors that precede a shipwreck, without the consolation of feeling that a voyage was in progress, or a port at hand into which they might run at the worst. On one occasion, indeed, after a storm they found themselves making a voyage in sad earnest, with the prospect of being dashed against the Bell Rock by way of termination—for the *Pharos* had broke from its moorings, and was drifting none knew whither. Even in fair weather it rolled like a tub, or rather like a barrel, so that such rocking was provocative of anything but tranquil repose. After the beacon or barrack was erected, Mr. Stevenson took up his

abode in it; but here the matter was not greatly amended, as this habitation was nothing more than a sort of pigeon-house edifice, perched on logs, and exposed to the onset of every wave, while the tide in calm weather rose upon it to the height of sixteen feet.

Such is but a specimen of the obstacles encountered and the toils endured in erecting that wondrous edifice the Bell Rock lighthouse. It was completed in December, 1810, and since that period it would be difficult to estimate the benefit it has conferred in that dangerous sea on the ships of every nation, which, but for its guidance, would have been dashed upon the rock, or wrecked on the neighbouring shore. There, from night to night, its lamp has continued to shine like a guiding star; while in snow and haze, its bell is heard as a warning voice through the thick atmosphere, when the light is obscured, or so dim that its meaning is unintelligible to the bewildered navigator. Not fully four years after it was finished, when Sir Walter Scott made that well-known cruise among the northern seas which he has entitled in his diary, "*Voyage in the Lighthouse Yacht to Nova Zembla, and the Lord knows where,*" he thus describes the edifice, at that time still fresh in early youth, and regarded with all the pleasure of a startling novelty.

July 30 [1814].—Waked at six by the steward; summoned to visit the Bell Rock, where the beacon is well worthy attention. Its dimensions are well known, but no description can give the idea of this slight, solitary, round tower, trembling amid the billows, and fifteen miles from Arbroath, the nearest shore. The fitting up within is not only handsome, but elegant. All work of wood (almost) is wainscot; all hammer-work brass; in short, exquisitely fitted up. You enter by a ladder of rope, with wooden steps, about thirty feet from the bottom, where the mason-work ceases to be solid, and admits of round apartments. The lowest is a storehouse for the people's provisions, water, &c.; above that a storehouse for the lights, of oil, &c.; then the kitchen of the people, three in number; then their sleeping chamber; then the saloon or parlour, a neat little room; above all, the lighthouse; all communicating by oaken ladders, with brass rails, most handsomely and conveniently executed. Breakfasted in the parlour." On being requested to inscribe his name in the album of the tower, Sir Walter, after breakfast, wrote the following lines, which Mr. Stevenson adopted for the motto of his work on the Bell Rock lighthouse:—

"Pharos loquitur:—

Far in the bosom of the deep,
O'er these wild shelves my watch I keep;
A ruddy gem of changeful light,
Bound on the dusky brow of night;
The seaman bids my lustre hail,
And scorns to strike his tumorous sail."

The whole diary of this voyage in the northern seas, which the great poet and novelist has fully detailed, abounds with incidental notices, in which Mr. Stevenson's amiable disposition, as well as remarkable professional ability, diligence, and enterprise, are strikingly exemplified. It was one of those periodical voyages which Mr. Stevenson was wont to make in the erection of lighthouses and the superintendence of northern lights; and besides three commissioners of the board, there were three pleasure tourists, of whom Sir Walter was one. The vessel in which they sailed was the lighthouse yacht, of six guns and ten men; for besides the storms of the Atlantic, lately a brush with a French cruiser, and even now with a Yankee privateer, might be no improbable contingency.

During the long course of Mr. Stevenson's professional labours his calm calculating sagacity and adaptation of means at once simple and effectual to an end that seemed unattainable, or not to be attained without the most complex agencies, were conspicuous to the last; and although not himself an inventor, he could largely improve on the inventions of others, and turn them to the best account. It was thus that the Eddystone lighthouse suggested to him the bolder and more difficult undertaking of that on the Bell Rock; while his plan of the *job* and *balance cranes*, and the changes which he adopted in the masonry of the building, especially in the laying of the floors, so that their stones should form part of the outward wall, were important improvements on the plans of Mr. Smeaton, whom he still was proud to call his master. The best mode of lighting these ocean lamps was also a subject of his inquiry; and the result was his invention of the *intermittent* and the *flashing* lights, the former suddenly disappearing at irregular intervals, and the latter emitting a powerful gleam every five seconds—a mode of illumination distinct from that of the ordinary lighthouses in the same range, and admirably suited for the dangerous navigation of narrow seas. For the last of these inventions he was honoured with a gold medal from the King of the Netherlands. While his scientific anxiety and skill were thus devoted to the improving and perfecting of those buildings upon which the safety of navigation so much depends, he did not overlook the welfare of those to whom the superintendence of their bale-fires is committed; and his humane regulations, by which the comforts of these self-devoted prisoners of the ocean pillars were promoted, as well as his rules of discipline, by which their duties were simplified, introduced a marked change for the better into the dreary life of those upon whose watchfulness and fidelity so vast an amount of human happiness is at stake. Mr. Stevenson, indeed, may justly be said not only to have created the lighthouse system of Scotland, where it was so much needed, but to have brought it also to that state of perfection in which it has become the model to other maritime nations.

Independently of his duties connected with northern lights, Mr. Stevenson, in his general capacity as a civil engineer, was frequently a co-operator with Rennie, Telford, and the other chief engineers of the day. He also, after the peace of 1815, was the principal adviser in the construction of those new roads, bridges, harbours, canals, and railways, towards which the national energy and capital were now directed. Even the beautiful approach to the city of Edinburgh from the east, by the Calton Hill, was planned by him, and executed under his direction. While his impress was thus stamped upon the public works of Scotland, he was often consulted upon those of England and Ireland; and his ingenious plans of simplifying and adapting, which he had so successfully employed upon one element, were followed by those which were equally fitted for the other. In this way his suggestion of the new form of a suspension bridge applicable to small spans, by which the necessity for tall piers is avoided, was partially adopted in the bridge over the Thames at Hammer-smith. While planning a timber bridge for the Meikle Ferry, he also devised an arch of such simple construction, composed of thin layers of plank bent into the circular form, and stiffened by *king-post pieces*, on which the level roadway rests, that this form of bridging has come into very general use in the construction of railways.

As an author Mr. Stevenson has not been particularly fertile. He sat down to draw a plan instead of

GENERAL SIR JOHN DUNDAS

excogitating a theory, and his published work was the erection itself, instead of a volume to show how it might be accomplished. Still, however, he has written sufficiently for one who did so much. Independently of his large work upon the Bell Rock lighthouse, he wrote several articles in the *Encyclopædia Britannica* and Brewster's *Edinburgh Encyclopædia*, and other scientific journals. In 1817 he published a series of letters in the *Scots Magazine*, giving an account of his tour through the Netherlands, and a description of the engineering works connected with the drainage and embankment of Holland. His professional printed reports and contributions are also sufficient to occupy four goodly quarto volumes. Owing, however, to the obstacles under which his early education was impeded, he had not acquired that facility in composition which a commencement in youth is best fitted to impart, so that we question whether, in his great achievement of the Bell Rock, his book or his lighthouse occasioned him most trouble. In 1815 he became a fellow of the Royal Society of Edinburgh; he afterwards joined the Geological Society of London, and the Wernerian and Antiquarian Societies of Scotland.

In private life Mr. Stevenson was endeared to all who knew him by his lively intelligent conversation, kind disposition, and benevolent deeds; while his whole course was a beautiful illustration of the Christian character superinduced upon the highest scientific excellence. And as he had lived, so he died, at the ripe age of seventy-nine, at peace with the world he was leaving, and rejoicing in the hope of a better to come. His decease occurred at his residence in Baxter's Place, Edinburgh, on the 12th of July, 1850. His most fitting monument is an admirable marble bust likeness, executed by Samuel Joseph, at the command of the commissioners of the Board of Northern Lights, and placed by them in the library of the Bell Rock lighthouse.

STEWART, MAJOR-GENERAL DAVID, author of the well-known *Sketches of the Highlanders* and Highland regiments, was the second son of Robert Stewart, Esq., of Garth, in Perthshire, and was born in the year 1772. In the seventeenth year of his age he entered the 42d regiment as an ensign, and soon became distinguished for that steadiness and firmness of conduct, joined to benignity of nature and amenity of manners, which marked him through life. He served in the campaigns of the Duke of York in Flanders, and was present at the siege of Nieupoort and the defence of Nimeguen. In 1796 he accompanied the regiment, which formed part of the expedition under Sir Ralph Abercromby, to the West Indies, and was for several years actively employed in a variety of operations against the enemy's settlements in that quarter of the world; particularly in the capture of St. Lucia, and the harassing and desperate contest which was carried on with the Caribbs in St. Vincent and other islands. In the landing near Pigeon Island he was among the first who jumped ashore, under a heavy fire of round and grape shot from a battery so posted as almost to sweep the beach. "A cannon-ball," says he, in a letter addressed to Sir John Sinclair, "passed Lord Hope-toun's left shoulder, and over my head. He observed that a miss was as good as a mile, to which I cordially agreed; and added, that it was fortunate for me that I was only five feet six inches; as if I were, like him, six feet five inches I would have been a head shorter." In the year just mentioned he was promoted to the rank of captain-lieutenant, and after serving in the West Indies for a year and a half he

returned to England, but not to enjoy repose, for he was almost immediately ordered to join the headquarters of the regiment at Gibraltar, and the following year accompanied it, when ordered to assist in the expedition against the island of Minorca. He was afterwards taken prisoner at sea, and detained for five months in Spain, when he had the fortune to be exchanged.

At the close of 1800 he was promoted to the rank of captain; a step which, like all others he subsequently obtained, was given him for his services alone; and in 1801 his regiment received orders to join Sir Ralph Abercromby, in the memorable expedition to Egypt. At the landing effected in the bay of Aboukir, in the face of the enemy, on the morning of the 8th of March, 1801, Captain Stewart was one of the first to leap on shore from the boats; and when the four regiments destined for the attack of the enemy's position on the sand-hills—the 40th, 23d, 28th, and 42d—had formed, and received orders to charge up the hill and dislodge the enemy at the point of the bayonet, the subject of this memoir, by his gallant bearing and knowledge of the capabilities of his countrymen when properly commanded, contributed essentially to the brilliant success which almost immediately crowned this daring operation. In the celebrated action of the 21st, when the British army overthrew the French, but with the loss of their commander-in-chief, the services of the 42d were such as to secure for them undying fame. On this occasion Captain Stewart, whose personal exertions had been conspicuous in inspiring the men with a determination to conquer or perish, received a severe wound, which prevented his taking almost any part in the subsequent operations of the campaign.

Few officers have ever possessed so powerful a command over the energies of their men as the subject of these pages. He had studied the Highland character thoroughly; had made himself the brother and confidant of the men under him; and could, with an art approaching to that of the poet, awaken those associations in their bosoms which were calculated to elevate and nerve their minds for the perilous tasks imposed upon them. The Highland soldier is not a mere mercenary: he acts under impulses of an abstract kind, which none but one perfectly skilled in his character, and who has local and family influences over him, can take full advantage of. The usual principles of military subordination fail in his case; while he will more than obey, if that be possible, the officer who possesses the influences alluded to, and will use them in a kind and brotherly spirit. Captain Stewart appears to have enjoyed and used these advantages in a remarkable degree, and to have possessed not only the affections of his men, but of all connected with them in their own country. Hence, when he had to recruit in 1804, for a majority, the stated number of men, 125, came to his quarters at Drumcherry House in less than three weeks, after which between thirty and forty arrived too late for admission into the corps, whose disappointment and vexation at finding they could not serve under Captain Stewart no language could describe. With this contingent he entered the 78th, with the rank of major, and in 1805 trained his men at Hythe, under the immediate direction of Sir John Moore. In June that year he was selected with four other officers to join the 1st battalion in India; but his parting with his men was accompanied with such poignant regret, and so many marks of reluctance on their part, that General Moore reported the case to the commander-in-chief, who, sensible of the value of a mutual esteem existing between men and officers,

countermanded his removal. In September he accompanied his regiment to Gibraltar, where it continued to perform garrison duty until the month of May, 1806, when it embarked for Sicily, to join in the descent which General Sir John Stuart was then meditating on Calabria. Major Stewart accompanied the battalion on this occasion, and was present at the battle of Maida, fought on the 4th of July, 1806, where he was again severely wounded. Being obliged to return to Britain for his health, he was, in April, 1808, promoted to the rank of lieutenant-colonel, with a regimental appointment to the 3d West India Rangers, then in Trinidad. But the severity of the wounds he had received, and the effects of the hard service he had encountered in various parts of the world, rendered it impossible for him to avail himself of his good fortune, and he was obliged to retire upon half-pay at a period when, had he been able to keep the field, he would soon have found further promotion, or a soldier's grave. Notwithstanding this circumstance, he was in 1814 promoted to the rank of colonel.

Colonel Stewart now for several years employed his leisure in the composition of his work on the Highlanders, which appeared in the year 1822, in two volumes, 8vo.¹ The earlier part of this work, which enters minutely into the character of the Highlanders, and embodies a great quantity of original anecdote and observation, is perhaps the most generally interesting, though it does not aspire to the important quality of historical accuracy: the most truly valuable part of the book is that which details the services of the regiments which have been at various times raised in the Highlands; a body of soldiers generally allowed to have surpassed every other part of the British army, of the same extent in numbers, at once in steady moral conduct and in military glory. The work attained a popularity proportioned to its high merits, and will ever remain as a memorial of its author, endearing his name to the bosoms of his countrymen.

A few months after the publication of his book, Colonel Stewart succeeded to his paternal estate, in consequence of the deaths of his father and elder brother, which occurred in rapid succession. He is understood to have employed part of the year 1823 in collecting materials for a history of the rebellion of 1745, a desideratum in our literature which no hand was so well qualified to supply; but finding insuperable difficulties in the execution of the task, he was reluctantly obliged to abandon it. In 1825 he was promoted to the rank of major-general, and he was soon after appointed governor of the island of St. Lucia. He proceeded to undertake this duty with high hopes on his own part, but the regrets and fears of his friends. Unfortunately, their anticipations proved true. General Stewart died of fever, on the 18th of December, 1829, in the midst of many improvements which his active mind had originated in the island, and which, had he lived to complete them, would have probably redounded to his honour as much as any transaction in his useful and well-spent life.

General Stewart was of the middle stature, but originally of a robust frame, which was latterly shattered considerably by wounds. His features, which spoke his character, have been commemorated in a spirited engraving, representing him in the Highland dress. Few individuals in recent times have secured so large a share of the affections of all classes of the people of Scotland, as David Stewart of Garth.

STEWART, DUGALD, a celebrated metaphysical writer, was the only son who survived the age of infancy of Dr. Matthew Stewart, professor of mathematics in the university of Edinburgh, and of Marjory Stewart, daughter of Archibald Stewart, Esq., writer to the signet. His father, of whom a biographical memoir follows the present, is well known to the scientific world as a geometrician of eminence and originality. His mother was a woman remarkable for her good sense, and for great sweetness and kindness of disposition, and was always remembered by her son with the warmest sentiments of filial affection.²

The object of this brief notice was born in the college of Edinburgh on the 22d of November, 1753, and his health, during the first period of his life, was so feeble and precarious, that it was with more than the ordinary anxiety and solicitude of parents that his infancy was reared. His early years were spent partly in the house at that time attached to the mathematical chair of the university, and partly at Catrine, his father's property in Ayrshire, to which the family regularly removed every summer when the academical session was concluded. At the age of seven he was sent to the high-school, where he distinguished himself by the quickness and accuracy of his apprehension, and where the singular felicity and spirit with which he caught and transfused into his own language the ideas of the classical writers, attracted the particular remark of his instructors.

Having completed the customary course of education at this seminary, he was entered as a student at the college of Edinburgh. Under the immediate instruction of such a mathematician and teacher as his father, it may readily be supposed that he made early proficiency in the exact sciences; but the distinguishing bent of his philosophical genius recommended him in a still more particular manner to the notice of Dr. Stevenson, then professor of logic, and of Dr. Adam Ferguson, who filled the moral philosophy chair.

In order to prosecute his favourite studies under the most favourable circumstances, he proceeded, at the commencement of the session of 1771, to the university of Glasgow, to attend the lectures of Dr. Reid, who was then in the zenith of his reputation. The progress which he here made in his metaphysical studies was proportioned to the ardour with which he devoted himself to the subject; and not content with listening merely to the instructions of his master, or with the speculations of his leisure hours, he composed during the session that admirable "Essay on Dreaming" which he afterwards published in the first volume of the *Philosophy of the Human Mind*.

The declining state of his father's health compelled him in the autumn of the following year, before he had reached the age of nineteen, to undertake the task of teaching the mathematical classes in the Edinburgh university. With what success he was able to fulfil this duty was sufficiently evinced by the event; for, with all Dr. Matthew Stewart's well-merited celebrity, the number of students considerably increased under his son. As soon as he had completed his twenty-first year he was appointed assistant and successor to his father, and in this capacity he continued to conduct the mathematical studies in the university till his father's death, in the year 1785, when he was nominated to the vacant chair. Although this continued, how-

¹ It was entitled "*Sketches of the Character, Manners, and Present State of the Highlanders of Scotland, with Details of the Military Services of the Highland Regiments.*"

² For the greater part of the present article we are indebted to the *Annual Obituary*; the source to which, on application to Mr. Stewart's representatives, we were referred for authentic information respecting their distinguished relative.

ever, to be his ostensible situation in the university, his avocations were more varied. In the year 1778, during which Dr. Adam Ferguson accompanied the commissioners to America, he undertook to supply his place in the moral philosophy class—a labour that was the more overwhelming as he had for the first time given notice, a short time before his assistance was requested, of his intention to add a course of lectures on astronomy to the two classes which he taught as professor of mathematics. Such was the extraordinary fertility of his mind, and the facility with which it adapted its powers to such inquiries, that, although the proposal was made to him and accepted on Thursday, he commenced the course of metaphysics the following Monday, and continued, during the whole of the season, to think out and arrange in his head in the morning (while walking backwards and forwards in a small garden attached to his father's house in the college) the matter of the lecture of the day. The ideas with which he had thus stored his mind he poured forth extempore in the course of the forenoon, with an eloquence and a felicity of illustration surpassing in energy and vivacity (as those who have heard him have remarked) the more logical and better digested expositions of his philosophical views which he used to deliver in his maturer years. The difficulty of speaking for an hour extempore every day on a new subject for five or six months is not small; but when super-added to the mental exertion of teaching also daily two classes of mathematics, and of delivering for the first time a course of lectures on astronomy, it may justly be considered as a very singular instance of intellectual vigour. To this season he always referred as the most laborious of his life; and such was the exhaustion of the body, from the intense and continued stretch of the mind, that, on his departure for London, at the close of the academical session, it was necessary to lift him into the carriage.

In the year 1780 he began to receive some young noblemen and gentlemen into his house as pupils, under his immediate superintendence, among whom were to be numbered Lord Belhaven, the Marquis of Lothian, Basil Lord Daer,¹ Lord Powerscourt, Mr. Muir Mackenzie of Delvin, and Mr. Henry Glassford. In the summer of 1783 he visited the Continent for the first time, having accompanied the Marquis of Lothian to Paris; on his return from whence, in the autumn of the same year, he married Helen Bannatyne, daughter of Neil Bannatyne, Esq., a merchant in Glasgow.

In the year 1785, during which Dr. Matthew Stewart's death occurred, the health of Dr. Ferguson rendered it expedient for him to discontinue his official labours in the university, and he accordingly effected an exchange of offices with Mr. Stewart, who was transferred to the class of moral philosophy, while Dr. Ferguson retired on the salary of mathematical professor. In the year 1787 Mr. Stewart was deprived of his wife by death; and the following summer he again visited the Continent, in company with the late Mr. Ramsay of Barnton.

These slight indications of the progress of the ordinary occurrences of human life must suffice to convey to the reader an idea of the connection of events up to the period when Mr. Stewart entered on that sphere of action in which he laid the foundation of the great reputation which he acquired as a moralist and a metaphysician. His writings are before the world, and from them posterity may be

safely left to form an estimate of the excellence of his style of composition—of the extent and variety of his learning and scientific attainments—of the singular cultivation and refinement of his mind—of the purity and elegance of his taste—of his warm relish for moral and for natural beauty—of his enlightened benevolence to all mankind, and of the generous ardour with which he devoted himself to the improvement of the human species—of all of which, while the English language endures, his works will continue to preserve the indelible evidence. But of one part of his fame no memorial will remain but in the recollection of those who have witnessed his exertions. As a public speaker he was justly entitled to rank among the very first of his day; and had an adequate sphere been afforded for the display of his oratorical powers, his merit in this line alone would have sufficed to secure him a lasting reputation. Among those who attracted the highest admiration in the senate and at the bar, there were not a few who could bear testimony to his extraordinary eloquence. The ease, the grace, and the dignity of his action; the compass and harmony of his voice, its flexibility and variety of intonation; the truth with which its modulation responded to the impulse of his feelings and the sympathetic emotions of his audience; the clear and perspicuous arrangement of his matter; the swelling and uninterrupted flow of his periods, and the rich stores of ornament which he used to borrow from the literature of Greece and of Rome, of France and of England, and to interweave with his spoken thoughts with the most apposite application,—were perfections not possessed in a superior degree by any of the most celebrated orators of the age. His own opinions were maintained without any overweening partiality; his eloquence came so warm from the heart, was rendered so impressive by the evidence which it bore of the love of truth, and was so free from all controversial acrimony, that what has been remarked of the purity of purpose which inspired the speeches of Brutus might justly be applied to all that he spoke and wrote; for he seemed only to wish, without further reference to others than a candid discrimination of their errors rendered necessary, simply and ingenuously to disclose to the world the conclusions to which his reason had led him: "*Non malignitate aut invidia, sed simpliciter et ingenue, judicium animi sui detexisse.*"

In 1790, after being three years a widower, he married Helen D'Arcy Cranstoun, a daughter of the Honourable Mr. George Cranstoun—a union to which he owed much of the subsequent happiness of his life. About this time it would appear to have been that he first began to arrange some of his metaphysical papers with a view to publication. At what period he deliberately set himself to think systematically on these subjects is uncertain. That his mind had been habituated to such reflections from a very early period is sufficiently known. He frequently alluded to the speculations that occupied his boyish and even his infant thoughts, and the success of his logical and metaphysical studies at Edinburgh, and the "Essay on Dreaming," which forms the fifth section of the first part of the fifth chapter of the first volume of the *Philosophy of the Human Mind*, composed while a student at the college of Glasgow in 1772, at the age of eighteen, are proofs of the strong natural bias which he possessed for such pursuits. It is probable, however, that he did not follow out the inquiry as a train of thought, or commit many of his ideas to writing before his appointment in 1785 to the professorship of moral philosophy gave a necessary and steady direction to his investigation

¹ Burns' first interview with Mr. Stewart in the presence of this amiable young nobleman at Cathine will be in every reader's remembrance, as well as the philosopher's attentions to the poet during his subsequent residence in Edinburgh.

of metaphysical truth. In the year 1792 he first appeared before the public as an author, at which time the first volume of the *Philosophy of the Human Mind* was given to the world. While engaged in this work he had contracted the obligation of writing the life of Adam Smith, the author of the *Wealth of Nations*, and very soon after he had disembarassed himself of his own labours, he fulfilled the task which he had undertaken; the biographical memoir of this eminent man having been read at two several meetings of the Royal Society of Edinburgh, in the months of January and March, 1793. In the course of this year also he published the *Outlines of Moral Philosophy*—a work which he used as a text-book, and which contained brief notices, for the use of his students, of the subjects which formed the matter of his academical prelections. In March, 1796, he read before the Royal Society his account of the *Life and Writings of Dr. Robertson*, and in 1802 that of the *Life and Writings of Dr. Reid*.

By these publications alone, which were subsequently combined in one volume quarto, he continued to be known as an author till the appearance of his volume of *Philosophical Essays* in 1810—a work to which a melancholy interest attaches, in the estimation of his friends, from the knowledge that it was in the devotion of his mind to this occupation that he sought a diversion to his thoughts from the affliction he experienced in the death of his second and youngest son. Although, however, the fruits of his studies were not given to the world, the process of intellectual exertion was unremitted. The leading branches of metaphysics had become so familiar to his mind, that the lectures which he delivered, very generally extempore, and which varied more or less in the language and matter every year, seemed to cost him little effort, and he was thus left in a great degree at liberty to apply the larger part of his day to the prosecution of his further speculations. Although he had read more than most of those who are considered learned, his life, as he has himself somewhere remarked, was spent much more in reflecting than in reading; and so unceasing was the activity of his mind, and so strong his disposition to trace all subjects of speculation that were worthy to attract his interest, up to their first principles, that all important objects and occurrences furnished fresh matter to his thoughts. The public events of the time suggested many of his inquiries into the principles of political economy; his reflections on his occasional tours through the country, many of his speculations on the picturesque, the beautiful, and the sublime; and the study of the characters of his friends and acquaintances, and of remarkable individuals with whom he happened to be thrown into contact, many of his most profound observations on the sources of the varieties and anomalies of human nature.

In the period which intervened between the publication of his first volume of the *Philosophy of the Human Mind* and the appearance of his *Philosophical Essays*, he produced and prepared the matter of all his other writings, with the exception of his "Dissertation on the Progress of Metaphysical and Ethical Philosophy," prefixed to the Supplement of the *Encyclopædia Britannica*. Independent of the prosecution of those metaphysical inquiries which constitute the substance of his second and third volumes of the *Philosophy of the Human Mind*, to this epoch of his life are to be referred the speculations in which he engaged with respect to the science of political economy, the principles of which he first embodied in a course of lectures, which, in the year 1800, he added as a second course to the lectures

which formed the immediate subject of the instruction previously delivered in the university from the moral philosophy chair. So general and extensive was his acquaintance with almost every department of literature, and so readily did he arrange his ideas on any subject, with a view to their communication to others, that his colleagues frequently, in the event of illness or absence, availed themselves of his assistance in the instruction of their classes. In addition to his own academical duties, he repeatedly supplied the place of Dr. John Robison, professor of natural philosophy. He taught for several months during one winter the Greek classes for the late Mr. Dalzell: he more than one season taught the mathematical classes for Mr. Playfair: he delivered some lectures on logic during an illness of Dr. Finlayson: and, if we mistake not, he one winter lectured for some time on belles-lettres for the successor of Dr. Blair.

In 1796 he was induced once more to open his house for the reception of pupils; and in this capacity Lord Ashburton, the son of the celebrated Mr. Dunning, the Earl of Warwick, the Earl of Dudley, the late Lord Palmerston, and his brother the Honourable Mr. Temple, were placed under his care. The late Marquis of Lansdowne, though not an inmate in his family, was resident at this time in Edinburgh, and a frequent guest at his house, and for him he contracted the highest esteem; and he lived to see him, along with two of his own pupils, cabinet ministers at the same time. Justly conceiving that the formation of manners, and of taste in conversation, constituted a no less important part in the education of men destined to mix so largely in the world than their graver pursuits, he rendered his house at this time the resort of all who were most distinguished for genius, acquirement, or elegance in Edinburgh, and of all the foreigners who were led to visit the capital of Scotland. So happily did he succeed in assorting his guests, so well did he combine the grave and the gay, the cheerfulness of youth with the wisdom of age, and amusement with the weightier topics that formed the subject of conversation to his more learned visitors, that his evening parties possessed a charm which many who frequented them have since confessed they have sought in vain in more splendid and ostentatious entertainments. In the year 1806 he accompanied his friend the Earl of Lauderdale on his mission to Paris; and he had thus an opportunity not only of renewing many of the literary intimacies which he had formed in France before the commencement of the Revolution, but of extending his acquaintance with the eminent men of that country, with many of whom he continued to maintain a correspondence during his life.

While individuals of inferior talents, and of much inferior claims, had received the most substantial rewards for their services, it had been long felt that a philosopher like Stewart, who derived so small an income from his professional occupations, was both unjustly and ungenerously overlooked by his country. During the continuance of Mr. Pitt's administration, when the government had so much to do for those who were immediately attached to it, it was hardly perhaps to be expected that an individual who owned no party affection to it should have participated of its favours. On the accession, however, of the Whig administration, in 1806, the oversight was corrected, though not in the manner which was to have been wished. A sinecure office, that of gazette writer for Scotland, was erected for the express purpose of rewarding Mr. Stewart, who enjoyed with it a salary of £600 a year for the remainder of his life. The peculiar mode in which the reward was conveyed

excited much notice at the time. It was agreed on all hands that Mr. Stewart merited the highest recompense; but it was felt by the independent men of all parties that a liberal pension from the crown would have expressed the national gratitude in a more elegant manner, and placed Mr. Stewart's name more conspicuously in the list of those public servants who are repaid, in the evening of life, for the devotion of their early days to the honour and interest of their country.

The year after the death of his son he relinquished the active duties of his chair in the university, and removed to Kinneil House, a seat belonging to the Duke of Hamilton, on the banks of the Frith of Forth, about twenty miles from Edinburgh, where he spent the remainder of his days in philosophical retirement.¹ From this place were dated, in succession, the *Philosophical Essays* in 1810; the second volume of the *Philosophy of the Human Mind* in 1813; the "Preliminary Dissertation" to the *Encyclopædia*; the continuation of the second part of the *Philosophy* in 1827; and, finally, in 1828, the third volume, containing the "Philosophy of the Active and Moral Powers of Man;" a work which he completed only a few short weeks before his career was to close for ever. Here he continued to be visited by his friends, and by most foreigners who could procure an introduction to his acquaintance, till the month of January, 1822, when a stroke of palsy, which nearly deprived him of the power of utterance, in a great measure incapacitated him for the enjoyment of any other society than that of a few intimate friends, in whose company he felt no constraint. This great calamity, which bereaved him of the faculty of speech, of the power of exercise, of the use of his right hand—which reduced him to a state of almost

infantile dependence on those around him, and subjected him ever after to a most abstemious regimen—he bore with the most dignified fortitude and tranquillity. The malady which broke his health and constitution for the rest of his existence happily impaired neither any of the faculties of his mind, nor the characteristic vigour and activity of his understanding, which enabled him to rise superior to the misfortune. As soon as his strength was sufficiently re-established, he continued to pursue his studies with his wonted assiduity, to prepare his works for the press with the assistance of his daughter as an amanuensis, and to avail himself with cheerful and unabated relish of all the sources of gratification which it was still within his power to enjoy, exhibiting, among some of the heaviest infirmities incident to age, an admirable example of the serene sunset of a well-spent life of classical elegance and refinement, so beautifully imagined by Cicero: "Quiete, et pure, et eleganter actæ ætatis, placida ac lenis senectus."

In general company his manner bordered on reserve; but it was the *comitate condita gravitas*, and belonged more to the general weight and authority of his character, than to any reluctance to take his share in the cheerful intercourse of social life. He was ever ready to acknowledge with a smile the happy sallies of wit, and no man had a keener sense of the ludicrous, or laughed more heartily at genuine humour. His deportment and expression were easy and unembarrassed, dignified, elegant, and graceful. His politeness was equally free from all affectation and from all premeditation. It was the spontaneous result of the purity of his own taste, and of a heart warm with all the benevolent affections, and was characterized by a truth and readiness of tact that accommodated his conduct with undeviating propriety to the circumstances of the present moment, and to the relative situation of those to whom he addressed himself. From an early period of life he had frequented the best society both in France and in this country, and he had in a peculiar degree the air of good company. In the society of ladies he appeared to great advantage, and to women of cultivated understanding his conversation was particularly acceptable and pleasing. The immense range of his erudition, the attention he had bestowed on almost every branch of philosophy, his extensive acquaintance with every department of elegant literature, ancient or modern, and the fund of anecdote and information which he had collected in the course of his intercourse with the world, with respect to almost all the eminent men of the day, either in this country or in France, enabled him to find suitable subjects for the entertainment of the great variety of visitors of all descriptions who at one period frequented his house. In his domestic circle his character appeared in its most amiable light, and by his family he was beloved and venerated almost to adoration. So uniform and sustained was the tone of his manners, and so completely was it the result of the habitual influence of the natural elegance and elevation of his mind on his external demeanour, that when alone with his wife and children, it hardly differed by a shade from that which he maintained in the company of strangers; for, although his fondness, and familiarity, and playfulness were alike engaging and unrestrained, he never lost anything either of his grace or his dignity: "Nec vero ille in luce modo, atque in oculis civium, magnus, sed intus domique præstantior." As a writer of the English language—as a public speaker—as an original, a profound, and a cautious thinker—as an expounder of truth—as an instructor of youth—as an elegant scholar—as an accomplished gentleman—in the ex-

¹ In 1812 Mr. Stewart read, before the Royal Society of Edinburgh, a highly interesting memoir, entitled "Some Account of a Boy born Deaf and Blind," which was subsequently published in the *Transactions* of that learned body. The boy was James Mitchell, the son of a clergyman in the north of Scotland; and, owing to his unfortunate defects, his knowledge of external objects was necessarily conveyed through the organs of touch, taste, and smell only. Mr. Stewart entertained hopes of being able to ascertain from this case the distinction between the original and acquired perceptions of sight; an expectation, however, which, from various circumstances, was not realized.

² He retired from active life, upon an arrangement with the scarcely less celebrated Dr. Thomas Brown, who had been his own pupil, who now agreed, as joint-professor with Mr. Stewart, to perform the whole duties of the chair. Mr. Stewart's biographer in the *Edinburgh Encyclopedia* gives the following paragraph in reference to this connection:—"Although it was on Mr. Stewart's recommendation that Dr. Brown was raised to the chair of moral philosophy, yet the appointment did not prove to him a source of unmixed satisfaction. The fine poetical imagination of Dr. Brown, the quickness of his apprehension, and the acuteness and ingenuity of his argument, were qualities but little suited to that patient and continuous research which the phenomena of the mind so peculiarly demand. He accordingly composed his lectures with the same rapidity that he would have done a poem, and chiefly from the resources of his own highly gifted, but excited mind. Difficulties which had appalled the stoutest hearts yielded to his bold analysis; and, despising the formalities of a siege, he entered the temple of pneumatology by storm. When Mr. Stewart was apprised that his own favourite and best founded opinions were controverted from the very chair which he had scarcely quitted; that the doctrines of his revered friend and master, Dr. Reid, were assailed with severe and not very respectful animadversions; and that views even of a doubtful tendency were freely expounded by his ingenious colleague, his feelings were strongly roused; and though they were long repressed by the peculiar circumstances of his situation, yet he has given them full expression in a note in the third volume of his *Elements*, which is alike remarkable for the severity and delicacy of its reproof."

It is worthy of notice, that from 1810 to 1818, when Mr. Adam Ferguson died, there were alive three professors of moral philosophy, who had been or were connected with the Edinburgh university. Upon the death of Dr. Brown, in 1820, Mr. Stewart resigned the chair in favour of the late Professor Wilson (Christopher North), who succeeded.

emplary discharge of the social duties—in unpromising consistency and rectitude of principle—in unbending independence—in the warmth and tenderness of his domestic affections—in sincere and unostentatious piety—in the purity and innocence of his life, few have excelled him: and, take him for all in all, it will be difficult to find a man, who, to so many of the perfections, has added so few of the imperfections, of human nature. “Mihi quidem quamvis subito ereptus, vivit tamen, semperque vivit; virtutem enim amavi illius viri, quæ extincta non est; nec mihi soli versatur ante oculos, qui illum semper in manibus habui, sed etiam posteris erit clara et insignis.”

Mr. Stewart's death occurred on the 11th of June, 1828, at No. 5 Ainslie Place, Edinburgh, where he had been for a few days on a visit.

The remains of this distinguished philosopher were interred in the Canongate Churchyard, near the honoured remains of Dr. Adam Smith. At a meeting of his friends and admirers, which soon after took place, a subscription was entered into for erecting a monument, in some conspicuous situation, to his memory; and a large sum being immediately collected, the work was soon after commenced, under the superintendence of Mr. Playfair, architect. Mr. Stewart's monument is an elegant Grecian temple, with a simple cinerary urn in the centre, and occupies a most fortunate situation on the south-west shoulder of the Calton Hill, near the observatory.

Mr. Stewart left behind him a widow and two children, a son and daughter; the former of whom, Lieutenant-colonel Matthew Stewart, has published an able pamphlet on Indian affairs. With appropriate generosity the government allowed the sinecure enjoyed by Mr. Stewart to descend to his family.

The subject of this memoir was of the middle size, and particularly distinguished by an expression of benevolence and intelligence, which Sir Henry Raeburn has well preserved in his portrait of him, painted for Lord Woodhouselee, before he had reached his 55th year. Mr. Stewart had the remarkable peculiarity of vision which made him insensible to the less refrangible colours of the spectrum. This affection of the eye was long unknown both to himself and his friends, and was discovered from the accidental circumstance of one of his family directing his attention to the beauty of the fruit of the Siberian crab, when he found himself unable to distinguish the scarlet fruit from the green leaves of the tree. One of the rules by which he guided himself in literary matters, was never to publish anything anonymously: a rule which, if generally observed, would probably save the world the reading of much inferior and much vicious composition.

STEWART, DR. MATTHEW, an eminent geometrician, and professor of mathematics in the university of Edinburgh, was born at Rothesay, in the island of Bute—of which his father, the Rev. Mr. Dugald Stewart, was minister—in the year 1717.¹ On finishing his course at the grammar-school he was entered at the university of Glasgow in 1734. At college he became acquainted with Dr. Hutcheson and Dr. Simson. In the estimation of the latter he rose, in after-life, from the rank of a favourite pupil to that of an esteemed friend. They were long intimate personal companions, admired the same branches of their common science, and exhibited in their works symptoms of mutual assistance. It is said, indeed, that we are indebted to the friendship and acuteness of Simson, for the suggestion of

mathematics as a study suited to the genius of Stewart. At all events there is every reason to suppose that the love of the latter for the geometry of the ancients was derived from his intercourse with his instructor. While attending the lectures of Dr. Gregory in Edinburgh, in 1741, the attractions of the new analysis were not sufficient to make him neglect his favourite study; and he communicated to his friend his discoveries in geometry, receiving similar communications in return. While Simson was conducting the laborious investigations which enabled him to revive the porisms of the ancients, Stewart received the progressive benefit of the discoveries, long before they were communicated to the world; and while he probably assisted his friend in his investigations, he was enabled, by investigating the subject in a new direction, to publish in 1746 his celebrated series of propositions, termed *General Theorems*. “They are,” says the author's biographer, “among the most beautiful as well as most general propositions known in the whole compass of geometry, and are perhaps only equalled by the remarkable *locus* to the circle in the second book of Apollonius, or by the celebrated theorems of Mr. Cotes. The first demonstration of any considerable number of them is that which was lately communicated to this society² [the Royal Society of Edinburgh]; though I believe there are few mathematicians into whose hands they have fallen, whose skill they have not often exercised. The unity which prevails among them is a proof that a single though extensive view guided Mr. Stewart in the discovery of them all.”

Meanwhile Mr. Stewart had become a licentiate of the Church of Scotland; and, through the joint influence of the Earl of Bute and the Duke of Argyll, had obtained the living of Roseneth. The *General Theorems* made their appearance at a time when they were calculated to have a considerable effect on the prospects of the author. In the summer of 1746 the mathematical chair of Edinburgh became vacant by the death of Mr. Maclaurin. Stewart was not at that period known to the learned world; and Mr. Stirling, a gentleman of well-known reputation, was requested to become the new professor. This gentleman declined the situation; and towards the end of the year, when the patrons of the university were looking for another candidate worthy of the important duty, Stewart's book was published. The author was readily offered the situation, which he accepted. “The duties of this office,” says his biographer, “gave a turn somewhat different to his mathematical pursuits, and led him to think of the most simple and elegant means of explaining those difficult propositions which were hitherto only accessible to men deeply versed in the modern analysis. In doing this he was pursuing the object which, of all others, he most ardently wished to attain, viz. the application of geometry to such problems as the algebraic calculus alone had been thought able to resolve. His solution of Kepler's problem was the first specimen of this kind which he gave to the world; and it was impossible to have produced one more to the credit of the method which he followed, or of the abilities with which he applied it.” This solution appeared in the second volume of the *Essays of the Philosophical Society of Edinburgh*, for the year 1756. To quote again the words of the eminent biographer: “Whoever examines it will be astonished to find a problem brought down to the level of elementary geometry, which had hitherto seemed to require the finding of fluents, and the reversion of series; he will acknowledge the reasonableness of

¹ Memoir by Professor Playfair, *Trans. R. Soc. Edin.* i. 57.

² Communicated by Dr. Small.

whatever confidence Mr. Stewart may be hereafter found to place in those simple methods of investigation, which he could conduct with so much ingenuity and success; and will be convinced, that the solution of a problem, though the most elementary, may be the least obvious; and though the easiest to be understood, may be the most difficult to be discovered." In pursuance of his principle of introducing the forms of ancient demonstration, as applicable to those more complicated parts of the science called the mixed mathematics, for which they had been considered unqualified, he published, in 1761, his "*Tracts, Physical and Mathematical*, containing an Explanation of several Important Points in Physical Astronomy; and a New Method of ascertaining the Sun's Distance from the Earth, by the Theory of Gravitation." "In the first of these," says his biographer, "Mr. Stewart lays down the doctrine of centripetal forces, in a series of propositions, demonstrated (if we admit the quadrature of curves) with the utmost rigour, and requiring no previous knowledge of the mathematics, except the elements of plane geometry and conic sections. The good order of these propositions, added to the clearness and simplicity of the demonstrations, renders this tract the best elementary treatise of physical astronomy that is anywhere to be found." It was the purpose of the three remaining tracts to determine the effect of those forces which disturb the motions of a secondary planet; and, in particular, to determine the distance of the sun, from its effect in disturbing the motions of the moon. Owing to the geometrical method which he adopted, and likewise to the extreme distance of the sun, which makes all the disturbances he produces on the motion of the moon very near to that point at which increase of distance to infinity would not change their force, he could only proceed on a system of approximation; and in applying the principles of his plan to a practical calculation of the sun's distance, which he published in 1763, entitled "*Distance of the Sun from the Earth*, determined by the Theory of Gravitation, together with several other Things relative to the same Subject," he was found to have made a very considerable error. He found the distance of the sun to be equal to 29,875 semi-diameters of the earth, or about 118,541,428 English miles. About five years afterwards there appeared a pamphlet from the pen of Mr. Dawson of Sudbury, called "*Four Propositions*, intended to point out certain Errors in Dr. Stewart's Investigation, which had given a Result much greater than the Truth." This was followed by a second attack from Mr. Lauden, who, like Price in arithmetic, accomplished the difficult task of becoming an enthusiast in mathematics, and by means of exaggerating errors, and commenting on their atrocity, astonished the world with a specimen of controversial mathematics. The biographer thus states the sources of the mistakes which called forth these animadversions: "As in arithmetic we neglect those small fractions which, though of inconsiderable amount, would exceedingly embarrass our computations; so, in geometry, it is sometimes necessary to reject those small quantities which would add little to the accuracy, and much to the difficulty, of the investigation. In both cases, however, the same thing may happen; though each quantity thrown out may be inconsiderable in itself, yet the amount of them altogether, and their effect on the last result, may be greater than is apprehended. This was just what had happened in the present case. The problem to be resolved is, in its nature, so complex, and involves the estimation of so many causes, that, to avoid inextricable difficulties, it is necessary to reject some quantities

as being small in comparison of the rest, and to reason as if they had no existence." Soon after the publication of this essay Dr. Stewart's health began to decline; and in 1772 he retired to the country, leaving the care of his class to his eminent son, Dugald Stewart, who was elected joint professor with him in 1775. He died on the 23d January, 1785, at the age of sixty-eight. Besides the works above mentioned, he published *Propositiones Geometricæ More veterum Demonstratæ ad Geometriam Antiquam Illustrandam et Promovendam Idoneæ*, 1763.

STEWART, LIEUTENANT-COLONEL PATRICK, C.B., R.E. This young and distinguished officer, whose career unexpectedly terminated in the mid-day of his life, was the second son of James Stewart, Esq., of Cairnmore. Having adopted the military service as his profession, he studied at the military college of Sandhurst, and after distinguishing himself by his scientific acquirements connected with the art of war, he entered the Bengal engineers, where he was appointed second-lieutenant on June 14, 1850. On August 1, 1854, he was promoted to a lieutenancy, and on August 27, 1858, to the rank of captain. During the Sepoy rebellion in India, he served in the staff of Lord Clyde in the advance to the relief of Lucknow, the siege of that city, and the battle of Cawnpore, and in this memorable expedition his knowledge of science in its application to military operations was called into full exercise. He was employed in extending and maintaining telegraphic communication between the army in its advance and the head-quarters of government, and this important office he discharged so ably and energetically as to obtain honourable mention in the despatches of Viscount Canning, the governor-general of India.

Although these were services in which military enterprise had no field for display, Captain Stewart's courage and daring as a soldier were so well known as to call forth the admiration of all ranks in the army, and these were all the more highly valued as he was habitually of an amiable and gentle disposition. During the Indian campaign he lost no opportunity of signaling his intrepidity in action; and carrying the same spirit into his active sports, he on one occasion nearly lost his life from the attack of a tiger while hunting. When the rebellion was suppressed he was rewarded with two clasps, and promoted to the rank of brevet-major.

His health having suffered from his Indian services, Major Stewart returned home, where his health was restored and his frame invigorated by the bracing atmosphere of his native Galloway, and the scenes of his early youth; and he married Miss M'Douall, daughter of Colonel M'Douall of Logan. Soon after this he was again called to active service by being appointed to superintend the extension of telegraphic communication with India, an important task to which his well-known talents recommended him; and it is enough to add that his services in this department did not belie the expectations which had been formed of him. Latterly, in consequence of his failing health, he had been residing at Constantinople, where Mrs. Stewart was seized with diphtheria; but although she recovered, her husband was struck down with the same disease, which in his case proved mortal. He died at Constantinople, on the 15th of January, 1865, at the early age of thirty-two years.

STONE, EDMUND, an ingenious self-taught mathematician, of whom nothing is known except from a letter written by the Chevalier Ramsay to Father Castel, published in the *Mémoires de Trévoux*. It there appears that Stone was the son of a gardener

in the employment of John Duke of Argyle, at Inverary, in the early part of the eighteenth century. "He attained the age of eight years before he learned to read; but a servant having taught him the letters of the alphabet, he soon made a rapid progress with very little assistance. He applied to the mathematics; and, notwithstanding the peculiar difficulties of his situation, attained a knowledge of the most sublime geometry and analysis without a master, and without any other guide, it is said, than his own genius. At the age of eighteen he had advanced thus far, when his abilities and the extent of his acquirements were discovered by the following accident. The Duke of Argyle, who to his military talents united a general knowledge of every science that can adorn the mind of a great man, walking one day in his garden saw lying upon the grass a Latin copy of Newton's *Principia*. Having called some one to carry it back to his library, the young gardener told him that it belonged to himself. The duke was surprised, and asked him whether he were sufficiently acquainted with Latin and geometry to understand Newton. Stone replied, with an air of simplicity, that he knew a little of both. The duke then entered into conversation with the young mathematician, asked him several questions, and was astonished at the force and accuracy of his answers. The duke's curiosity being redoubled, he sat down on a bank, and requested to know by what means he acquired such knowledge. 'I first learned to read,' said Stone: 'the masons were then at work upon your house: I went near them one day, and I saw that the architect used a rule and compass, and that he made calculations. I inquired what might be the meaning and use of these things; and I was informed that there was a science named arithmetic. I purchased a book of arithmetic, and I learned it. I was told that there was another science called geometry: I bought books, and learned geometry also. By reading I found that there were good books on these two sciences in Latin: I bought a dictionary and learned Latin. I understood also that there were good books of the same kind in French: I bought a dictionary and I learned French. And this, my lord, is what I have done. It seems to me that we may learn anything when we know the twenty-four letters of the alphabet.' With this account the duke was delighted. He drew this wonderful young man from his obscurity, and provided him with an employment which left him plenty of time to apply to his favourite pursuits. He discovered in him also the same genius for music, for painting, for architecture, and for all the sciences that depend upon calculations and proportions."

Stone is said to have been a man of great simplicity; and, though sensible of his own acquirements, neither vain nor conceited. It is to be regretted that no particulars are accessible respecting the latter part of his career: we are not even informed whether he spent the remainder of his life in Argyleshire or in London; though it seems probable that the latter was the scene of his chief scientific labours. His works, partly original and partly translations, are as follows: *A New Mathematical Dictionary*, first printed in 1726, 8vo; *A Treatise on Fluxions*, 1730, 8vo: in this work the direct method is a translation from the French of the Marquis de l'Hôpital's *Analysis des Infiniments Petits*, and the concise method was supplied by Stone himself; *The Elements of Euclid*, 1731, 2 vols. 8vo; a neat and useful edition, with an account of the "Life and Writings of Euclid," and a defence of his elements against modern objectors; besides some smaller works. Stone was a fellow of the Royal Society, and communicated to it an "Ac-

count of Two Species of Lines of the Third Order not mentioned by Sir Isaac Newton or Mr. Sterling," which was printed in the *Philosophical Transactions*, vol. xli.

STOW, DAVID. This worthy founder of the training system of education was born at Paisley, on the 17th of May, 1793. His father, William Stow, who had migrated in early life from his native county of Durham to the town of Paisley, established himself there as a merchant, and was not only prosperous in business, but elected to the honourable office of a magistrate in the town. David Stow in early youth was educated in the grammar-school of Paisley; but while he received there the ordinary routine of education, it was in the domestic circle of the paternal home that he underwent a system of religious and intellectual training which fitted him to turn his acquirements to the best account. Having become, at the age of eighteen, connected with a mercantile establishment in Glasgow, he took up his residence in that city, and on his way to his place of business had occasion daily to go through one of its lowest and most depraved districts on the south side of the river Clyde. The sight of its neglected vagrant children, the denizens of the open air, who were allowed to live and grow up as they best could, first excited his compassion; and to instruct and reclaim them he became a Sabbath-school teacher, at a time when such an office was little respected in Glasgow. Resolved also to carry on the work in earnest, he selected for the place of his labours a densely-peopled locality in the Saltmarket, lying between St. Andrew's Street and the Cross; and to induce a sufficient attendance of pupils, he tried what he called the process of "deep-sea fishing" over his selected area of about seventy families. These he visited twice a week, and thus maintained not only the superintendence of his pupils, but came in contact with their parents, who in most cases were in as much need of instruction as their children. In this way also he endeared himself more to the people of his own little parish than if he had collected his flock indiscriminately from the streets at large. He was theirs, and his school was theirs; he had chosen them in preference to others; and while they were assured that he cared for them, they enjoyed the weekly privilege of his intercourse and sympathy. This local and exclusive plan of Sabbath-school teaching, of which Mr. Stow was the originator, soon caught the observing eye of Dr. Chalmers, at that time organizing his parochial machinery; and struck with the benefits that might accrue from such a mode of religious Sabbath instruction for the young, he established in his parish of St. John's, Glasgow, this principle of Sabbath-schools, by which the labours of each teacher was to be confined to his own appointed locality, so that not a family in it should be omitted or an individual neglected. This was the only way, as the reverend doctor saw, by which the parochial distinctions of a city could be restored, and a clergyman become the minister of his parish. Such was the commencement of local Sabbath-schools, a method to which Dr. Chalmers was enthusiastically devoted, and which he continued to practise until the close of his well-spent life. "This," he exclaimed when he first established his local schools, "This is what I call preaching from house to house!"

In consequence of the acquaintanceship of Mr. Stow with Dr. Chalmers, and the efficient aid with which he seconded his parochial arrangements, he was elected one of the doctor's church elders, a situation demanding no small amount of time and

labour. Mr. Stow also, notwithstanding the requirements of his business as a merchant in the stirring and bustling city of Glasgow, showed no abatement of earnestness in Sabbath-school teaching. But his growing experience suggested doubts as to the adequateness of such an instrument for the reformation of our social fabric. To the young it was only one day of religious training in the Sunday-school against six days of evil training in the streets. Between two such counteracting forces it was easy to guess as to which of them would obtain the mastery. From their parents also he could expect little aid, as they were confirmed in their ignorance or callousness. He saw that weekly training instead of Sunday training was necessary for the reformation of the young of our streets, and a healthful change in the character of society at large: and this change from street-training to school-training he proceeded to advocate with all his habitual earnestness. Such in 1824 was the result of his experience over a course of years of Sabbath-school teaching; in which he had been more diligent and more successful than most of his contemporaries. It was of value simply as an auxiliary of the church, by preparing the neglected young for its ministrations. In his new views of religious and moral training he would probably have been aided by the influence of Dr. Chalmers, had not the latter been removed from Glasgow to the chair of moral philosophy in St. Andrews. He therefore had to fight the battle for weekly training single-handed until philanthropic friends came to the rescue. But all the while the conduct of Mr. Stow evinced that he had not exchanged his old theory for a new, but merely sought an expansion of the old. He wished to extend the benefits of the latter from one day in the week to seven. He therefore continued in the zealous and effective discharge of his Sabbath-school duties more than ten years after his weekly-training experiment had commenced, and not only taught his own Sabbath classes, but was treasurer and secretary to different societies in connection with the Sunday-school system. Nor did his devotedness go unrewarded. His Sabbath-school of the Saltmarket, in which his training mode of teaching had commenced, showed its renovating and expanding power, so that after many years he was enabled thus to state of it:—"In my Sabbath-school, consisting of about thirty boys and girls, when the leading principles of the training system were first practically worked out, I may state that during the first ten years out of the sixteen or eighteen years that most of them were consecutively in attendance, I saw no fruit save that they all got better and more decently dressed, and their hair more smoothly combed or brushed, and that several of them attended church, and whose parents were now induced to attend who had never done so before. Soon after that time, however, . . . nearly all the girls, or rather young women, decidedly turned to the Lord, and immediately held prayer-meetings in the school-room, viz. a good-sized kitchen, by themselves. Six months afterwards, the same operation of the divine Spirit was exhibited in most of the boys, or rather young men, and then both sexes held a united prayer-meeting once a week, and also one separately, each by themselves. Like a hive of bees, they soon afterwards seized upon a neighbouring very destitute district in the suburbs, in which they established and taught most efficiently fifteen Sabbath-schools, on the strict local principle, having about 350 children in attendance; a district in which there was neither church nor school. Now, being occupied on Sunday afternoons, they then met on Monday evenings in my house, two miles distant

from my district, for conversation and prayer, which the young men wholly conducted. I then felt myself in the position not of a teacher but a hearer, through them, in the school of Christ. Their calmness, fervour, and enlightened faith truly surprised and delighted me. Soon after this (twenty-five years ago) I received a petition from fifteen of them, requesting me to use my influence to get up a church and day-school (afterwards termed St. Luke's), so that they might have a regular organized Christian machinery. In one word, out of thirty scholars twenty-three became Sabbath-school teachers; five, elders of the church; four, day-school teachers; one, head of a normal training seminary in the colonies; two are ministers of the gospel, one in England the other in Scotland; and five are now, I believe, in glory. Of course, some of these pupils held different offices in succession, the correct 'statistical' number being twenty-three in all."

Having formed his theory of the training system from his ten years of experience in Sabbath-school teaching, Mr. Stow proceeded in the spring of 1827 to reduce it to action, by adapting a house and garden in the Drygate as a school and play-ground for about 100 pupils, and a dwelling for the teacher. The Drygate was a poor and densely-peopled district abounding in idle unreclaimed children, and therefore fitted in every way to try his experiment and test its efficiency. The principles on which the teaching was to be conducted were of such a simple and natural character, that they had been overlooked by educational theorists in their search after the new and unknown. Devotional principle and moral practice, the chief essentials of human training, were to be inculcated during the whole week, instead of a seventh of it. It was to be inculcated also not by formal lessons and grave harangues, which would only have repelled or puzzled the young learners, but in a way best suited both to their likings and capacities. Mr. Stow had noted in his class, writes his biographer, "the power which the 'picturing out in words' of the doctrines, precepts, narratives, figures, and allusions in Scripture gave him over young minds; not only winning them to attention by arresting their sympathies, but leading them to higher exercises by enlightening their understanding and taxing their reasoning powers." There was to be no corporal punishment; instead of this the only chastisement was the public opinion of the class, which would fall upon the offender more heavily than stripes, and be more influential as a check upon his conduct. As for the play-ground, it was to form their world, instead of the streets in which they had roamed at large; and there, while acting under the principles of their common instruction, virtue was more certain to be rewarded and vice put to shame. Mr. Stow, as will be seen, was well aware of the mesmeric power of mutual action, especially in children, and has thus announced it: "To meet the sympathy of companionship in what is evil, we ought to oppose it by the only antidote, viz. the *sympathy of companionship in what is good*. Let the morning lessons of a week-day training-school, therefore, be made the basis of the practice of the children during each day, under the superintendence of an accomplished master-trainer in-doors at lessons, and out-of-doors at play. Let the *sympathy of numbers*, which in towns so materially leads to evil, be laid hold of, on scriptural principles, as in the moral training-school, on the side of good; and then, but not till then, will the *sunken* class be elevated, the *sinking* kept from falling, and the *uprising* class be safe in bringing up their offspring amidst the contaminating influence of a city atmosphere."

At first, this new system established by the training-school—this substitution of education for teaching—excited an outcry which required no little courage to confront. The school required a playground to keep children apart from the contamination of the street, and give fair development to their physical aptitudes—but how, in our large and crowded towns, where every foot of ground is so costly, could such an accommodation be obtained? The walls of the school, too, were to be draped with illustrative pictures; but was not the old plan of teaching better, that compelled the pupil to keep his eyes fixed upon his book, under the penalty of a blow if he glanced aside? And how could religion be better taught than by compelling the learner to read the Bible right on, and committing the Shorter Catechism to memory? This new-fangled “training,” it was maintained, by which children were to be conducted into the way they should go by such soft and gentle inducements that appealed to their own free choice, was a sorry substitute for the *taraise*, under which the “young idea” was taught to shout, and go on like a whipping-top. But in spite of financial considerations and vulgar prejudices, Mr. Stow persevered, and his model school in the Drygate, which he had placed under a most efficient instructor, was soon able to refute these objections, and effect a favourable reaction. The pale, ragged, ignorant children had become healthy, happy, and intelligent, and their answers in trying examinations produced approval, and sometimes wonder. It was evident that the training system had either wonderfully evolved the sleeping faculties of these poor children, or moulded them anew. To make the effects of this new system more widely known, the master and mistress of the Drygate school, with a dozen of their juvenile scholars, visited different towns from Rothesay to Stranraer in 1829, only two years after it had been established; and so deep was the impression produced by these visits, that similar schools were established in various towns in Scotland. Edinburgh was not to be behind in an example which Glasgow had originated, and accordingly a society was formed there, and the teacher of Drygate school (Mr. Caughie) with twelve of his pupils, was invited to Edinburgh, to exhibit the nature of his teaching. The advent is thus described in a letter of the secretary of the training system established in Edinburgh:—“I have great pleasure in informing you not only of the safe arrival of the twelve infant pupils, in high spirits and trim, without fatigue or drowsiness, but of their really satisfactory exhibition before the company in the Waterloo Rooms, which produced a very strong sensation, and was declared a high moral treat. They . . . The children, several of whom are very sweet little things, and all well trained, alert, and cheerful, excited almost an affectionate feeling: little strangers just arrived, and introduced in the middle of the lecture, at the moment when they were wanted, was quite dramatic. The coach arrived at the ‘Star’ in Prince’s Street at a quarter past two, the lecture going on at the time. I was myself in waiting, and got the coachman, as he went near the place with his coach and horses, to set them down at the Waterloo Hotel. They got five minutes to stare at the curtains, and especially the magnificent lustres (which they were afterwards asked to give an opinion of), and then were in the middle of business as if they were in their own school. A monitor named Beton struck up a hymn, and did other monitorial feats, and as he was pronounced a worthy, and had no shoes to walk withal, he was a shod man—the sum being given to the mistress before they left the room.”

Three successive days were these exhibitions continued in the Waterloo Rooms, which were attended by most of the magistrates and many of the leading men of the city, and the result of their approbation of this plan of teaching was the establishment of the Edinburgh Model Infant School. But while this and other schools upon the same principles were rising in various towns in Scotland, Mr. Stow contemplated the advance which had been made as only the first step of progress. Evil habits had been unlearned, but unless new habits were formed the old would return, and perhaps be more mischievous than ever. But the public interest which had been so highly raised at the beginning was now suffering such a collapse, that even the annual sum of £150 which had been subscribed to support his school in the Drygate was no longer forthcoming. It was one of those trials which usually confront the progress of a genuine reformer, but Mr. Stow showed that he had a reformer’s spirit to surmount it. He had obtained premises for the establishment of a new school upon the ground-floor of a Wesleyan chapel in the Saltmarket, with the space in front for a playground, and here a fresh legion of young city pariahs was assembled, whose conduct soon justified the principles of their training. The flowers of their playground remained uninjured, and the tempting currants unplucked. Their new sense of beauty admired the former, and their adopted principles of honesty spared the other. The money they had hitherto squandered was spent in the purchase of books; and in many cases their reckless parents were shamed or allured by this example of their children into more orderly behaviour. Encouraged by these proofs of the utility of his plan, Mr. Stow resolved to provide another school, into which the children might be drafted who were too far advanced for the infant classes. In this way pupils of the same age and progress could better sympathize in the work of the school-room and the playground, and more effectually promote each other’s improvement. By this idea he laid the basis of that plan now so widely carried out under the title of “graded schools.” It was also necessary to provide for the training of teachers themselves as well as of pupils, as already more than 100 of the former had been indoctrinated with his method entirely by his own instruction. And hence the origin of Normal colleges. The first of these was established in Glasgow, and the day of its inauguration (Nov. 14, 1836) was a happy day for Mr. Stow: 500 of the leading citizens, including the dean of guild, the members of the Merchants’ House, the members of the Trades’ House, many of the clergy, the professors of the Andersonian University, with their distinguished president James Smith, Esq., of Jordanhill, and the office-bearers of the Educational Society, walked in procession to lay the foundation-stone, and the moderator of the General Assembly offered up the dedicatory prayer. It was a public, formal recognition of the efficacy of the training system, and a pledge to carry it into effect. In reference to this institution, Mr. Stow thus enunciated its objects in the following sketch:—First, to improve the system of our popular education; secondly, to organize our school system, that it might be an assistance to parents in training their young; and thirdly, to diffuse and extend the system, by establishing a model school for the instruction of the public, and for the training of schoolmasters.” In announcing the necessity of a change in the old-established mode of our teaching, from the new and unforeseen growth of cities, Mr. Stow continued, “Large towns are the bane of our country in a moral point of view. Why?

It is because our educational systems have not hitherto been so organized as to meet this comparatively new state of society. We continue simply to teach in the schools, while the wicked one is actively training in the streets. But let the principle of *social* sympathy, while freely at play, be concentrated habitually, as under the training system, in favour of what is good, through infancy and youth, and by the divine blessing large towns and their factories will prove vastly increased sources of morality and virtue." This startling assertion, so much at war with previous experience, he verified by the following fact:—"In the model infant school 200 children, and in the model juvenile 180, had amused themselves freely at play during a whole summer in their respective school play-grounds, and yet small fruit had been left to ripen in the side borders within the reach of the youngest child."

Although the commencement of the Glasgow Normal College was so promising, difficulties still continued to oppose its progress. It was hoped that Mr. Stow, already over-laboured by his philanthropic exertions, would have been relieved by this establishment of more than half of his burdens; but the accomplished rector of the college, Mr. John M'Crie (son of the biographer of Knox and Melville), died as soon as he had entered into office, and Mr. Stow was committed to more than his former toils. The Glasgow establishment also was expensive, and could not be upheld without voluntary contributions; but this was a new demand on the part of public education to which the people of Scotland had been unaccustomed, and which they were unable or unwilling to comprehend. Mr. Stow was therefore oppressively taxed, not only in labour but in outlay. But how successfully these labours were continued, was proved by the evidence of Sir John K. Shuttleworth, in his examination before the select committee of the House of Commons on the education of the poorer classes. This was in March, 1838, about fourteen months after the Glasgow institution had been inaugurated, and to the question of what schools were best adapted for the purpose he gave the following answer:—"The most perfect school of this description with which I am acquainted, is a school recently established in Glasgow, by the Glasgow Educational Society, denominated the Glasgow Normal Seminary. A very large sum has been expended in erecting the building of that school, and a gentleman of excellent education [Mr. M'Crie] was sent to Prussia and Germany, to acquire a knowledge of the plans pursued in the Prussian and German schools, who was afterwards elected rector of the Normal Seminary. The building consists of rooms for the instruction of children, and smaller apartments in which the miniature schools are conducted by the teachers who are undergoing training in the school. There are likewise rooms in which the rector of the school conveys information to the teachers, and instructs them privately in the principles upon which the various methods of training the children are based. In such a school two objects have to be fulfilled: the one of conveying general knowledge to the teachers, and the other making them theoretically acquainted with principles upon which the methods of instruction are founded, and giving them an opportunity of carrying those principles into execution by practising the method in a miniature school, and afterwards of conducting from time to time the larger school upon the same plan."

The merits of Mr. Stow as a reformer in education were now so generally recognized, that the committee of privy-council on education offered him the first inspectorship of schools in Scotland. It

was an honourable tender, and grateful to his feelings, but after anxious consideration he declined it. "I would not like," he said, "to be paid for services in any shape, although I consider it right and proper that all special services should be paid." With this dislike to payment for a duty which he had undertaken so cheerfully and hitherto performed gratuitously, was the feeling that his health was failing as years advanced, and he playfully added, "I have pursued a course of over-exertion for many years, and my medical adviser has told me that if I do not pull in I must be stretched out." His labours, after the death of Mr. M'Crie, had happily been lightened by the appointment of the Rev. Robert Cunningham to the vacant rectorship—one whose extensive observations in the educational systems on the Continent, and practice as a professor in one of the colleges of the United States, combined with his learning and practical energy of character, in every way qualified for the office. Mr. Stow was therefore enabled to enjoy longer intervals of rest than had fallen to his lot for many years. He was also gratified to witness how widely his training system had been adopted, and how likely it was to go on from the impetus which he had imparted. Normal schools and training schools had now become household words, so that their titles were adopted by those academies that were still ignorant of their peculiar meaning. There was also a larger demand for trained teachers from the Normal College than it was able to supply, and the Wesleyans of England, who had no institution of their own, sent their students to be trained as schoolmasters under the direction of Mr. Stow. As the kind of religious instruction also was based upon the most liberal principles, instead of being confined to merely sectarian distinctions, students from missionary societies of every denomination—Episcopalian, Wesleyan Methodist, United Presbyterian, and Baptist—were sent to the Glasgow Normal College. Of those important pledges of the public approval of his system, Mr. Stow became the careful teacher and affectionate father, and the happy evenings which they spent under his hospitable roof drew many young men together who were like-minded and devoted to a common calling, but who in the absence of such re-unions would probably have remained strangers to each other, however connected by character and occupation. Thus at some of these meetings might be seen teachers under training from twelve or fourteen counties of Scotland, and from as many of England, with several from Ireland, from the West Indies, and from Caffraria. The two methods of culture introduced by Mr. Stow in preparing these future teachers for their avocation were, 1st, By private criticisms; and 2d, By public lessons given weekly. As these are too important to be passed over, we give them in the words of his biographer:—"In the first, or 'private criticism,' the students were seated in their gallery, and answered as children, while in succession teachers gave them lessons in reading, spelling, arithmetic, or catechetical exercises, under the guidance of Mr. Stow and the rector. The 'criticism' was given during the lesson; manner, matter, look, intonation, forms of questions, were all referred to, exhibited, corrected with gentleness, and always most effectively. The females gave lessons in a separate hall, and were similarly criticized and guided. They were taught to teach as girls are to sew, by *doing* it. Telling *how* to do was reckoned insufficient, the work must be *done*. By practice alone were they supposed likely to succeed. They could only *know* the work by doing it. 'While the public admit,' said Mr. Stow when stimulating the students to

submit to this drilling, 'that training is necessary to the mechanic, the sailor, the soldier, the lawyer, they have no idea of the propriety or necessity of the teacher being trained to *his* art, any further than by serving an apprenticeship to himself. I may see a system in operation in a model school, just as I might see a hem frilled by a lady; but the witnessing of this will not enable me to follow her example, until cloth and needle are placed in my hands, and I actually learn to do it practically. I must see the system in operation; I must have it explained to me by suitable trainers; I must endeavour to put it in practice under experienced superintendents; I must have the model to imitate, the children at the same time to work upon—the lack of any of which influences must leave me imperfectly trained.'

Of the second method—by public lessons given weekly—the following account is derived from the same source:—"The plan originated by Mr. Stow was so controlled by him as to prove most effective. But for his firmness and kindly bearing it might have been the source of irritating personal rivalry. To four students a lesson each was prescribed a week before it was required, that it might be carefully prepared. The four lessons generally embraced a Scripture narrative or emblem—an object—reading with explanations—and a fact or law in science. When the children were seated in the gallery, and the students had assembled in their presence, each of the four students, in his turn, gave his lesson, ten or twelve minutes being allowed; and the teachers noted not only every defect in pronunciation, in manner, in the arrangement of the lessons, in the ellipses formed, or in the method of questioning, but also all that was commendable. It was a trying time; but these respective exercises gave the teacher greater confidence and ease in the subsequent management of his own school, and constrained each to study the lesson given, and to try the best means of rivetting attention. No suggestions were made in the presence of the scholars. The students, the head-masters of the departments, the rector, and Mr. Stow adjourned to the students' hall, when, Mr. Stow or the rector presiding, the four who had given lessons on the preceding week, and had been criticized, began in turn the review of the lessons given, and spoke for a limited time. Others followed. No one who has listened to the lessons and the subsequent criticisms can have forgotten the frank, off-hand, hearty commendation, the gentle rebukes, the sometimes subtle and sometimes broad humour of the more experienced critics, and the timid half-hesitating remarks of beginners. Sometimes the lessons were analyzed, and discussion sustained, in such a way as to show how deeply some of the teachers were inquiring into the philosophy of education, and making the human mind their study. They were thus taught to speak accurately and with ease, to observe closely, to treat each other as gentlemen, and to think. To no part of Mr. Stow's labours, in the practical training of teachers, is greater importance to be attached than this. It contributed greatly to the subsequent efficiency of the school-master, and diffused a higher *esprit de corps*."

But while the training system was thus vindicating its superiority, and recommending itself to public favour, an arrest was laid upon its progress by the want of funds. Calculating upon the general liberality in its behalf, Mr. Stow and the directors had been at considerable expense in furnishing the Normal College with its necessary equipments, so that there was now a debt upon the building of £10,677, and in consequence of the scantiness of voluntary contributions the work of the college could not be carried

on with its former efficiency. Mr. Stow therefore applied to the committee of privy-council for a grant in aid, upon the plea of the unsectarian character of the Normal Seminary, and this was granted to the extent of £5000; but it was on condition that the site, buildings, and school management should be transferred to the Established Church, to be maintained and conducted by the General Assembly. Mr. Stow was delighted with this arrangement, as the means of delivering the system from its present difficulties, and speeding it onward with double efficiency; but little did he calculate upon an impending event, by which he was to be driven as an intruder from this beloved house, which he had spent such time and labour in rearing. This was the Disruption of 1843, by which the Church of Scotland was rent in twain—an event that was both sudden and unexpected; and as Mr. Stow and his coadjutors had joined the seceding portion of the church, his Normal Seminary, with all its apparatus, became the property of the Established Church, and subject to its exclusive control. Every state-endowed teachership in Scotland must be held from henceforth by a member of the Established Church only, and a clearance immediately took place of those educational charges which had been held by men who had joined the Disruption. Mr. Stow, however, thought his own peculiar case an exception to the rule, and this he proceeded to show in an appeal to the lords of the privy-council. He stated that hitherto the teachers had been appointed by himself—that the institution was in all respects national, not exclusive, being attended by pupils from various denominations—that it was hard that he and his coadjutors should be saddled with the debt that still remained on it of £5677, and themselves the while excluded—that they still held every doctrine as before, and vindicated the principle of an established church—and that the only changes were unexpected interpretations of ecclesiastical law. But the appeal was in vain, and the transference of his Normal College into the hands of the Establishment was only a question of time and convenience. Until this should take place, he continued his work of teaching, and although he might still have sold the building for any public purpose, the negotiations at the Disruption having been still incomplete, he preferred to leave the college as a training institution in the hands of the rival church rather than see it alienated to other purposes.

This dreaded transference occurred in May, 1845, and Mr. Stow, sad of heart, with the directors and teachers, and followed by 50 students and 700 pupils, proceeded to a long series of canvas-covered tents, floored with sawdust and seated with rough benches, which had been extemporized as a new normal college. A very sad change it was, but still Mr. Stow endeavoured to make the best of it. "Every person will admit," he said, "that the buildings of the institution are not the institution itself; even this temporary building, embodying as it does all the trainers, students, and children, will exhibit the system as it existed ten years previous to the erection of the edifice which we have now left; it was then the Glasgow Normal Seminary, and such it must continue to be!" In this condition, however, alone and unsupported, and with little prospect of either state or voluntary support, the institution must have moved sadly and slowly onward, or come to an absolute pause, but for one of those unexpected events which proceeded from the Disruption. Originally the Free Church had only contemplated the upholding of its ecclesiastical institutions, and its efforts and means were in the first instance directed

to a provision for the ministry, and the erection of churches and manse. But the secession of so many parochial schoolmasters, and the marvellous liberality of the Free Church communities, extended the aims of that church to the establishment of colleges and schools also, and of these the Normal institution was least of all to be neglected. The friends and adherents of the system accordingly exerted themselves so strenuously, that in a few months a second Normal College reared its head in Glasgow, of a richer and more imposing form than the first. The building was completed at a cost of £10,000, of which £3000 was granted by government. It had ten class-rooms, four large halls, students' rooms, library and museum, and janitor's house, and spacious playgrounds on the outside. On being opened, each of the four schools was crowded, students of different denominations filled the halls, so that additional buildings had afterwards to be erected; and as an architectural structure the Free Church Normal School of Glasgow excites the pride of the citizens and the admiration of strangers. It was a delightful transition for Mr. Stow, and here he continued to illustrate the worth of his training system with more ample means and greater efficacy. And how well its worth was now appreciated is explained in the following extract of a letter written to him at this time by J. C. Colquhoun, Esq. of Killermont:—"Your system has now had ample trial. You had the merit of introducing it into the Church of Scotland. You are now establishing it in the Free Church. Experience of its value has induced the Wesleyans to adopt it. It has been tried with success by many clergy and lay members of the Church of England. The poor-law commissioners have sanctioned it, and its efficacy is now proved in the most unfavourable circumstances among the juvenile convicts in Parkhurst prison. It has had the emphatic sanction of a committee of the House of Commons and of the privy-council. I regret that parliament has not yet been induced by this ample evidence to select it for general adoption. It secures what must be the great object of the state—the intelligence and moral development of the popular mind. Its applicability to all varieties of religious opinion makes it especially fitted for the exigencies of our times. All the religious disputes which have hitherto obstructed national education disappear before it; and there only remains to government the easy task of sanctioning this system of education wherever they find it, and by whatever religious party it is conducted. I indulge a hope that parliament will yet see its wisdom in adopting this course. I shall always regard it as a pleasure to support it wherever it presents itself, whether within the Church of England, where it may render the highest service; or in the Church of Scotland, which I hope will be so wise as to retain it; or within the church to which you now have carried your energy and zeal."

We have thus traced the career of Mr. Stow from his commencement as a Sabbath-school teacher to his becoming the founder of the best and most comprehensive training system of education that as yet had been devised,—and his progress from the unnoticed commencement of the system until the time when it was adopted as a system of national education, and established on a foundation that promises to be enduring to the last. He had fought his "good fight," and even upon earth had witnessed its success. The rest of his life was devoted to benevolent objects to its close, and especially to the interests of his educational establishments, which had become limbs and functions of his existence. In so busy a life, which combined the work of a merchant with that of the teacher and philanthropist, his pen

was too much employed in correspondence upon his favourite subject to indulge in authorship, so that besides a work entitled *Moral School Training for Large Towns*, and contributions to a small educational magazine, he gave no other literary productions to the world, although he showed that he had talent to win distinction in that department if he had willed to prosecute it. Active and indefatigable to the last, he held onward in his wonted course, and died at Bridge-of-Allan on the 6th of November, 1864, in the seventy-first year of his age.

It is only necessary to add that Mr. Stow was twice married. His first wife was Marion Freebairn, a young lady of great moral worth and accomplishments, who died in 1831. His second wife was Elizabeth MacArthur, to whom he was married in 1841, and who died in 1847.

STRAHAN, WILLIAM, an eminent printer and patron of literature, was born at Edinburgh in the year 1715.¹ His father, who held a situation connected with the customs, was enabled to give him a respectable education at a grammar-school, after which he was apprenticed to a printer. Very early in life he removed to the wide field of London, where he appears to have worked for some time as a journeyman printer, and to have with much frugality, creditably supported a wife and family on the small income so afforded him. His wife, whom he early married, was sister to Mr. James Elphinstone, the translator of *Martial*. It can be well supposed that he had for many years many difficulties to overcome; but he was of a happy temper, looking forward to prosperity as the reward of his toils, without being unduly sanguine. It is said he used to remark, "that he never had a child born that Providence did not send some increase of income to provide for the increase of his household."

After shaking himself free of his difficulties he grew rapidly wealthy, and in 1770 was enabled to purchase a share of the patent for king's printer of Mr. Eyre. Previously to this period Mr. Strahan had commenced a series of speculations in the purchase of literary property, that species of merchandise which more than any other depends for its success on the use of great shrewdness and critical discernment. Strahan was eminently successful, and with the usual effect of good management, was enabled to be liberal to authors, while he enriched himself. With Dr. Johnson he was for some time intimately connected, and he took the charge of editing his prayers and meditations after the doctor's death. Johnson, however, has been accused of speaking of him in a manner which the world seldom admires, when used towards a person to whom the speaker owes obligations, whatever may be the intellectual disparity. Boswell observes, "Dr. Gerard told us, that an eminent printer was very intimate with Warburton. *Johnson*. 'Why, sir, he has printed some of his works, and, perhaps, bought the property of some of them. The intimacy is such as one of the professors here might have with one of the carpenters who is repairing the college.'" In a letter to Sir William Forbes, Dr. Beattie has made the following remark on this passage:—"I cannot but take notice of a very illiberal saying of Johnson with respect to the late Mr. Strahan (Mr. Boswell has politely concealed the name), who was a man to whom Johnson had been much obliged, and whom, on account of his abilities and virtues, as well as rank in life, every one who knew him, and Johnson as well as others, acknow-

¹ Memoir in *Lounger* of August 20, 1785.—Nichol's *Lit. An.* iii. 399.

ledged to be a most respectable character. I have seen the letter mentioned by Dr. Gerard, and I have seen many other letters from Bishop Warburton to Mr. Strahan. They were very particularly acquainted: and Mr. Strahan's merit entitled him to be on a footing of intimacy with any bishop or any British subject. He was eminently skilled in composition and the English language, excelled in the epistolary style, had corrected (as he told me himself) the phraseology of both Mr. Hume and Dr. Robertson; he was a faithful friend, and his great knowledge of the world and of business made him a very useful one."¹ The expression was probably one of a splenetic moment, for Johnson was not on all occasions on good terms with Strahan. "In the course of this year" (1778), says Boswell, "there was a difference between him (Johnson) and his friend Mr. Strahan: the particulars of which it is unnecessary to relate." The doctor must have been signally in the wrong, for he deigned to offer terms of accommodation. "It would be very foolish for us," he says in a letter to Strahan, "to continue strangers any longer. You can never by persistency make wrong right. If I resented too acrimoniously, I resented only to yourself. Nobody ever saw or heard what I wrote. You saw that my anger was over, for in a day or two I came to your house. I have given you longer time; and I hope you have made so good use of it as to be no longer on evil terms with, Sir, yours, &c., Sam. Johnson."² Strahan, when he became influential with the ministry, proposed Johnson as a person well fitted to hold a seat in parliament for their interest, but the recommendation was not adopted.

So soon as he found himself in easy circumstances, Mr. Strahan became an active politician, and corresponded with many eminent statesmen. In the year 1769 he wrote some queries to Dr. Franklin, respecting the discontents of the Americans, which were afterwards published in the *London Chronicle* of 28th July, 1778. In 1775 he was elected member for the borough of Malmesbury, in Wiltshire, with Fox as his colleague, and in the succeeding parliament he represented Wotton Bassett in the same county. He is said to have been an active and useful legislator. On the resignation of his friends in 1784, he declined, partly from bad health, to stand again for a seat. His health from this period quickly declined, and he died on the 9th July, 1785, in the seventy-first year of his age. He provided munificently for his widow and children, and among many other eleemosynary bequests, left £1000 to the company of stationers, to be disposed of for charitable purposes.

The author of the memoir in the *Lounger* gives the following account of his character:—"Endued with much natural sagacity and an attentive observation of life, he owed his rise to that station of opulence and respect which he attained, rather to his own talents and exertion, than to any accidental occurrence of favourable or fortunate circumstances. His mind, though not deeply tinctured with learning, was not uninformed by letters. From a habit of attention to style he had acquired a considerable portion of critical acuteness in the discernment of its beauties and defects. In one branch of writing himself excelled. I mean the epistolary, in which he not only showed the precision and clearness of business, but possessed a neatness, as well as fluency of expression, which I have known few letter-writers to surpass. Letter-writing was one of his favourite amusements; and among his correspondents were men of such eminence and talents as well repaid his

endeavours to entertain them. One of these, as we have before mentioned, was the justly celebrated Dr. Franklin, originally a printer like Mr. Strahan, whose friendship and correspondence he continued to enjoy, notwithstanding the difference of their sentiments in political matters, which often afforded pleasantries, but never mixed anything acrimonious in their letters. . . . In his elevation he neither triumphed over the inferiority of those he had left below him, nor forgot the equality in which they had formerly stood. Of their inferiority he did not even remind them, by the ostentation of grandeur, or the parade of wealth. In his house there was none of that saucy train, none of that state or finery, with which the illiberal delight to confound and to dazzle those who may have formerly seen them in less enviable circumstances. No man was more mindful of, or more solicitous to oblige, the acquaintance or companions of his early days. The advice which his experience, or the assistance which his purse could afford, he was ready to communicate: and at his table in London every Scotchman found an easy introduction, and every old acquaintance a cordial welcome."

STRANG, DR. JOHN, minister of Errol, and principal of the university of Glasgow in the early part of the seventeenth century, was born at Irvine in Ayrshire (of which his father, Mr. William Strang, was minister), in 1584. He had the misfortune to lose his father at a very early period, but the place of a parent was supplied to him in Mr. Robert Wilkie, minister of Kilmarnock, whom his mother married soon after she became a widow. Under the care of that gentleman he was educated at the public school of Kilmarnock, where he had as a schoolfellow Mr. Zachary Boyd, renowned as a divine, as a poetical paraphrast of the Bible, and as a munificent benefactor to the university of Glasgow. That singular person always mentioned Strang as being from the earliest period remarkable for piety; together with acuteness and its frequent concomitant, modesty. At the age of twelve his stepfather sent him to study Greek and philosophy at St. Leonard's College, St. Andrews, then under the direction of his kinsman, Principal Robert Wilkie. Nor did he disgrace the patronage of the principal: he equalled or surpassed all his contemporaries, and was made Master of Arts in his sixteenth year. Although still very young, he was then unanimously invited by the master of the college to become one of the regents. That office he accepted and continued to discharge with great fidelity and effect till about the end of 1613, when he was with similar unanimity urged to become minister of the parish of Errol, in the presbytery of Perth. Thither he accordingly removed in the beginning of the following year, carrying with him the best wishes of his colleagues at St. Andrews, and an ample testimonial from the presbytery. Among the signatures attached to that document appear those of Alexander Henderson, John Carmichael, Robert Howie, and John Dykes—the first highly celebrated, and the others well known to those who have studied the history of the period. The head of the family of Errol, who resided in the parish to which Strang had been appointed, had as a sort of chaplain a Jesuit of the name of Hay, whose subtilty and eloquence are said to have been the means of converting him and his family to the Roman Catholic faith, and of spreading the doctrines of Papistry through the country. These circumstances afforded Strang an opportunity not to be omitted, and he is said to have so far counteracted the efforts of the Jesuit, that, although he could

¹ Forbes' *Life of Beattie*, ii. 183.

² Boswell, iii. 392.

never persuade Lord Errol fully to embrace the Protestant doctrines, he was the means of converting his family. His son, Francis, a youth of great hopes, died in early life in that faith, and his daughters, Ladies Mar and Buccleugh, adhered to it throughout their lives.

Among the steps by which King James and the Scottish bishops were now attempting gradually to introduce Episcopacy, one was the restoration of academic degrees in divinity, which had been discontinued in Scotland almost since the Reformation, as resembling too much some of the formalities of Popery. In the year 1616 it was determined to invest several persons with the honour of Doctor of Divinity at St. Andrews, and, as it was considered good policy to introduce a few popular names into the list, Mr. Strang, though in no way attached to the new system, was among others fixed upon. In the following year the monarch revisited his native country, and, among the long train of exhibitions which marked his progress, the public disputations held in the royal presence were not the least. One of these was held at St. Andrews by the masters of the university and doctors of divinity, and according to his biographer, "by the universall consent of all present, Dr. Strang excelled all the rest of the speakers in discourse, which was pious, modest, but full of the greatest and subtilest learning." But any favour which he might gain with the learned monarch upon this occasion was more than counterbalanced in the following year by his opposition to the famous Articles of Perth: he was the only doctor in divinity who voted against their adoption. Yet, notwithstanding this circumstance, when the Archbishop of St. Andrews got the Court of High Commission remodelled, with the view of compelling conformity to these articles, Dr. Strang's name was included among the members. It is greatly to his honour that he did not attend its meetings or give his sanction to any of its acts; a circumstance which renders it at least doubtful whether he approved of the principles of such an institution. In the year 1620 Dr. Strang was chosen one of the ministers of Edinburgh; but he was too shrewd an observer of the signs of those times, and too much attached to his flock, to desire a more public and a more dangerous field of ministration. Neither persuasion nor the threat of violence could induce him to remove.

In 1626 Dr. Strang received the king's patent, appointing him principal of the university of Glasgow, in place of Dr. John Cameron, who resigned the charge and returned to France. At the same time he received a unanimous invitation from the masters of the university, but it was not till a second letter arrived from court, and till he had received many urgent solicitations, both from the university and the town, that he could be prevailed upon to accept the office. His modesty, as well as his prudence, seems to have inclined him to a refusal; and although, perhaps, with such commands laid upon him, he could not with a good grace resist, the subsequent part of his history leads to a belief that he must have often looked back with regret. The duties incumbent on the principal of a university were at that period considerable; but his active mind led him to take a voluntary interest in everything connected either with the well-being of the university or of the town. Under his superintendence the revenues of the former were greatly augmented—the buildings on the north and east sides of the inner court were begun and completed—a large and stately orchard was formed—and it is supposed that to his early and continued intimacy with Mr. Zachary Boyd, the society was indebted for the large endowments which it received

by his will. In the business of the presbytery he also took an active part; and when sickness or other causes prevented the ministers of the town from occupying their pulpits, he willingly supplied their place.

Yet the performance of these duties, arduous as they were, and most perseveringly continued for many years, was not enough to screen Dr. Strang from the suspicion of belonging to that class which received the names of Malignants and Opposers of the work of reformation. Several concurrent circumstances compelled the king, in 1638, to yield to a meeting of the General Assembly; and, from that period the zeal of the Presbyterians, like a flame long concealed, and almost smothered by confinement, burst forth into open air, as if in full consciousness of its strength. It may be sufficient to remark here, that their suspicions respecting Dr. Strang were verified a few years afterwards, when, among the papers of the king, taken at the battle of Naseby, were discovered "nine letters of Mr. William Wilkie's,¹ one of Dr. Strang's, and a treatise," all of which had been addressed to the noted Dr. Walter Balcanqual. These papers were for some time retained by the commissioners as an instrument "to keep the persons that wrote them in awe, and as a mean to win them to a strict and circumspect carriage in their callings." At length, however, they were sent down to Scotland, in 1646, with a desire that they might still be kept private for the same reasons. But neither the letter of Dr. Strang, nor his treatise, so far as we can judge of its spirit from the introduction (which Wodrow has inserted at full length), can excite the smallest suspicion of the perfect integrity of his character. Like many other excellent men, he objected to the conduct of the Presbyterians, not from any approbation of the measures of the king—of whose character, however, he had perhaps too good an opinion—but because "reason and philosophy recommendeth unto us a passing from our rights for peace sake." This, and the impossibility of obtaining "a perfect estate of God's church, or the government thereof upon earth," are in amount the arguments upon which he builds his objections to the covenant. He concludes his introduction by protesting that his opinions were formed entirely upon information which was known to all; but "if," says he, "there be any greater mysteries, which are only communicat to few, as I am altogether ignorant thereof, so I am unable to judge of the same, but am alwise prone to judge charitably; and protest in God's presence, that I have no other end herein but God's glory and the conservation of truth and peace within this kingdome." The treatise is entitled, "Reasons why all his Majesty's orthodox Subjects, and namely those who subscribed the late Covenant, should thankfully acquiesce to his Majesty's late Declaration and Proclamations; and especially touching the subscription of the Confession of Faith, and generall Band therein mentioned: with an Answer to the Reasons objected in the late Protestation to the contrary."

But although the Presbyterians might not be able to verify their suspicions respecting Principal Strang, while his correspondence with Balcanqual remained unknown, there were points in his public conduct which were considered sufficient to justify proceedings to a certain extent against him. "The spleen of many," writes Baillie, "against the principal in the assembly [of 1638] was great, for many passages of his carriage in this affair, especially the last two: his subscribing that which we affirmed, and

¹ Minister of Govan, in the neighbourhood of Glasgow.

he denied, to be a protestation against elders, and so [against] our assembly, consisting of them and ministers elected by their voices: also, his deserting the assembly ever since the commissioner's departure, upon pretence that his commission being once cast, because it was four, the elector would not meet again to give him, or any other, a new commission. Every other day, some one or other, nobleman, gentleman, or minister, was calling that Dr. Strang should be summoned; but by the diligence of his good friends, it was shifted, and at last, by this means, quite put by."¹ The assembly, however, appointed a commission to visit and determine all matters respecting the university. "This," continues the writer, "was a terrible wand above their heads for a long time. Divers of them feared deposition. . . . We had no other intention but to admonish them to do duty." From the account given by the same author of the proceedings of the assembly of 1643, it appears that, at that period, the principal was still very unpopular with the more zealous noblemen and ministers; and if the account there given of the manner in which he managed the affairs of the college, and the stratagems by which he sometimes attempted to gain his ends, be correct, we have no hesitation in pronouncing him deservedly so. According to that statement, the chancellor, the rector, the vice-chancellor, dean of faculty, the rectors, assessors, and three of the regents, were not only all "at his devotion," but most of them "otherwise minded in the public affairs than we did wish;" and an attempt was made to introduce a system by which he should always be appointed commissioner from the university to the assembly. Baillie was at bottom friendly to the principal, and his fears that any complaint made against him at the assembly might raise a storm which would not be easily allayed, induced him to be silent. He contented himself with obtaining a renewal of the commission for visiting the university. "This I intend," he says, "for a wand to threat, but to strike no man, if they will be pleased to live in any peaceable quietness, as it fears me their disaffection to the country's cause will not permit some of them to do."² It must be confessed, however, that these statements of Baillie, written to a private friend, and probably never intended to meet the eye of the public, form a strange contrast to the general strain in which he has written the life of Strang, prefixed to his work on the interpretation of Scripture. In the latter it is declared, respecting this period of his life, that "he fell under the ill-will of some persons, without his doing anything to lay the ground of it. When such made a most diligent search into his privat and publick management, that they might have somewhat against him, he was found beyond reproach in his personall carriage, and in the discharge of his office; only in his dictats to his schollars, some few things were taken notice of, wherein he differed in his sentiments from Dr. Twiss and Mr. Rutherford in some scholastick speculations. He was not so much as blamed for any departure from the confession of any reformed church, . . . but, in a few questions, exceeding nice and difficult, as to God's providence about sin, he thought himself at liberty modestly to differ in his sentiments from so many privat men." Yet the clamour thus raised against Dr. Strang, however

groundless in Baillie's estimation, was encouraged by his adversaries, and became at length so great, that the General Assembly, in 1646, appointed commissioners to examine his dictates, which he was required to produce, and to report. Their report accordingly appears in the acts of the next assembly (August, 1647), and sets forth that the said dictates contained some things "so expressed, that scruples have therefrom risen to grave and learned men; but after conference with the said doctor anent those scruples, and (having) heard his elucidations, both by word and writ, given to us, we were satisfied as to his orthodoxy; and, to remove all grounds of doubting as to his dictates, the doctor himself offered to us the addition of several words for the further explication of his meaning, which also was acceptable to us."

But the peace which Dr. Strang hoped to enjoy after the decision of this question, was not destined to be granted him. "Some turbulent persons envied his peace," and a new series of attacks, of which Baillie declines giving any account, because, to use his own strong expression, he would not "rake into a dunghill," followed. "The issue of these new attacks," he continues, "was, the doctor, outraged by their molestations, demitted his office, and the rather that, in his old age, he inclined to have leisure, with a safe reputation, to revise and give his last hand to his writings. . . . To this his own proposal, the visitors of the collidge went in; but both the theologicall and philosophy faculty of the university opposed this, and with the greatest reluctance were at length brought to part with a colleague they so much honoured and loved." The visitors, by their demissory act, dated 19th April, 1650, granted him "a testimoniall of his orthodoxie;" and as a proof of their affection, allowed him not only the whole of his salary for the year 1650, but an annuity of 1000 merks Scots from the funds of the university, and £200 more as often as circumstances would permit.

The remaining part of Dr. Strang's life was spent in comparative quiet, although an expression of Baillie's would lead to a supposition that the malice of his enemies reached even to the withholding of the annuity just mentioned. "Having to do in Edinburgh with the lawyers, concerning the unjust trouble he was put to for his stipend," says he, "Dr. Strang, after a few days' illness, did die so sweetly and graciously, as was satisfactory to all and much applauded all over the city, his very persecutors giving him an ample testimony."³ That event took place on the 20th of June, 1654, when he was in the seventy-eighth year of his age. Two days afterwards, his body, followed by a great assemblage of persons of all ranks, was carried to the grave, and buried next to Robert Boyd of Trochrig, one of his predecessors in the professorship at Glasgow College.

Amongst the last labours of Dr. Strang's life was the revival of his treatise, *De Voluntate et Actionibus Dei circa Peccatum*, which he enlarged and made ready for the press. In the author's lifetime it had been sent to his friend Mr. William Strang, minister of Middleburg, with a desire that the sentiments of the Dutch divines might be obtained respecting it. At his death it was left to the charge of Dr. Baillie, who got the MS. transcribed, and sent it to the same person. By Mr. Strang it was sent to the famous Elzevirs at Amsterdam; and, having been carried through their press by the learned Mr. Alexander More, was published at that place in 1657. The only other work of Dr. Strang which we are aware of having been published, is entitled *De Interpretatione et Perfectione Scripturae*, Rotterdam, 1663, 4to.

¹ Baillie's printed *Letters and Journals*, i. 145. That the reader may understand the allusion to his commission, it is necessary to mention, that the university of Glasgow had nominated four commissioners to attend the assembly; but the assembly would not recognize their right to appoint more than one, and their commission was therefore annulled.—*Ibid.* i. 107.

² Printed *Letters and Journals*, i. 378.

³ Printed *Letters and Journals*, ii. 382, 383.

To this work is prefixed the life of the author, by Baillie, to which we have already referred.

Dr. Strang was thrice married, and had a numerous family, but few of his children survived. William, the only son who lived to majority, and "a youth of eminent piety and learning," was a regent in the university of Glasgow; but died of a hectic fever, at the age of twenty-two, before his father. He had four daughters, who survived him; all, according to Baillie, "eminent patterns of piety, prudence, and other virtues."¹

STRANG, JOHN, LL.D. This well-known Glasgow citizen was the son of John Strang, Esq., of Dowanhill, who had won competence and a respectable position as a wine-merchant: his mother was Miss M'Gilp, daughter of a substantial trader. Their son John was born in Glasgow in 1795; another son, Ninian, died young, but four daughters grew up to maturity. John Strang had only reached the age of fourteen when his father died, and his guardians, intending to bring him up as a man of business, gave him a substantial as well as classical education—and in order that his means of commercial intercourse might be perfected, he was instructed in the French and German languages, to which he afterwards added the Italian. This very carefulness, however, seems to have aided in defeating its purpose; the youth having already a competence sufficient for all his wants, preferred the enjoyments of modern literature to the stir of mercantile speculation and the alluring prospects of profit. Although he succeeded, therefore, to his father's business, he neither attempted to extend nor even to preserve it, and thus it imperceptibly vanished away, or glided into other hands. He found enjoyments more congenial to his taste in visiting France and Italy in 1817, for which countries his acquaintanceship with continental literature was an excellent introduction, and there he not only matured his knowledge in it, but acquired a taste for travel that led him summer after summer to short trips to the Continent, which he continued until the close of his life. This partiality for foreign literature was also manifested, in the early part of his life, by translations from German tales and poetry, which appeared in various periodicals; and by the publication of a slight volume entitled the "*Life of Theodore Karl Körner*, with translated Specimens of his Poetry;" and he also published a volume of "*Tales of Humour and Romance*, from the German of Hoffman and others," which was favourably received by the public. He was during its whole subsistence a frequent contributor to the *Scots Times* (a Glasgow newspaper), and he was also for a number of years the regular literary critic of the *Scotsman*; and he occupied his leisure in compiling various little works, chiefly in relation to his native city, and to its social and economic statistics. By his literary labours and the occasional visits to the Continent to which we have alluded, he was brought into intercourse with distinguished literary men both of our own and foreign countries, which he enjoyed till his death.

These continental visits brought out another trait of character in Dr. Strang which proved of essential benefit to his native city. He was a lover of the fine arts, and when abroad he availed himself of every opportunity by visiting the foreign picture-galleries, and studying the rich stores they contained. He thus qualified himself as a critic in art, at a time

when correct discrimination was less diffused and more needed than at present; and his first appearance in this capacity was by his publication of a small volume entitled "*A Glance at the Exhibition of the Works of Living Artists*, under the Patronage of the Glasgow Dilettanti Society, by Geoffrey Crayon, junr." This unpretending volume was greatly admired at the time for its sound discriminating criticisms; and of several artists then undistinguished, he pointed out the excellence, and predicted for them a success which their professional career afterwards fulfilled. He was however not only a critic in art but also an artist, and several of his sketches indicated the excellence he might have attained if he had devoted himself to painting. His chief themes too in these performances were the past and future of his native city—sketches of the old quaint buildings which still lingered about the lanes and streets in the outskirts of Glasgow, which an improving age was fast sweeping away; and plans by which the city might be beautified and improved. In these studies originated one of the noblest features of which Glasgow is justly proud. In the churchyard of the cathedral, the practice of sepulture had continued so long, that the height of the graves had intruded upon the venerable building, and somewhat lowered its stately appearance; while behind the building rose a gloomy, profitless hill called the Fir Park, which had remained undisturbed from time immemorial. It struck the observant eye of Dr. Strang that the nuisance of the churchyard might be extinguished by the bleak and useless Fir Park being converted into a picturesque and attractive cemetery. Accordingly he suggested his plan first in the local newspapers, and afterwards in a small volume in 1831, under the title of *Necropolis Glasguensis*; the Park was transformed into the Glasgow Necropolis; and now it is one of the noblest and most imposing cities of the dead of which our island can boast; while the Merchants' House of Glasgow, to which it belongs, derive from it a large revenue. Justly was Dr. Strang proud of the commendations which were bestowed upon it by all visitors to the city, and at the close of his life his parting wish was expressed to a friend in the following words:—"I should like my bones to be laid in the Glasgow Necropolis, in the establishment of which, it is well known, I took so active and so zealous a part. If the Merchants' House would grant me and my wife a small last resting-place, as a recognition of my labours connected with the cemetery from 1827 to 1833, you will of course accept it—if not, you must purchase one." He only needed to express the desire to have it cordially granted.

In 1831 Dr. Strang made a very extended tour through Germany, increasing his acquaintanceship among its literary men, and viewing with interest its various forms of society; but the fruits of this tour did not appear until 1836, when he published his *Germany in 1831*, in two octavo volumes. The work, which contained much valuable information upon the Teutonic character and usages of life, was well received by the public, and passed through two editions. In 1832 he adventured upon the dangerous enterprise of publishing a daily newspaper, the first of the kind that had appeared in Glasgow: it was called the *Day*, and consisted of eight pages; but although he was ably supported by several talented local contributors, among whom were Motherwell and Carrick, and introduced many of his own contributions, original and translated, the attempt was as yet premature in Glasgow, for the *Day* lasted only six months. In 1834, the office of city-chamberlain having become vacant, Dr. Strang was unanimously

¹ Abridged from Wodrow's *Life of Strang*, in his biographical MSS. in Bibl. Acad. Glasg. fol. vol. ii. See also, *Life*, by Baillie, above mentioned. The extracts from the latter are borrowed from Wodrow's translation, inserted in his life.

appointed to fill it—the electors thus showing their just appreciation both of his civic and literary fitness for such an office. And this office he filled for thirty years so admirably, as to give satisfaction to the magistracy and the mercantile community alike. As chamberlain of such a growing city as Glasgow, his duties were not light; they involved the keeping of public accounts, the arrangement of important pecuniary transactions, and a continuous communication with a changing body of councillors and magistrates. But the appointment and its duties developed a new feature in Dr. Strang's character, for which even his friends were scarcely prepared. They knew well that integrity and accuracy would pervade his management and accounts; and accordingly during his long official career these qualities distinguished, without a single exception, all the important pecuniary transactions of the city. They also knew that from his knowledge of continental speech and manners, and his gentlemanly bearing, his services would be extremely useful to the local authorities when foreign celebrities honoured Glasgow with visits; but they were scarcely prepared for a new and voluntary labour which he imposed on himself soon after his appointment—we allude to his collecting and embodying in a report to the civic council the vital, social, and commercial statistics of the city. He undertook this labour at a time when the means of securing the materials for such statistics were not so easily obtained as they now are, and he continued from year to year to pursue the same course. His reports were printed by the council and eagerly studied, and they gave rise to or favourably stimulated similar collections and reports in many quarters of the kingdom. With commendable perseverance Dr. Strang continued and extended these reports annually till his death, and the result is that in them an amount of statistical information relating to Glasgow, in regard to health, society, and commerce, now exists, which must be of incalculable value to future statisticians and historians. In these reports, too, Dr. Strang introduced occasional notices of changes in city manners, of city institutions and buildings, and of city extensions and developments, so that they form almost a continuous history of the progress of this great city during the last twenty years.

In the midst of all those onerous duties of his office, Dr. Strang found time to illustrate Glasgow manners still farther, and in 1855 he published *Glasgow and its Clubs*, the most characteristic and well-known of all his writings. Of a city which has so rapidly grown in magnitude and importance, little was known, even at the close of the last century, except from the narratives of those "oldest inhabitants" who were now passing away, and it was desirable that this much of its past history should be chronicled by one who was able to appreciate it. And this Dr. Strang was well qualified to do, both by his love of the subject and his free access to the city archives, from which he had long been preparing his materials. His work is a lively and interesting one, and in reading it we pass in a few years from what Glasgow at present is, into something like what London was in the days of Charles I. It is thus correctly criticized by one of his critics:—"Dr. Strang's official and social position has afforded him peculiar opportunities of noting the progress of Glasgow in all its manifold interests and phases, and the result is a volume of much delightful gossip connected with times, characters, and events now passed away for ever, not without romantic sighs and regrets, mingled, however, with suitable and well-grounded congratulations. It is a work which preserves a good deal of what must otherwise

be forgotten, and which must often be referred to by the future historians of Glasgow." All who have perused this lively and interesting production will agree to the foregoing criticism. Two editions of the work were published during the author's lifetime, and a third was published in 1864, the year subsequent to his death, with his last additions and annotations.

In 1842 Dr. Strang married the daughter of Dr. William Anderson, an eminent physician of Glasgow; and soon afterwards the honorary degree of Doctor of Laws was conferred upon him by the University of Glasgow. In the summer of 1863, in consequence of an attack of serious illness, he revisited France and Italy, and as usual gave full scope to his active investigating spirit; but the elaborate accounts of the objects of his tour, which he published in a series of letters in the *Glasgow Herald*, were thought to have exhausted his already debilitated constitution. These letters he collected on his return, and published in a volume which he entitled *Travelling Notes of an Invalid in Search of Health*. In the autumn of this year he received from the principal citizens of Glasgow an expression of their sense of the value of his services, by a princely testimonial in the form of £4600, which they had subscribed among themselves. Thus labouring to the last, and honoured by the community for whom he laboured, this talented, useful, and distinguished citizen died on the 8th December, 1863.

STRANGE, SIR ROBERT, Knight, the father of the *line* manner of engraving in Britain, was born in the island of Pomona, in Orkney, July 14, 1721. He was lineally descended from Sir David Strange, or Strang, a younger son of the family of Strang of Balcaskie, in Fife, who had settled in Orkney at the time of the Reformation. He received a classical education at Kirkwall, under the care of Mr. Murdoch Mackenzie, teacher there, and who rendered some estimable service to his country by accurate surveys of the Orkney islands, and of the British and Irish coasts.

The subject of this memoir successively applied himself to the law and to the sea, before his talent for sketching pointed out the propriety of his making art his profession. Some sketches shown by a friend to Mr. Richard Cooper, an engraver of some eminence in Edinburgh, and approved by him, led to Mr. Strange being placed under that individual as an apprentice; and the rapid progress he made in his new profession soon showed that he had only now for the first time fallen into the line of life for which he was destined by nature. He was practising his art in Edinburgh on his own account, when, in September, 1745, the Highland army took possession of the city. Mr. Strange was not only himself well inclined to this cause, but he had formed an attachment to a Miss Lumisden,¹ who had the same predilections. These circumstances, with his local notoriety as an engraver, pointed him out as a proper person to undertake a print of the young Chevalier. While employed on this work, his lodgings in Stewart's Close were daily resorted to by the chief officers and friends of the prince, together with many of the most distinguished ladies attached to his cause. The portrait, when completed, was looked upon as a wonder of art; and it is still entitled to considerable praise. It was a half length in an oval frame on a stone pedestal, on which is engraved, "EVERSO MISSUS SUC-

¹ Sister to Mr. Andrew Lumisden, a Jacobite partizan of some note, and who afterwards formed part of the household of Prince Charles Stuart at Rome, of the antiquities of which city he published an account.

CURRERE SECLIO. As a reward for his services, he was offered a place in the finance department of the prince's army, or, as another account states, in the troop of life-guards; which, partly at the instigation of his mistress, who otherwise threatened to withdraw her favour from him, he accepted. He therefore served throughout the remainder of the campaign. Soon after the battle of Falkirk, while riding along the shore, the sword which he carried in his hand was bent by a ball from one of the king's vessels stationed a little way out at sea. Having surmounted all the perils of the enterprise, he had to skulk for his life in the Highlands, where he endured many hardships. On the restoration of quiet times, he ventured back to Edinburgh, and supported himself for some time by drawing portraits of the favourite Jacobite leaders, which were disposed of to the friends of the cause, at a guinea each. A few, also, which he had destined for his mistress, and on that account adorned with the utmost of his skill, were sold about this period with a heavy heart to the Earl of Wemyss, from whom, in better times, he vainly endeavoured to purchase them back. In 1747 he proceeded to London, but not before he had been rewarded for all his distresses by the fair hand of Miss Lumisden. Without waiting long in the metropolis, he went to Rouen, where a number of his companions in the late unfortunate war were living in exile, and where he obtained an honorary prize given by the Academy. He afterwards resided for some time at Paris, where he studied with great assiduity under the celebrated Le Bas, who taught him the use of the dry needle. In 1751 he returned to London, and settled as an engraver, devoting himself chiefly to historical subjects, which he handled in so masterly a manner that he soon attracted considerable notice. In 1759, when he had resolved to visit Italy, for his further improvement, Mr. Allan Ramsay intimated to him that it would be agreeable to the Prince of Wales and the Earl of Bute if he would undertake the engraving of two portraits which he had just painted for those eminent personages. Mr. Strange refused, on the plea of his visit to Italy, which would thus be put off for a considerable time, and he is said to have thus lost the favour of the royal preceptor, which was afterwards of material disadvantage to him, although the king ultimately approved of his conduct, on the ground that the portraits were not worthy, as works of art, of being commemorated by him.

Mr. Strange set out for Italy in 1760, and in the course of his tour visited Naples, Florence, and other distinguished seats of the arts. He was everywhere treated with the utmost attention and respect by persons of every rank. He was made a member of the academies of Rome, Florence, and Bologna, and professor of the Royal Academy at Parma. His portrait was introduced by Roffanelli, amongst those of other distinguished engravers, into a painting on the ceiling of that room in the Vatican library where the engravings are kept. He had also the distinguished honour of being permitted to erect a scaffold in one of the rooms of that magnificent palace for the purpose of taking a drawing of the Parnassus of Raphael;

a favour not previously granted for many years to any petitioning artist. And an apartment was assigned for his own abode, while engaged in this employment. A similar honour was conferred upon him at the palace of the King of Naples, where he wished to copy a celebrated painting by Schidoni. Mr. Strange's drawings were in coloured crayons; an invention of his own, and they were admired by all who saw them. He subsequently engraved prints on a splendid scale from about fifty of the paintings which he had thus copied in Italy.¹

The subsequent part of the life of Mr. Strange was spent in London, where he did not acquire the favour of the court till 1787, when he was knighted. A letter by him to Lord Bute, reflecting on some instances of persecution which he thought he traced to that nobleman, appeared in 1775, and was subsequently prefixed to an *Inquiry into the Rise and Establishment of the Royal Academy at London*, which was provoked from his pen by a law of that institution against the admission of engravings into the exhibitions. After a life spent in the active exercise of his professional talents, he died of an asthmatical complaint on the 5th of July, 1792, leaving, besides his lady, a daughter and three sons. Sir Robert has been described by his surviving friends as one of the most amiable and virtuous of men, as he was unquestionably among the most able in his own peculiar walk. He was unassuming, benevolent, and liberal. His industry was equally remarkable with his talent. In the coldest seasons, when health permitted him, he went to work with the dawn, and the longest day was too short to fatigue his hand. Even the most mechanical parts of his labours he would generally perform himself, choosing rather to undergo a drudgery so unsuitable to his talents than trust to others. His remains were interred in Covent Garden churchyard.

STRUTHERS, JOHN. "It is said that the solitary and meditative generation of cobblers have produced a larger list of murders and other domestic crimes than any other mechanical trade except the butchers; but the sons of Crispin have, to balance their account, a not less disproportionate catalogue of poets; and foremost among these stands the pious author of the *Poor Man's Sabbath*, one of the very few that have had sense and fortitude to resist the innumerable temptations to which any measure of celebrity exposes persons of their class." This honourable attestation, from the pen of the distinguished editor of the *Quarterly Review*, in his *Life of Sir Walter Scott*, when speaking of John Struthers, entitles this lowly bard to not a little consideration. The author of the *Poor Man's Sabbath* was born at Forefaulds, a cottage built upon the estate of Long Calderwood, East Kilbride, Lanarkshire, on July 18, 1776, and was the son of William Struthers, who for more than forty years had been a shoemaker in that parish. The education of John, when a boy, was of the simplest kind: he was taught to read from the Shorter Catechism, the Proverbs of Solomon, and the Bible; and to write, by copying the letters of the

¹ The following are among the principal engravings by Sir Robert Strange:—Two heads of himself, one an etching, the other a finished proof; The Return from Market, by Wouvermans; Cupid, by Vanloo; Mary Magdalen; Cleopatra; the Madonna; the Angel Gabriel; the Virgin with the Child asleep; Liberality and Modesty, by Guido; Apollo Rewarding Merit and Punishing Arrogance, by Andrea Sacchi; the Finding of Romulus and Remus, by Pietro de Cortona; Cæsar Repudiating Pompeia, by the same; Three Children of Charles I., by Vandyke; Belshazzar, by Salvator Rosa; St. Agnes, by Domenichino; the Judgment of Hercules, by Nicolas Poussin; Venus Attired by the Graces, by Guido; Justice and Meekness, by Raphael; the Offspring of Love, by Guido; Cupid Sleeping, by

the same; Abraham Giving up the Handmaid Hagar, by Guercino; Esther, a Suppliant before Ahasuerus, by the same; Joseph and Potiphar's Wife, by Guido; Venus, by the same; Danae, by the same; Portrait of Charles I. by Vandyke; the Madonna, by Corregio; St. Cecilia, by Raphael; Mary Magdalen, by Guido; Our Saviour Appearing to his Mother after his Resurrection, by Guercino; a Mother and Child, by Parmegiano; Cupid Meditating, by Schidoni; Laomedon, King of Troy, Detected by Neptune and Apollo, by Salvator Rosa. Sir Robert, near the close of his life, formed about eighty reserved proof copies of his best prints into as many volumes, to which he added a general title-page, and an introduction on the progress of engraving.

alphabet in a rude printing fashion upon the side of an old slate. His mother, however, who was his preceptor, was aided in the task of tuition by Mrs. Baillie, widow of Dr. James Baillie, formerly professor of theology in the university of Glasgow, then residing at Long Calderwood, and by her two daughters, the youngest of whom was the afterwards celebrated Joanna Baillie. These accomplished ladies had the sickly little boy frequently brought to their house, where they conversed with him, read to him, told him amusing stories, and gave him his first glimpses of the bright world of music, by airs upon the spinnet. That mind must have had no imagination whatever which such a training could not waken into poetry, or something resembling it. When the house was shut up, and the family had departed to London, it seemed to John, now only seven years old, as if a beatific vision had been closed for ever; and the consequence was a fever, that confined him to bed for six weeks. No one who afterwards knew the hard-visaged and iron-minded John Struthers, would have suspected him of ever having been the victim of such susceptibility, were we not aware that it is often such seemingly impassive characters who feel most keenly. On going afterwards to school, he made such progress in the common branches of education, that his parents were urged to have him trained for the ministry; but this temptation, so strong among the peasantry of Scotland, they had the good sense to resist, and John was sent for three years and a half to the occupation of a cow-herd. During this period he unconsciously trained himself for his future work of an ecclesiastical historian, by devouring the contents of his grandfather's covenanting library, which was stored with the works of Knox, Calderwood, Wodrow, and other Scottish writers of the seventeenth and eighteenth centuries, while he cherished the polemical spirit, so essential to his future task, by keen debates with a neighbouring herd lad upon the religious controversies of the day.

After a rough kind of life, partly as cow-herd, and partly as farm-servant, John Struthers, at the age of fifteen, settled in Glasgow, for the purpose of learning his father's occupation of shoemaker; and this being fully attained, he returned to the paternal home, and was busily employed in his new calling. During these changes he had also diligently pursued the task of self-education, in which he made himself acquainted with the best poetical and prose writers both of England and Scotland, while his intellectual superiority gave him a high standing among the rustic society by which he was surrounded. At the age of twenty-two he married, after a courtship of more than four years. Having removed once more to Glasgow, which he now made his permanent abode, Struthers adventured on his first attempt in authorship, and, like many tyro authors, he was soon so much ashamed of it that he burned the whole impression, and did his best to forget the trespass. What was the nature of the work, or whether it was in poetry or prose, he has not informed us, although from a chance hint that escapes him in his biography, we rather think it was the former.

The next attempt of Mr. Struthers in authorship was one that was to bring him into notice, and establish his reputation as a poet of no common order. We allude to his *Poor Man's Sabbath*; and as the origin of this work is characteristic both of the writer and the period, we give it in his own words, where he speaks of himself in the third person: "Though the removal of our subject from a country to a town life was upon the whole less grievous than he had anticipated, still it was followed by regrets, which forty-eight long years have not yet laid wholly

asleep. Of these the first, and the most painful, was his position on the Sabbath-day. In the country his Saturday was equally tranquil, rather more so than any other day of the week. He was on the Saturday night always early to bed, and on the Sabbath morning up at his usual hour—had his moments of secret meditation and prayer—his family devotions—his breakfast and dressing over by nine o'clock, when his fellow-worshippers of the same congregation, who lived to the westward of him, generally called at his house. Among them was his excellent father, and one or two old men of the highest respectability as private members of the church, with whom he walked to their place of worship, Black's Well meeting-house, Hamilton, returning with them in the evening, enjoying the soothing influences of the seasons, whether breathing from the fragrant earth, or glowing from the concave of the sky; taking sweet counsel together, and holding delightful fellowship with the God of all grace and of all consolation, and with each other, in talking over the extent, the order, the grandeur, and the excellent majesty of his kingdom." From this picture of a rural Scottish Sabbath at the beginning of the present century, he turns to those Sabbatical evils of our cities, which, at that period of recent introduction, have ever since been on the increase:—"In town, on the contrary, he found Saturday always to be a day of bustle and confusion. There was always work wanted, which could not be had without extra exertion. He was always earlier up in the morning, and later in going to bed, on that day than on any other day of the week. With the extra labour of that day, added to the everyday toils of the week, he was often exhausted, and his hands so cut up that it was not without difficulty that he managed to shave himself. On the morning of the Sabbath, of course, he was weary, drowsy, and listless, feeling in a very small degree that glowing delight with which he had been accustomed to hail the hallowed day. At the sound of the bell he walked into the meeting-house with the crowd, an unnoticed individual, unknown and unknowing; his nobler desires clogged and slumbering; his activities unexecuted; and his whole frame of mind everything but that which he had been accustomed to experience, and which it was, amidst all these evil influences, his heart's desire it should have been."

These feelings wrought themselves into stanzas, and the stanzas, in course of time, grew into a regular poem. Still warned, however, by his late failure, Struthers was afraid to venture once more into the press, until the success of a war ode, entitled *Anticipation*, which he published in 1803, when the dread of a French invasion was at its height, encouraged him to commit the *Poor Man's Sabbath*, in the following year, to the tender mercies of the public. The approbation with which it was welcomed was great, and the sale of it was rapid. A few weeks after this, Graham's *Sabbath* was published, so that the *Poor Man's Sabbath*, on account of its priority, had established a refutation of the charge of plagiarism, which was attempted to be brought against it. A first and second, and afterwards a third impression of the work was rapidly sold; and although the profits collectively amounted to no great sum, it brought Struthers something better than a few fleeting pounds; "it made his name and character known," says Lockhart in his *Life of Scott*, "and thus served him far more essentially; for he wisely continued to cultivate his poetical talents, without neglecting the opportunity thus afforded him through them of pursuing his original calling under better advantages." It is not a little to the honour of Struthers, that his pro-

duction was patronized by Sir Walter Scott, and also by Joanna Baillie, the friend and instructor of his early boyhood, from whom he was so fortunate as to receive a visit at Glasgow, in 1808. Such a visit he thus touchingly commemorates in his old days:—"He has not forgotten, and never can forget, how the sharp and clear tones of her sweet voice thrilled through his heart, when at the outer door she, inquiring for him, pronounced his name—far less could he forget the divine glow of benevolent pleasure that lighted up her thin and pale but finely expressive face, when, still holding him by the hand she had been cordially shaking, she looked around his small but clean apartment, gazed upon his fair wife and his then lovely children, and exclaimed, 'that he was surely the most happy of poets.'"

Encouraged by the success that had crowned his last effort, Struthers persevered amidst the many difficulties of his humble position to cultivate the muse, and the result was the *Peasant's Death*, intended as a sequel to the *Poor Man's Sabbath*, and which was as favourably received by the public as its predecessor. Then succeeded the *Winter Day*, a poem in irregular measure, which he published in 1811. This was followed, in 1814, by a small volume bearing the title of *Poems, Moral and Religious*. In 1818 he published his poem of the *Plough*, written in the Spenserian stanza. About the same time he also edited, from the original MS., a collection of poems by Mr. William Muir, to which he appended a biographical preface. A still more important editorial work, which he was induced to undertake, was a collection of songs, published in three volumes, under the title of the *Harp of Caledonia*. But after all this labour, the author was as poor as ever, and still dependent upon the work of his hands for his daily bread. The cause of this is to be found not only in his general indifference to lucre, but his sturdy independence, that would not stoop to the higgling of the literary market, and the high estimate he had formed of the dignity of literary exertion. Hear his own estimate of the matter:—"The mercenary spirit of literary men he considers to be the disgrace and bane of human nature—an intellectual harlotry, more disgraceful and more destructive to the immortal spirit, than that prostitution of the body which subjects all who submit to it to self-loathing and the contempt of all men—a vice which converts one of the noblest acquisitions of human nature, and that which should be one of the principal sources of distinction in the world—THE KNOWLEDGE OF LETTERS—into a curse the most wide-spreading and morally ruinous to which our frail nature can be subjected; and he confesses candidly, that up to this day he has serious doubts whether general or miscellaneous literature, as the sole means of supporting existence, be, after all, a lawful profession."

It was not, however, merely to poetry that Struthers confined his intellectual exertions. Looking sharply at men and things, he knew much of the prose of life; while his course of reading, which he had never intermitted from boyhood, and which extended over an ample range of Scottish theology, history, and general literature, fitted him for writing upon the most important subjects of the day. He felt it also the more necessary to be a prose writer and public instructor, in consequence of the innovations that were taking place in society, under which all old time-honoured institutions were decried as the mere ignorance of childhood, compared with that great millennium of improvement of which the French revolution was the commencement. On this account he had sturdily opposed the *strikes* of his fellow-workmen,

and the levelling democratic principles of the class of society to which he belonged, although he stood alone in the contest. While these were at the wildest, he published, in 1816, an "*Essay on the State of the Labouring Poor*, with some Hints for its Improvement." The plan he recommended was that of the ten-acre farm, which has so often been reiterated since that period; and such were the merits of the production, which was published anonymously, that more than one writer of eminence had the credit of the authorship. Another pamphlet, which he afterwards published, with the title of *Tekel*, was written during the heat of the voluntary controversy, and intended to represent what he conceived to be the ruinous effects of the voluntary principle upon religion in general. He was now to become more closely connected with authorship as a profession than ever, in consequence of being employed as a literary reader and corrector of the press, first at the printing-office of Khull, Blackie, and Co., Glasgow, and afterwards in that of Mr. Fullarton. During this period, which lasted thirteen years, besides the task of correcting proofs, and making or mending paragraphs, he furnished notes for a new edition of Wodrow's *History of the Church of Scotland*. He also wrote a history of Scotland from the Union (1707) to 1827, the year in which it was published, in two volumes, and was afterwards employed in preparing a third, continuing the narrative until after the Disruption, so that it might be a complete history of the Scottish church; when, just as it was all but completed, death put a period to his labours. He was also, for sixteen or eighteen months, occupied with Scottish biography; and most of the lives which he wrote on this occasion were ultimately transferred to Chambers' *Lives of Eminent Scotsmen*.

In 1833 an important change occurred in the tranquil career of Mr. Struthers, by his being appointed to the charge of that valuable collection, well known in Glasgow as the Stirling Library. Here his salary as librarian was only fifty pounds a year; but his wants were few and simple, and the opportunities of the situation for study were such as would have outweighed with him more lucrative offers. In this office he remained nearly fifteen years, and returning in his old days to his first love, he resumed his poem entitled *Dychmont*, commenced in early life, which he completed and published in 1836. These literary exertions were combined with biographical sketches, which appeared in the *Christian Instructor*, several tracts on the ecclesiastical politics of the period, and essays on general subjects, of which only a few were printed. In 1850 a collection of his poetical works was published in two volumes, by Mr. Fullarton, to which the author added a highly interesting autobiography.

In this manner passed the useful life of John Struthers to its close, while every year added to the esteem of his fellow-citizens, who regarded him not only as an excellent poet, but an able historian and general writer—an estimation in which society at large has fully coincided. He died in Glasgow, on the 30th July, 1853, in the seventy-eighth year of his age.

STUART, DR. GILBERT, an eminent historical essayist, was born at Edinburgh in 1742. His father was Mr. George Stuart, professor of humanity (Latin) and Roman antiquities in the university of Edinburgh. Gilbert received an accomplished education in his native city, under the superintendence of his father. His education was directed towards qualifying him for the bar; but it is questionable whether his magnificent opinion of his own abilities

permitted him ever seriously to think of becoming an ordinary practising advocate. Before he was twenty-two years of age he made what was considered a splendid entrance on the career of authorship by publishing a *Historical Dissertation concerning the English Constitution*; the circumstance that four editions of a work on a subject requiring so much information and power of thought, yet which almost every man possessed knowledge enough to criticize, were speedily issued, is of itself sufficient evidence that the young author possessed a very powerful intellect.¹ When we consider the reputation of his father, it cannot perhaps be argued as a very strong additional evidence of the esteem in which the work was held, that the university of Edinburgh conferred on the author the degree of Doctor of Laws. His next literary labour was the editing of the second edition of Sullivan's *Lectures on the English Constitution*, in 1772, to which he prefixed a "Discourse on the Government and Laws of England." Dr. Stuart endeavoured to obtain one of the law-chairs in the university of Edinburgh, whether that of Scottish or of civil law the writers who have incidentally noticed the circumstances of his life do not mention; nor are they particular as to the period, which would appear from his conduct to his opponents, in the *Edinburgh Magazine* of 1773, to have been some time before that year.² Whether he possessed a knowledge of his subject sufficiently minute for the task of teaching it to others may have been a matter of doubt; his talents and general learning were certainly sufficiently high, but his well-earned character for dissipation, the effect of which was not softened by the supercilious arrogance of his manners, was, to Dr. Robertson and others, sufficient reason for opposing him, without farther inquiry. To the influence of the worthy principal it has generally been considered that his rejection was owing; and as he was of a temperament never to forgive, he turned the course of his studies and the future labour of his life to the depreciation of the literary performances of his adversary, turning aside only from his grand pursuit when some other object incidentally attracted his virulence, and making even his inordinate thirst of fame secondary to his desire of vengeance. After his disappointment Stuart proceeded to London, where he was for some time employed as a writer in the *Monthly Review*. His particular contributions to this periodical have not been specified; but to one at all curious about the matter it might not be difficult to detect every sentence of his magniloquent pen, from the polished order of the sentences, their aspect of grave reflection, and the want of distinctness of idea, when they are critically examined. By the establishment of the *Edinburgh Magazine and Review*, in 1773, Stuart had more unlimited opportunities of performing the great duty of his life. As manager of that periodical he was associated with Mr. Smellie, a man of very different habits and temperament; and Blacklock, Richardson, Gillies, and other men of considerable eminence, were among the contributors. This periodical, which

extended to five volumes, was creditable to the authors as a literary production, and exhibited spirit and originality unknown to that class of literature in Scotland at the period, and seldom equalled in England. But in regard to literature, Edinburgh was then, what it has ceased to be, a merely provincial town. The connections of the booksellers, and the literature expected to proceed from it, did not enable it to support a periodical for the whole country. It was the fate of that under consideration, while it aimed at talent which would make it interesting elsewhere, to concentrate it, in many instances, in virulence which was uninteresting to the world in general, and which finally disgusted those persons more personally acquainted with the parties attacked, whose curiosity and interest it at first roused. Mr. D'Israeli has discovered, and printed in his *Calamities of Authors*, a part of the correspondence of Stuart at this period, curiously characteristic of his exulting hopes of conquest. "The proposals," he says, "are issued; the subscriptions in the booksellers' shops astonish; correspondents flock in; and, what will surprise you, the timid proprietors of the *Scots Magazine* have come to the resolution of dropping their work. You stare at all this; and so do I too." "Thus," observes Mr. D'Israeli, "he flatters himself he is to annihilate his rival, without even striking the first blow; the appearance of his first number is to be the moment when their last is to come forth." Authors, like the discoverers of mines, are the most sanguine creatures in the world. Gilbert Stuart afterwards flattered himself that Dr. Henry was lying at the point of death, from the scalping of his tomahawk pen. But of this anon. On the publication of the first number, in November, 1773, all is exultation; and an account is facetiously expected that 'a thousand copies had emigrated from the Row and Fleet Street.' There is a serious composure in his letter of December, which seems to be occasioned by the tempered answer of his London correspondent. The work was more suited to the meridian of Edinburgh, and from causes sufficiently obvious—its personality and causticity. Stuart, however, assures his friend that 'the second number you will find better than the first, and the third better than the second.' The next letter is dated March 4th, 1774, in which I find our author still in good spirits. 'The magazine rises and promises much in this quarter. Our artillery has silenced all opposition. The rogues of the 'uplifted hands' decline the combat.' These rogues are the clergy, and some others, who had 'uplifted hands,' from the vituperative nature of their adversary: for he tells us, that 'now the clergy are silent, the town-council have had the presumption to oppose us, and have threatened Creech (the publisher in Edinburgh) with the terror of making him a constable for his insolence. A pamphlet on the abuses of Heriot's Hospital, including a direct proof of perjury in the provost, was the punishment inflicted in turn. And new papers are forging to chastise them, in regard to the poor's-rate, which is again started; the improper choice of professors; and violent stretches of the impost. *The liberty of the press*, in its fullest extent, is to be employed against them.'³

The natural conclusion from the tone of these letters, from circumstances in the conduct of Stuart which we have already recorded, and from some we may hereafter mention, might perhaps be, that he was a man possessed with a general malignity against the human race; yet it has been said that he was

¹ Kerr (*Life of Smellie*) and others say he was then only twenty-two years old; yet there is no edition of this work older than 1768, when, according to the same authorities, he must have been twenty-six years old.

² According to the list of professors in Bower's *History of the University of Edinburgh*, the only law-chair succeeded to for many years at this period of Stuart's life is that of the law of nature and nations, presented to Mr. James Balfour in 1764. If we can suppose this person to have been Mr. Stuart's successful opponent, we would find him disappointed by the same fortunate person who snatched the moral philosophy chair from Hume. The list seems, however, to be imperfect. No notice, for instance, is taken of any one entering on the Scots law-chair in 1765, when it was resigned by Erskine.

³ *Calamities of Authors*, i. 54-57.

warm in his friendships, and that his indignation against vice and meanness, frequently exhibited, came from his heart. It will appear perhaps to be the truest conclusion as to his character that he was simply one of those men who are termed persons of violent passions, and who may be made Falconbriggs, Squire Westerns, or Gilbert Stuarts, from circumstances.

Mr. Smellie seems to have laboured with patient but ineffectual perseverance to check the ardour of his restless colleague. An attack by Stuart on the *Elements of Criticism* by Lord Kames he managed, by the transmutation of a few words, adroitly to convert into a panegyric. "On the day of publication," says the memorialist of Smellie, "Dr. Stuart came to inquire at the printing-office 'if the ——— was damned,'" using a gross term which he usually indulged in when he was censuring an author. Mr. Smellie told him what he had done, and put a copy of the altered review into his hands. After reading the two or three introductory sentences, he fell down on the floor, apparently in a fit: but on coming to himself again, he good-naturedly said, "William, after all, I believe you have done right."¹ Smellie was not, however, so fortunate on other occasions. The eccentricities of the classical Burnet of Monboddoo afforded an opportunity which Stuart did not wish to omit. He proposed to adorn the first number of the *Magazine* with "a print of my Lord Monboddoo, in his quadruped form. I must, therefore," he continues, "most earnestly beg that you will purchase for me a copy of it in some of the macaroni-print shops. It is not to be procured at Edinburgh. They are afraid to vend it here. We are to take it on the footing of a figure of an animal not yet described; and are to give a grave yet satirical account of it, in the manner of Buffon. It would not be proper to allude to his lordship but in a very distant manner."² Although this laborious joke was not attempted, Stuart's criticism on the *Origin and Progress of Language*, notwithstanding the mollifications of Smellie, had a sensible effect on the sale of the *Magazine*. "I am sorry," says Mr. Murray in a letter to Smellie, "for the defeat you have met with. Had you praised Lord Monboddoo instead of damning him, it would not have happened." It is to be feared the influence against the periodical was produced, not so much by its having unduly attacked the work of a philosopher, as from its having censured a lord of session.

During his labours for this magazine Stuart did not neglect his pleasures. He is said one night to have called at the house of his friend Smellie in a state of such complete jollity, that it was necessary he should be put to bed. Awakening, and mistaking the description of place in which he was lodged, he brought his friend in his night-gown to his bedside by his repeated cries of "*house! house!*" and, in a tone of sympathy, said to him, "Smellie! I never expected to see you in such a house. Get on your clothes, and return immediately to your wife and family; and be assured I shall never mention this affair to any one." The biographer of Smellie, who has recorded the above, gives the following similar anecdote of Stuart and his friends. "On another ramble of dissipation, Dr. Stuart is said to have taken several days to travel on foot between the cross of Edinburgh and Musselburgh, a distance of only six miles, stopping at every public-house by the way in which good ale could be found. In this strange expedition he was accompanied part of the way by several boon companions, who were fascinated beyond their ordinary excesses by his great powers of

wit and hilarity in conversation, but who gradually fell off at various stages of the slow progression. The last of these companions began his return towards Edinburgh from the Magdalen Bridge, within a mile of Musselburgh; but, oppressed by the fumes of the ale which he had too long and too liberally indulged in, he staggered, in the middle of the night, into the ash-pit of a great steam-engine, which then stood by the road-side, and fell into a profound sleep. On awakening before day he beheld the mouth of an immense fiery furnace open; several figures, all grim with soot and ashes, were stirring the fire, ranging the bars of the enormous grate, and throwing on more fuel, while the terrible clanking of the chains and beams of the machinery above impressed his still confused imagination with an idea that he was in *hell*. Horror-struck at the frightful idea, he is said to have exclaimed, 'Good God! is it come to this at last?'"³

The persecution of Henry, the author of the *History of Great Britain*, commenced by Stuart in the *Edinburgh Magazine and Review*, has been recorded in the memoir of that individual. Before quitting this subject, let us give the parting curse of the editor for his literary disappointments in Scotland. "It is an infinite disappointment to me that the *Magazine* does not grow in London. I thought the soil had been richer. But it is my constant fate to be disappointed in everything I attempt; I do not think I ever had a wish that was gratified; and never dreaded an event that did not come. With this felicity of fate, I wonder how the devil I could turn projector. I am now sorry that I left London; and the moment I have money enough to carry me back to it I shall set off. *I mortally detest and abhor this place, and everybody in it.* Never was there a city where there was so much pretension to knowledge, and that had so little of it. The solemn foppery and the gross stupidity of the Scottish literati are perfectly insupportable. I shall drop my idea of a Scots newspaper. Nothing will do in this country that has common sense in it; only cant, hypocrisy, and superstition will flourish here. *A curse on the country, and on all the men, women, and children of it!*"⁴ Accordingly, Stuart did return to England, and along with Whitaker, the historian of Manchester, a man of very different literary habits, but somewhat similar in temper, for some time supported the *English Review*. In 1778 he published his well-known "*View of Society in Europe in its Progress from Rudeness to Refinement*"; or, *Inquiries concerning the History of Law, Government, and Manners*.⁵ This, the most popular of his works, and for a long time a standard book on the subject, is certainly the most carefully and considerably prepared of all his writings. Its adoption almost to caricature of that practice of the great Montesquieu, which was all of him that some writers could imitate, of drawing reflections whether there were or were not facts to support them, was fashionable, and did not perhaps disparage the work; while the easy flow of the sentences fascinated many readers. It cannot be said that in this book he made any discovery, or established any fact of importance. He contented himself with vague speculations on the description of the manners of the Germans by Tacitus, and new reflections upon such circumstances as had been repeatedly noticed before. To have made a book of permanent interest and utility from facts which every one knew, required a higher philosophical genius than that of Stuart; and since the more accurate researches of Hallam and Meyer, the book has fallen into disuse. In 1779 he published *Observations con-*

¹ Kerr's *Smellie*, i. 409.

cerning the *Public Law and the Constitutional History of Scotland, with Occasional Remarks concerning English Antiquity*. To a diligent man, who would have taken the trouble of investigating facts, there would here have been a very tolerable opportunity of attacking Robertson, at least on the score of omissions, for his constitutional views are very imperfect; Stuart, however, had no more facts than those which his adversary provided him with, and he contented himself with deducing opposite opinions. As there was a real want of matter sufficient to supply anything like a treatise on the subject—a want scarcely yet filled up—this work was still more vague and sententious than that on the general history of Europe. A sentence towards the commencement is very characteristic of the author's habits of thought. "An idea has prevailed that one nation of Europe adopted the feudal institutions from another, and the similarity of fiefs in all the states where they were established has given an air of plausibility to this opinion. It is contradicted, however, by the principles of natural reason, and by the nature of the feudal usages; and, if I am not mistaken, it receives no real sanction from records or history." Thus, his own opinions on "the principles of natural reason," and on "the nature of the feudal usages," were to him of more importance than "records or history." In 1780 he published his *History of the Establishment of the Reformation of Religion in Scotland*, commencing in 1517 and ending in 1561; and in 1782 the *History of Scotland, from the Establishment of the Reformation till the Death of Queen Mary*. Both these works are said by those who have perused them to be written with the view of controverting the opinions of Dr. Robertson. In 1785 Stuart was at the head of the "*Political Herald and Review*, or a Survey of Domestic and Foreign Politics, and a Critical Account of Political and Historical Publications." In this work we frequently meet the flowing sentences of Stuart, especially in papers relating to Scotland, of which there are several. It is a curious circumstance that, especially in letters of animadversion addressed to individuals, he has evidently endeavoured to ingraft the pointed sarcasm of Junius on his own slashing weapon. One of these, "An Address to Henry Dundas, Esq., Treasurer of the Navy, on the Perth Peerage," is with some servility signed "Brutus." This work extended, we believe, to only two volumes, which are now rather rare.

In London Stuart seems to have suffered most of the miseries of unsuccessful authorship, and to have paid dearly for talents misapplied.

In the life of Dr. William Thomson, in the *Annual Obituary* for 1822, there is the following highly characteristic notice of his life and habits at this period: "Although the son of a professor, and himself a candidate for the same office, after a regular education at the university of Edinburgh, yet we have heard his friend assert, and appeal to their common acquaintance Dr. Grant for the truth of the position, that, although he excelled in composition and possessed a variety of other knowledge, yet he was actually unacquainted with the common divisions of science and philosophy. Under this gentleman, as has been already observed, he (Dr. Thomson) composed several papers for the *Political Herald*, for which the former, as the ostensible editor, was handsomely paid, while the latter received but a scanty remuneration. But it was as a boon companion that he was intimately acquainted with this gentleman, who was greatly addicted to conviviality, and that too in a manner and to an excess which can scarcely be credited by one who is ac-

quainted with the elegant effusions of his polished mind. The 'Peacock,' in Gray's-Inn Lane, was the scene of their festivities, and it was there that these learned doctors, in rivelets of Burton ale, not unfrequently quaffed libations to their favourite deity, until the clock informed them of the approaching day."

His constitution at length broke down, and he took a sea-voyage to the place of his nativity for the recovery of his health, but died of dropsy, at his father's house, near Musselburgh, August 13, 1786, aged forty-four.

STUART, JAMES, Earl of Murray, celebrated in Scottish history by the title of the "Good Regent," was an illegitimate son of James V., by Margaret Erskine, daughter of John fourth Lord Erskine. The precise year of his birth is not certainly known; but there is good reason for believing that this event took place in 1533. Agreeably to the policy which James V. pursued with regard to all his sons—that of providing them with benefices in the church while they were yet in infancy, that he might appropriate their revenues during their nonage—the priory of St. Andrews was assigned to the subject of this memoir when he was only in his third year.

Of the earlier years of his life we have no particulars; neither have we any information on the subject of his education. The first remarkable notice of him occurs in 1548, when Scotland was invaded by the Lords Grey de Wilton and Clinton, the one by land and the other by sea. The latter having made a descent on the coast of Fife, the young prior, who then lived at St. Andrews, placed himself at the head of a determined little band of patriots, waylaid the invaders, and drove them back to their boats with great slaughter. Shortly after this he accompanied his unfortunate sister Queen Mary, then a child, to France, whither a party of the Scottish nobles sent her, at once for safety and for the benefits of the superior education which that country afforded. The prior, however, did not remain long in France on this occasion; but he seems to have been in the practice of repairing thither, from time to time, during several years after. At this period he does not appear to have taken any remarkable interest in national affairs, and none whatever in those of the church, to which he had always a decided aversion as a profession. He, however, did not object to the good things in its gift. In addition to the priory of St. Andrews, he acquired that of Pittenweem, and did not hesitate, besides, to accept that of Mascon in France, *in commendam*, with a dispensation to hold three benefices. For these favours of the French court he took an oath of fealty to Pope Paul III. in 1544.

From the year 1548, when the prior, as he was usually called, defeated the English troops under Clinton, till 1557, there occurs nothing in his history, with the exception of the circumstance of his accompanying Mary to France, worthy of any particular notice. In the latter year, accompanied by his brother Lord Robert Stuart, abbot of Holyrood, he made an incursion into England at the head of a small force, but without effecting any very important service, or doing much injury to the enemy. In the same year he proceeded to Paris, to witness the ceremony of marriage between the young Queen of Scotland and the Dauphin of France, having been appointed one of the commissioners on the part of the former kingdom for that occasion. Soon after the celebration of the marriage, the prior solicited from Mary the earldom of Murray; but this request, by the advice of her mother, the queen-regent, she

refused; and although she qualified the refusal by an offer of a bishopric, either in France or England, instead, it is said that from this circumstance proceeded, in a great measure, his subsequent hostility to the regent's government.

During the struggles between the queen-regent and the lords of the congregation, the prior, who had at first taken part with the former, how sincerely may be questioned, but latterly with the lords, gradually acquired, by his judicious conduct and general abilities, a very high degree of consideration in the kingdom. He was by many degrees the most potent instrument, after John Knox, in establishing the reformed religion. Having now abandoned all appearance of the clerical character, he was, soon after the death of the queen-regent, which happened on the 11th of June, 1560, appointed one of the lords of the articles; and in the following year he was commissioned by a council of the nobility to proceed to France to invite Mary, whose husband was now dead, to return to Scotland. This commission he executed with much judgment, and with much tenderness towards his ill-fated relative; having, much against the inclination of those by whom he was deputed, insisted on the young queen's being permitted the free exercise of her own religion after she should have ascended the throne of her ancestors.

On Mary's assuming the reins of government in her native land, the prior took his place beside her throne, as her confidant, prime-minister, and adviser; and by his able and judicious conduct carried her safely and triumphantly through the first act of her stormy reign. He swept the borders of the numerous bands of freebooters with which they were infested. He kept the enemies of Mary's dynasty in abeyance, strengthened the attachment of her friends, and by his vigilance, promptitude, and resolution, made those who did not love her government learn to fear its resentment. For these important services Mary, whose implicit confidence he enjoyed, first created him lieutenant of the borders, and afterwards Earl of Mar. Soon after his creation, the earl married the Lady Agnes Keith, daughter of the earl-marischal. The ceremony was publicly performed in the church of St. Giles, Edinburgh, with a pomp which greatly offended the reformers, who were highly scandalized by the profanities which were practised on the occasion. The earldom which the prior had just obtained from the gratitude of the queen, having been claimed by Lord Erskine as his peculiar right, the claim was admitted, and the prior resigned both the title and the property attached to it; but was soon after gratified by the earldom of Murray, which had long been the favourite object of his ambition. Immediately after his promotion to this dignity the Earl of Huntly, a disappointed competitor for the power and popularity which Murray had obtained, and for the favour and confidence of the queen, having been proclaimed a rebel for various overt acts of insubordination, originating in his hostility to the earl; the latter, equally prompt, vigorous, and efficient in the field as at the council-board, led a small army, hastily summoned for the occasion, against Huntly, whom he encountered at the head of his adherents at a place called Corrichie. A battle ensued, and the Earl of Murray was victorious. In this engagement he displayed singular prudence, skill, and intrepidity, and a military genius which proved him to be as able a soldier as he was a statesman. On the removal of Huntly—for this powerful enemy died suddenly and immediately after the battle, although he had received no wound, and his eldest son perished on the scaffold at Aberdeen—Murray remained in undisputed pos-

session of the chief authority in the kingdom, next to that of the sovereign; and the history of Scotland does not present an instance where a similar authority was more wisely or more judiciously employed. The confidence, however, amounting even to affection, which had hitherto subsisted between Murray and his sovereign, was now about to be interrupted, and finally annihilated. The first step towards this unhappy change of sentiment was occasioned by the queen's marriage with Darnley. To this marriage Murray was not at first averse; nay, he rather promoted it: but some personal insults which the vanity and weakness of Darnley induced him to offer to Murray, together with an offensive behaviour on the part of his father, the Earl of Lennox, produced in the haughty statesman that hostility to the connection which not only destroyed the good understanding between him and the queen, but converted him into an open and undisguised enemy. His irritation on this occasion was further increased by Mary's imprudently evincing in several instances a disposition to favour some of his most inveterate enemies; and amongst these the notorious Earl of Bothwell, who had some time before conspired against his life. In this frame of mind Murray not only obstinately refused his consent to the proposed marriage of Mary to Darnley, but ultimately had recourse to arms to oppose it. In this attempt, however, to establish himself by force, he was unsuccessful. After raising an army, and being pursued from place to place by Mary in person, at the head of a superior force, he fled into England, together with a number of his followers and adherents, and remained there for several months. During his expatriation, however, a total change of affairs took place at the court of Holyrood. The vain and weak Darnley, wrought upon by the friends of Murray, became jealous of the queen, and impatient for uncontrolled authority. In this spirit he was prevailed upon, by the enemies of his consort, to league himself with Murray and the banished lords who were with him. The first step of the conspirators was the murder of Rizzio, the queen's secretary; the next, the recall, on their own responsibility, sanctioned by Darnley, of the expatriated nobleman, who arrived in Edinburgh on the 9th of March, 1566, twenty-four hours after the assassination of the unfortunate Italian.

Although Murray's return had taken place without the queen's consent, she was yet very soon, not only reconciled to that event, but was induced to receive him again apparently into entire favour. Whatever sincerity, however, there was in this seeming reconciliation on the part of the queen, there appears to be good reason for believing that there was but little of that feeling on the side of Murray; for from this period he may be distinctly traced, notwithstanding of occasional instances of apparent attachment to the interests of the queen, as the prime mover, sometimes secretly and sometimes openly, of a faction opposed to the government of Mary; and whose object evidently was to overthrow her power, and to establish their own in its stead. To this end, indeed, the aim of Murray and his confederates would seem to have been long steadily directed; and the unguarded and imprudent, if not criminal, conduct of the queen, enabled them speedily to attain their object. The murder of Darnley, and the subsequent marriage of Mary to Bothwell, had the twofold effect of adding to the number of her enemies, and of increasing the hostility of those who already entertained unfriendly sentiments towards her. The result was, that she was finally dethroned, and confined a prisoner in Lochleven Castle, and the Earl of Murray was appointed Regent of Scotland. With

this dignity he was invested on the 22d of August, 1567; but whatever objection may be urged against his conduct previous and relative to his elevation, or the line of policy he pursued when seeking the attainment of this object of his ambition, there can be none urged against the system of government he adopted and acted upon when placed in power. He procured the enactment of many wise and salutary laws, dispensed justice with a fearless and equal hand, kept down the turbulent and factious, restored internal tranquillity and personal safety to the people, and in every public act of his authority discovered a sincere desire for the welfare of his country. Still the regent was yet more feared and respected than loved. He had many and powerful enemies; while the queen, though a captive, had still many and powerful friends. These having succeeded in effecting her liberation from Lochleven, mustered in arms, and took the field in great force, with the view of restoring her to her throne. With his usual presence of mind, fortitude, and energy, the regent calmly, but promptly, prepared to meet the coming storm; and in place of demitting the regency, as he had been required to do by the queen, he determined on repelling force by force. Having mustered an army of 3000 men, he encountered the forces of the queen, which consisted of double that number, at Langside, and totally routed them; his cool, calculating judgment, calm intrepidity, and high military talents being more than a match for their numerical superiority. This victory the regent instantly followed up by the most decisive measures. He attacked and destroyed all the castles and strongholds of the nobles and gentlemen who had joined the queen; and infused a yet stronger and more determined spirit into the administration of the laws: and thus he eventually established his authority on a firmer basis than that on which it had rested before.

After the queen's flight to England the regent, with some others, was summoned to York, by Elizabeth, to bear witness against her in a trial which had been instituted by the latter, to ascertain Mary's guilt or innocence of the crime of Darnley's murder. The regent obeyed the summons, and did not hesitate to give the most unqualified testimony against his unhappy sister. Having performed this ungenerous part, he left the unfortunate queen in the hands of her enemies, and returned to the administration of the affairs of that kingdom, of which he was now uncontrolled master. The proud career, however, of this wily but able politician, this stern but just ruler, was now soon to be darkly and suddenly closed. While passing on horseback through the streets of Linlithgow, on the 23d of January, 1570, he was fired at from a window by James Hamilton of Bothwellhaugh, nephew to the Archbishop of St. Andrews. The ball passed through his body, but did not instantly prove fatal. Having recovered from the first shock of the wound, he walked to his lodgings, but expired a little before midnight, being at the period of his death in the thirty-eighth year of his age. Hamilton's hostility to the regent proceeded from some severities with which the latter had visited him for having fought under the queen at Langside. The assassin escaped to France, where he died a few years afterwards, deeply regretting the crime he had committed.

STUART, JOHN, third Earl of Bute, and prime minister of Great Britain, was the eldest son of the second Earl of Bute, by Lady Anne Campbell, daughter of Archibald first Duke of Argyle. He was born in the Parliament Square, Edinburgh, May

25, 1713, and succeeded to the title on the death of his father, in January, 1723. In April, 1737, on a vacancy occurring in the representation of the Scottish peerage, the Earl of Bute was chosen to fill it: he was rechosen at the general elections of 1761, 1768, and 1774. His lordship married, August 24, 1736, Mary, only daughter of the celebrated Lady Mary Wortley Montagu, by whom he had a numerous family. On his first introduction to court life, Lord Bute had the good fortune to ingratiate himself with the Princess of Wales, mother of George III., who admitted him to that close superintendence of the education of her son which was the foundation of all his historical importance. In 1750 he was appointed one of the lords of the bed-chamber to Frederick Prince of Wales; and on the settlement of the household of the heir-apparent, in 1756, the Earl of Bute was appointed his groom of the stole. His lordship acquired the full confidence and friendship of the young prince; and is believed to have been chiefly instrumental in training and informing his mind. Before the prince's accession to the throne in 1760, Lord Bute was continued in his situation as groom of the stole; and in March next year, on the dismissal of the Whig ministry, was appointed one of the principal secretaries of state. His lordship was in the same year appointed keeper and ranger of Richmond Park, on the resignation of the Princess Amelia; and invested with the order of the Garter—an honour, as is well known, rarely bestowed, except upon persons who have rendered important services to the state.

The elevation of a nobleman only known heretofore as the royal preceptor, and who was also obnoxious to vulgar prejudices on account of his country, to such high place and honour, excited much irritation in England. This feeling was greatly increased when, in May, 1762, his lordship was constituted first lord of the treasury. It reached its acme on his lordship taking measures for concluding a war with France, in which the British arms had been singularly successful, and which the nation in general wished to see carried on till that country should be completely humbled. The great Whig oligarchy, which, after swaying the state from the accession of the house of Hanover, had now seen the last days of its dominancy, was still powerful, and it received an effective though ignoble aid from a popular party, headed by the infamous Wilkes, and inflamed by other unprincipled demagogues, chiefly through the medium of the press. A newspaper, called the *Briton*, had been started for the purpose of defending the new administration. It was met by one called the *North Briton*, conducted by Wilkes, and which, in scurrility and party violence, exceeded all that went before it. Wilkes, it is said, might at one time have been bribed to silence by Lord Bute; he now took up the pen with the determined purpose, as he himself expressed it, of writing his lordship out of office. Neither the personal character of the minister nor his political proceedings furnishing much matter for satire, this low-minded, though clever and versatile man, set up his country and countrymen as a medium through which to assail him. The earl, seeing it in vain to contend against prejudices so firmly rooted, lost no time, after concluding the peace of Paris, in resigning; he gave up office on the 16th of April, 1763, to the great surprise of his enemies, who, calculating his motives by their own, expected him, under all circumstances, to adhere to the so-called good things which were in his grasp.

The Bute administration, brief as it was, is memorable for the patronage which it extended to

literature. The minister, himself a man of letters and of science, wished that the new reign should be the commencement of an Augustan era; and he accordingly was the means of directing the attention of the young monarch to a number of objects which had hitherto languished for want of the crown patronage. One of the most remarkable effects of the spirit infused by his lordship into the royal mind was the rescuing of the majestic mind of Johnson from the distresses of a dependence on letters for subsistence; a transaction for which many bosoms, yet to be animated with the breath of life, will expand in gratitude at the mention of the name of George III.

The ministerial character of Lord Bute has been thus drawn by an impartial writer:—"Few ministers have been more hated than Lord Bute was by the English nation; yet if we estimate his conduct from facts, without being influenced by local or temporary prejudices, we can by no means find just grounds for the odium which he incurred. As a war minister, though his plans discovered little of original genius, and naturally proceeded from the measures of his predecessor, the general state of our resources, the conquests achieved, and the dispositions of our fleets and armies, yet they were judicious; the agents appointed to carry them on were selected with discernment, and the whole result was successful. His desire of peace, after so long and burdensome a war, was laudable, but perhaps too eagerly manifested. As a negotiator he did not procure the best terms which, from our superiority, might have been obtained. His project of finance, in itself unobjectionable, derived its impolicy from the unpopularity of his administration. Exposed from unfounded prejudices to calumny, he deserved and earned dislike by his haughty deportment. The manners which custom might have sanctioned from an imperious chieftain to his servile retainers in a remote corner of the island, did not suit the independent spirit of the English metropolis. The respectable mediocrity of his talents, with the suitable attainments, and his decent moral character, deserved an esteem which his manners precluded. Since he could not, like Pitt, command by superior genius, he ought, like the Duke of Newcastle, to have conciliated by affable demeanour. His partisans have praised the tenacity of Lord Bute in his purposes; a quality which, guided by wisdom in the pursuit of right, and combined with the power to render success ultimately probable, is magnanimous firmness, but without these requisites, is stubborn obstinacy. No charge has been more frequently made against Lord Bute than that he was a promoter of arbitrary principles and measures. This is an accusation for which its supporters can find no grounds in his particular acts; they endeavoured therefore to establish their assertion by circuitous arguments. Lord Bute had been the means of dispossessing the Whig connection of power, and had given Scotsmen appointments which were formerly held by the friends of the Duke of Newcastle. To an impartial investigation, however, it appears evident that Lord Bute merely preferred himself as minister to the Duke of Newcastle. If we examine his particular nominations we shall find that he neither exalted the friends of liberty nor despotism, but his own friends. It would probably have been better for the country if Lord Bute had never been minister; but all the evils that may be traced to that period did not necessarily proceed from his measures, as many of them flowed from circumstances over which he had no control. Candour must allow that the comprehensive principle on which his majesty resolved to govern was liberal and meri-

torious, though patriotism may regret that he was not more successful in his first choice. The administration of Bute teaches an instructive lesson, that no man can be long an effectual minister of this country who will not occasionally attend, not only to the well-founded judgment, but also to the prejudices of Englishmen."¹

The Earl of Bute spent the most of the remainder of his life in retirement at his seat of Luton in Bedfordshire, but not without the suspicion of still maintaining a secret influence over the royal counsels. "The spirit of the favourite," says Junius, "had some apparent influence over every administration; and every set of ministers preserved an appearance of duration as long as they submitted to that influence." The chief employment, however, of the ex-minister was the cultivation of literature and science. He was more fond of books of information than of imagination. His favourite study was botany, with which he acquainted himself to such an extent that the first botanists in Europe were in the habit of consulting his lordship. He composed a work on English plants, in nine quarto volumes, of which only sixteen copies were thrown off; the text as well as the figures of the plants being engraved on copper-plates, and these plates, it is said, immediately cancelled, though the work cost upwards of £1000. He presented to the Winchester College a bronze statue of their founder, William of Wykham, supposed to have been the work of some great artist in the fourteenth century. It is a full-length figure in the episcopal habit, sixteen inches high, and executed with remarkable elegance. His lordship was elected one of the trustees of the British Museum in 1765; held the office of chancellor of the Marischal College of Aberdeen; and on the institution of the Society of Antiquaries in Scotland (1780), was elected president. He was an honorary fellow of the Royal College of Physicians at Edinburgh, and to him the university of that city was indebted for its useful appendage the botanic garden.

Part of his lordship's time in his latter years was spent at a marine villa which he built on the edge of the cliff at Christ Church, in Hampshire, overlooking the Needles and the Isle of Wight. Here his principal delight was to listen to the melancholy roar of the sea, of which the plaintive sounds were probably congenial to a spirit soured with what he believed to be the ingratitude of mankind. His lordship died at his house in South Audley Street, London, March 10, 1792, in the seventy-ninth year of his age. Of his private character and manners, which may now properly be touched upon, an acute observer has written as follows:—"I never knew a man with whom one could be so long *tête-à-tête* without being tired. His knowledge was so extensive, and consequently his conversation so varied, that one thought one's self in the company of several persons, with the advantage of being sure of an even temper in a man whose goodness, politeness, and attention were never wanting to those who lived with him."²

STUART, JOHN M'DOUALL, a distinguished Australian explorer, was born at Dysart in Fife, on the 7th September, 1815. He was the fifth son of Captain William Stuart, a retired military officer, who served with distinction in the Irish rebellion of 1798. After being privately educated for some years in Edinburgh, he finished his education in the Military Academy. He then entered on a commer-

¹ Bisset's *Reign of George III. and Brydges' Peerage*.

² *Memoirs of a Traveller now in Retirement*, iv. 177.

cial life, but probably finding it not to his taste, he emigrated in 1838 to Adelaide, South Australia. There he joined the government survey, and subsequently surveyed for some years on his own account, chiefly in the bush. During part of this time he tried sheep-farming also, but in this he seems not to have had much success. His experiences as surveyor and sheep-farmer gave him excellent opportunities for learning the art of "roughing it in the bush," and accordingly he became a splendid bushman. In 1844, when Captain Sturt was preparing to set out on his last journey, Stuart volunteered to join the exploring party in the capacity of draughtsman. Leaving Lake Torrens on their left, the travellers pushed their way in a northerly direction into the interior, and after crossing a long stretch of barren land, encamped by the side of a sheet of water in a rocky glen. Here the dryness of the country compelled them to remain for six months, with the sun glaring down upon them, while not a drop of rain fell. Scurvy attacked them; Mr. Poole, the second in command, died; they had to dig a cave in the earth as a refuge from the intolerable heat. Rain came at last, and they pushed on; but after struggling for some hundreds of miles through deserts of rocks and sandstone, they were compelled to return. They had reached to within 250 miles of the centre of Australia. In 1858 M'Douall Stuart passed to the westward of the saline tract in which Lake Torrens and other sheets of water lie, and discovered a well-watered and more elevated region, with several thousand square miles of good pasturage. For his discoveries on this occasion he was awarded a gold watch by the Royal Geographical Society of London. In 1859-60 he accomplished two journeys of exploration in the region north-west of Lake Torrens. In 1860, with only two companions, thorough bushmen like himself, and thirteen horses, he set out with the intention of crossing the country to the Gulf of Carpentaria. Leaving Chambers Creek on the 2d March, he reached the centre of Australia on the 22d of April, and planted the British flag on the top of a hill, which he named Central Mount Stuart. Passing this, he advanced as far as lat. $18^{\circ} 47' S.$, when he was forced to return after a sharp fight with some hostile natives. On this expedition he had gone farther than any previous traveller, and in recognition of his valuable discoveries was presented by the Royal Geographical Society with the patron's gold medal. Undismayed by his repulse, he again set out on the 31st December, 1860, and holding chiefly by his old track, reached lat. $17^{\circ} S.$; but being brought to a halt by an impenetrable scrub, and finding provisions running short, he reluctantly turned his face homeward, and reached Adelaide on the 23d of September, 1861. These repulses might have daunted many a man, but such was not their effect on John M'Douall Stuart. Before the end of the year, after a very short rest, he set out on his last and greatest journey. After passing the arid plains that lay beyond the farthest point he had previously reached, the scenery began gradually to change, and he finally found himself in the midst of a most luxuriant tropical vegetation, with pines and palm-trees rising on every side. Pushing onward, the party reached the Adelaide river, which flows into Van Diemen's Gulf, more than 300 miles westward of the Gulf of Carpentaria. On the 24th July, after forcing their way through a belt of scrub, the travellers hailed with a shout of joy the blue rolling waves of the Indian Ocean. They were the first that had crossed the continent from sea to sea. Burke and Wills, indeed, had reached a tidal river, and M'Kinlay was separated from the shore by

nothing but mangrove swamps, but Stuart and his men were the first to stand with the water of the ocean bathing their feet. Having fixed the union-jack to one of the tallest trees near the beach, and buried at the foot of it a paper in a tin case stating that the party left Adelaide on the 26th of October, 1861, and after crossing the continent, passing through the centre, had reached that spot on the 25th July, 1862, they bade farewell to the Indian Ocean. After suffering much from drought on their homeward route, the party succeeded in reaching Mount Stuart station on the 10th of December. In reward for his services Stuart received liberal grants of money and land from the government of South Australia. An accident that happened to him before the commencement of this last journey fatally injured his health; and in 1862-3 he became so ill, that the doctors recommended, as his only chance of recovery, a return to his native land. Here he arrived in September, 1864, with a shattered constitution. He survived till 5th June, 1866, when he died at Notting Hill Square, London, where he had lived from his arrival in England. He lies buried in Kensal Green Cemetery.

STUART, MARY, Queen of Scots, daughter of James V. and Mary of Guise, was born in the palace of Linlithgow, December 7, 1542. Her father was on his death-bed at Falkland, when her birth was announced to him; and in seven days after that event he expired, bitterly regretting, in his dying moments, that it was a female and not a male child that had been born to him. The young queen having been removed to Stirling, was there solemnly crowned by Cardinal Beaton on the 9th of September, 1543, while she was yet only nine months old. The two first years of the infant princess's life were spent at Linlithgow, under the immediate charge of her mother, and, more remotely, under that of commissioners appointed by parliament, on the part of the nation, to watch over the tender years of their future sovereign. During her residence here she was attacked with smallpox; but the disease was of so mild a nature as to leave no trace behind.

The three following years she spent at Stirling, under the superintendence of the Lords Erskine and Livingstone. At the end of this period she was removed to Inchmahome, a small island in the lake of Menteith, in Perthshire. The disturbed state of the country had rendered this measure necessary, as a precaution against any attempts which might be made to get possession of her person. To divert the young princess in her solitary residence, four young ladies of rank were chosen by her mother, the queen-dowager, to accompany her. These ladies were, Mary Beaton, niece of Cardinal Beaton; Mary Fleming, daughter of Lord Fleming; Mary Livingstone, daughter of one of the young queen's guardians; and Mary Seton, daughter of Lord Seton. Whether it was by chance or by design that these four ladies bore the same surname with the queen is not now known; but they have since been distinguished by the conjunctive appellation of the *FOUR MARIES*, and as such are celebrated in history.

In this island Mary resided for upwards of four years; when, agreeably to an intention which had been early entertained regarding her, she was sent to France, to receive the refined education which that country then, above all others, was capable of affording. The young queen, now in her sixth year, embarked at Dumbarton on board of a French ship, which, accompanied by several other vessels of that nation, had been sent to the Clyde to receive her. On her arrival at Brest, which she reached on the

14th of August, 1548, after a tempestuous and tedious voyage of nearly three weeks' duration, she was received, by the orders of the French monarch, Henry II., with all the marks of respect due to her exalted station; and was soon afterwards sent, with the king's own daughters, to one of the most celebrated monasteries in France, to receive such an education as should become the future queen.

Remarkable as was the beauty of Mary's person, it was not more worthy of admiration than her intellectual superiority. In all the various and numerous branches of education in which she was instructed she made rapid progress, and attained in all a proficiency that excited universal admiration. She rode fearlessly and gracefully, and in dancing was unrivalled even at the gay and refined court of Henry II. Caressed and admired by all, and surrounded by every enjoyment within the reach of humanity, the earlier part of Mary's life glided rapidly away, while she herself, in her person, gradually advanced towards that perfection of beauty, which is to this hour matter of interesting speculation, and which she seems to have possessed in the highest degree of which perhaps the human form is susceptible.

A desire long entertained by Mary's mother, the queen-dowager, and Henry of France, to unite the interests of the two kingdoms, had early produced a contract of marriage between Francis, the young dauphin, and the Scottish queen. This contract Henry now thought it full time to consummate, and the youthful pair were accordingly united. The nuptials took place on the 24th of April, 1558. Mary was then in the sixteenth year of her age, and her husband but little older. The ceremony, which was celebrated with great pomp, was attended, amongst others, by the Lord James, prior of St. Andrews, and other eight persons of distinction from Scotland, who had been deputed for that purpose by the parliament of that kingdom. Mary, already Queen of Scotland and heir-presumptive of England, was now, by her marriage to the dauphin, queen-consort apparent of France; a concentration of dignities which perhaps never before occurred in one person. The last of these honours was realized, but only for a short period. In 1559, a year after her marriage, her husband the dauphin succeeded to the throne by the death of his father; but in another year afterwards, in 1560, he died, while yet only in the seventeenth year of his age. Mary's husband was not, either in mental attainments or personal appearance, at all equal to his beautiful and accomplished wife; he was, besides, of a weakly and sickly habit of body, but he appears to have been of a mild and affectionate disposition; and there is every reason to believe that he was sincerely beloved by his royal consort. On the death of her husband Mary was invited to return to Scotland, in order to undertake the government. Political motives seconding this invitation, she complied with it, and in August, 1561, sailed from the harbour of Calais, and on the 21st of the same month arrived safely at Leith. Her reception in her native land was warm and enthusiastic; and although she soon discovered many things to increase her respect for the country she had left, she yet fully appreciated the sincerity with which she was welcomed.

The period of Mary's arrival in Scotland was singularly inauspicious for a sovereign educated as she had been, in devoted attachment to the faith which her Scottish subjects had just abjured. The Reformed religion had gradually advanced from small beginnings, amidst great opposition, until it had now attained a parliamentary establishment. Mary had been taught to regard the late proceedings of

her Scottish subjects in the light of rebellion against her lawful authority. Before she left France her mind was filled with prejudices against the Reformed faith and its promoters. She came to Scotland prepared to subvert the Reformation. The reformers apprehended such an attempt on the part of Mary and her French courtiers; and, amidst the enthusiastic loyalty expressed on her arrival, it is not surprising that every opportunity was taken to impress the queen's mind with a sense of the value which her subjects attached to their new-born liberties. Knox and the other leading reformers, who have been censured for their uncompromising deportment towards their sovereign, were, in addition, influenced by a just regard for their personal safety, which could not fail to be seriously compromised in the event of Popery regaining its ascendancy in Scotland. The recent history of France, the Netherlands, Spain, Italy, and England bore testimony to the perfidious and truculent foe with which they had to contend in the Romish church. "The rage for conquest on the Continent (remarks Dr. Mc'Crie) was now converted into a rage for proselytism; and steps had already been taken towards forming that league among the Popish princes which had for its object the universal extermination of Protestants. The Scottish queen was passionately addicted to the intoxicating cup of which so many of 'the kings of the earth had drunk.' There were numbers in the nation who were similarly disposed. The liberty taken by the queen would soon be demanded for all who declared themselves Catholics. Many of those who had hitherto ranged under the Protestant standard were lukewarm in the cause; the zeal of others had already suffered a sensible abatement since the arrival of their sovereign; and it was to be feared that the favours of the court, and the blandishments of an artful and accomplished princess, would make proselytes of some, and lull others into security, while designs were carried on pregnant with ruin to the religion and liberties of the nation." On the first Sunday after her arrival Mary was so ill-advised as to have mass celebrated in the chapel at Holyrood, on which occasion her attendants received some rough treatment at the hands of the people. John Knox denounced the observance of mass as idolatry in the pulpit on the succeeding Sabbath. Two days afterwards the queen sent for Knox to the palace, and held a long conversation with him in the presence of her brother, the prior of St. Andrews, afterwards Earl of Murray. She plied all her blandishments to soften the reformer; failing in which she resorted to threats, in the hope of overawing him. The firmness of the reformer was as immovable as his faith was inflexible, and both were proof against the smiles and tears of the youthful princess. On taking leave of her majesty, Knox said, "I pray God, madam, that you may be as blessed within the commonwealth of Scotland as ever Deborah was in the commonwealth of Israel."

Mary soon afterwards made her first public entry into Edinburgh. Mounted on her palfrey and suitably escorted, she proceeded up the High Street to the castle, where a banquet was prepared for her. The reception she met with from the citizens was extremely gratifying, notwithstanding the somewhat obtrusive manner in which many of them indicated their contempt for her religion, and their resolution to defend their own. In a subsequent progress through Linlithgow, Stirling, Perth, St. Andrews, and the neighbouring districts, she was welcomed with high-hearted loyalty, such as the Scottish nation never withheld from Mary or her descendants so long as they respected the religious principles and

political liberties of the people. On one occasion during the royal tour, some public demonstration of the reformers moved the queen to tears. On her return to Edinburgh she evinced a disposition to check the practice of publicly insulting her faith. Within a few days after her arrival the civil authorities issued a proclamation, proscribing the "wicked rabble of the antichrist of the pope," and ordering them to withdraw from the bounds of the town within four-and-twenty hours, under pain of carting through the streets, burning on the cheek, and perpetual banishment. Mary, however, did not allow this invasion of her authority to pass with the same impunity which she had permitted in some other instances of a similar kind. She ordered the town-council to deprive the provost and bailies instantly of their offices, and to elect others in their stead.

All the French friends who had accompanied her to Scotland, excepting her uncle the Marquis d'Elbeuf, disgusted with the treatment which they met with from the reformers, now returned to their own country; and the young and inexperienced queen was thus left nearly alone, to maintain the elevated and dangerous position in which hereditary right had placed her, against the stormy and conflicting interests and passions of those by whom she was surrounded. She was now thrown upon her own resources, and at a most critical period left to rely wholly upon the firmness and energy of her own character to carry her through the arduous part which destiny had assigned her.

The fame of Mary's beauty and accomplishments, as was naturally to be expected, procured her many suitors, not only amongst her own nobility, but amongst foreign princes. She, however, declined all addresses of this nature, and resolved, in the meantime at least, to remain as she was: a resolution which it had been well for the unfortunate queen she had always adhered to.

In the month of August, 1562, little of any interest having occurred in the interval, Mary set out on a progress through the northern part of her dominions, accompanied by her brother the Earl of Murray and a numerous train of nobles and attendants. On this expedition she spent three months, when she again returned to Edinburgh. The two following years, viz. 1563 and 1564, were undistinguished by any public event of importance, and were, on that account, probably the happiest that Mary ever spent in her native land. Though no circumstance of national consequence, however, occurred during this period, one of a singular and melancholy interest did take place. This was the execution of the young French poet Chatelard. This unfortunate gentleman, who was attached to Mary's court, had fallen wildly and desperately in love with his royal mistress. He wrote numerous verses to her; and, encouraged by the unreflecting approbation with which they were received, and mistaking the good-natured courtesy of Mary for a return of his passion, he madly intruded himself into her bed-room. Here he was discovered by her maids of honour; but, after being severely reprimanded by the queen for his audacity, was allowed, from a natural feeling of lenity, as it was his first offence, to escape further punishment. Undeterred by the imminence of the danger to which he had been exposed, and of which he must have been fully aware, Chatelard, in two nights afterwards, again entered the queen's bed-chamber. On this occasion it was at Dunfermline, where Mary had stopped for one night on her way to St. Andrews. Highly incensed by the young man's insolent pertinacity, Mary, after having in vain ordered him to quit her apartment, called out for assistance, and

was instantly attended by the Earl of Murray, who happened to be within hearing. The unfortunate Chatelard was immediately taken into custody, tried at St. Andrews, condemned to death, and executed on the 22d of February, 1563. Before laying his head on the block, which he did with the utmost composure, he turned towards the house in which the queen lodged, and where he presumed her at the moment to be, and exclaimed, "Farewell, loveliest and most cruel princess whom the world contains!"

Mary, if she had not hitherto enjoyed positive happiness, had at least been free from any very serious annoyances, since her accession to the throne. This comparative quiet, however, was now about to be disturbed, and the long series of miseries and misfortunes, which render her history so remarkable, were on the eve of assailing her. These began with her unfortunate marriage to Darnley, an event which took place on the 29th of July, 1565. The ceremony was performed in the chapel of Holyrood on a Sunday, between the hours of five and six in the morning. Henry Stuart, Lord Darnley, at the time of his marriage was in the nineteenth year of his age; Mary in her twenty-third. The former was the son of Matthew Earl of Lennox and of the Lady Margaret Douglas, niece of Henry VIII. Even at this early period of his life Darnley was esteemed one of the handsomest men of his time; but, unfortunately, there was little correspondence between the qualities of his person and his mind. He was weak, obstinate, and wayward, possessing scarcely one redeeming trait, unless it were a simplicity, or rather imbecility, which rendered him an easy dupe to the designing.

Amongst the first evil results which this unfortunate connection produced to Mary, was the hostility of her brother the Earl of Murray, who foresaw that the new character of a king-consort would greatly lessen, if not entirely put an end to, the almost regal power and influence which he enjoyed whilst his sister remained single. Impressed with this feeling he had, at an early period, not only expressed his displeasure at the proposed marriage, but, in concert with some other nobles, whom he had won over to his interest, had taken measures for seizing on the queen's person whilst she was travelling between Perth and Edinburgh. Being earlier on the road, however, and better guarded than the conspirators expected, she reached the latter place without experiencing any interruption; and in a few days afterwards her union with Darnley took place. On the 15th of August, 1565, seventeen days after the celebration of the queen's marriage, Murray, who now stood forward as an open and declared enemy, summoned his partisans to meet him, attended by their followers, armed, at Ayr, on the 24th of the same month. To oppose this rebel force Mary mustered an army of 5000 men, and with a spirit worthy of her high descent placing herself in the midst of her troops, equipped in a suit of light armour, with pistols at her saddle-bow, she marched from Edinburgh to the westward in quest of the rebel forces. Murray, who had been able to raise no more than 1200 men, finding himself unable to cope with the queen, retired from place to place, closely pursued by the royal forces. Being finally driven to Carlisle, whither he was still followed by Mary with an army now increased to 18,000 men, his troops there dispersed, and he himself and his friends, abandoning their cause as hopeless, fled to the English court.

This triumph of Mary's, however, in place of securing her the quiet which might have been expected to result from it, seemed merely to have opened a way for the admission of other miseries,

not less afflicting than that which had been removed. Murray and the other lords who had joined him in his rebellious attempt, though now at a distance and under a sentence of expatriation, still continued their machinations, and endeavoured to secure, by plot and contrivance, that which they had failed to obtain by force. In these attempts they found a ready co-operator in the Earl of Morton, who, though entertaining every good-will to their cause, having taken no open part in their rebellious measures, was now amongst the few counsellors whom Mary had left to her. Working on the vanity and weakness of Darnley, Morton succeeded in inducing him to join a conspiracy, which had for its object the restoration of the banished lords, and the wresting from, or at least putting under such restraints as they should think fit, the authority of the queen. Tempted by promises of undivided sway, that imbecile prince, slighting the ties of natural affection, and forgetting all the kindnesses and honours which his wife had heaped upon him, became an active partisan in a plot devised against her interest, her dignity, and her happiness. There was, however, one person whose fidelity to the queen made him sufficiently dangerous to render it necessary, for the safety of all, that he should be removed out of the way. This was David Rizzio, Mary's secretary. Sincerely interested in the safety and honour of his royal mistress, he was known to have exerted his influence with her against those who had aimed at depriving her of her authority; and he was also known to have exerted that influence to prevent her yielding up too much of that authority to Darnley. Being thus equally detested by both, and generally unpopular on account of his religion and his country, and for the high estimation in which he was held by the queen, his destruction was determined upon. On the evening of the 9th of March, 1565, the conspirators, headed by Lord Ruthven, entered the queen's chamber while she was at supper with several of her household, including Rizzio. On their entering the queen indignantly demanded the meaning of this intrusion. This they soon explained; and immediately proceeded to attack their victim with their drawn weapons. Rizzio, by taking shelter behind the queen, for some time escaped the blows of the assassins, but was at length stabbed in the side over the queen's shoulder, and immediately after dragged into an adjoining apartment, and despatched with no fewer than fifty-six wounds. Immediately after the assassination Darnley and Morton placed the queen in ward; and on the following morning issued a proclamation, in the king's name, proroguing the parliament, which was then sitting, and which had discovered such a disposition in favour of the queen as rendered it highly dangerous. In the evening of the same day Murray, with the other banished lords, returned from England.

At this critical period the vacillating Darnley, unable to pursue any course whether for good or evil steadily, began to repent of the part he was acting, and allowed himself to be persuaded by Mary, not only to desert his accomplices, but to assist and accompany her in making her escape from Holyrood. Attended only by the captain of the guard and two other persons, Mary and her husband left the palace at midnight for Dunbar, at which they rode without stopping. Here the queen found herself, in the course of a few days, surrounded by the half of her nobility, and at the head of a powerful army. With these she returned, after an absence of only five days, in triumph to Edinburgh, where she was again reinstated in full and uncontrolled authority. The conspirators, unable to offer the slightest resistance, fled

in all directions; while their leaders, Morton, Maitland, Ruthven, and Lindsay, sought safety in New-castle. Mary had, a few days before, with not an unwise policy, lessened the number of her enemies, and increased that of her friends, by receiving Murray, and several others of those who had been associated with him, into favour; and therefore now again enjoyed the benefit of the judicious counsel of her able but ambitious brother.

Soon after the occurrence of the events just related Mary became aware of the near approach of the hour which was to make her a mother. In the anticipation of this event she took up her abode, by the advice of her privy-council, in the castle of Edinburgh, where, on the 19th of June, 1566, between the hours of nine and ten in the morning, she was delivered of a son, afterwards James VI. of Scotland and I. of England. The intelligence of Mary's accouchement was received with the utmost joy throughout the whole kingdom. In Edinburgh it amounted to enthusiasm. All the nobles in the city, accompanied by the greater part of the citizens, went in solemn procession to the High Church, and returned thanks to the Almighty for bestowing a prince upon them, and for the mercy which had been extended to their queen. This impressive ceremony was followed by three entire days of continued revelry and triumph. After her recovery the queen proceeded on an excursion through various parts of the country; and again returned to Edinburgh on the 11th or 12th of September, having previously placed the infant prince in charge of the Earl and Lady Mar. From this period the page of Mary's history rapidly darkens; and it is now that her enemies assail her character, and that her friends find themselves called upon to defend it. Each have written volumes in their turn to establish her guilt or her innocence, but hitherto without approaching to anything like complete success on either side.

At the suggestion of the Earl of Bothwell, now one of the most active of Mary's officers of state, the privy-council submitted to Mary, then (December, 1566) residing at Craigmillar Castle, the proposal that she should divorce her husband Darnley, to whom she had now been married about a year and a half. There were sufficient reasons, both of a public and personal nature, to make such a proposal neither singular nor unwarrantable. Darnley's intellectual incapacity rendered him wholly unfit for his situation, and his wayward temper had wrecked the happiness of his wife. But the proposal originated in neither of these considerations. It was the first step of the new ambition of Bothwell, which aimed at the hand of his sovereign. Mary refused to accede to the proposal, alleging, amongst other considerations, that such a proceeding might prejudice the interests of her son. This resolution, however, in place of diverting Bothwell from his daring project, had the effect only of driving him to a more desperate expedient to accomplish it. He now resolved that Darnley should die. Attended by a band of accomplices, he proceeded, at midnight on Sunday the 9th of February, 1567, to the Kirk of Field House, situated near to where the college of Edinburgh now stands, and where Darnley, who was at the time unwell, had taken up a temporary residence. The mode of his death had been matter of some discussion previously, but it had been finally determined that it should be accomplished by the agency of gunpowder. A large quantity of that material had been therefore secretly introduced into the chamber beneath that in which Darnley slept. This, on the night spoken of, was fired by a match applied by the assassins, but which burned slowly enough to

allow of themselves escaping to a safe distance; and in a few minutes the house, with all its inmates, including Darnley, was totally destroyed.

For some time after the murder, vague and contradictory surmises regarding the assassins filled the kingdom. Suspicion, however, at length became so strong against the true perpetrator, that, at the instigation of Darnley's father, the Earl of Lennox, he was brought to a public trial. Bothwell, however, was too powerful a man, and had too many friends amongst the nobility, to fear for the result. He had provided for such an occurrence. On the day of trial no one appeared to prosecute him, and he was acquitted. Thus far the dark and daring projects of Bothwell had been successful, and he now hurried on to the consummation of his guilty career. On the 20th of April, little more than two months after the assassination of Darnley, Bothwell procured the signatures of a number of the nobility to a document setting forth, first, his innocence of that crime; secondly, the necessity of the queen's immediately entering again into the married state; and lastly, recommending James Earl of Bothwell as a fit person to become her husband. In two or three days after this Mary left Edinburgh for Stirling, on a visit to her infant son; and as she was returning from thence, she was waylaid by Bothwell, accompanied by a troop of 1000 men, all well mounted, at a bridge which crosses the river Almond, within a mile of Linlithgow. Mary, when she encountered Bothwell, was attended by but a slight retinue, and by only three persons of note; these were the Earl of Huntly, Secretary Maitland, and Sir James Melville. Bothwell having dismissed all her attendants, with the exception of the three last, seized the bridle of Mary's horse, and immediately after the whole cavalcade proceeded with their utmost speed to Dunbar, one of Bothwell's castles. Here Mary was detained for ten days, during which time Bothwell had succeeded in obtaining her consent to espouse him. At the end of this period the queen and her future husband returned to Edinburgh, and in a few weeks afterwards were married, Bothwell having previously obtained a divorce from his wife, the Lady Jane Gordon, and a formal pardon, before the lords of session, from Mary herself, for his having seized upon her person. With regard to these transactions, thus briefly narrated, much has been said of the determined, unprincipled, and ferocious character of Bothwell, and much of the helplessness of the condition to which Mary was reduced; but it cannot be denied that they present still a startling appearance, even after all that has been said to explain away what part of them affects the character of Mary. Bothwell, however, did not long enjoy the success of his villany. Disgusted with the insolence of his manner, and not improbably disappointed in the hopes which they had entertained from his elevation, a number of those very lords who had assisted him to attain it, together with many others, took up arms to displace him. On learning the designs of his enemies Bothwell hastily collected at Dunbar a force of 2000 men, and with these marched towards Edinburgh on the 14th of June, 1567. The hostile lords, with an army somewhat less in number, marched from the latter city to meet him, and on the 15th the two armies came in sight of each other, Bothwell's troops occupying Carberry Hill, a rising ground to the east of Musselburgh. Neither army evincing much inclination to come to blows, negotiations were entered into, and the final result of these was, that Mary, who had accompanied Bothwell to the field, offered to deliver herself up to the opposite party, on condition that they would

conduct her safely to Edinburgh, and thereafter yield obedience to her authority. This being agreed to, she prevailed upon her husband to quit the field, and, conducted by Kirkcaldy of Grange, presented herself before the hostile lords and claimed their protection. Mary was now conducted into Edinburgh, but with little respect either to her rank, her sex, or her feelings. Insulted by the rabble as she passed along, and dissolved in tears, she was taken to the house of the provost instead of the palace, a circumstance which added greatly to her distress. Dreading a reaction of the popular feeling towards the queen—which, indeed, shortly afterwards took place—Mary's captors, for they now stood in that position, conveyed her on the evening of the following day to Holyrood, and at midnight hurried her away on horseback to the castle of Lochleven, situated on a small island in a lake of that name in Fifehire, and placed her in charge of Lady Douglas, mother of the Earl of Murray by James V., a woman of haughty and austere manners and disposition.

This extreme proceeding towards the unhappy queen was in little more than a month afterwards followed by another still more decisive and humiliating. On the 24th of July, 1567, Lord Lindsay and Sir Robert Lindsay, deputed by the lords of secret council, proceeded to Lochleven, and by threats of personal violence compelled Mary to sign a deed of abdication, a proceeding which was soon after followed by the election of Murray to the regency. Bothwell, in the meantime, after some ineffectual attempts to regain his lost authority, retired to his estates in the north, but being pursued thither by Grange and Tullibardine, he embarked for Denmark. Ruthless and desperate in all his proceedings, he attempted, on his way thither, to replenish his exhausted finances by piracy. The intelligence of his robberies reaching Denmark, several ships were despatched from that country in quest of him, and in a very short time he was taken and carried a prisoner into a Danish port. On his landing he was thrown into prison, where he remained for many years, and finally ended his days in misery and neglect. Such was the fate of the proud, ambitious, and wicked Bothwell, the husband of Mary Queen of Scotland.

Though Mary's fortunes were at this low ebb, and her enemies both numerous and powerful, she had still many friends, who waited anxiously for an opportunity of asserting her rights; and for such an opportunity, although it was unsuccessful, they had not to wait long. On the 25th of March, 1568, about nine months after she had been imprisoned in Lochleven Castle, an attempt was made, by the assistance of George Douglas, a relation of the family of Lochleven, who resided in the castle, to effect Mary's escape in the disguise of a laundress. She was, however, discovered by the boatmen who had been employed to convey her to the shore, and carried back to the castle. In about a month afterwards the attempt was again made, but now under the auspices of William Douglas, a young man of sixteen years of age, a relation of the Douglas family, and also a resident on the island. Douglas, having purloined the keys of the fortress, liberated the captive princess, May 2d, and conducting her to a boat which was in readiness to receive her, conveyed her to the shore. Here she was met, with joy and loyal affection by a number of her nobility, who, having been previously informed of the design, were awaiting her arrival. Placing the queen on horseback the whole party instantly set off at full speed for Hamilton, where they arrived on the following forenoon.

The intelligence of Mary's escape, and of the place of her temporary abode, rapidly spread throughout the whole kingdom, and nobles and troops instantly poured in from all quarters to her assistance. In a few days Mary found herself at the head of a formidable army, and surrounded by the greater part of her nobility. She now solemnly and publicly protested that her abdication had been compulsory, and therefore not valid, and called upon Murray, who was then at Glasgow, to surrender his regency. This he refused to do, and both parties prepared for hostilities. On Thursday the 13th of May, Murray, who was still at Glasgow, having learned that the queen with her forces were on their way to Dunbarton, where it was proposed by the friends of the former that she should be lodged, as being a place of greater safety than Hamilton, he hastily assembled an army of 4000 men, and marched out to a place called Langside, about three miles distant from the city, to intercept her. The hostile armies soon came in sight of each other, and a battle followed, fatal to the hopes of Mary. The main body of the queen's army was led by the Earl of Argyle, the van by Claud Hamilton second son of the Duke of Chateherault, and the cavalry by Lord Herries. Murray himself led on the main body of the opposing forces, and the Earl of Morton the van. Mary, on perceiving that the day had gone against her (for she had witnessed the contest from a neighbouring height), instantly took to horse, and, accompanied by Lord Herries and a few other trusty friends, rode off at full speed, nor ever drew bridle until she had reached Dundrennan Abbey in Galloway, sixty miles distant from the field of battle.

Here she remained for two days, uncertain whither to proceed. Resolving at length to throw herself on the protection of Elizabeth, she embarked, with a train of eighteen or twenty persons, on board a fishing boat, and, sailing along the shore until she arrived at Workington in Cumberland, was there landed with her suite. From Workington she proceeded to Cockermouth, twenty-six miles distant from Carlisle, where she was met by the deputy of the warden of these frontiers and a number of gentlemen of rank and respectability, and conducted with every mark of respect to the castle of Carlisle. This honourable treatment, however, was but of short duration. Mary was now in the hands of her bitterest and most inveterate enemy, Elizabeth, and though not yet aware of it, the conviction of its truth was very soon forced upon her. From Carlisle Mary was, by Elizabeth's orders, removed to Bolton, where she was strictly guarded, and forbidden to hold any communication with her Scottish subjects. Elizabeth had previously refused to admit Mary to a personal interview, alleging that she was under a suspicion of having been accessory to the murder of Darnley, and that until her innocence of that crime was established, she could not afford her any countenance, or bestow upon her any mark of favour. Affecting an anxiety for Mary's honour, Elizabeth now proposed that an examination of evidence should be gone into, to prove either the truth or falsehood of the allegation. Three sets of commissioners were accordingly appointed for this purpose, one by Elizabeth, as umpires or judges, one by Murray and his party as defenders, and one by Mary as plaintiff. These met at York on the 4th of October, 1568, bestowing upon their proceedings the gentle name of *conference*. From York the conference, unattended yet with any decisive result, was removed to Westminster, where it was again resumed, and finally, after several disingenuous proceedings on the part both of Elizabeth and Murray's commissioners, was

brought to a close without being terminated. Without any conclusive or satisfactory evidence of her guilt, or any decision having been pronounced on the evidence which had been led, Mary was, though not formally, yet virtually condemned to perpetual imprisonment.

The unfortunate queen was now moved from castle to castle as notions of caprice or fancied security dictated, and with diminished comforts and enjoyments at each remove, until she was finally stripped, not only of all personal liberty, but of every consolation which could make life endurable. Her letters of remonstrance to Elizabeth under this treatment are pathetic in the last degree, but they had no effect upon her to whom they were addressed. For eighteen years the severities to which she was exposed were left not only uninvestigated, but were gradually increased to the end of her unhappy career.

On the 25th of September, 1586, Mary was removed from Chantry to the Castle of Fotheringay, with a view to her being brought to trial before a commission appointed by Elizabeth, on a charge of having abetted a conspiracy, in which the chief actor was one Anthony Babington, and which had for its object the assassination of Elizabeth and the liberation of the captive queen. The trial commenced on the 15th of October, but was afterwards adjourned to the Star Chamber at Westminster, where on the 25th of the same month it was finally adjudged that "Mary, commonly called Queen of Scots and Dowager of France, was accessory to Babington's conspiracy, and had compassed and imagined divers matters within the realm of England, leading to the hurt, death, and destruction of the royal person of Elizabeth, in opposition to the statute formed for her protection." Mary had been charged with abetting a number of minor plots during the previous term of her captivity, and one in especial set on foot by the Duke of Norfolk, who had not only aimed at restoring her to liberty, but had looked forward to the obtaining her hand. Norfolk's designs were discovered, and he perished on the scaffold. Elizabeth's parliament now, therefore, alleged that their sovereign's security was incompatible with Mary's life, and urged her to give effect to the sentence of the Star Chamber, by ordering her immediate execution. Elizabeth affected to feel the utmost reluctance to proceed to the extremity recommended by the councillors, but at length gave way to their importunity, and signed the warrant for her unfortunate captive's execution, and a commission was given to the Earls of Shrewsbury, Kent, Derby, and others, to see it carried into effect. Aware of her approaching fate, for the sentence of the commissioners had been early conveyed to her, with an intimation to prepare for the result, Mary calmly awaited its consummation, without stooping to any meanness to avert it, or discovering the slightest dread in its contemplation.

The fatal hour at length arrived. On the 7th of February, 1587, the earls who were appointed to superintend her execution arrived at Fotheringay, and requesting an audience of Mary, informed her of the purpose for which they came, and that her execution would take place on the following morning at eight o'clock. Mary heard the dreadful intelligence without discovering the slightest trepidation. She said she had long been expecting the manner of her death, and was not unprepared to die. Having, with the utmost composure and self-possession, arranged all her worldly affairs she retired to bed, about two in the morning; but though she lay for some hours, she slept none. At break of day she arose, and, surrounded by her weeping domestics,

resumed her devotions. She was thus employed when a messenger knocked at the door to announce that all was ready, and in a short time afterwards the sheriff, bearing in his hand the white wand of office, entered her apartment to conduct her to the place of execution. Mary was now led into the hall in which her trial had taken place, and which had been previously fitted up for the dreadful scene about to be enacted. A scaffold and block, covered with black cloth, rose at the upper end, and on one side of the latter stood the Earls of Shrewsbury and Kent, on the other two executioners. Having ascended the scaffold, which she did with a dignity and composure that rather increased than diminished as her fate approached, Mary prepared for the fatal stroke. After spending a short time in prayer, she desired Jane Kennedy, one of two female attendants for whom she had with difficulty obtained the melancholy privilege of accompanying her to the scaffold, to bind her eyes with a handkerchief which she had brought with her for the purpose. This done, she laid her head on the block, and the axe of the executioner descended. The

severed head was immediately held up by the hair, which was now observed to have become gray, by the executioner's assistant, who called out, "God save Elizabeth Queen of England!" To this sentence the Earl of Kent added, "Thus perish all her enemies!"

Mary's remains were embalmed and buried in the cathedral at Peterborough, but twenty-five years afterwards were removed by her son James VI. to Henry VII.'s Chapel in Westminster Abbey. She was at the time of her death in the forty-fifth year of her age, and the nineteenth of her captivity. Time and grief had greatly impaired the symmetry and beauty of her person; yet her figure, even at the hour of her death, was one of matchless elegance. Still mindful of her dignity, of her high birth, and of what she once had been, the unfortunate queen appeared upon the scaffold arrayed in her best and most splendid attire, and her whole conduct throughout the trying scene was marked with the noble bearing and unshaken fortitude of a heroine. Mary never for a moment forgot that she was Queen of Scotland, and she died with a magnanimity worthy of the title.

T.

TANNAHILL, ROBERT, a very popular writer of Scottish songs, was born in Paisley on the 3d of June, 1774. He was the son of James Tannahill, a weaver of silk gauze there, who originally came from Kilmarnock, and Janet Pollock, the daughter of a farmer near Beith. Both parents were much respected for their intelligence and worth; the mother, in particular, was a woman of very general information and exemplary conduct in life. Their family consisted of six sons and one daughter; Robert being the fourth child. At his birth one of his legs was deformed, the foot being considerably bent, and the leg smaller than the other. During his boyhood he was much ashamed of his crooked foot, and took every opportunity, when alone, to try and straighten it with his hand. In this manner, by constant application, he brought it into a proper position; but the leg always continued smaller than its fellow, and to hide this deformity, he generally wore upon it two or more pairs of stockings. The deception succeeded so well, that few of his companions knew that the one leg differed from the other; nor did he suffer much inconvenience from it, being able to join in the dance or afternoon excursion without betraying any lameness, although in long journeys it generally failed him. When at school he began to distinguish himself by writing verses. These were generally upon some odd character about the place, or upon any unusual circumstance that might occur. After school-hours it was customary for the boys to put riddles to each other, or, as they called it, to "speer guesses." Robert usually gave his in rhyme; and a schoolfellow, to whom we are indebted for some of the particulars of this memoir, remembers one of them to this day. It was as follows:—

My colour's brown, my shape's uncouth,
On ilka side I hae a mouth;
And, strange to tell, I will devour
My bulk of meat in half an hour.

This riddle, on being solved, turned out to allude to the big, brown, unshapely nose of a well-known character, who took large quantities of snuff.

From the school, where he was taught to read,

write, and cast accounts, Tannahill was sent to the loom. About this time, the weaving of cotton was introduced into Paisley, and the high wages realized by it induced parents to teach their children the trade at an early age, so that their apprenticeships were generally finished by the time they reached fifteen or sixteen. The flow of money which persons thus so young could command by the exercise of a flourishing handicraft, led to the early marriages for which Paisley was then noted; and no town at the time abounded in more merrymakings, or presented a more gay and thriving community. Education was widely diffused amongst the inhabitants, who were remarkable for the intelligent and active interest they took in public affairs. The weaving population could always afford a weekly half-holiday for cultivating their gardens or rambling into the country. Tannahill participated in the general prosperity. Dancing parties and rural excursions were frequent among the young people of both sexes, and in these he often joined. He then formed many of those poetical attachments which he afterwards celebrated in song. It was in such meetings, and such excursions, that he first saw "Jessie the Flower o' Dumblane,"—first heard the song of the "mavis" from the "Wood of Craigielee,"—and first breathed the fragrant "broom" of the "Braes o' Gleniffer."

While at work it was his custom to occupy his mind with the composition of verses. To his loom he attached a sort of writing-desk, by which he was enabled, in the midst of his labours, to jot down any lines that might occur to him, without rising from his seat. In this way some of his best songs were composed. He had a correct ear for music, and played the flute well; and whenever a tune greatly

¹ It disturbs the fancy to know, that, although Tannahill wrote all his love-songs under the inspiration of some particular object, in this case the girl was neither a Jessie, nor was she from Dumblane. The words were originally written to supplant the old doggerel song, "Bob o' Dumblane,"—hence the title. Tannahill never was in Dumblane—never, indeed, beyond the Forth—and knew no person belonging to Dumblane; yet the guards of coaches and others hesitate not to point out the very house in Dumblane in which Jessie was born.

JOHN HENRY LAMARTINE
1800-1870

pleased him, it was his ambition to give it appropriate words of his own. It has been said in most of the notices of his life, that from his fourteenth to his twenty-fourth year, he wholly neglected the muse; but this is a mistake. He seldom allowed many days to pass without composing some song or copy of verses, which it was his custom to read to one or two only of his intimate acquaintances. The first poem of his which appeared in print was in praise of Ferguslee Wood, a wood which was one of his favourite haunts, and which often in the summer evenings rang to the notes of his flute. The lines were sent to a Glasgow periodical, and obtained immediate insertion, accompanied with a request for further favours. This was the more gratifying to the young poet, as in one or two previous endeavours at publication he had been unsuccessful; and from this period he continued, for two or three years afterwards, to send occasional contributions to the Glasgow papers.

After his apprenticeship had expired, he removed to the village of Lochwinnoch, about nine miles from Paisley, where he continued to work at the loom for some time. It may be worth mentioning, that Alexander Wilson, the poet and future American ornithologist, was at this time also weaving in the same village. He was by some years the senior of Tannahill; and the latter, being then unknown to fame, had not the fortitude to seek his acquaintance, although he greatly admired the pieces by which Wilson had already distinguished himself.

About the year 1800 some of the figured loom-work for which Paisley was famed was beginning to be manufactured in England, and it was reported that great wages were to be had there for weaving it. Tempted by the report, or more probably by a desire of seeing the country, Tannahill left Paisley for England, accompanied by a younger brother. They went away without informing their parents, who, they rightly supposed, would have put a stop to the journey, as their circumstances in Paisley were too comfortable to justify a change. They were both at this time in the strength and buoyancy of youth; they were both also of industrious habits, of excellent dispositions, and of modest manners. They travelled mostly on foot, often stepping out of the way to view the curiosities of the country, until they reached Preston, which they had marked as the limit of their journey. They found, however, that nothing but plain work was woven there, and while Robert went forward to Bolton, to inquire after figured work, his brother took lodgings at Preston, in the house of an old woman of the Roman Catholic persuasion. At Bolton Robert found plenty of employment of the desired description: but his brother, notwithstanding the superior wages to be made there, remained at Preston all the time he resided in England, being constrained to do so by the kindness of his old landlady, in whom he found a second mother. The two brothers, though thus separated, did not forget each other. Being much attached, they frequently met half-way between Preston and Bolton, and spent a few hours together: they also frequently wrote home to their parents an account of their welfare. Their stay in England lasted two years, and was only cut short by receiving intelligence of the fatal illness of their father. They hurried home without delay, and arrived in time to receive his dying blessing. After that event they did not choose to return to England. The younger brother married, while Robert took up his abode with his mother, and till his death continued to be a comfort to her. His filial affections were at all times strong, and through life he honourably discharged the duties of an affectionate son.

It may be proper here to advert to a very erroneous

impression which prevails respecting his worldly circumstances. In most of the notices taken of him, he is represented as leading a life of privation, and as fulfilling all that is supposed to be connected with the poet's lot in regard to penury. But so far from this being the case, his means were always above his wants. The house in which his mother resided was her own, and she was not only herself comfortably situated, but was enabled, by indulging in little charities, to add somewhat to the comforts of others. Such, also, was the state of trade at the time, that Robert could command good wages without extreme labour, and though more than one respectable situation, as foreman or overseer, was offered him, he chose to continue at the loom, because by doing so his time was more at his own disposal, and his personal independence greater. He had no wish to accumulate money; but long before his death he lodged twenty pounds in the bank, with the express intention that it should go to defray the expense of his funeral, and this sum was found untouched when his melancholy decease took place—a circumstance which of itself proves the unfounded nature of the reports regarding his poverty and destitution.

Soon after his return from England, he had the good fortune to become acquainted with Mr. R. A. Smith, a gentleman of distinguished talent as a composer, who set to music and arranged some of his finest songs. He also formed an intimacy with several other individuals possessed of good judgment in musical matters, such as Mr. James Barr of Kilbarchan (composer of the tune of "Craigielee"), Mr. Andrew Blaikie, engraver, Paisley, and Mr. James Clark, master of the Argyle band. These gentlemen, and several others, were of service to him, in improving his taste for composition, and in encouraging him in his love of song. His own manners were so retiring, and his reliance on himself so small, that, without the assurances of friendship, he probably would never have been induced to give to the world many of those pieces which have made his name known.

The first edition of his *Poems and Songs* appeared in the year 1807. It was very favourably received by the public, the previous popularity of several of his songs tending to make it sought after. But the author speedily came to regret that he had so prematurely given it to the world. Errors and faults he now detected in it, which had before escaped him, and he began assiduously to correct and rewrite all his pieces, with a view to a second edition. He continued also to add to the number of his songs, and in these reached a high degree of excellence. Some of them, indeed, may be pronounced to be the very perfection of song-writing, so far as that consists in the simple and natural expression of feelings common to all. The extensive popularity which they attained indicates how universally were felt and understood the sentiments which they recorded. It is gratifying to know, that the poet was in some measure a witness of his own success, and lived to hear his songs sung with approbation both in hall and cottage. In a solitary walk, on one occasion, his musings were interrupted by the voice of a country girl in an adjoining field, who was singing by herself a song of his own—

"We'll meet beside the dusky glen, on yon burnside;—"

and he used to say, that he was more pleased at this evidence of his popularity than at any tribute which had ever been paid him.

But his celebrity as a song-writer brought its annoyances. Visitors of every description broke in

upon his daily labours; an adjournment to the tavern was often the result, and acquaintanceships were formed too frequently over the bowl.¹ Tannahill at no time was addicted to liquor; but the facility of his nature prevented him from resisting the intrusions of idle and curious people, and the very character of the pieces for which he was distinguished led to convivialities, for how could the merits of a song be tested without the flowing glass? This was the more to be pitied, as the slightest irregularity injured him. His constitution was never strong. His father, his sister, and three brothers had all died of consumption; and he himself was often troubled with a pain in the chest, which was increased by working too hard. For some time before his lamentable end he was observed frequently to fall into a deep melancholy. His temper became irritable, he was easily agitated, and prone to imagine that his best friends were disposed to injure him. His eyes were observed to sink, his countenance got pale, and his body emaciated. His whole appearance, in short, indicated a breaking up of his mental and bodily powers. The second edition of his poems, which he had prepared for the press, was offered about this time to Mr. Constable of Edinburgh for a very small sum, but was unfortunately declined. This tended still farther to depress him, and he came to the resolution of destroying everything which he had written. All his songs, to the amount of one hundred, many of which had never been printed, and of those printed all had been greatly corrected and amended, he put into the fire; and so anxious was he that no scrap of his should be preserved, he requested his acquaintances to return any manuscript which they had ever got from him. Of the immediate circumstances connected with his death we have received the following account. The day previous to that event he went to Glasgow, and displayed there such unequivocal proofs of mental derangement, that one of his friends upon whom he called, felt it necessary to convoy him back all the way to Paisley, and to apprise his relations of the state of his mind. Alarmed at the intelligence, his brothers, who were married and resided at different parts of the town, hastened to their mother's house, where they found that he had gone to bed, and as it was now late, and he was apparently asleep, they did not choose to disturb him, hoping that by the morning he would be better. About an hour after leaving the house, one of the brothers had occasion to pass the door, and was surprised to find the gate that led to it open. On further investigation, it was found that Robert had risen from bed, and stolen out, shortly after their departure. Search was now made in every direction, and by the gray of the morning, the worst fears of the poet's friends were realized, by the discovery of his coat lying at the side of a pool in the vicinity of Paisley, which pointed out where his body was to be found. This melancholy event happened on the 17th of May, 1810, when he had only reached his thirty-sixth year.

Tannahill's appearance was not indicative of superior endowment. He was small in stature, and in manners diffident almost to bashfulness. In mixed company he seldom joined in general conversation, yet from the interest he manifested in all that was said, his silence was never offensive. Among inti-

mate friends he was open and communicative, and often expressed himself with felicity. His sympathies invariably went with the poor and unfortunate, and perhaps it was the result of his education and position in society that he was jealous of the attentions of the wealthy, and disposed rather to avoid than to court their company. In his disposition he was tender and humane, and extremely attached to his home, his kindred, and his friends. His life was simple and unvaried in its details, but even the uneventful character of his existence renders more striking and more affecting its tragic close. In 1838 an enlarged edition of his poems and songs, with memoirs of the author and of his friend Robert Archibald Smith, by Mr. Philip A. Ramsay, was published in Glasgow.

TASSIE, JAMES. This excellent sculptor, who acquired distinction by his imitations of antique gems, was of humble parentage, and born in the neighbourhood of Glasgow in or about 1735. Although brought up in the mechanical occupation of a country stone-mason, the struggles of a higher genius in the direction of imitative arts were going on within him, which an accidental visit was sufficient to call into action. Having gone to that great saturnalia of the west of Scotland, a fair annually held at Glasgow, with a troop of his companions, he visited the collection of paintings then forming by the brothers Foulis, for the establishment of an academy for the fine arts in that city. This exhibition decided the vague aspirations of James Tassie; he resolved to become a painter, and with that view removed to Glasgow and became a student in the Foulis' Academy, continuing, however, to practise his former mechanical occupation in consequence of his poverty. Finding, however, that he was not likely to secure superior excellence as a painter, or unwilling to be confined to one branch of imitative art, he attempted sculpture, in which he hoped for greater success; and in consequence of this change he went to Dublin in 1766, and for some time found employment as a modeller and sculptor. There he fortunately became acquainted with Dr. Quin, who was making experiments in the beautiful art of imitating engraved gems by means of coloured glass or pastes, and who selected Tassie as his confidential assistant. The latter, after his previous attempts, had now fallen upon the art in which he was best fitted to excel, and he adhered to it until he had secured a reputation which incontestably placed him at the head of his department. It will be seen from this statement that all his previous efforts in painting and statuary had been merely preparatives, and that had he solely adhered to these, he might never have won a higher grade than that of a third-rate artist.

After he had aided Dr. Quin in making extensive improvements in the art of imitating engraved gems, Tassie was advised by his employer to remove to London, and adopt the art as his profession. With this judicious counsel the former complied, and went to London in 1766. His occupation was of a kind that could as yet be only appreciated by few, and although frugal, industrious, and persevering, his diffidence and modesty, however commendable, were not the qualities which carry an adventurer onward in the great struggle of the metropolis. What could an illiterate country mason know about antique cameos? The national jealousy of England, also, against Scotsmen in general, had been intensified into white heat by the Wilkes riots and Bute administration. In coming to London, therefore, poor Tassie had a double amount of the usual difficulties of an unfriended stranger to confront and overcome;

¹ An exception must here be made in favour of Mr. James Hogg, the Ettrick Shepherd, who, much to his own credit and the credit of Tannahill, made a pilgrimage to Paisley, with the express purpose of seeing him. They spent one happy night together, and next morning Tannahill conveyed him half-way on the road to Glasgow. On parting, Tannahill, with tears in his eyes, said, "Farewell! we shall never meet again! Farewell! I shall never see you more!" a prediction which was too truly verified.

and a trying penance of poverty and neglect had to be endured before he could struggle into notice. But he bravely persevered and was successful; and among his earliest patrons in the metropolis were the Society of Arts, who in 1767 awarded him the sum of ten guineas for imitations of ancient onyx. When his reputation was established his productions were in great request; he realized a comfortable income, and the principal cabinets of Europe were opened to his inspection. His carefulness also in preserving his professional reputation showed how well and worthily it had been won. He would allow no imperfect impression to pass from his hands—a precaution all the more necessary, as in consequence of their celebrity, very inferior imitations were introduced into the market under his name.

In 1775 Tassie, who pursued his occupation in Compton Street, Soho, had a collection of 3000 gems ancient and modern, published a catalogue of them, and sold his imitations of them in pastes or sulphur at very moderate prices. But this valuable collection grew so rapidly, that in 1791 it consisted of 15,500 articles, of which he published a new catalogue in two volumes quarto. This work was also something much better than a dry inventory, being compiled by Mr. E. Raspe, who prefixed to it an introduction on the utility of such a collection of works of art, and on the history of engraving upon hard stones, and the imitation of gems by artificial pastes. The volumes were also adorned with a frontispiece, and fifty-seven plates of gems, etched by David Allan. From the introduction of Raspe it also appears that the demand for Tassie's paste imitations of seals and cameos had been largely encouraged by the jewellers, who made them fashionable by setting them in seals, bracelets, rings, and other trinkets. About 1787 or 1788 Tassie received an order from the Empress of Russia for a complete set of his gems; which he executed in a most satisfactory manner, and upon a beautiful white enamel composition, so hard as to strike fire with steel; of such a texture as to take a fine polish, and to show every touch of the artist with the greatest accuracy. His imitations both of ancient and modern gems were in every way facsimiles of the originals: the colouring was the same, and in other cases where this could not be done, such colours were used as might display the works with the best effect. Besides this branch of his art, upon which his highest reputation was established, Tassie displayed considerable talent in modelling small portraits in wax, from which he frequently made pastes. After a life in which he was respected for his piety, simplicity, modesty, and benevolence, as well as for his professional talents and beautiful productions, he died in 1799.

TAYLOR, JAMES, whose name must ever bear a conspicuous and honourable place in the history of the invention of steam navigation, was born, May 3, 1758, at the village of Leadhills, in Lanarkshire, and received the rudiments of his education at the academy of Closeburn. After fitting himself to enter the medical profession, he was engaged, in the year 1785, by Mr. Patrick Miller of Dalswinton, to superintend the education of the two sons of that gentleman who were in attendance at the university of Edinburgh. It was also the aim of Mr. Miller that Mr. Taylor, whose scientific acquirements had been warmly spoken of by the common friend who recommended him to the situation, should assist him in those mechanical pursuits with which for some years he had been in the habit of amusing his leisure hours. In the year just mentioned Mr. Miller was engaged in a series of operations for applying paddle-wheels

to vessels, rather with a view to extricating them from perilous situations against the impulse of wind and tide, than with any expectation that such machinery, driven, as he contemplated it to be, by human power alone, could be of use in ordinary navigation. Mr. Taylor entered at once into Mr. Miller's views, and aided in the preparation of a double vessel of sixty feet in length, with intermediate paddles, driven by a capstan, which Mr. Miller tried in the Firth of Forth, in spring, 1787, against a custom-house wherry, which it easily distanced. On this occasion Mr. Taylor became convinced of the utility of the paddles; but observing that the men were much exhausted by their labour, he was equally convinced that a superior mechanical power was wanting, in order to realize the full value of the invention. Having communicated his thoughts to Mr. Miller, he received from that gentleman the following answer:—"I am of the same opinion, and that power is just what I am in search of. My object is to add mechanical aid to the natural power of the wind, to enable vessels to avoid and to extricate themselves from dangerous situations, which they cannot do on their present construction." Invited to co-operate in this object, Mr. Taylor applied himself to the consideration of all the mechanical powers already in common use, but without being able to convince himself of the applicability of any of them. At length the steam-engine presented itself to him; and though he might be naturally supposed to have been himself startled at the boldness of such a thought, he soon convinced himself of its being practicable. On suggesting it to Mr. Miller he found he had excited more astonishment at the novelty than respect for the feasibility of the scheme. Mr. Miller allowed the sufficiency of the power; but was disposed to deny that it could be applied, more particularly in those critical circumstances to obviate which was the chief aim of his own project. "In such cases," said he, "as that disastrous event which happened lately, of the wreck of a whole fleet upon a lee-shore, off the coast of Spain, every fire on board must be extinguished, and of course such an engine could be of no use." Mr. Taylor was not daunted by these objections, but, on the contrary, the more he thought of the project, the more convinced he became of its practicability. He represented to Mr. Miller that, if not applicable to purposes of general navigation, it might at least prove useful on canals and estuaries. After many conversations, the latter gentleman at length conceded so far to Mr. Taylor's suggestion, as to request him to make drawings, for the purpose of showing how the engine could be connected with the paddle-wheels. Mr. Taylor did so, and Mr. Miller, being still farther satisfied, though as yet, it appears, unconvinced, agreed to be at the expense of an experiment, provided it should not amount to a large sum, and that Mr. Taylor should superintend the operations, as he candidly confessed he was a stranger to the use of steam. The two projectors were then at Dalswinton; but it was arranged that, when they should return to Edinburgh in the early part of winter, an engine should be constructed for the purpose. Part of the summer was employed by Mr. Miller in drawing up a narrative of his experiments upon shipping, with a view to its being printed and circulated. This he submitted to Mr. Taylor for the benefit of his correction; and the latter gentleman, observing that no mention had been made of the application of the steam-engine, "I have not done that inadvertently," answered Mr. Miller, "but from a wish not to pledge myself to the public for a thing I may never perform: you know my intentions on that subject are as yet

conditional." Mr. Taylor replied, that he could hardly look upon them in that light, as he was satisfied that any expense which could attach to so small a matter would not prevent him (Mr. Miller) from making the experiment; that he considered the mention of the steam-engine as of importance; and that it could be alluded to in such a manner as to pledge him to nothing. Mr. Miller was convinced, and introduced an allusion to steam, as an agent he might perhaps employ for the propulsion of his vessels. Copies of the paper thus improved were transmitted to the royal family, the ministers, many of the leading members of both houses of parliament, and to all the maritime powers in Europe, besides the president of the United States of America.

In November, 1787, Mr. Miller removed as usual to the capital, and Mr. Taylor, having been empowered by his employer to proceed about the construction of an engine, recommended to Mr. Miller's notice a young man named Symington, who had attempted some alterations upon the steam-engine, and was now residing in Edinburgh for his improvement in mechanics. It was agreed that Symington should form an engine on his own plan, and that the experiment should be made in the ensuing summer upon the lake of Dalswinton. The construction of the engine occupied several months, and was not completed at the conclusion of that session of the university; so that Mr. Taylor was detained in town, to superintend the operations, for some time after his pupils had returned with their father to the country. When all was ready he proceeded with Symington to Dalswinton, where, on the 14th of October, 1788, the experiment was made in the presence of Mr. Miller and a considerable concourse of spectators. The boat was a double one, and the engine, which had a four-inch cylinder, was placed in a frame upon the deck. The experiment was successful beyond the most sanguine wishes of any of the parties concerned. The vessel moved at the rate of five miles an hour, and neither was any awkwardness found in the connection of the engine with the wheels, nor hazard apprehended in any considerable degree from the introduction of a furnace into so inflammable a fabric. The experiment was repeated several times during the course of the few ensuing days, and always with perfect success, inasmuch that the invention became a subject of great local notoriety. An account of the experiments, drawn up by Mr. Taylor, was inserted in the *Dumfries Journal* newspaper, and the event was also noticed in the *Scots Magazine* of the ensuing month.

Mr. Miller now formed the design of covering his own and Mr. Taylor's joint invention by a patent; but, in the first place, it was judged expedient that experiments should be made with a vessel and engine more nearly approaching the common size. For this purpose Mr. Taylor went to the Carron Foundry, with his engineer, Symington, and there, in the summer of 1789, fitted up a vessel of considerable dimensions with an engine, of which the cylinder measured eighteen inches in diameter. In the month of November this was placed on the Forth and Clyde Canal, in the presence of the Carron committee of management, and of the parties chiefly interested. The vessel moved along very smoothly for a space beyond Lock Sixteen, when, on giving the engine full play, the flat boards of the paddles, which had been weakly constructed, began to give way, which put an end to the experiment. The paddles having been reconstructed on a stronger principle, another experiment was made on the 26th of December, when the vessel made easy and uninterrupted progress, at the rate of seven miles an hour. Except in speed

the performances on these occasions were as perfect as any which have since been accomplished by steam vessels. The project was now conceived by all parties to have gone through a sufficient probation, so far as the objects of inland navigation were concerned; and in an account of the latter experiments, drawn up by Mr. (afterwards Lord) Cullen, and published in the Edinburgh newspapers, February, 1790, this view is firmly taken.

On reviewing the expenses of these proceedings, Mr. Miller found considerable cause of chagrin in their amount, which, chiefly in consequence, as he said, of the extravagance of the engineer, greatly exceeded what he had been led to expect. Subsequently he devoted his attention and means to agricultural improvements; and Mr. Taylor could never prevail on him to resume their project. The cultivation of fiorine grass at last took such hold of the mind of Mr. Miller, that, in the belief of Mr. Taylor, no other object on earth could have withdrawn him from it. Mr. Fergusson, younger of Craigdarroch, in 1790, endeavoured, but in vain, to engage the interest of the court of Vienna in the new invention.

The indifference of Mr. Miller, the direction of public attention to the war which soon after commenced, and the unfavourable situation of Mr. Taylor in an inland part of the country, and unable of himself to do anything, conspired to throw the project for several years into abeyance. At length, in 1801, Mr. Symington, who had commenced business at Falkirk, resolved to prosecute a design, in the origination of which he had borne an active and serviceable, though subordinate part. He wished Lord Dundas to employ him to fit up a small experimental steam-vessel, which was tried on the Forth and Clyde Canal, but, causing much disintegration of the banks, was forbidden by the company to be ever set in motion again. This vessel was laid up at Lock Sixteen, where it remained for a number of years. Symington was afterwards in terms with the Duke of Bridgewater for introducing steam navigation on his grace's canal, and Messrs. Miller and Taylor were about to take measures to protect their joint invention from being appropriated by this individual, when the death of the duke, and the abandonment of the scheme, saved them that trouble.

Some time after, Mr. Fulton, from the United States of America, accompanied by Mr. Henry Bell of Glasgow, when on a visit to the Carron works, waited on Mr. Symington, and inspected the boat which he had fitted up for the Forth and Clyde Canal. The consequence was, that, in 1807, the former gentleman launched a steam vessel on the Hudson, and, in 1812, Mr. Bell another upon Clyde, being respectively the first vessels of the kind used for the service of the public in the new and old hemispheres. Thus, after all the primary difficulties of the invention had been overcome—when the bark was ready, as it were, to start from the shore, and waited only for the master to give the word for that purpose—did two individuals, altogether alien to the project, come in and appropriate the honour of launching it into the open sea. Unquestionably, the merit of these individuals in overcoming many practical difficulties, is very considerable; yet it is clear that they were indebted for the idea to the previous inventions and operations of Messrs. Miller and Taylor; and that if the latter gentlemen had, in the one instance, been inclined, and in the other able, to carry their project into effect at the proper time, they would not have been anticipated in this part of the honour, any more than in the suggestion of the paddles and the engine.

It appears that Mr. Taylor by no means sat tamely

by, while Fulton and Bell were reaping the credit due to their labours. Mr. Taylor repeatedly urged Mr. Miller to renewed exertions, though always without success; kept his claims as well as he could before the public eye; and on finding that Mr. Symington had obtained a patent, forced him into an agreement to share the profits, none of which, however, were ever realized. When the vast importance of steam navigation had become fully established, the friends of Mr. Taylor, who was not in prosperous circumstances, urged upon him the propriety of laying his claims before the government, and soliciting a reward suitable to the magnitude and importance of the discovery. At last, in 1824, he was induced to draw up a statement of his concern in the invention of steam navigation, which he printed and addressed to Sir Henry Parnell, chairman of a select committee of the House of Commons upon steam-boats. He hoped that this narrative might be the means of obtaining from the government some remuneration for the incalculable services he had performed to mankind; but it had no such effect. Bowed down by infirmities and the fruits of a long life of disappointments, this ingenious man died on the 18th of September, 1825, in the sixty-eighth year of his age.

TELFORD, THOMAS, an eminent engineer and constructor of public works, was born about the year 1755, in the parish of Westerkirk in Dumfriesshire. His outset in life was strikingly humble in comparison with its close. He began the world as a working stone-mason in his native parish, and for a long time was only remarkable for the neatness with which he cut the letters upon those frail sepulchral memorials which "teach the rustic moralist to die." His occupation fortunately afforded a greater number of leisure hours than what are usually allowed by such laborious employments, and these young Telford turned to the utmost advantage in his power. Having previously acquired the elements of learning, he spent all his spare time in poring over such volumes as fell within his reach, with no better light in general than what was afforded by the cottage fire. Under these circumstances the powers of his mind took a direction not uncommon among rustic youths; he became a noted rhymster in the homely style of Ramsay and Fergusson, and, while still a very young man, contributed verses to Ruddiman's *Weekly Magazine*, under the unpretending signature of "Eskdale Tam." In one of these compositions, which was addressed to Burns, he sketched his own character, and hinted his own ultimate fate—

Nor pass the tentie curious lad,
Who o'er the ingle hangs his head,
And begs of neighbours books to read:
For hence arise
Thy country's sons, who far are spread,
Baith bold and wise.

Though Mr. Telford afterwards abandoned the thriftless trade of versifying, he is said to have retained through life a strong "frater-feeling" for the corps, which he showed in a particular manner on the death of Burns, in exertions for the benefit of his family. Having proceeded to London in quest of work, he had the good fortune to be employed under Sir William Chambers in the building of Somerset House. Here his merit was soon discovered by the illustrious architect, and he experienced promotion accordingly. We are unable to detail the steps by which he subsequently placed himself at the head of the profession of engineering; but it is allowed on all hands that his elevation was owing solely to his consummate ability and persevering

industry, unless we are to allow a share in the process to the singular candour and integrity which marked every step in his career. His works are so numerous all over the island that there is hardly a county in England, Wales, or Scotland, in which they may not be pointed out. The Menai and Conway bridges, the Caledonian Canal, the St. Katharine's Docks, the Holyhead roads and bridges, the Highland roads and bridges, the Chirke and Pontcysulste aqueducts, the canals in Salop, and great works in that county, of which he was surveyor for more than half a century, are some of the traits of his genius which occur to us, and which will immortalize the name of Thomas Telford.

The Menai Bridge will probably be regarded by the public as the most imperishable monument of Mr. Telford's fame. This bridge, which is on the suspension principle, passes over the Bangor ferry, and connects the counties of Caernarvon and Anglesea. The distance between the two main piers is 570 feet, and the height of the roadway above high-water 102 feet. Seven stone arches connect the land with the two main piers, which rise fifty-three feet above the level of the road, and over the top of which the chains are suspended, each chain being 1714 feet from the fastenings in the rock. The first three-masted vessel passed under the bridge in 1826. Her top-masts were nearly as high as a frigate, but they cleared twelve feet and a half below the centre of the roadway. The suspending power of the chains was calculated at 2016 tons. The total weight of each chain, 121 tons.

The Caledonian Canal is another of Mr. Telford's splendid works, in constructing every part of which, though prodigious difficulties were to be surmounted, he was successful. But even this great work does not redound so much to his credit as the roads throughout the same district. That from Inverness to the county of Sutherland, and through Caithness, made not only, so far as respects its construction but its direction, under Mr. Telford's orders, is superior, in point of line and smoothness, to any part of the road of equal continuous length between London and Inverness. This is a remarkable fact, which, from the great difficulties he had to overcome in passing through a rugged, hilly, and mountainous district, incontrovertibly establishes his great skill in the engineering department, as well as in the construction of great public communications.

Mr. Telford was not more remarkable for his great professional abilities than for his sterling worth in private life. His easiness of access, and the playfulness of his disposition, even to the close of life, endeared him to a numerous circle of friends, including all the most distinguished men of his time. For some years before his death he had withdrawn himself in a great measure from professional employment, and amused his leisure by writing a detailed account of the principal works he had planned, and lived to see executed. He died September 9, 1834, in his seventy-ninth year, and was buried in Westminster Abbey.

TENNANT, WILLIAM, LL.D., Professor of Oriental Languages in St. Mary's College, St. Andrews. This most accomplished linguist and excellent poet was born in Anstruther, a royal burgh on the south-eastern coast of Fife, once a town and seaport of great commercial importance in the history of Scotland, but which has now dwindled, in the course of mercantile changes, into a place of little note. He was, however, the fellow-townsmen and contemporary of Dr. Chalmers. He was born in the year 1784. His father, who was a small merchant in Anstruther,

appears to have been a man in straitened circumstances, while in early infancy the future poet and professor, without any original malformation, lost the use of both his feet, and was obliged for life to move upon crutches. Thus desperate from the beginning was his chance of attaining to excellence and distinction. But within that puny frame was lodged a spirit that could wrestle down such obstacles, and grow stronger from the conflict.

In those days it was the custom in Scotland, that whosoever was thought not fit to be anything else, was judged good enough to be a teacher, and destined accordingly; and thus it too often happened that our parochial seminaries were Bethesda pools, surrounded by the lame, the halt, and paralytic, waiting for the friendly hand of patronage to lift them into office when a vacancy occurred. It was not wonderful, therefore, that the poor lame boy was educated with the view of permanently occupying a schoolmaster's chair, instead of *poussing* his fortune by a life of travel and adventure. He was accordingly sent betimes to the schools of his native town, and after he had learned all that they could teach him, he was transferred in 1799 to the university of St. Andrews, with the view of finishing his education. One so fitted to be a linguist by nature, could not fail to make a rapid progress under the prelections of such instructors as Dr. Hunter and Dr. Hill. After having spent two years at the United College, St. Andrews, in the study of the classics, the state of pecuniary affairs at home did not permit him to enjoy the usual curriculum, and he was hastily recalled to Anstruther. In the meantime, however, by the study of two languages, he had acquired the key that could unlock them all, be his circumstances what they might; and of this facility he soon showed himself a ready occupant. Independently of the higher Latin and Greek writers, so seldom mastered at our universities, but with which he became as conversant as with the authors of his own tongue, he ventured upon the study of Hebrew, with no other teachers than a dictionary and grammar, and made such proficiency, that in half a year and three days he read through the whole of the Hebrew Bible. While thus employed in the study of languages at Anstruther, and laying the foundation of his future renown and success, the claims of business called him away to Glasgow in 1803-4, where he was employed as clerk to his brother, a corn-factor in that city; and on the removal of the business to his native town a year after, he continued in the same capacity in Anstruther. While thus exalted upon the high tripod of a counting-house, or haggling with borrel discontented farmers upon the price of *aits* and barley—an admirable specimen of the "pursuit of knowledge under difficulties"—he was making, by his unaided efforts, and in his moments of leisure, such acquisitions as the halls of Oxford or Cambridge would have been proud to have enshrined. Language after language yielded before his onset, whether dead or living, whether barbarous or refined, whether eastern, western, northern, or southern. One startling proof of this desperate indomitable perseverance, as well as peculiar aptitude in acquiring a tongue, was, that in a very few weeks after studying the Gaelic, reckoned the most impracticable of all living languages, he was able to read the whole of the Highland New Testament with ease and fluency.

While William Tennant was thus laudibly occupied, a more than ordinary portion of the cares of life interposed to annoy him. The business of a corn-factor, in which his brother was engaged in Anstruther, was unsuccessful, and became involved in such pecuniary responsibilities, that the principal

found it advisable to make a hasty retreat, leaving poor William, his substitute, to answer in his stead. This the latter did, not only by enduring incarceration, as if he had been the real debtor, but a large amount of obloquy to boot, from those who went in search of the assets of the business, but could not find them. After the innocent scape-goat had sustained his unmerited share of reproach and imprisonment, he was set free, upon which he retired to his father's humble dwelling. He was soon to emerge into the world in a new character. To his remarkable powers of application and abstraction, by which he was enabled to acquire so many languages, he added the higher qualities of taste and imagination, so that the study of poetry and the occupation of verse-making had been alternated with his graver pursuits. He now set himself in earnest to attempt authorship as a poet, and the result was *Anster Fair*, not only the first, but the best of all the productions he has given to the world. Its chances of fame were at first extremely precarious, for it appeared in 1811 in a humble unpretending form, and from the obscure press of an Anstruther publisher. It was thus accessible to few except the peasants and shopkeepers of Fife, who had no fitting relish for such poetical *caviare*; so that, after languishing a year unnoticed, it might have passed into oblivion, but for one of those simple accidents that sometimes arrest a work of merit in downward transit, and restore it to its proper place. Lord Woodhouselee, the accomplished scholar and critic, having seen the little volume, perused it—and to read it was to admire and appreciate. Anxious to know who the author was—for the poem was published anonymously—and to make his merits known to the world, he applied to Mr. Cockburn, the Anstruther publisher, for information, in the following letter:—

"SIR,—I have lately read, with a very high degree of pleasure, a small poetical performance, which, I observe, bears your name as publisher on the title-page. The author of *Anster Fair* cannot long remain concealed. It contains, in my opinion, unequivocal marks of strong original genius, a vein of humour of an uncommon cast, united with a talent for natural description of the most vivid and characteristic species, and, above all, a true feeling of the sublime—forming altogether one of the most pleasing and singular combinations of the different powers of poetry that I have ever met with. Unless the author has very strong reasons for concealing his name, I must own that I should be much gratified by being informed of it.

"ALEX. FRASER TYTLER."

After this *Anster Fair* began to be read in circles where it could be best appreciated, and a criticism in the *Edinburgh Review*, from the discriminating pen of Jeffrey, in 1814, established the character of the poem as one of the most talented and remarkable productions of its kind that had yet appeared. Its merits are thus summed up by the lynx-eyed, accomplished critic: "The great charm of this singular composition consists, no doubt, in the profusion of images and groups which it thrusts upon the fancy, and the crowd, and hurry, and animation with which they are all jostled and driven along; but this, though a very rare merit in any modern production, is entitled perhaps to less distinction than the perpetual sallies and out-breakings of a rich and poetical imagination, by which the homely themes on which the author is professedly employed are constantly ennobled or contrasted, and in which the ardour of a mind evidently fitted for higher tasks is somewhat capriciously expended. It is this frequent kindling of the diviner spirit—this tendency to rise above the trivial subjects among which he has chosen to disport himself, and this

power of connecting grand or beautiful conceptions with the representation of vulgar objects or ludicrous occurrences—that first recommended this poem to our notice, and still seem to us to entitle it to more general notoriety. The author is occupied, no doubt, in general with low matters, and bent upon homely mirth, but his genius soars up every now and then in spite of him; and ‘his delights’—to use a quaint expression of Shakspeare—

—‘his delights
Are dolphin-like, and show their backs above
The element they move in.’”

Thus far the critic. The groundwork which the poet selected for this diversified and gorgeous superstructure was as unpromising as it well could be, for it was the dirty and unpicturesque Loan of Anster; the sports were sack-racing, ass-racing, and a yelling competition of bagpipes; and the chief personages of the tale were Maggie Lauder, a nymph of less than doubtful reputation in the songs and legends of Fife, and Rob the Ranter, a swaggering, deboshed bagpiper, of no better character. All this, however, was amplified into a tale of interest, as well as purified and aggrandized by redeeming touches; so that, while Maggie under his hands became a chaste bride, and Rob the pink of rural yeomanry, Puck, almost as kingly as Oberon himself, and his tiny dame, scarcely less fair than Titania, take a part in the revels. And the exuberant wit that sparkles, effervesces, and bubbles o’er the brim—the mirth and fun, that grow fast and furious as the dancing nimble-footed stanzas proceed—for all this, too, we can find a sufficient cause, not only in the temperament of the poet, but the peculiar circumstances under which the poem was produced. For Tennant himself, although a cripple, so that he could not move except upon crutches, was requisited for the loss by a buoyancy of spirit that bore him more lightly over and through the ills of life than most men. In addition to this, also, it must be remembered that he had been impoverished, imprisoned, and vilified; and that *Anster Fair* was the natural rebound of a happy cheerful spirit, that sought and found within itself a bright and merry world of its own, in which it could revel to the full, undisturbed by debts, duns, writs, empty pockets, and sour malignant gossipred. What were John Doe and Richard Roe compared with Rob the Ranter and his bright-haired Maggie, or with Puck and his little Mab fresh from their imprisonment of mustard-pot and pepper-box. These were circumstances that made him write in such a rattling mirthful strain as he never afterwards reached, when every aid of an honoured and prosperous condition stood obedient beside his learned chair.

As for the mechanical structure of the poem, this too was happily suited to the subject, being as completely out of the beaten track as the tale itself. The following is his own account of it in his original preface: “The poem is written in stanzas of octave rhyme, or the *ottava rima* of the Italians, a measure said to be invented by Boccaccio, and after him employed by Tasso and Ariosto. From these writers it was transferred into English poetry by Fairfax, in his translation of *Jerusalem Delivered*, but since his days has been by our poets, perhaps, too little cultivated. The stanza of Fairfax is here shut with the ‘Alexandrine’ of Spenser, that its close may be more full and sounding.” It was not the least of Tennant’s poetical achievements, that he restored this long-neglected stanza into full use in English poetry. It was adopted by Lord Byron in his *Beppo* and *Don Juan*, and has since been followed by a whole host of imitators, both in the serious and comic strain.

As it was not by poetry, however, that William

Tennant meant to live, he set himself in earnest to the humble and laborious but less precarious occupation of a schoolmaster, for which he had been originally designed. In 1813, he was so fortunate as to be appointed teacher of a school in the parish of Denino, a district situated between Anstruther and St. Andrews, and about five miles from the last-named seat of learning. And it speaks not a little for his contented spirit and moderate wishes, that he accepted a situation yielding only £40 a year, at a time when his poetical reputation had obtained a fair start in the race, while his acquirements as a linguist could scarcely have been matched in Scotland. But for the present he was fully content with a quiet little cottage, and access to the stores of St. Andrews College library; and here, without any other teacher than books, he made himself master of the Syriac, Persian, and Arabic languages. From his limited means he also published a second edition of *Anster Fair*, much superior in typography and external appearance to the humble little volume that had first issued from the press of Anstruther. After labouring three years at Denino, where he had little literary society of any kind, except that of Hugh Cleghorn, Esq., of Stravithie, and the minister of the parish, Tennant was promoted to the more lucrative situation of schoolmaster of Lasswade, chiefly through the kind offices of Mr. George Thomson, the friend and correspondent of Burns. Besides the superior means which he now possessed of pursuing his beloved studies, his nearness to the capital and his growing reputation brought him into full intercourse with the distinguished literary society with which Edinburgh at this time abounded, so that, both as linguist and poet, his social spirit found ample gratification. At Lasswade he continued to perform the duties of a parish schoolmaster, when a further rise in office awaited him. The newly established and richly endowed institution of Dollar was in want of a teacher of the classical and oriental languages, and as Tennant’s reputation was now deservedly high, not only for his scholarship, but—what was of far greater importance—his power of making others good scholars as well as himself, he was appointed to this profitable and important charge, in January, 1819. Even yet, however, he had not attained a promotion that was fully adequate to his merits, for in the highest charge which profound and varied scholarship could reach he would have been found the best fitted to occupy it. The opportunity seemed to occur in 1831, when the chair of oriental languages in St. Mary’s College, St. Andrews, became vacant, and Tennant offered himself as candidate for the professorship, and had almost succeeded, his claims and those of his rival, Dr. Scott, minister of Corstorphine, having been for some time doubtfully deliberated by the crown authorities. The latter, however, was preferred, and Tennant continued three years longer at Dollar, when, by the death of Dr. Scott, he was, on the strength of his former competition, appointed to the professorship.

In this way the author of *Anster Fair*, by a series of steps, ascended from the lowest to one of the highest grades of Scottish academical distinction. But while he was thus struggling onward as a teacher, and at every stage adding to his philological acquirements, he did not lose sight of that poetical character through which he had first risen into notice. Some years, therefore, after his Anstruther production, he produced a new poem, entitled *Papistry Storm’d, or the Dingin’ doun o’ the Cathedral*. The subject, as may be guessed, was the demolition of the cathedral of St. Andrews, the metropolitan church of Scotland at the commencement of the Reformation; and in

the style of the narrative he endeavoured to imitate the quaint and vigorous manner of Sir David Lyndesay. But it was not easy for a poet of the 19th century to imitate one who impersonated the very fashion and spirit of the 16th; and therefore it is no wonder that the attempt was a failure. Had there been a "No Popery" cry, or had the poem been published in the present day, the subject, independently of the intrinsic merits of the work, might have forced it into wide though temporary popularity; but as it was, the age had not yet got reconciled to the demolition of the stately strongholds of Antichrist, and therefore his *Dingin' down o' the Cathedral* was as complete a downfall as the eversion it tried to commemorate.

The next poetical attempt of Tennant was a poem of the epic character, which he published in 1822, under the title of the *Thane of Fife*, having for its theme the invasion of the east coast of Fife by the Danes in the 9th century, when Constantine, the Scottish king, was slain, and the enemy obtained a footing on the coast of Fifehire, to the great advantage of our fishing villages, and the provision of skate, haddocks, and oysters for the tables of the present generation. But who of our living race could otherwise care for Hungar and his hard-knuckled belligerent Scandinavians, although the poet brought in Odin, the sire of gods and men, and Niord, the god of the winds, to back them? Therefore, although the poem was a very good poem as far as the rules of epic poetry went—even better by half than Sir Richard Blackmore's *Arthur*—and although the correctness of the Runic mythology was such that an ancient Scald would have translated it into a rune without alteration, the *Thane of Fife* was such an utter failure, that it met with less acceptance than its predecessor. Luckily only the first part of the poem, consisting of six cantos, was published; the rest, like the story of *Cambuscan Bold*, or of the *Wondrous Horse of Brass*, remained unsung.

Only a year after the *Thane* (in 1823), Tennant published his "*Cardinal Beaton*, a Tragedy in Five Acts." This dramatic poem few have read, and of that few not half of the number would greatly care to remember it. The subject itself is a noble one, and the character of the cardinal, that "less than a king, yet greater," was amply fitted to develop the very highest of poetic talent. But, unluckily, the poet, instead of exhibiting this bold bad man with the lofty regal and intellectual qualities which he undoubtedly possessed, has stuck to the sordid and sensual vices with which Beaton was chargeable, and has thus converted him into a mere vulgar incubus. In fact, he has made him talk, not in the elevated language of one to whom high designs, by which Europe itself was to be shaken, were familiar, but rather after the fashion of the vulgar sensualist, who, in the phrase of Knox, "was busie at his compts with Mistris Marion Ogilbie." This was not a picture suited to the improved tastes of the day, and therefore the public would none of *Cardinal Beaton*.

Undeterred by the failure of this attempt in dramatic poetry, Tennant, in 1825, published *John Balioh*, and only added another unit to his failures. His adoption of the "toom tabard" as his hero seemed to intimate that his own wits were run out, and the poem therefore fared as its namesake had done—it was deposed and sent into oblivion. The public now wondered, and well it might, that the rich promise given in *Auster Fair* had been so poorly redeemed. What had become of that ungovernable wit that had burst its bounds, and overflowed in such profusion? A single stanza of *Rob the Kanter* was worth fifty Baliohs and Beaton's to boot. Fortu-

nately for Tennant's character as a poet, his retirement from the stage was calm and graceful. His last work, which he published in 1845, entitled *Hebrew Dramas, founded on Incidents in Bible History*, and consisting of three dramatic compositions illustrative of characters and events mentioned in the earlier part of the Old Testament, are free of the extravagance and bad taste of his former productions, while they abound in passages of poetical dignity and gracefulness. It will easily be surmised, however, from the foregoing statements, that Tennant would have ranked higher as a poet, had he abandoned poetry altogether after his first fortunate hit. It would seem as if he had either poured out all his poetical genius in this one happy attempt, or dried it up in those verbal studies that occupied him wholly to the last.

As a prose writer, Tennant, like other great masters of languages, never attained any high distinction. It would be too much, indeed, to expect from a man who has acquired a dozen or a score of tongues, that he should possess the same power over the world of thought. Accordingly, although he was a contributor to the *Edinburgh Literary Journal*, his articles, which chiefly consisted of a correspondence with the Ettrick Shepherd about a new metrical version of the Psalms, do not exhibit any peculiar excellence. His prose, indeed, is as stiff and artificial as if it were a translation, leaving the reader to suspect that he could have written it every whit as well in Syriac or Hindostanee. It seemed, indeed, as if in the study of so many languages, he had partly forgot his own.

By a system of rigid economy, which his early condition had probably taught him, Tennant became proprietor of the pleasant villa of Davengrove, near Dollar, where he usually spent the summer months at the close of each college session; and there his library was his world, and his books his chief companions. There, also, his peaceful life passed away, on the 15th of October, 1848, in consequence of a cold of two years' standing, by which his constitution was exhausted.

THOM, JAMES. This wonderful self-taught sculptor, whose productions excited such general interest, was born, we believe, in Ayrshire, and in the year 1799. Such is all that we can ascertain of his early history, except the additional fact that he was brought up to the trade of a mason or stone-cutter, in which humble and laborious occupation he continued unnoticed until he started at once into fame. This was occasioned by his celebrated group of "Tam o' Shanter," where the figures of that well-known legend, as large as life, were chiselled out of the material upon which he had been accustomed to work—the Scotch gray-stone. No sooner was this singular production unveiled to the public gaze, than everyone recognized the likeness of personages who had long been familiar to their thoughts, and who were now thus strangely embodied, as if they had been recalled from the grave. Tam himself, happier than a king—the Souter in the midst of one of his queerest stories—and the "couthie" landlady supplying the materials of still further enjoyment, until it should reach its utmost, and enable "heroic Tam" to encounter and surmount the terrible witches' sabbath that was awaiting him at Alloway Kirk—all these, in feature, expression, figure, attitude, and costume, were so admirably embodied, that each seemed ready to rise up and walk; and so truthfully withal, that in each impersonation the delighted beholder saw an old acquaintance. While such was the fitness of the humblest classes for the task of

criticism, and while such was the manner in which it was expressed, the same approving feelings were uttered by those who were conversant with the highest rules of art, and conversant with the productions of ancient Greece and modern Italy. Here was evidently a kindred genius with Burns himself—one who had expressed in stone what the poet had uttered in words; and the admiration which had been exclusively reserved for the “Ayrshire ploughman,” was now shared by the Ayrshire stone-cutter, who had shown himself such an able and congenial commentator.

Thom having thus attained, by a single stride, to high celebrity, and been recognized as the Canova of humble everyday life, was not allowed to remain idle; orders for statues and groups poured in upon him, which brought him not only fame but fortune; and his productions in gray-stone, the first material in which he had wrought, and to which he still adhered, were eagerly sought, as choice ornaments for princely halls and stately classical gardens. After Mr. Thom had been for some time thus employed in London, he found it necessary to visit America, in consequence of the agent who had been commissioned to exhibit his “Tam o’ Shanter” group and that of “Old Mortality,” by the proprietors of these statues, having made no returns, either in money or report of proceedings. In this pursuit he was partially successful; and having been gratified with his reception by the Americans, he resolved to become a citizen of the United States. In his new adopted country his fame soon became as extensive as in the old, so that his chisel was in frequent demand for copies of those admirable statues upon which his fame had been established. To this, also, he joined the profession of builder and architect; and as his frugality kept pace with his industry, in the course of twelve or fourteen years of his residence in America, he acquired a comfortable competence. He died of consumption, at his lodgings in New York, on the 17th of April, 1850, at the age of fifty-one.

THOM, WILLIAM. This poet of humble life, known by the title of the weaver-poet of Inverurie, was born at Aberdeen in 1799. Even in earliest life his misfortunes, which accompanied him to its close, commenced, for while an infant his leg was crushed under the wheel of a carriage, in consequence of which he became lame. This misfortune not only unfitted him for labours requiring much personal activity or strength, but obliged him to use mechanical appliances of his own contriving for the performance of the heavier parts of handloom occupations. Being the son of a poor widow who could not afford to keep him idle at home, he was placed in a public factory where he was apprenticed for four years, and at the end of that time entered another weaving establishment, where he remained seventeen years. During his apprenticeship, he tells us he “picked up a little reading and writing,” and afterwards commenced the study of Latin; but want of time, and the necessity of supporting his mother, who was becoming frail, soon arrested his progress in classical learning. He was more successful in the study of arithmetic, of which he acquired as much proficiency as might fit him for a better situation, should such await him; in flute-playing, in which he became a tolerable proficient. Such appears to have been the whole of his education, which was chiefly acquired by his own industry; but although his opportunities of intellectual improvement were so scanty and precarious, even the little of his prose writings which he published shows considerable vigour of thought, as well as gracefulness and correctness of language.

Still, however, the opportunities of self-improvement were at a stand, and he could not emerge from the condition of a hard-working loom-weaver. At the age of thirty he married, and while his family was increasing, he, after several removals in the vain hope of bettering his circumstances, at last settled at the village of Newtyle, near Cupar-Angus, in Forfarshire.

It was here that the calamities of William Thom were to commence in earnest. When the great commercial failures in America occurred, the working of more than 6000 looms was stopped in Dundee. This calamity so sorely affected the weavers in Newtyle, that all of them who could migrate left the village, while those who had families only remained from want of the means of removal. But hard was their fate, a heavy week’s work yielding only a return of five shillings of wages. Among these sufferers were poor Thom and his family, whose condition he has thus piteously described: “Imagine a cold spring forenoon. It is eleven o’clock, but our little dwelling shows none of the signs of that time of day. The four children are still asleep. There is a bed-cover hung before the window to keep all within as much like night as possible; and the mother sits beside the beds of her children to lull them back to sleep whenever any shows an inclination to awake. For this there is a cause, for our weekly five shillings have not come as expected, and the only food in the house consists of a handful of oatmeal saved from the supper of last night. Our fuel is also exhausted. My wife and I were conversing in sunken whispers about making an attempt to cook the handful of meal, when the youngest child awoke beyond its mother’s power to hush it again to sleep, and then fell a whimpering, and finally broke out in a steady scream, which, of course, rendered it impossible any longer to keep the rest in a state of unconsciousness. Face after face spring up, each with one consent exclaiming, ‘Oh, mother, mother, gie me a piece!’ How weak a word is sorrow to apply to the feelings of myself and wife during the remainder of that dreary forenoon!”

In this state the family lingered through the spring, in the vain hope that matters would mend; and finding that their strength would soon be too exhausted for flight, Thom resolved with his wife and children to go forth either as homeless wanderers, or in quest of some other residence, and trust the while to the chances of the highway. For this purpose he pawned at Dundee the last and most valued relic of his better days, on which he raised ten shillings; and laying out four shillings on the contents of a “pack,” which his wife was to carry, and other four on second-hand books, which were to be his own stock in trade (and which proved unsaleable), he and his famished household in 1837 departed on their do-or-die pilgrimage, where a dinner, or a ditch for a grave, might be the alternative. And seldom has such a piteous quest been more pathetically detailed than in the description which he has left of it. The weather was bleak and inclement; the mother, besides having an infant at her breast, frequently had to carry the youngest boy also, while the father had to look out for their sustenance during the day, or accommodation for the night. And need it be added, that the first was both scanty and precarious, and the last often denied them? Amidst these privations the poor infant died, and the diminished family continued on their route to Errol, and afterwards to Methven, finding shelter at nights in the wretched houses of “tramps,” where wanderers of every shade of poverty and crime—the sweepings of the highway—were huddled together. Finding by the time he had reached

Methven that his peddler's wares were not in request, Thom at last humbled himself into the grade of a mendicant musician, consoling his wounded pride with the thought that Homer had sung his epics for a morsel of bread, and Goldsmith piped his way over half the Continent. His flute was accordingly disinterred from the budget, and at evening, in the outskirts of the town, he commenced his new vocation, which he found somewhat more profitable than peddling. Thus encouraged, he improved upon his scheme by wedding music to voice, and after sundry excogitations by waysides and in barns produced the following stanzas, of which he sent a printed copy into the houses before which he played:—

TO MY FLUTE.

'Tis nae to harp, to lyre, nor lute,
I ettle now to sing;
To thee alane, my lo'esome flute
This hamely strain I bring.
Oh! let us flee on memory's wing
O'er twice ten winters flee,
An try ance mair that ae sweet spring
Whilk young love breathen in thee.

Companion o' my happy then,
Wi' smilin' frien's around,
In ilka but, in ilka ben,
A couthe welcome found—
Ere yet thy master proved the wound
That ne'er gaed skaitless by;
That gies to flutes their safest sound,
To hearts their saddest sigh.

Since then, my bairns hae danced to thee,
To thee my Jean has sung;
And mony a night in guiltless glee,
Our hearty hallan rung.
But noo, wi' hardship worn and wrung,
I'll roam the world about;
For her, and for her friendless young,
Come forth, my faithful flute!

Your artless notes may win the ear
That wadna hear me speak,
And for your sake that pity spare,
My full heart couldna seek.
And whan the winter's cranreuch bleak
Drives houseless bodies in,
We'll aiblings get the ingle-check
A' for your lightsome din.

Although the wandering musician was thus elevated into a genuine bard, and the addition of poetry to his music brought him an increase of pence, Thom grew sick of what he considered to be mere beggar's work, and on reaching Aberdeen he sat down once more to the loom. Finding more profitable occupation at Inverurie, he in the following year removed to that village, where, nine months afterwards, Jean, the affectionate partner of his wanderings, died, in consequence of the fatigues and privations she had undergone. A lull in his occupation having occurred, he employed his leisure time in writing verses; and having sent a poem entitled the "Blind Boy's Pranks, No. 1," to the *Aberdeen Herald*, he was delighted to find it copied from that print into most of the newspapers in the kingdom. Still, however, he was without work, and he and his family, now reduced to their last meal, had no prospect but the house of refuge, or a fresh pilgrimage in quest of a new home, when he was gratified by a highly flattering letter from Mr. Gordon of Knockespock, a gentleman in the neighbourhood, who not only admired his poem of the "Blind Boy's Pranks," but sent him immediate relief, and undertook to patronize him. And now occurred a change sufficient to overturn a poor poet's brain. Through the kindness of Mr. Gordon William Thom was carried to London, introduced to fashionable and intellectual society as a poet of Heaven's own making, and for four months was whirled about the metropolis and other parts of England as a second Burns whom men should welcome and worship. The public was soon cured of

the temporary fever, but not so poor Thom, and although he returned to Scotland and his loom it was no longer as the man he had been. To dissipation of mind intemperate habits were added, and although he published at Aberdeen a small volume of poems entitled *Rhymes and Recollections of a Hand-loom Weaver*, it met with a neglect from which its merits might have saved it. He married a second wife, was often exposed to even worse destitution than he had previously encountered, and at last he died in great poverty in March, 1850. His wife died in the following July, and a subscription of about £250 was raised for the support of his destitute children.

Such is the brief but melancholy record of the poetical weaver of Inverurie. The flattery that aided in accomplishing his ruin can no longer assert that he was a first-rate poet, or even one of the second class. Still, his merits of themselves were considerable, and viewed in reference to his position and opportunities, were absolutely wonderful. His poetry displays an elevated and well-regulated imagination, with a happy command of language and melody of versification; and instead of aiming at themes too high for him, he confined himself to those with which he was best acquainted—the fireside virtues, and the sorrows and sufferings of the poor. His little volume of *Rhymes and Recollections* is an evidence of the power that was in him, and a promise of what in happier circumstances he might have been able to accomplish.

THOMSON, ANDREW, D.D., an eminent modern divine and leader in the national church-courts, was born at Sanquhar, in Dumfriesshire, July 11, 1779. His father, Dr. John Thomson, was originally minister of Sanquhar, afterwards of Markinch in Fife, and lastly one of the ministers of Edinburgh. In early life the subject of this memoir exhibited no indications of those singular talents which afterwards distinguished him; and he was several years at college before he discovered any predilection for that profession of which he was destined to become so great an ornament, or felt the influence of that spirit which is so necessary for its effectual exercise. The precise period when he first turned his attention to the ministry is not known; but in 1802 he was licensed to preach the gospel by the presbytery of Kelso; and on the 11th of March of the same year, was ordained minister of the parish of Sprouston: shortly after which he married, and, by a happy union, added greatly to his felicity.

Though Dr. Thomson's earlier years presented no indications of those powerful talents which raised him, in more advanced life, to a high place amongst the eminent men of his country and time, he had not long occupied the pulpit before these talents became conspicuous. During his ministry at Sprouston he was distinguished by that unbending integrity of character, that zeal in the sacred cause to which he had devoted his life, and that vigorous eloquence which procured him so high a reputation in the elevated sphere in which he was afterwards placed. Dr. Thomson now, also, began to take an active part in the business of the church-courts of which he was a member; and further aided the interests of religion by publishing a *Catechism on the Lord's Supper*, which subsequently passed through many editions, and has proved eminently beneficial and useful.

In 1808 Dr. Thomson was removed to the East Church of Perth, where he laboured assiduously and successfully till the spring of 1810, when he received a presentation from the magistrates and council of Edinburgh to the New Grayfriars' Church in that

city. He was now in a situation where his singular talents could be fully appreciated, and where they had a field wide enough for their exercise: of these advantages he did not fail to avail himself. He applied himself to the discharge of his sacred duties with redoubled ardour, and with a vigour and activity, both of body and mind, that at once procured him an extraordinary share of public admiration. His powerful eloquence and fearless character pointed him out as no ordinary man, and made an impression on the public mind which has but few parallels in the history of ministerial labours. Indefatigable and zealous in a singular degree, he left no hour unemployed and no means untried to forward the good work in which he was engaged. He laboured incessantly; and such was the vigour and grasp of his comprehensive mind, and the versatility as well as brilliancy of his talents, that he could, at one and the same time, bring the most various and wholly different means to bear upon the one great end which he had in view—the spiritual and temporal happiness of mankind. To the discussion of every variety of subject within the sphere of his calling, he came alike prepared, and on each shed the strong light of his powerful intellect, exciting the admiration of all who heard him by his manly eloquence, and convincing most, it is to be hoped, by the force of his reasoning.

Among the other means to which Dr. Thomson had recourse to promote the interests of religion, was the publication of a periodical work entitled the *Christian Instructor*. This work he commenced, with the assistance of several of his clerical brethren, a few months after his settlement in Edinburgh; and for many years he discharged the duties of its editor, besides contributing largely to the work itself. It is almost unnecessary to add, after what has been said of Dr. Thomson, that the *Christian Instructor* is a work of singular merit, and altogether, perhaps, one of the ablest of the kind which the cause of Christianity has produced.

Dr. Thomson's literary labours were not, however, confined at this period to the *Christian Instructor*. He contributed, besides, many valuable articles to the *Edinburgh Encyclopedia*; all of which are distinguished by that nervous style and accuracy of conception which so peculiarly belonged to their author.

The extraordinary merits of Dr. Thomson had early forced themselves on the public notice; but they were now become so obvious and incontestable, as to engross a very large share of the public attention, and to form a subject of its consideration. The result of this general feeling was, his appointment to St. George's Church, which took place on the 16th of June, 1814; one of the most important and dignified charges in the Church of Scotland. In this conspicuous situation he rapidly extended his reputation, and increased the number of his friends; and ultimately acquired an influence over his congregation, composed of the most influential persons in the metropolis, which few preachers have ever enjoyed. Previously to his appointment to St. George's, Dr. Thomson had not been in the habit of writing out his discourses. He trusted to the natural promptness with which his ideas presented and arranged themselves, and to the remarkable fluency of expression with which he was gifted; and these did not fail him: but he now thought it advisable, as he was to preach to a more refined class of persons, to secure more correctness for his discourses, by committing them to paper before delivering them from the pulpit. And in the pursuance of this resolution he weekly composed and wrote two sermons, and this in the midst of other avocations which alone would

have occupied all the time of any man of less bodily and mental activity than he was possessed of.

To the ordinary duties of the Sunday Dr. Thomson added the practice of catechising the young persons of his congregation, devoting to this exercise the interval between the forenoon and afternoon services. He also held week-day meetings in the church, for the purpose of instructing in the principles of religion, as they are taught in the *Shorter Catechism*; and to complete the system of moral and religious culture which his unwearying zeal had planned out, he instituted a week-day school for the benefit of those of his young parishioners whose circumstances either prevented their attending church, or rendered a greater extent of tuition necessary than he could afford to bestow on Sunday. But he did still more than merely institute this little seminary. He compiled suitable books for the different classes it comprised, and crowned the good work by acting himself as their teacher—as the teacher of the poorest and humblest of his flock.

With all this devotion to the higher and more important duties of his sacred office, Dr. Thomson did not neglect those of a minor character. Amongst these, church-music had an especial share of his attention. Together with his other rare endowments, he possessed an exquisite ear and taste for music, and not only introduced an improved psalmody into the Scottish church, but added to it several eminently beautiful compositions of his own. Admirable as Dr. Thomson was in all his relations to his flock, he was in none more so than in that of the personal friend, the soother of affliction, and the alleviator of domestic misery. His private labours of this kind were very great, and eminently successful. His presence never failed to excite a new feeling of animation, nor his words to inspire hope. To the sick and the bereaved his visits were peculiarly acceptable, for his manner and his language were kind, and soothing, and conciliating, in a remarkable degree: and although these could not always lessen pain, they never missed of reconciling the sufferer to that which was inevitable.

Besides thus faithfully and laboriously discharging the various important duties of his office, Dr. Thomson took an active part in all the church-judicatories of which he was a member. In these his singular talents and high character, as might be expected, always secured for him the first place, and at length acquired for him the distinction, conceded silently but spontaneously, of being considered the leader of the Evangelical party in the church to which he had attached himself. Amongst the other characteristics of that party, was a strong feeling of hostility to the system of patronage; and to this feeling Dr. Thomson gave utterance in the General Assembly, on several occasions, in a strain of eloquence and with a power of reasoning that will not soon be forgotten.

Although a zealous member of the Church of Scotland, and strongly attached to her institutions, Dr. Thomson's liberal and enlightened mind kept him entirely aloof from anything approaching to bigotry. With dissenters of all descriptions he maintained a friendly understanding. He made every allowance for difference of opinion on points of comparatively inferior importance; and, when he was satisfied that a genuine spirit of Christianity existed, never allowed such difference of opinion to disturb that harmony which he wisely and benevolently conceived ought to exist between those who, after all, laboured in the same vineyard, and to obtain the same end.

Ever ready to lend his powerful aid to all rational schemes for promoting the interests of religion and

extending its sacred influence, he eagerly enrolled himself amongst the supporters of the British and Foreign Bible Society; and while that society adhered to the principles which were laid down at its institution, he continued to take a warm interest in its affairs, and laboured with tongue and pen to secure success to its efforts. On the departure, however, of this society from one of the leading conditions by which it was understood it should be regulated, namely, that the copies of the Bible which it issued should be purely scriptural, and unaccompanied by note or comment of any kind, Dr. Thomson felt himself called upon, as a minister of the gospel, not only to withdraw his support from it, but to oppose, by every means in his power, the continuance of a system so injurious to the best interests of religion. Into the well-known controversy which ensued, and which has been called "the Apocrypha Controversy," he entered with all his characteristic zeal; and so effectually employed his powerful talents during its progress, that his enemies, whatever cause they may have found for rejoicing in the issue, could find but little in the circumstance of having provoked his resentment.

The last great public effort of Dr. Thomson was in behalf of the slaves in our West India colonies; and in the prosecution of this humane and philanthropic work, he, on several occasions, made displays of oratory which have been seldom equalled, and still seldomer surpassed. He demanded immediate emancipation, and supported this demand with an eloquence and power of reasoning which were altogether overpowering.

These mighty labours and unceasing exertions in the causes of religion and philanthropy, were destined, however, to come to a premature termination. Dr. Thomson's constitution was naturally strong, and in person he was robust and athletic; but unremitting study, and incessant toil of both body and mind, had their usual effects. His health was impaired; and for some time before his death, a secret sensation gave him warning that that event would take place soon, and suddenly. The fulfilment of this melancholy anticipation took place on the 9th of February, 1831. On that day he appeared in his usual health, and went through the ordinary routine of business with his accustomed activity and energy, taking the same interest in everything that came under his consideration as he had been accustomed to do; and altogether presenting nothing, in either manner or appearance, to indicate the near approach of that catastrophe which was to deprive religion and morality of one of their ablest supports, and society of one of its brightest ornaments. Having completed the out-door business of the day, Dr. Thomson returned home about five o'clock in the afternoon, and while standing on the threshold of his own door, just previous to his entering the house, he suddenly fell down, and expired without a struggle or a groan. His remains were interred in St. Cuthbert's Churchyard; and if anything were wanting to impress those who have only read or heard of him with a full conception of the estimation in which he was held by all ranks and denominations in the metropolis, it would be found in a description of his funeral,—the most numerously attended, perhaps, that had ever been witnessed in the Scottish capital. Dr. Thomson's literary labours exhibit a long array of religious works of various descriptions, including lectures, sermons, and addresses. To these there is to be added a volume of posthumous *Sermons and Sacramental Exhortations*, published in Edinburgh in the same year in which he died, with a memoir of the author prefixed.

THOMSON, ANTHONY TODD, M.D. This distinguished medical practitioner and teacher of medical science was born at Edinburgh, on the 7th of January, 1778. His father, a Scotsman, had settled in America, and held two lucrative appointments under the British government, being postmaster-general for the province of Georgia, and collector of customs for the town of Savannah. But on the breaking out of the revolt of the transatlantic colonies, he refused to take the oath of allegiance to the American government, and was in consequence obliged to relinquish his offices and return to Edinburgh. Previous to his return Anthony was born at that city, while his mother was there upon a visit.

After the usual education of early boyhood, Anthony was enrolled a pupil in the high-school of Edinburgh, and here he formed an intimacy with Henry (afterwards Lord) Cockburn, which he continued to the end of his days. His father had intended him for a life of active business, but his own inclinations had always been for medical studies; and having obtained a clerkship in the post-office, he was enabled to gratify his wishes. At the university he attended the classes of Munro, Gregory, Black, and Dugald Stewart; and having in 1798 become a member of the Speculative Society, at that time the nursery of some of the best intellects of Scotland, he there established an acquaintanceship with Jeffrey, Horner, Brougham, and Lord Lansdowne. This combination of literary friendships and studies, with his application to the science of medicine, could not fail to produce an effect upon his subsequent career, so that while he was eminent in his own profession, he also distinguished himself in the walks of science and literature.

In 1799 Thomson became a member of the Royal Medical Society, and in the same year he graduated. Having selected London as his place of occupation, he removed thither about the year 1800, and commenced his profession as a general practitioner in Sloane Street, Chelsea. His progress at first was slow, as might have been expected in so young a physician; but he waited and persevered until occupation came, after which the tide continued without interruption to the end of his life. His course was one of active practice intermixed with extensive literary and scientific authorship, and perhaps can be best given in chronological order.

When he had been about ten years in the metropolis, and had secured a considerable practice, Dr. Todd Thomson published in 1810 his *Conspectus Pharmacopæie*. The fate of this work was not unusual in authorship. He sold the copyright of it for twenty pounds, but it has gone through fourteen editions, and was purchased by the Messrs. Longman in 1833 for £200. In 1811 he published the *London Dispensatory*, a work of great labour and research, giving a critical account of all the medicines and their compounds which were in use in Great Britain. This work was so highly valued that it has been translated into several languages, while in England it has gone through ten editions. In his extensive researches into the *materia medica*, he perceived the necessity and uses of a knowledge of botany, and having mastered this science, he delivered in London a course of lectures on the subject, and in 1821 published a first volume of his *Lectures on Botany*, a work containing many valuable observations on the structures and functions of plants—a department of the subject which has since become an important part of the study of botany. In his botanical investigations he also introduced an extensive use of the microscope, a valuable aid which his example brought into general practice in the study

of the science. In 1826 he became a member of the Royal College of Physicians of London, and commenced practice as a consulting physician.

Having so high a professional reputation both as an author and practitioner, his appointment to some correspondent office appeared so certain as only to depend upon the first that might fall vacant. This was decided by his election to the chair of *materia medica* in the newly-established London University, now the University College, in which situation he applied himself with great ardour to the subject of therapeutics, and was one of the first to introduce the new substances discovered by chemistry into medical practice. He also collected a valuable private museum of specimens of *materia medica*, which after his death the college unfortunately had not the means to purchase, so that it was unfortunately neglected, and finally dispersed. In 1832 Dr. A. T. Thomson was appointed professor of medical jurisprudence, and his lectures in this department were published in the *Lancet* in 1836-37. In 1832 he published his *Elements of Materia Medica*, a work more ample and accurate than his *London Dispensatory*, and entering more fully into the subject of therapeutics, which at the time of his death had passed through three editions. In 1839 he edited *Bateman on Cutaneous Diseases*; and until disabled by his last illness he was employed in preparing a *Practical Treatise on Diseases affecting the Skin*, a work which he did not live to finish, but which was completed and edited by Dr. Parkes.

The foregoing list of publications is still insufficient to give a full idea of the varied talents and intellectual industry of Professor Thomson. His was a life in which every day had its work, and in authorship his principal relief amidst grave professional subjects was only a transition into the lighter departments of literature, so that he was frequently a contributor, and a valued one, to the principal reviews and magazines. He translated from the French and edited a work by M. Salvarte, entitled the *Philosophy of Magic, Omens, and Apparent Miracles*, which he also largely illustrated with notes both curious and interesting. He edited an edition of Thomson's *Seasons*, to which he appended copious notes and a life of the author. He contributed many articles to the *Cyclopædia of Practical Medicine*, and was for many years editor of the *Medical Repository*. One of his last works was entitled *Domestic Management of the Sick-Room*, which has gone through several editions. In 1848, when he had now reached the general terminus of human life, the age of three-score and ten years, the health of Professor Todd Thomson first began to fail, but he still continued his lectures, although with occasional interruptions, until the following summer, when he was obliged to retire into the country. He died at Ealing, of bronchitis, on the 3d of July, 1849.

Professor Thomson was married, and happily to one whose literary tastes and habits were similar to his own, while the subjects were so different as to occasion no unpleasant collision. The contributions of Mrs. Thomson to literature were various, and occupied a considerable range. Besides being authoress of a considerable number of romances and novels, she published *Memoirs of the Court of Henry VIII.*, 2 vols. 8vo, 1826; *Memoirs of Sarah Duchess of Marlborough*, and *of the Court of Queen Anne*, 2 vols. 8vo, 1839; *Memoirs of the Jacobites of 1715 and 1745*, 3 vols. 8vo, 1845; and *Memoirs of Viscountess Sandon, Mistress of the Robes to Queen Caroline, Consort of George II., including Letters from the most Celebrated Persons of her Time, now first published from their Originals*, 2 vols. 8vo, 1847. Subsequently to these

she published a light, sketchy, popular work called *Recollections of Literary Characters and Celebrated Places*, 2 vols. 8vo. These were a series of articles which originally appeared in *Bentley's Miscellany* and *Fraser's Magazine*, under the signature of a "Middle-aged Man," assumed, as she informs us, "in order that by better disguising myself, I might at that time express myself the more unreservedly."

THOMSON, GEORGE. Independently of the merited reputation he acquired for his successful labours in Scottish music and song, he will go down to posterity as the "friend and correspondent of Burns." In the very brief sketch which he has given of his own life till 1838, written for the *Land of Burns*, a valuable and well-known publication, he states that he was born at Limekilns in Fife, and, as he supposes, about 1759, at least he was so informed; for at the time of writing, although touching on his eightieth year, he found himself so hale and vigorous, that, as he playfully adds, he could scarcely persuade himself that he was so old. His father was a teacher at Limekilns, and afterwards in the town of Banff; and at this latter place George was taught by his parent the elements of education, and afterwards sent to study Latin and Greek at the grammar-school. From Banff his father, who had been struggling for some time in vain for a moderate livelihood, removed to Edinburgh, and here his son, now seventeen years old, soon obtained a situation as clerk in the office of a writer to the signet. In this situation he remained till 1780, when, through the recommendation of Mr. John Home, author of the tragedy of *Douglas*, he was appointed junior clerk to the honourable Board of Trustees, and soon after, on the death of the principal clerk, he was promoted to that vacant office. Here he found himself so comfortable in worldly circumstances, and so highly esteemed by Mr. Robert Arbuthnot, the secretary of the board, and afterwards by Sir William, his son and successor, that he had no desire to risk his present happiness in search of more, and accordingly he continued in this situation until the close of his long and well-spent life. On having thus established himself in comfort, Mr. George Thomson performed what he calls the "wisest act of his life," for at the age of twenty-five he married Miss Miller, daughter of Lieutenant Miller, of the 50th Regiment, a lady who made him the happy father of two sons and four daughters.

The tastes of Thomson from an early period were those that are best qualified to foster such a happy contented spirit. He saw that there were other aims in life than that of seeking adventures, and purer pleasures to be enjoyed than that of making money. In boyhood a love of the beautiful led his heart to the study of music and painting, and these attractive pursuits he continued to cherish in the society of their ablest professors. It was a most unwanted occupation, as some can still remember, for a young lawyer's clerk in the city of Edinburgh, in the latter part of the 18th century; and in Mr. Thomson's case no small amount of devoted enthusiasm must have been required to meet the ridicule of his companions, or resist their invitations, that would have drawn him from his path. But he persevered in his own way, and soon found that the fine arts, like virtue itself, are their own reward. As one of these is generally found sufficient for the final occupation of one man, music obtained the preference, and his retrospections, in old age, of the musical evenings of his early days among those who were of kindred spirit with himself, in some measure serve to redeem even the Edinburgh of that period from its notorious

grossness. "Having studied the violin," he tells us, "it was my custom, after the hours of business, to con over our Scottish melodies, and to devour the choruses of Handel's oratorios, in which, when performed at St. Cecilia's Hall, I generally took a part, along with a few other gentlemen—Mr. Alexander Wight, one of the most eminent counsel at the bar; Mr. Gilbert Innes, of Stow; Mr. John Russel, W.S.; Mr. John Hutton, &c.—it being then not uncommon for grave amateurs to assist at the Cecilia concerts, one of the most interesting and liberal musical institutions that ever existed in Scotland, or, indeed, in any country. I had so much delight in singing those matchless choruses, and in practising the violin quartettos of Pleyel and Haydn, that it was with joy I hailed the hour when, like the young amateur in the good old Scotch song, I could hie me hame to my Cremona, and enjoy Haydn's admirable fancies:—

"I still was pleas'd, where'er I went; and when I was alone
I screw'd my pegs, and pleas'd myself with John o' Baden-
yon."

Although music was his recreation, not his profession, George Thomson could not long content himself with being merely a musical dilettante. Like Burns, he resolved to do something for "puir auld Scotland's sake," in the way that nature and training had best qualified him. Might he not make a national collection of our best melodies and songs, and obtain for them suitable accompaniments? With this patriotic ambition he was inspired by the arrival of that celebrated *musico*, Signor Tenducci, into Scotland—the first *man* of his kind, be it observed, who had ever visited the country, and who brought to Scottish ears a style of singing of which they previously could have little or no conception. The enterprise which Mr. Thomson thus contemplated was one of the most daring and self-denying description. There was the toil of collecting, arranging, and improving to be undergone; there was the expense of publishing such a costly work to be encountered. If it succeeded, there was no hope of profit to be obtained from it, or at least of profit adequate to the toil; and if it failed, he was certain to be buried in the ruin of the downfall, amidst the jeers of those who would wonder that a lawyer should have embarked in such an undertaking. But it was now the great business of his life, and he was ready to stake life itself upon the issue.

At the very commencement of his labour he was confronted by difficulties under which most persons would have succumbed. "On examining with great attention," he says, "the various collections on which I could by any means lay my hands, I found them all more or less exceptionable; a sad mixture of good and evil, the pure and the impure. The melodies in general were without any symphonies to introduce and conclude them; and the accompaniments (for the piano only) meagre and common-place; while the verses united with the melodies were, in a great many instances, coarse and vulgar, the productions of a rude age, and such as could not be tolerated or sung in good society." He first obtained the melodies themselves, both in print and manuscript, and after comparing copies, and hearing them sung by his fair friends, he selected the copy which he found the most simple and beautiful. His next work was to obtain accompaniments to these airs, and symphonies to introduce and conclude them; and for this purpose he applied to Pleyel, at that time at the height of his musical popularity. As the collection grew upon his hands, Thomson found that more extensive aid than that of Pleyel was necessary, and

accordingly, after dividing the numerous airs which he thought worthy of preservation into different portions, he transmitted them to Haydn, Beethoven, Weber, Hummel, and other musicians, at that time the most distinguished in Europe, to whom his commission was a welcome one—for they at once appreciated the beauties of our national melodies, at that time little known beyond the boundary of the Tweed, and composed for them such rich original accompaniments, as have imparted to them all the superiority as well as permanence of an established classical music. It was, indeed, a glorious achievement that made such lifts as the "Broom of the Cowdenknows," "O'er the Muir among the Heather," or "Logan Water," become almost as much at home on the banks of the Seine, the Rhine, or the Dnieper, as they had hitherto been among their native streamlets. From the Grampians to the Himalayas every mountain was thenceforth to re-echo with the music of Scotland.

The poetry, which was the last, was also the greatest of Thomson's difficulties. It was needful that the music, now so beautified and adorned, should be "married to immortal verse;" but where was he to find the Cupid of such a Psyche? Some, indeed, of the old songs were everyway worthy of the music in which they were embodied; but these were so few, that while of the Scottish muse it was too justly said,

"High-kilted was she
As she gaed o'er the sea,"

our worthy countryman felt that in such a trim she could not be allowed to go inland, to provoke the scoff and merriment of proud conceited foreigners. But the hour brought the man—the soul of Scottish song to the body of Scottish melody—the Promethean fire to the beautifully modelled clay. Burns was living, for whose poetry no loveliness or grandeur of music could be too much; and when Thomson, in a happy hour, applied to him for co-operation, and unfolded to him the nature of his work, the great bard threw himself into the undertaking with all his characteristic enthusiasm. It needed but this to make the work perfect, for when has the world ever seen such a song-maker? It needed also a noble occasion like this to make Burns put forth his uttermost, and surpass all that he had as yet accomplished, for by far the choicest of his poetry is certainly to be found in Thomson's collection. The correspondence between the musical lawyer and the poetical ploughman, which extended from 1792 till the death of the latter in 1796, while it is full of wit, vivacity, and hearty patriotic ardour in the good work in which they were engaged, reflects high credit not only upon the critical taste and vigorous intellect of George Thomson, but also upon his affectionate feelings and honourable upright disposition. It is the more necessary to announce this fact, as, after the death of Burns, certain anonymous biographers presumed to state that Thomson, after securing the services of the poet to a large extent, had churlishly and unjustly refused to requite them. A single glance at the correspondence between them, which was published by Dr. Currie, is sufficient to refute this odious calumny, independently of the subsequent attestations of Thomson himself. It will there be seen that the latter, although engaged in so precarious and costly an undertaking, invited the assistance of the bard with offers of a fair remuneration; and that although Burns gladly embarked in the enterprise, he studiously stipulated that his contributions should be accepted gratuitously, or not at all. It will also be seen that after some time Thomson,

impatient at receiving such rich donations without requital, ventured, in the most delicate manner, to transmit to the poet a sum of money, at which the latter was so indignant that he vowed, if the offence was repeated, he would drop the correspondence at once and for ever. It is well known that Burns entertained, among his other peculiarities, such lofty notions of independence as would have stopped all reciprocity in the interchange of favours, and thrown an impassable gulf between giver and receiver, or even debtor and creditor. He would bestow, and that largely and freely, but he would not for an instant stoop to receive; his songs must be considered as either beyond price or not worth purchase. Had he lived in the present day, when genius and poetical inspiration are as marketable as the commodities in the bakehouse or shambles upon which they are nourished; and had he seen, not starveling threadbare authors, but high-born dames and mighty earls, haggling about the price of their productions, and sticking upon a few shillings more or less per sheet, against the calculating and demurring publisher; he would have learned that even poetry has its price, and that a Milton himself might exact it to the last doit, without derogation of his dignity.

Of these matchless contributions which Burns submitted to Thomson, it is enough to state, that during the course of four short years they amounted to more than 120. He also fully empowered Mr. Thomson to make use of all the songs he had written for Johnson's *Scots Musical Museum*. But during the lifetime of Burns only six of his productions appeared in Thomson's collection. On the death of the poet, Mr. Thomson, had he been avaricious, might have turned the rich contributions which he had on hand to his own account, by publishing them as a separate work; for they had been unreservedly given to him, and were his own unquestionable property. But on learning that the poetical works of his friend were about to be republished in behalf of the poet's family, he transmitted the whole of these contributions to Dr. Currie, as well as the correspondence, by which the value of the publication was immeasurably enhanced, and ample profits realized for the bereaved survivors. Little indeed did Burns imagine that such a controversy would ever have been raised; and still less would he have thanked the ill-advised zeal of those who endeavoured to heighten the public sympathy in behalf of his memory by traducing the character of a man whom he had so highly and justly esteemed.

After the completion of his great national work, little remains in the life of George Thomson that is of public interest. He left the Trustees' office in 1838, after a long course of usefulness in that department; and on the September of that year he went to London, where he took up his residence, and afterwards to Brighton. In June, 1845, he returned to Edinburgh, and three years afterwards went again to the British metropolis; but after little more than a year of residence there, he came back at the close of 1849 to the city in which all his early affections were enshrined. He was now so old that it seemed as if the day of his death could not be distant; and as he trod the streets of Edinburgh, now one of the oldest of its inhabitants, he must have felt that this was no longer the world in which he had once lived. But still his cheerfulness was unbroken, and his enjoyment of happiness undiminished, and his letters of this period, written in the regular formal text-like hand of our great grandfathers, are as juvenile and buoyant as his productions of a former century. In this way the "time-honoured" lived till the 16th of February, 1853, when he was gathered to his fathers

after a few days' illness, and with a gentle departure, in which he suffered little pain, and enjoyed the full possession of all his faculties to the last. Independently of his invaluable services to Scottish song, his name will go down to posterity from being associated with that of Burns, whose memory ages will continue to cherish.

THOMSON, JAMES, a celebrated poet, was born September 11, 1700, at Ednam, near Kelso, of which parish his father was minister. Beatrix Trotter, the mother of the poet, was daughter and co-heiress of a small portion of land at Foggo, in Berwickshire, and is described as having been a woman of "a singular fervour of imagination," at the same time that she shone in the domestic and social virtues. The difficulty with which his father supported his family, having nine children, occasioned his removal, in the early childhood of the poet, to the parish of Southdean, in the presbytery of Jedburgh, where the stipend, though not large, was somewhat better than that which he had enjoyed at Ednam. The change was from a low and beautifully ornamented part of the country, and the close neighbourhood of a considerable market-town, to an elevated pastoral district, enlivened only by the slender waters of the Jed, and frequented by few except the lonely angler. In the churchyard of Southdean may yet be seen the humble monument of the father of the poet, with the inscription almost obliterated. The manse in which that individual reared his large family, of whom one was to become so illustrious, was what would now be described as a small thatched cottage.¹ The poet received the rudiments of his education at the school of Jedburgh, and was not distinguished among his youthful companions by remarkable superiority of parts. He was still, however, very young when his talents for writing verses attracted the attention of several respectable individuals in that part of the country. Mr. Riccarton, minister of the neighbouring parish of Hobkirk, and a man of taste and learning, observed and encouraged this talent; and young Thomson was occasionally invited, on account of his promising abilities, to spend his vacations at the country seats of Sir William Bennet of Chesters, Sir Gilbert Elliot of Minto, and Lord Cranstoun. He was so little pleased, however, with the poetry he produced at this early period, that on every new-year's day he burned all that he had composed during the foregoing year. At a proper age he was sent to the university of Edinburgh. According to tradition, a servant of his father conducted him to the capital, seated behind himself on horseback; but such was his reluctance to forsake the country, that he had no sooner been left to himself in the city, than he set out on foot for home, and was back at his father's manse (between fifty and sixty miles distant) as soon as the man and the horse. When his parents remonstrated with him respecting this disobedient conduct, he passionately observed that "he could study as well on the haughs of Sou'den [so Southdean is commonly pronounced] as in Edinburgh."² He was, nevertheless, prevailed upon to commence a course of study in Edinburgh.

In the second year of his attendance at the university, his studies were interrupted by the sudden death of his father. He was summoned home to receive his parent's dying benediction, but came too late. This circumstance contributed to increase his sorrow, and his filial piety was expressed on this mournful

¹ Information supplied by Mr. Richmond, formerly minister of Southdean.

² The editor is obliged for this curious anecdote to Mr. Richmond.

occasion in instances of conduct which his surviving relations afterwards delighted to recollect.

His mother now realized as much as she could from her own little inheritance, and removed with her family to Edinburgh, in order to give them what persons of her rank in Scotland generally consider as the best of all endowments—a good education. James recommenced his studies, and with some reluctance was induced by his friends to enter upon a course of divinity, with the view of applying his talents to the church. After the usual attendance on the professor of theology, he delivered a probationary exercise in the hall; but his diction was so poetically splendid that the professor reproved him for using language unintelligible to a popular audience; which so disgusted him with his theological pursuits that he seems to have, soon after this event, resolved to abandon them. He had already contributed to a poetical volume entitled the *Edinburgh Miscellany*, which was compiled by a society of young aspirants in verse who were attending the college, and among whom was David Mallet. About the same time he acted as tutor to Lord Binning—the son of the sixth Earl of Haddington, and himself a poet; to whom he had probably been introduced by his mother's friend, Lady Grizel Baillie, mother-in-law to his lordship, and whose *Memoirs* possess so much tender interest; who, finding him unlikely to do well in any other pursuit, advised him to try his fortune in London as a poet, and promised him some countenance and assistance. Accordingly, in the autumn of 1725, he took leave of his mother, whom he was never more to behold, and proceeded by sea to London, carrying with him little besides his poem of "Winter." On arriving in the metropolis, he found his way to his college friend Mallet, who then acted as preceptor to the two sons of the Duke of Montrose; he also sought out Mr. Duncan Forbes, afterwards president of the Court of Session, who, having conceived a favourable opinion of his talents in Scotland, was now disposed to promote his views by all means in his power. He was at first in considerable difficulties for the means of subsistence, and is found writing to an ancient friend of his family, the minister of Ancrum, for the loan of twelve pounds, in order to pay off some little debts he had contracted since his arrival in the metropolis, and to procure necessities till he should raise something by the sale of his deceased mother's lands of Whitehope. By the friendly intervention of Mallet, a bookseller named Millar was induced to buy "Winter" at a low price, and it was accordingly published in 1726, with a dedication to Sir Spencer Compton, and several commendatory verses by his friends. Though unnoticed for some time, it gradually attained that estimation which it has ever since maintained, and soon procured for the author the friendship of all the men then distinguished in literature. His acquaintance was sought by Dr. Rundle, afterwards Bishop of Derry, who recommended him to the Lord-chancellor Talbot. In 1727 he published another of his *Seasons*, "Summer," which he at first proposed dedicating to Lord Binning, but eventually, by the disinterested advice of that nobleman, inscribed to Mr. Dodington, afterwards Lord Melcombe, whom Binning thought likely to advance his interest. The same year he gave to the public two more of his productions: *A Poem Sacred to the Memory of Sir Isaac Newton*, who died in that year; and *Britannia*, a poetical invective against the ministry, whom the nation then thought not forward enough in resenting the depredations of the Spaniards. His "Spring," published in 1728, and addressed to the Countess of Hertford, afterwards Duchess of

Somerset, procured him an invitation to pass a summer at Lord Hertford's country-seat. The *Seasons* were not completed by the addition of "Autumn" till 1730, when he published his poems collectively. "Autumn" was addressed to Mr. Onslow.

In the same year he brought upon the stage, at Drury Lane, his tragedy of *Sophonisba*, which raised such expectation that every rehearsal was dignified with a splendid audience, collected to anticipate the delight that was preparing for the public. It was observed, however, that nobody was affected, and that the company rose as from a moral lecture. It was one of the many proofs that dramatic genius is a very different thing from the power of putting in dialogue fine sentiment and poetical description. Not long afterwards, the recommendation of Dr. Rundle caused him to be selected as the travelling associate of the Honourable Mr. Talbot, eldest son of the chancellor, with whom he visited most of the courts and countries of the European continent. Such an opportunity could not fail to be a source of much improvement to one whose mind was well prepared for the observation of the different forms of society, and appearances in external nature. The idea of his poem on *Liberty* suggested itself to him during this tour, and after his return he employed nearly two years in its completion. He was now enabled to pursue his studies at leisure, having been remunerated for his attendance on Mr. Talbot by the place of secretary of the briefs, which was nearly a sinecure. His poem *Liberty* at length appeared, being inscribed to Frederick Prince of Wales, and opening with an affectionate tribute to the memory of Mr. Talbot, who had died during his journey with the poet. Thomson congratulated himself upon this work as the noblest effort of his mind; but it was received with coldness by the public, and has never been so generally read as the rest of his compositions. In reality, a long historical piece in blank-verse, the incidents of which were taken from common reading, was not very likely to prove attractive.

The lord-chancellor soon after died, and Thomson having neglected to apply for a renewal of his place, it was bestowed by the succeeding judge, Lord Hardwicke, upon another. The poet was therefore reduced once more to a dependence on his talents for support. It is creditable to him that while in this painful situation he showed, in his letters to a friend in Edinburgh, an affectionate anxiety to assist the narrow circumstances of his sisters Jean and Elizabeth, who then lived with Mr. Gusthart, one of the ministers of the city. He was introduced, about this time, by Mr. (afterwards Lord) Lyttleton to the Prince of Wales; and being questioned as to the state of his affairs, he answered, "that they were in a more poetical posture than formerly;" which induced the prince to bestow upon him a pension of £100 a year.

In 1738 his second tragedy, entitled *Agamemnon*, was brought upon the stage at Drury Lane. Pope, who had favoured the author when in Italy with a poetical epistle, countenanced the performance on the first night by his presence; and was received in the house with a general clap. It had the fate of most mythological pieces, and was only endured, not favoured. The reception it met with is said to have thrown the author into such a copious perspiration that he found it necessary to change his wig before he could join a party of friends at supper. Another tragedy which he offered to the theatre was *Edward and Eleonora*; but it was prevented from appearing by the lord-chamberlain, on account of its political complexion. In 1740 he wrote, in conjunction with Mallet, the *Masque of Alfred*, which

was performed before the Prince of Wales, at Cliefden House, on the birth-day of the Princess Augusta. In this piece was introduced the song, "Rule Britannia," which has ever since maintained so high a popularity. It is understood to be the composition of Thomson.¹

The most successful of his dramatic compositions, *Tancred and Sigismunda*, was brought out at Drury Lane in 1745: it is still occasionally acted. His poem entitled the *Castle of Indolence*, which had been several years under his polishing hand, and which is perhaps the most perfect and pleasing of all his compositions, was published in 1746. His friend Lord Lyttleton was now in power, and procured him the place of surveyor-general of the Leeward Islands; from which, when his deputy was paid, he received about £300 a year. He did not live long to enjoy this state of comparative independence. He was in the habit of walking from London to his house at Richmond for the sake of exercise. One evening, after he had proceeded a certain distance, being fearful that he would be too late, he took a boat for the remainder of the way, not observing that the dews of the evening, and the cold air of the river, were dangerous to a person whose pores were opened by the perspiration of a hasty walk. The cold which he caught on this occasion terminated in a fever, which carried him off, August 27, 1748, when he had nearly completed the forty-eighth year of his age. He was buried under a plain stone in Richmond Church, where the Earl of Buchan, forty years afterwards, erected a tablet to his memory. A monument, however, had been raised to him at an earlier period in Westminster Abbey. The poet left a tragedy entitled *Coriolanus*, which was brought upon the stage at Covent Garden, in 1749, and realized a considerable sum for the benefit of his relations.

It is as a descriptive poet that Thomson has gained a permanent fame; for all his compositions, except of that kind, have sunk into comparative neglect. His *Seasons* has now kept its place amongst the poetical classics of England for upwards of a century; and still there is no perceptible tendency to decline in its popularity. In reference to this poem Dr. Johnson has written as follows; and no further criticism seems to be necessary:—"As a writer, Thomson is entitled to one praise of the highest kind—his mode of thinking, and of expressing his thoughts, is original. His blank-verse is no more the blank-verse of Milton, or of any other poet, than the rhymes of Prior are the rhymes of Cowley. His numbers, his pauses, his diction, are of his own growth, without transcription, without imitation. He thinks in a peculiar train, and he always thinks as a man of genius: he looks round on nature and on life with the eye which nature only bestows on a poet, the eye that distinguishes, in everything presented to its view, whatever there is on which imagination can delight to be detained, and with a mind that at once comprehends the vast, and attends to the minute. The reader of the *Seasons* wonders that he never saw before what Thomson shows him, and that he never yet felt what Thomson impresses. His descriptions of extended scenes and general effects bring before us the whole magnificence of nature, whether pleasing or dreadful. The gaiety of spring, the splendour of summer, the tranquillity of autumn, and the horrors of winter, take in their

turns possession of the mind. The poet leads us through the appearances of things as they are successively varied by the vicissitudes of the year; and imparts to us so much of his own enthusiasm, that our thoughts expand with his imagery, and kindle with his sentiments. Nor is the naturalist without his share in the entertainment; for he is assisted to recollect and to combine, to arrange his discoveries, and to amplify the sphere of his contemplation."

"Thomson," says Dr. Aikin, "was in person large and ungainly, with a heavy unanimated countenance, and nothing in his appearance or manner in mixed society indicating the man of genius or refinement. He was, however, easy and cheerful with select friends, by whom he was singularly beloved for the kindness of his heart, and his freedom from all the little malignant passions which too often debase the literary character. His benevolence is said to be more ardent than active, for indolence was extremely prevalent in his nature; and though he would readily give to the utmost of his ability, he could not overcome his reluctance to exert himself in doing services. He was fond of indulgences of every kind, and was more attached to the grosser pleasures of sense than the sentimental delicacy of his writings would lead a reader to suppose: but this is a common failing. No poet has deserved more praise for the moral tenor of his works. Undoubted philanthropy, enlarged ideas of the dignity of man, and of his rights; love of virtue, public and private, and of a devotional spirit, narrowed by no views of sect or party, give soul to his verse when not merely descriptive: and no one can rise from the perusal of his pages without melioration of his principles or feelings."

The remark here made as to the attachment of Thomson "to the grosser pleasures of sense" demands some comment. The purity of his writings has been celebrated by Lord Lyttleton, and generally allowed by the world; and excepting the above remark, which is to be traced to the report of Savage to Dr. Johnson, and has not been generally credited, no charge was for a long period laid against the private character of the poet.

In a work published in 1832, under the title of *Records of my Life*, a posthumous autobiography of Mr. John Taylor, the author of the humorous poem of *Monsieur Tonson*, a curious tale is related on the authority of Mr. George Chalmers. "Mr. Chalmers," says Taylor, "had heard that an old housekeeper of Thomson's was alive, and still resided at Richmond. Having determined to write a life of the celebrated poet of his country, he went to Richmond, thinking it possible he might obtain some account of the domestic habits of the poet, and other anecdotes which might impart interest and novelty to his narration. He found that the old housekeeper had a good memory, and was of a communicative turn. She informed him Thomson had been actually married in early life, but that his wife had been taken by him merely for her person, and was so little calculated to be introduced to his great friends, or indeed his friends in general, that he had kept her in a state of obscurity for many years; and when he at last, from some compunctious feelings, required her to come and live with him at Richmond, he still kept her in the same secluded state, so that she appeared to be only one of the old domestics of the family. At length his wife, experiencing little of the attention of a husband, though otherwise provided with everything that could make her easy, if not comfortable, asked his permission to go for a few weeks to visit her own relations in the north. Thomson gave his consent, exacting a promise that she

¹ It appears from the letters published by the Earl of Buchan, that Thomson at this time rented a house at the upper end of Kew Lane; and that the Amanda whom he so frequently celebrated in his verses, was a Miss Young, sister of Mrs. Robertson, wife of the surgeon to the household at Kew.

would not reveal her real situation to any of his or her own family. She agreed; but when she had advanced no farther on her journey than to London she was there taken ill, and in a short time died. The news of her death was immediately conveyed to Thomson, who ordered a decent funeral; and she was buried, as the old housekeeper said, in the churchyard of old Marylebone Church. Mr. Chalmers, who was indefatigable in his inquiries, was not satisfied with the old woman's information, but immediately went and examined the church register; where he found the following entry—"Died, Mary Thomson, a stranger"—in confirmation of the housekeeper's testimony."

There is little, perhaps, in this story to invalidate the commonly received notions as to the worth of Thomson's character; though, allowing it to be true, it certainly is not calculated to elevate him in the estimation of the world. The present writer has, of course, no wish to degrade any of the eminent names of the past; but he thinks it worth while, by way of correcting a piece of literary history, to mention that the Earl of Buchan possessed a poem in Thomson's handwriting, and bearing all the erasures, interpolations, and other peculiarities that could mark the composition as his own, which displayed a marked degree of licentiousness. He has therefore been satisfied that Thomson, though he had the good sense to publish nothing of an impure character, was not incapable of delighting in gross ideas, and composing lines

"——— which dying, he could wish to blot."

THOMSON, REV. JAMES, D.D. This excellent country clergyman, and talented scholar and writer, was born at Crief in Perthshire, in May, 1768. He was the second son of John Thomson and Elizabeth Ewan. His father had been in the wool business; but being unsuccessful he was finally obliged to retire upon a scanty income, which, however, was dutifully augmented by his sons, who among other uses, were thus enabled to turn their superior education to a good account. In his early life James attended the parish school, where he was trained in the usual branches of an English education, accompanied with a tincture of Latin; but the teacher was not only a wrong-headed pedant but an indiscriminate flogger—and one proof of this was the infliction of a severe scourging upon the unlucky James, for accentuating the word "deponent" upon the second syllable instead of the first, as it had issued from the infallible lips of the pedagogue. It took the youth no little labour, after he had left the school, to get rid of the blunders engrafted on his education by such a preceptor.

At the age of sixteen Mr. James Thomson became a student of the university of Edinburgh, and the diligence with which he prosecuted his studies quickly won for him the regards of Professors Hardie and Finlayson, the latter of whom was distinguished by his kindness to deserving young men in the course of their college career. On completing the course prescribed by the laws of the church, James Thomson was licensed to preach, and frequently officiated as assistant to his uncle, the Rev. John Ewan, minister of Whittingham in East Lothian. While thus employed in that county he frequently met with John Home, the author of the tragedy of *Douglas*, in company with Anderson of Whitburgh, and the latter sometimes joked with the poet at his having been a prisoner in the army of the Pretender. There was a tender part, however, in Anderson's history, which afforded a good mark for reprisals. He had been in the "forty-five" a supporter of Prince Charles, and

after the defeat of the Highlanders at Culloden was obliged to betake himself to hidings. While skulking about in this obscure fashion he was apprehended on the suspicion of robbing the mail; and on being carried to prison the jail-birds gathered round him, and asked if he had been committed for high treason—not supposing it possible that one of so respectable an appearance could have condescended to the ordinary crimes of highway robbery or burglary.

When an edition of the *Encyclopædia Britannica* was passing through the press, Mr. James Thomson in 1795 became colleague in the editorship with Dr. (afterwards Bishop) Gleig, in consequence of the vacancy left by the retirement of Bishop Walker from the office. It was a charge well suited to try the abilities of a young man who had only reached the age of twenty-seven. While he was connected with this great national publication he wrote the articles "Thomas Ruddiman," "Scripture," "Septuagint," "Spectre," "Suicide," "Superstition," "Thrashing," "Water," which were all composed in the year 1796. Of these articles, that of "Scripture" was judged so important, that it was republished in several of the subsequent editions, until a wider acquaintance with the science of theology superseded it by a new treatise. Thomson's article, for the day at least, was a very valuable *résumé* of the history of the peculiarities and sources of the books of the Old and New Testaments, and an excellent foundation for the Christian's faith in their authenticity and authority. While editing the *Encyclopædia Britannica* he had a free house, with coal and candle, and £50 a year of regular salary, besides an allowance of £3, 3s. per sheet for the articles of his own writing—but this last was a remuneration which he never claimed. The house which he occupied was the most northerly on the east of the Advocate's Close, the windows looking to the new town. While he was thus supporting himself by literature, until he should change the nominal condition of a probationer for the practical status of a parish minister, Mr. Thomson also edited an edition of the *Spectator*, with biographies prefixed to the contributions of the principal authors; and these biographies are still retained in many reprints of the work. He also wrote a work in 1799 entitled *The Rise, Progress, and Consequences of the New Opinions and Principles lately Introduced into France*, 8vo, a volume which from the time and the paramount importance of the subject, as well as the ability with which it was treated, obtained an extensive sale.

Having become tutor to Stirling of Kippendavie, Mr. Thomson resigned his share in the editorship of the *Encyclopædia Britannica* to his brother Thomas, afterwards Dr. Thomas Thomson, the renowned chemist and professor of chemistry in the university of Glasgow. James, after teaching the boy Latin and arithmetic, had sent him to the grammar-school of Stirling, at that time taught by the distinguished Dr. Doig, author of *Letters on the Savage State*, and opponent of Lord Kames. When the question of school fees was to be settled, Dr. Doig was referred to the elder brother, James, as the person from whom payment was to be obtained; but the generous teacher declared that he would rather wait until Thomas himself had entered into public life, when he was certain to be repaid—a hope which was by no means disappointed. While James resided in Edinburgh, employed in the study of theology and engaged in literary employment, he also attended the medical classes at college; and when the alarms occasioned by the French revolution had culminated in the fear of an invasion, he became a volunteer, and regularly

attended his military duties. It was one of those outbursts of national enthusiasm which occasionally enlist strange recruits into the ranks of soldier citizens. Of one of these Mr. Thomson related an amusing anecdote. The gallant volunteer in question was Dr. Gregory, who belonged to his own corps, but the philosopher was so awkward in the simplest parts of military exercise that Sergeant Gould lost all patience with him, and advised that as he never could be a soldier, he should therefore be made an officer. One day the doctor asked the matter-of-fact sergeant why the left leg was always lifted first in marching? "Because," exclaimed the other in a blaze of loyalty, "because it is his majesty's orders." According to the creed of the day no man had a right to be on the parade-ground who could demur at such a reason. At this time the subject of the present memoir was a member of the Forenoon or Saturday Select Theological Society, and acted as its secretary. He was also a member of the Select Society for General Subjects, which consisted of six gentlemen who afterwards exercised a considerable influence upon the progress of science and literature: these were Dr. John Barclay, Dr. Miller, Mr. James Mill the future historian of India, a gentleman who was afterwards minister of Carlisle, and James and Thomas Thomson. It was by the advice of the latter gentleman, who had commenced as lecturer on chemistry in Edinburgh, that James Mill in the beginning of 1802 was persuaded to try the hazardous career of a life of literature in London, although unpatronized and a stranger, and the new character which the change imparted is worth noticing in a biographical dictionary of eminent Scotsmen. After he had been a few days in the metropolis he thus expressed his feelings in a letter to Dr. Thomas Thomson: "I am extremely ambitious to remain here, which I feel to be so much the best scene for a man of letters, that you can have no notion of it till you be upon the spot. You get an ardour and a spirit of adventurousness which you never can get an idea of among our over-cautious countrymen at home. Here everybody applauds the most romantic scheme you can form. In Scotland everybody represses you if you but propose to step out of the beaten track." Having thus lauded the adventurous spirit imparted to a Scottish heart by a residence of even a few weeks or days in London, James Mill brings the subject to a practical bearing in the following manner: "On the idea of remaining here, I have even formed schemes for you and me already. If you were here, and we had made to ourselves something of a name, which I think we surely might do, what would hinder us to produce a periodical work of our own, of any description we might approve? I am sure we might make it more interesting than anything which is published at present, and the profits of these things, when they have a quick sale, are immense." Dr. Thomson was not likely to yield to such allurements, and he preferred to remain in Scotland: he furnished, however, a letter which introduced Mr. Mill to Dr. Gifford of the *Quarterly*. The result of Mill's enterprising spirit was, that he started the proposed periodical so early as the beginning of the following year, under the title of the "*Literary Journal*, a Review of Literature, Science, Manners, and Politics," which was published weekly at the price of one shilling; and while Mill was the editor and wrote the political and general articles, the scientific part was managed by Dr. Thomas Thomson, and the philosophy of mind and literature by Mr. James Thomson. The editor's satisfaction with the performances of James was thus expressed in a letter to the great chemist: "I am

happy you have got so good a hand to execute our article 'Literature' as your brother, and hope he will not be sparing in his communications. I wish, however, that he would not confine his review to the philosophy of mind, but embrace the whole of the subjects belonging to that article. I do fear the capability of our labourers here." Mr. J. Thomson's first article, entitled the "Philosophy of the Mind," appeared on the 20th of January, 1803, and is thus analyzed by his biographer: "It is characterized by a clear and transparent style, well worthy of being studied by our metaphysical students of the present day, who too frequently cultivate the mystic phraseology without the depth of true philosophy. In this paper he classifies everything belonging to the human mind into two great parts, 1. The powers of thinking, which are generally attended with belief; and, 2. The desires which prompt to action in order to accomplish some end. The first he states had hitherto received no name, and he proposes to term it intellectual philosophy, while the second comprehends moral philosophy."

After continuing his contributions to the *Literary Journal* until 1805, Mr. James Thomson was presented by the crown to the parish of Eccles. His season of probationership had been a long one, but instead of dreaming away its years in fruitless expectation, or repining discontent, he had filled them up with an active, useful, and honourable life of literary labour; and on becoming a minister he threw himself as earnestly into his sacred duties as if he had never been employed in literature, or won for himself a name in it. His studies were now chiefly confined to the Bible and the languages in which it was originally written; and thus he continued for nearly half a century in the investigation of Scripture in its Hebrew and Greek originals, instead of satisfying himself with the interpretations and glosses of commentators. His practice, we are told, "was to rise early in the morning, and master a certain amount of Old Testament Hebrew, and with regard to the New Testament, some years before his death he had completed a translation of the whole of it." Nor was this labour undergone to satisfy a mere literary curiosity, or allowed to remain an inert mass: it was to benefit the souls of his parishioners that he studied, and the profound and new ideas with which he enlightened them were expressed in such clear and simple language that they were unaware of their originality. In the earlier years of his ministry he had been in the practice merely of making notes of the sermons on which he preached; but, latterly, he wrote them out carefully and *in extenso*; and when he obtained an assistant and successor, he employed himself from his eightieth to his eighty-seventh year in revising and rewriting them, many of which in this their finished state he published at great personal expense, in his three volumes on the Gospel of St. Luke, and his volume on the Acts of the Apostles. It is enough to add, that these productions reflected honour in their day upon the theology of Scotland. In 1842 he received the degree of Doctor of Divinity from the university of St. Andrews, and in the same year he was presented with a testimonial of a splendid silver urn by the landowners and parishioners of Eccles. After a long life devoted to his parochial duties and the interests of religion at large, and endeared to all who knew him as the model of a Christian minister and gentleman, Dr. Thomson, in the eightieth year of his age (1847), went to live in Edinburgh, where he remained till 1854, after which he resided with his eldest son in London, where he died on the 28th of December, 1855, in the eighty-eighth year of his age and fifty-first of his ministry.

In 1805 Dr. Thomson married the eldest daughter of Captain James Skene of Aberdeen, second son of George Skene, Esq., of Skene, and with her he lived happily until she died in 1851, being the last of the name of that ancient family in the direct line, and the hereditary estates devolved into the possession of the Earl of Fife, her uncle's grandson. Dr. Thomson had the satisfaction of living to see his family in useful and distinguished offices. The eldest son, Dr. R. D. Thomson, was professor of chemistry at St. Thomas' Hospital, London, and his nephew, Dr. Thomas Thomson, was superintendent of the East India Company's Botanic Gardens at Calcutta, while his second son, James Thomson, Esq., was appointed chairman of the Government Bank of Madras. The following obituary, which appeared in the Scottish newspapers, gave a just sketch of the venerable doctor:—

“The Rev. Dr. Thomson, minister of the parish of Eccles, whose death, at the venerable age of eighty-seven, we announced on Saturday last, was the author of several works of merit. Besides the articles ‘Scripture,’ ‘Superstition,’ and others which he contributed to the earlier editions of the *Encyclopædia Britannica*, he published, within the last few years, three volumes of lectures on St. Luke, and quite recently a volume of lectures on the Acts of the Apostles. . . . Like all Dr. Thomson's writings, they are distinguished by their good sense, simple language, their useful and practical tendency. Dr. Thomson was universally respected and beloved by all who knew him. To a clear and vigorous understanding he added an affectionate heart, and a calmness and placidity of temper not always found in combination with this quality. He was an ardent student, particularly of the Scriptures, with which he had attained to a great acquaintance, and which he regarded with a profound veneration. In the same degree he felt a repugnance to all human dogmas when set up as authorities in religion. Few men, probably, have studied the Sacred Volume with more earnestness, or with greater candour or singleness of aim. Dr. Thomson had great powers of conversation, and was a delightful companion even to the last. He retained much of that politeness which distinguished a bygone generation. He took great delight in witnessing the advancement of knowledge, particularly of biblical knowledge; and he often expressed regret that he should not live to see the vast improvement which it would produce upon the minds and lives of men. But his most striking characteristics, perhaps, were the generous tolerance of his temper and the liberality of his sentiments. Nothing appeared to him more repugnant to Christianity than that bigotry and narrow-minded dogmatism which have been so often claimed as genuine exhalations of its spirit. On the whole, there will be no difference of opinion among those who knew him—that Dr. Thomson was an able, an honest, and a good man. Such clergymen are the best ornaments and the strongest pillars of the churches to which they belong.”

THOMSON, REV. JOHN. The title of the Scottish Claude Lorraine which this reverend candidate for distinction acquired, at once announces the walk in which he excelled, and the progress he attained in it. He was born in Dailly, Ayrshire, on the 1st of September, 1778, and was the fourth and youngest son of the Rev. Thomas Thomson, minister of the parish of Dailly. As he was destined by his father at an early age for the ministry, John's studies in boyhood were directed with a reference to this sacred calling; but already he had unconsciously made a

choice for himself, and such a choice as was little in coincidence with the wonted occupations of a country pastor. Instead of submitting to the drudgery of the school-room and the study, the young boy was to be found a-field, roaming in quest of the beautiful and the picturesque, for which the banks of the Water of Girvan are so justly famed; and to extend these explorations, he frequently rose at two o'clock in a summer morning, and made a journey of miles, that he might watch the effect of sunrise, as it fell upon different portions of the scenery, or played among the foliage with which the cliffs and hill-tops were clothed. What he thus appreciated and admired he was anxious to delineate, and this he did on paste-board, paper, or the walls of the house, while his only materials for painting were the ends of burned sticks or the snuffings of candles. This was by no means the most hopeful of preparations for the ministry, and so he was told by his father, while he was informed at the same time that the pulpit was to be his final destination. John at first stood aghast, and then wept at the intelligence. He was already a painter with all his heart and soul, and how then could he be a minister? He even knelt to the old man, and besought him with tears in his eyes to let him follow out his own favourite bent; but the father in reply only patted the boy's head, bidding him be a good scholar, and go to his Latin lessons. In this way, like many Scottish youths of the period, John Thomson, through mistaken parental zeal, was thrust forward towards that most sacred of offices, for which, at the time at least, he felt no inclination.

As nothing remained for him but submission, the embryo painter yielded to necessity, and in due time was sent to the university of Edinburgh. There, besides the learned languages, he earnestly devoted his attention to the physical sciences, and became a respectable proficient in astronomy, geology, optics, and chemistry. While in Edinburgh he lodged with his brother, Thomas Thomson, afterwards the distinguished antiquarian, who was twelve years his senior, and at that time a candidate for the honours of the bar; and in consequence of this connection John was frequently brought into the company of Walter Scott, Francis Jeffrey, and other rising luminaries of the literary world, who had commenced their public life as Scottish barristers. It was impossible for the young student to mingle in such society without catching its intellectual inspiration; and he showed its effect by the proficiency he made in the different departments of his university curriculum, as well as the acquisition of general knowledge, and his facility in imparting it. Such was his career during the winter months; but when the return of summer released him from attendance on his classes, he showed his prevailing bent by an escape into the country, where the green earth and the blue sky were the volumes on which he delighted to pore. During the last session of his stay at college, he also attended for a month the lessons in drawing of Alexander Nasmyth, the teacher of so many of our Scottish artists, by whose instructions, as well as his own diligent application, he improved himself in the mechanical departments of pictorial art.

Having finished the usual course of theology, John Thomson, at the age of twenty-one, was licensed as a preacher; and his father having died a few months after, he succeeded him as minister of Dailly in 1800. A short time after his settlement as a country clergyman, he married Miss Ramsay, daughter of the Rev. John Ramsay, minister of Kirkmichael, Ayrshire. He had now full inclination (and he took full leisure also) to pursue his favourite bent, and thus the pencil was as often in his hand as the pen, while the

landscapes which he painted and distributed among his friends diffused his reputation as an artist over the country. But little did the good folks of Dailly rejoice in his growing fame: in their eyes a minister who painted pictures was as heinous a defaulter as the divine who actually played "upon the sinfu' sma' fiddle;" and this, with his buoyant fancy and exuberant spirits, which were sometimes supposed to tread too closely upon the bounds that separate clergymen from ordinary mortals, made the rustics suspect that their pastor was not strictly orthodox. This dislike of his strange pictorial pursuits, which they could not well comprehend, and his mirthful humour, which they could comprehend too well—for Mr. Thomson, at this time, could draw caricatures as well as landscapes—excited the attention of his brethren of the presbytery, one of the eldest of whom (so goes the story) was sent to remonstrate with him on the subject. The culprit listened in silence, and with downcast eyes; and at the end of the admonition was found to have sketched, or rather etched, an amusing likeness of his rebuker with the point of a pin upon his thumb-nail.

The incumbency of Mr. Thomson in Dailly was a short one, as in 1805 he was translated to the parish of Duddingston, a picturesque village within a mile of Edinburgh, and having the manse situated on the edge of its lake. In the neighbourhood of the northern metropolis, now rising into high literary celebrity, surrounded with scenery which can scarcely anywhere be surpassed, and by a society that could well appreciate his artistic excellence, he gave full scope to his hitherto half-imprisoned predilections, while his improvement continued to keep pace with the number of his productions. He was soon noted as a landscape painter of the first order; and such was the multitude of commissions that poured upon him, that sometimes nine carriages could be counted at the manse door, while at one period his revenue from this profitable source did not fall short of £1800 per annum. Who can here fail to regret the over-eager zeal of his father, by which such a painter was compelled to adopt the ministerial office, or be slow to perceive that these were not the kind of applications that should beset a clergyman's dwelling? True, the pulpit of Duddingston was regularly occupied on the Sabbath, and the usual number of sermons preached; but Edinburgh was close at hand, and abounded with probationers whose offices could be secured at a day's notice. In the meantime, as years went onward, Mr. Thomson's love of rich and striking scenery continued unabated, and his long pilgrimages in quest of it as ardent and frequent as ever. Often, indeed, he was to be found travelling with Grecian Williams, long before dawn, towards some selected spot, where they wished to delineate its appearance at the first sunrise; and having reached it, the enthusiastic pair would sketch and retouch, until each had depicted the view according to his own perceptions and tastes, communicating from time to time the progress they were making, and playing the part of friendly critics on each other's productions. On returning to his home from these excursions, it was commonly a change from the beauties of nature to the charms of conversation and social intercourse; for the manse of Duddingston was famed for hospitality, while the artistic reputation of its tenant was so high and so widely spread abroad, that few strangers of distinction in the fine arts arrived in Edinburgh without visiting Mr. Thomson. Independently, too, of his conversational talents and warm-hearted affectionate disposition that endeared him to his guests, and made his society universally courted, Mr. Thomson was

almost as enthusiastic a lover of music as of painting, and played both on the violin and flute with admirable skill. Nor were the more intellectual studies of his earlier days neglected amidst the full enjoyment of society and his increasing popularity as an artist, and several articles on the departments of physical science which he wrote in the *Edinburgh Review* were conspicuous even in that distinguished journal for the vigour of their style and clearness of their arguments.

Such a course of uninterrupted felicity would at last have become cloying; for man, as long as he is man and not angel, must weep and suffer as well as laugh and rejoice, in order to be as happy as his mixed and imperfect nature will permit. This the minister of Duddingston undoubtedly knew, and besides knowing, he was fated to experience it. For in the midst of his success, and when his young family was most dependent upon maternal care, he became a widower. The evil, heavy as it was, was not irremediable, and in fitting time a comforter was sent to him, and sent in such romantic fashion as to enhance the value of the consolation. An amiable and attractive lady, daughter of Mr. Spence the distinguished London dentist, and widow of Mr. Dalrymple of Cleland, happened one day, when visiting Edinburgh, to step into a picture-shop, where she saw a painting of the Fall of Foyers. Struck with the originality and beauty of this production, she eagerly asked the name of the artist, and was astonished to find that it was Mr. Thomson of Duddingston; for although she had seen several of his former paintings, none of them was to be compared to this. She was anxious to be personally acquainted with the author of such a painting—and such an anxiety seldom remains ungratified. She was soon introduced to him by mutual friends, and the first time that Thomson saw her, he said to himself, "That woman must be my wife; never have I beheld for years a woman with whom I could sympathize so deeply." The result may be easily guessed. In a short time she became Mrs. Thomson; and seldom, in the romance of marriage, has a couple so well assorted been brought together, or that so effectually promoted the happiness of each other. Independently of her taste in painting, she was, like himself, an ardent lover of music; and such was her earnest desire to promote the cultivation of the latter art, that she set up a musical class at the manse, which was attended not only by the most tasteful of the young parishioners of Duddingston, but by several pupils from Edinburgh, all of whom she instructed of course gratuitously. Two minds so assimilated could not fail to be happy, unless there had been a dogged determination to be otherwise, which was not in their nature, and accordingly the domestic ingle of Duddingston manse beamed brighter than ever. As if all this, too, had not been enough, an event occurred by which every chivalrous feeling in the heart of Mr. Thomson was gratified to the full. His eldest son was first mate of the *Kent* East Indiaman that took fire and went down at sea—an event that was associated with such circumstances of heroic devotedness that it is not yet altogether forgotten. At this trying crisis, when the captain was stunned with the magnitude of the danger, and unable to issue the necessary orders, young Thomson assumed the command, and used it with such judiciousness, promptitude, and presence of mind, that the whole ship's crew and passengers were extricated from the conflagration, and conveyed to the shore in safety, while he was himself the last to leave the vessel.

The paintings of Mr. Thomson were so numerous,

that it would be difficult to attempt a list of them, more especially as they were exclusively devoted to portions of Scottish scenery over the whole extent of the country. As the manse of Duddingstone commanded a full view of the castle of Craigmillar, and the picturesque landscape that surrounds it, he made this stately ruin and its accompaniments the subject of many a painting from different points of view, and under every variety of light—from the full blaze of an autumnal noonday to the soft, half-shadowed outline and tint of a midnight moon. The striking towers and fortalices along the Scottish coast—famed as the ancient residences of the champions of our national independence, from Dunstaffnage, Dunluce, and Wolfs-Crag, down to the humble peel upon the rocky sea-shore, were also the subjects of his pencil; and when these were exhausted, he devoted himself to the romantic inland scenery, which the genius of Scott had but lately opened, not only to the world, but his own countrymen—the Trosachs, Loch Achray, and Achray Water, as well as the more familiar scenes of Benblaffen, Glenfishie, Loch Lomond, Loch Etive, and others, in which land and water, striking outline, change of light and shade, and rich diversity of hue, are so dear to the painter of nature as well as the general tourist. As Mr. Thomson was not a professional artist, in the proper acceptance of the term, he was not eligible for the honour of membership among the Royal Academicians; but his paintings, nevertheless, were gladly received into their annual exhibitions; while his merits, instead of being regarded with jealousy, were acknowledged as occupying the front rank among the British masters of landscape-painting, and incontestably the best which his own country had as yet produced.

These indefatigable labours were continued till 1840, when symptoms of rapid constitutional decay began to manifest themselves, so that he was laid aside altogether from clerical duty; and when autumn arrived, he occupied a sick-bed, without any prospect of recovery. His death was characteristic of that deep admiration and love of the beauty of nature which had distinguished him through life, and secured him a high name in the annals of his countrymen. On the 26th of October, feeling that his last hour was drawing nigh, he caused his bed to be wheeled towards the window, that he might look upon the sunset of a bright afternoon; and upon this beloved spectacle he continued to gaze until he swooned from exhaustion. This was his last effort, and he died at seven o'clock on the following morning.

THOMSON, THOMAS, M.D., F.R.S., regius professor of chemistry in the university of Glasgow. This distinguished chemist was the seventh child and youngest son of John Thomson and Elizabeth Ewan, and was born at Crieff, on the 12th of April, 1773. He was first educated at the parish school of Crieff, and was sent in 1786, in his thirteenth year, for two years, by the advice of his brother, and of his uncle, the Rev. John Ewan, minister of the parish of Whittingham, in East Lothian, a man of some independent means, to the burgh school of Stirling, at that time presided over by Dr. Doig, the distinguished author of the *Letters on the Savage State*. Here he acquired a thorough classical education, the benefits of which have been so signally manifested in his numerous improvements of chemical nomenclature now generally adopted in the science. In consequence of having written a Latin Horatian poem of considerable merit, his uncle was recommended by Principal M'Cormack of St. Andrews to advise that he should try for a bursary at that university, which was open to public competition. He accordingly went, in

1788, to that school of learning, and having stood an examination, carried the scholarship, which entitled him to board and lodging at the university for three years. In 1791 he came to Edinburgh, and became tutor in the family of Mr. Kerr of Blackshields, one of his pupils being afterwards well known in connection with the Bank of Leith. In session 1794–5 he began the study of medicine, and in 1795 resided in Edinburgh with his elder brother, afterwards the Rev. James Thomson, D.D., and minister of the parish of Eccles, of whom a biographical notice will be found above. In the session of 1795–6 Dr. Thomson attended the lectures of the celebrated Dr. Black, of whom he always spoke in terms of the utmost veneration, and of gratitude for those invaluable instructions which first awoke the latent taste for the science of which he was destined to become so bright an ornament. In this session he wrote the article "Sea" for the *Encyclopædia*. In November, 1796, he succeeded his brother in the editorship of the third edition of the *Encyclopædia*, and remained connected with it till 1800. It was during this period that he drew up the first outline of his "System of Chemistry," which appeared in the Supplement to the *Encyclopædia*, under the articles "Chemistry," "Mineralogy," "Vegetable Substances," "Animal Substances," and "Dyeing Substances." These all appeared before the 10th December, 1800, when the preface was published, in which it is stated by Dr. Gleig: of the author "of these beautiful articles, a man of like principles with Dr. Robison, it is needless to say anything, since the public seems to be fully satisfied that they prove their author eminently qualified to teach the science of chemistry." During the winter session of 1800–1 he gave his first chemical course with fifty-two pupils. Hence he appears to have been before the public as a lecturer for the long period of fifty-two years, and, as he used latterly to say, he believed he had lived to be the oldest teacher in Europe.

It was in the article "Mineralogy," written about 1798, that he first introduced the use of symbols into chemical science, universally acknowledged to be one of the most valuable improvements in modern chemistry. In this article he arranges minerals into genera, according to their composition. Thus his first genus is A, or alumina, under which are two species, topaz and corundum, in accordance with the analyses of the day. The second genus is A M C, comprising spinell, which, according to Vauquelin, contained alumina, magnesia, and chrome iron ore. The fourth genus is S, including the varieties of silica or quartz. The eighth genus is S A G, or silica, alumina, and glucina, including the emerald or beryl; and thus he proceeds throughout. In the editions of his *System*, the first of which (a development of the original article in the *Encyclopædia*) was published in 1802, he continued the same arrangement and symbols, and was thus not only the originator of symbolic nomenclature in modern chemistry, but was the first chemist to bring mineralogy systematically within the domain of that science. In the third edition of his *System*, published in 1807, in illustrating the atomic theory of Dalton, and in his article on oxalic acid in the *Philosophical Transactions* for 1808, he freely uses symbols. Berzelius, who appeared some years later on the chemical stage, being Dr. Thomson's junior by five years, published a work in 1814, in Swedish, in which he adopted the system of symbols used by Dr. Thomson, with some modifications (the introduction of Latin initials in certain cases), but he strictly followed the rules for this purpose given by Thomson in his *System of Chemistry*, "(öch skall dervid följa

THE HISTORY OF THE UNITED STATES OF AMERICA

en enledning som Thomson gifvit i sin kemiska handbok). The work in which this passage occurs, entitled *Försök att genom användandet af den electrokemiska teorien, &c., grundlägga för mineralogier*, af J. Jacob Berzelius, Stockholm, 1814, p. 18, was sent by Berzelius to Dr. Thomson, in the same year, with a request, in a letter which is still extant, that he would endeavour to procure a translator for it. Dr. Thomson applied to Dr. Marcet and others without success; but at last prevailed on his learned friend John Black, Esq., who so ably conducted the *Morning Chronicle* for many years, to undertake the task. Dr. Thomson graduated in 1799. He continued to lecture in Edinburgh till 1811, and during that time opened a laboratory for pupils, the first of the kind, it is believed, in Great Britain. Among those who worked in his laboratory was Dr. Henry of Manchester, a chemist for whom he had always the greatest regard, who had visited Edinburgh for the purpose of graduation, and who there made many of his experiments on the analysis of the constituents of coal-gas. During this period likewise Dr. Thomson made his important investigations for government on the malt and distillation questions, which laid the basis of the Scottish legislation on excise, and rendered him in after-life the arbitrator in many important revenue cases. He likewise invented his saccharometer, which is still used by the Scottish excise under the title of Allan's saccharometer. In 1807 he first introduced to the notice of the world, in the third edition of his *System*, Dalton's views of the atomic theory, which had been privately communicated to him in 1804. He did not confine his remarks to mere details, but made many important new deductions, and by his clear, perspicuous, and transparent style, rendered the new theory soon universally known and appreciated. Had Richter possessed such a friend as Thomson, the atomic theory of Dalton would have long been previously fully discovered and attributed to Richter. In his papers on this theory, which occupied much of his thoughts, from the mathematical precision which it promised to impart to the science, we find numerous suggestions cautiously offered, which have often been subsequently examined and confirmed, or developed in another direction. Thus, in August, 1813, he states that, according to the atomic numbers then determined, "an atom of phosphorus is ten times as heavy as an atom of hydrogen. None of the other atoms appear to be multiples of 132 (the atom of hydrogen at that time adopted by chemists), so that, if we pitch upon hydrogen for our unit, the weight of all the atoms will be fractional quantities, except that of phosphorus alone." It was undoubtedly this observation which caused Dr. Prout to make new inquiries, and to announce, in Nov. 1815, the view that the relation of phosphorus as a multiple of hydrogen, as detected by Thomson, may be general, connecting all other atomic weights with that unit—a view now generally adopted, and considered as a nearly demonstrated law.

The existence of such mathematical relations Dr. Thomson was continually in the habit of testing at the conclusion of his own researches, or in examining the experiments of others. Any peculiarity of character in a substance hitherto known, or in a newly-discovered body, he never failed to point out in his *System*, and innumerable instances have occurred, and might be mentioned did our space admit, where lucrative patents have resulted from a simple statement or foot-note, often original on the part of the author. A fact of this kind in the *Animal Chemistry* led Mr. Robert Pattison to his ingenious patent invention of lactarin, a preparation of casein from

milk, for fixing ultramarine on cotton cloth; and Dr. Thomson's systematic plan of describing all the characters of bodies in detail led Henry Rose of Berlin to the discovery of niobium and pelopium, two new metals. From the fragments of four imperfect crystals of certain tantalites, as the mineral dealers who sold them to him termed them, he was enabled to make some analyses, and to take a series of specific gravities, which he published in a paper, "On the Minerals containing Columbium," in his nephew, Dr. R. D. Thomson's *Records of General Science*, vol. iv. p. 407, in 1836. He found that these minerals possessed an analogous constitution, but their specific gravity differs. He termed them torreyite, columbite, tantalite, and ferrotantalite. In making his experiments he expended all the material he possessed, and he had passed the great climacteric. Professor Rose, struck with the facts, examined the minerals upon a greater scale, and after immense labour, showed that not only columbic or tantalic acid was present in these minerals, but likewise two new acids, niobic and pelopic acids. Instances of this kind of contribution made by Dr. Thomson to chemistry might be indefinitely particularized. About 1802 he invented the oxy-hydrogen blowpipe, in which he introduced the oxygen and hydrogen into one vessel; but the whole apparatus having blown up and nearly proved fatal to him, he placed the gases in separate gas-holders. At that time he made many experiments on its powers of fusion, but as Dr. Hare had invented an apparatus at the same time, and published his experiments, Dr. Thomson did no more than exhibit the apparatus in his lectures. In August, 1804, in a paper on lead, he first published his new nomenclature of the oxides and acids, in which Latin and Greek numerals were made to denote the number of atoms of oxygen in an oxide. He thus introduces this important invention, which has been almost universally adopted in the science:—"As colour is a very ambiguous criterion for distinguishing metallic oxides, I have been accustomed for some time to denote the oxide with a minimum of oxygen, by prefixing the Greek ordinal number to the term oxide. Thus, protoxide of lead is lead united to a minimum of oxygen; the oxide with a maximum of oxygen I call peroxide. Thus, brown oxide of lead is the peroxide of lead. I denominate the intermediate degrees of oxidization by prefixing the Greek ordinals 2d, 3d, 4th, &c. Thus, deutoxide is the second oxide of lead, trioxide of cobalt the third oxide of cobalt, and so on." This paper being translated and published in France, the nomenclature was speedily introduced into that country. But the improvements which he afterwards adopted by denoting the exact number of atoms of oxygen present, by the Latin, and those of the base by the Greek numerals, and used in Great Britain, never superseded in that country the original suggestion in the above note.

All these inventions were merely particular parts of a systematic arrangement adopted in his *System of Chemistry*—a work which, if carefully examined with a philosophic eye, will be found to have produced beneficial results to chemical science, similar to those which the systems of Ray, Linnæus, and Jussieu effected for botany. In his second edition, published in 1804 (the first large edition having been sold in less than ten months), he divided the consideration of chemical bodies into—"Book I. *Simple Substances*: 1. Confinable Bodies, including Oxygen, Simple Combustibles, Simple Incombustibles, Metals; 2. Unconfinable Bodies, comprising Heat and Light. Book II. *Compound Bodies*: 1. Primary Compounds; 2. Secondary Compounds, &c." It is

most interesting to observe how his plan was developed with the progress of the science in the different editions. It is sufficient to say that it was generally considered as a masterly arrangement, and used to be quoted by the professor of logic in Edinburgh as an admirable example of the analytic and synthetic methods. Previous to the publication of his *System*, British chemists were contented with translations from the French; and hence it was believed on the Continent that "Britain possessed scarcely a scientific chemist." That all his contemporaries viewed his plan as highly philosophic cannot be affirmed. There are some men who, having no mental powers of arrangement in themselves, discover in a systematic treatise only a compilation possessing the generic characters of matter; while those who can pry below the surface, on the other hand, know that the art of arranging is one of the most difficult tasks of the philosopher; that it requires a comprehensiveness of mind, a clearness of judgment, and a patience of labour, which fall to the lot of a small number of the human race. When we recollect that many of these remarkable views began to be devised by the self-taught chemist in a narrow close in the High Street of Edinburgh, the author being in the receipt of a salary of £50 a year, from which he sent £15 to his aged parents; and when we contrast such a picture with the costly education and refined apparatus of the modern laboratory, it is impossible to avoid the inference, that in Dr. Thomson Britain possessed a genius of no common order.

One immediate result of the publication of his *System* was the appropriation of their due merit to respective discoverers, and especially to British chemists, who had been overlooked in the continental treatises. It was the subject of our memoir who thus first imparted to us the true history of chemistry, and in doing so often gave offence to disappointed individuals; but the honesty of his nature and his unswerving love of truth never allowed him for a moment to sacrifice, even in his own case, the fact to the fallacy.

During the first years of this century he discovered many new compounds and minerals, as chloride of sulphur, allanite, sodalite, &c.; but to give a list of the numerous salts which he first formed and described during his onward career would be difficult, as he scarcely ever treated of them in separate papers, but introduced them into the body of his *System*, without any claim to their discovery. His exact mind was more directed towards accurate knowledge and principles, than to novelties merely for their own sake, although there is probably no chemist who has added so many new bodies to the science. Hence many of his discoveries have been attributed to others, or rediscovered over and over again, as was the case with many of his chromium compounds—viz. chlorochromic acid, the two potash oxalates of chromium, bichromate of silver, potash chromate of magnesia, chromate of chromium, hyposulphurous acid (1817), and hydrosulphurous acid (1818), S_2O_3 , &c., all of which were examined by him many years ago.

In 1810 Dr. Thomson published his *Elements of Chemistry*, in a single volume, his object being to furnish an accurate outline of the actual state of the science. In 1812 he produced his *History of the Royal Society*, a most important work, as showing the influence which that society produced on the progress of science. In August, 1812, he made a tour in Sweden, and published his observations on that country in the following year. It is still a valuable work, and contains a very complete view of the state of science and society in Sweden. In 1813 he

went to London, and started the *Annals of Philosophy*, a periodical which he continued to conduct till 1822, when the numerous calls upon his time in the discharge of the duties of his chair at Glasgow compelled him to resign the editorship in favour of Mr. Richard Phillips, one of his oldest friends, who predeceased him by one year. The journal was, in 1827, purchased by Mr. Richard Taylor, and was merged in the *Philosophical Magazine*. In 1817 he was appointed lecturer on chemistry in the university of Glasgow; and in 1818, at the instance of the Duke of Montrose, chancellor of that institution, the appointment was made a professorship with a small salary under the patronage of the crown. As soon after his appointment as he was enabled to obtain a laboratory, he commenced his researches into the atomic constitution of chemical bodies, and produced an amount of work unparalleled in the whole range of the science, in 1825, by the publication of his *Attempt to Establish the First Principles of Chemistry by Experiment*, in 2 vols. It contained "the result of many thousand experiments, conducted with as much care and precision as it was in his power to employ." In this work he gives the specific gravities of all the important gases, ascertained by careful experiment. The data thus ascertained were often disputed and attacked in strong but unphilosophical terms, as they tended to supersede previous experimental deductions; but the excellent subsequent determinations of specific gravities by Dumas, which were made at the request of Dr. Thomson, after that distinguished chemist had visited him at Glasgow in 1840, fully substantiated the greater accuracy of Dr. Thomson's numbers over those which preceded him, and in most cases furnished an identity of result. The atomic numbers given in his *First Principles* as the result of his labours, were the means of a vast number of experiments made by himself and pupils, the data of which still exist in his series of note-books. They all tended to the result that the atomic weights of bodies are multiples by a whole number of the atomic weight of hydrogen—a canon confirmed to a great extent by the recent experiments of French and German chemists, and which he himself was the first to point out in the case of phosphorus. That the subject of our memoir was frequently in error in his experiments is not attempted to be denied; for, as the great Liebig has said, it is only the sluggard in chemistry who commits no faults; but all his atomic weights of important bodies have been confirmed. After the publication of this work he devoted himself to the examination of the inorganic kingdom of nature, purchasing and collecting every species of mineral obtainable, until his museum, now at St. Thomas' Hospital, London, which he has left behind him, became not only one of the noblest mineral collections in the kingdom, but a substantial monument of his taste and of his devotion to science. The results of his investigation of minerals were published in 1836, in his *Outlines of Mineralogy and Geology*, in 2 vols., and contained an account of about fifty new minerals which he had discovered in a period of little more than ten years.

In 1830–31 Dr. Thomson published his *History of Chemistry*, a master-piece of learning and research. During these feats of philosophic labour the eyes of the community were attracted to Glasgow as the source from which the streams of chemistry flowed, the class of chemistry and the laboratory being flocked to as to fountains of inspiration.

It would be a great omission not to mention that it was Dr. Thomson who introduced a system of giving annual reports on the progress of science in his *Annals of Philosophy*; the first of these was pub-

lished in 1813, and the last in 1819. These reports were characterized by his usual perspicuity and love of *sum cuique* which distinguished his conduct through life, and were composed with a mildness of criticism far more conducive to the dignity of the science than those which, three years after his reports had ceased, were begun by the distinguished Swedish chemist Berzelius. In 1835, when Dr. R. D. Thomson started his journal the *Records of General Science*, his uncle contributed to almost every number, and encouraged him by his sympathy in his attempts to advance science.

Dr. Thomson continued to lecture till the year 1841, discharging all the duties of his chair without assistance; but being then in his 60th year, and feeling his bodily powers becoming more faint, he associated with him at that period his nephew and son-in-law, Dr. R. D. Thomson, who was then resident in London. He continued, however, to deliver the inorganic course only till 1846, when the dangerous illness of his second son, from disease contracted in India, hurried him for the winter to Nice, when his nephew was appointed by the university to discharge the duties of the chair, which he continued to perform till Dr. Thomson's death. Of the hardship of being obliged in his old age thus to toil in harness, and to have no retiring allowance, he never murmured or complained. But there were not wanting suggestions, that one who had raised himself to eminence from comparative obscurity, and who had benefited his country in no common measure, might have been relieved in some degree by the guardians of the state, without popular disaffection, from fatigues which even a green old age cannot long sustain. Dr. Thomson continued to attend the examinations for degrees for some years after retiring from the duties of the chair; but in consequence of the increasing defect in his hearing, he ultimately gave up this duty, and confined his public labours to attendance at the fortnightly meetings of the winter session of the Philosophical Society of Glasgow, of which he was president from the year 1834. His last appearance there was on the 6th November, at the first meeting of the session 1850-51, when he read a biographical account of his old and affectionate friend Dr. Wollaston, to whom he was ever most strongly attached. During the early part of 1852 his frame became visibly weaker, and, latterly, having removed to the country, where it was hoped the freshness of the summer season might brace his languishing powers, his appetite failed; but no pain appeared to mar the tranquil exit of the philosophic spirit. To inquiries after his health—"I am quite well, but weak," the good old man replied, within a few hours of his last summons. On the morning of the 2d of July he breathed his last in the bosom of his affectionate family, on the lovely shores of the Holy Loch. Dr. Thomson married, in 1816, Miss Agnes Colquhoun, daughter of Mr. Colquhoun, distiller, near Stirling, with whom he enjoyed most complete and uninterrupted happiness. He was left a widower in 1834. He left a son, Dr. Thomas Thomson, of the Bengal army, the author of *Travels in Tibet*, the result of several years' researches into the botany and physical structure of the Himalaya Mountains, and afterwards superintendent of the botanic gardens at Calcutta; and a daughter, married to her cousin, Dr. R. D. Thomson, professor of chemistry at St. Thomas' Hospital, London. On strangers Dr. Thomson occasionally made an unfavourable impression; but by all who knew him intimately he was universally recognized as the most friendly and benevolent of men. Dr. Thomson was originally destined for the Church of Scotland, and continued to the last a faithful adherent. He was

wont to attribute his sound and intellectual views of the Christian faith to the care of his mother—a woman of great beauty and sense; and it was perhaps from his affection for her that his favourite axiom originated—that the talents are derived from the maternal parent. Who shall prescribe exact limits to the benefits conferred on her country and her race by this humble but pious Christian woman—who taught in early life religion to her elder son, the author of the article "Scripture" in the *Encyclopædia Britannica*, which, in the third and many subsequent editions of that work, has been read and distributed over the globe for nearly half-a-century, to a greater extent than perhaps any other religious treatise—and who gave the earliest impressions of his relations to his Maker to the great chemical philosopher?

THOMSON, THOMAS. In few countries has the study of national antiquities been prosecuted so zealously or so successfully as in Scotland. It would be too much to assign this peculiarity either to the romantic character or the importance of the early achievements of Scotland, for these were certainly of small account in the general history of Europe. The cause is rather to be found in the grievous calamities that befell our national archives in the times of Edward I. and Oliver Cromwell. By these, our written records, and even our national monuments, were so destroyed or obliterated, that nothing but the most devoted antiquarianism could have restored to us the semblance of a history. Hence not only the necessity of diligent Scottish research among the relics of bygone ages, but the keenness with which it has been prosecuted, and the success that has attended it. Through these labours Scotland now possesses a history that, in point both of accuracy and fulness, may compete with that of most countries of Europe. And among the foremost of those antiquaries who, for a century, have toiled in such a patriotic task, perhaps there is none entitled to take precedence of him whose name stands at the head of this notice.

Thomas Thomson was descended of a family that might well be characterized as a portion of the tribe of Levi; for not only his father, but also his grandfather and great-grandfather, had been successively ministers of the Kirk of Scotland. To this also it may be added, that his younger brother John was minister of Duddingston from 1805 to 1840, although he is better known among the lovers of the fine arts as the Claude Lorraine of Scotland. Thomas, the future antiquary, was born in the manse of Dailly, Ayrshire, of which parish his father was minister, on the 10th of November 1768. As it was nothing more than natural that his views, from an early period, should be directed towards the church, in which his ancestors had held the ministerial office since the close of the seventeenth century, he was sent in 1782 to prosecute the necessary studies in the university of Glasgow. He passed through what are called the "gown classes" with considerable distinction, took the degree of A.M. in 1789, and became, during the two following sessions a student in theology. But at this time the lectures in the divinity hall, as well as the class-room of church history in the college of Glasgow, were of such a massive, not to say a heavy character, that none but a mind of congenial calibre could endure them to the end. Accordingly, in spite of every prospect of church advancement, which was now a sort of heir-loom in the family, Mr. Thomson's mercurial spirit broke impatiently from the restraint, and sought shelter in other pursuits. He resolved to study law, and devote himself

to the bar; and for this purpose he exchanged the hall of theology for the law classes of Professor Millar, whose lectures were of a very different description from those he had hitherto attended. After this he completed his course of legal study in the university of Edinburgh, and at the close of 1793 was admitted a member of the faculty of advocates.

It is not our purpose to follow out the course of Mr. Thomson at the bar, where, to gain a high name at this period, it was necessary to be wholly as well as completely a lawyer and orator. His own bias in a different direction was so distinctly indicated, as quickly to secure for him a high reputation in Scottish antiquarianism, and on this account he was selected in 1800 to superintend a new edition of the works of Lord Hailes, which were to be collected and edited for publication, accompanied with a biographical memoir. This intention was not carried out, and Mr. Thomson's aid was only available for an edition of his lordship's *Annals and Historical Tracts*, which were afterwards published in 1819. An office, however, of permanent character, as well as of the highest importance, was already being prepared for his occupation. The neglect that had hitherto been shown towards our national records began, although at a late hour, to be acknowledged, and after due consideration of the subject in the House of Commons, two royal commissions were issued, the one in 1800, and the other in 1806, for the preservation and due arrangement of our public archives. It was found, however, that "the superintendence of the matters arising within this office should be confided to a deputy of acknowledged skill and ability, being a resident advocate of the Scottish bar, of undoubted learning, tried merit, and considerable standing;" and to this effect Lord Frederick Campbell, the lord-clerk register, having memorialized his majesty (George III.), a royal warrant was issued in 1806, authorizing the appointment of the office. A fit archivarius to fill it was not still to seek; and, to the satisfaction of all who felt an interest in this important department, Mr. Thomas Thomson was forthwith nominated deputy clerk-register. Among those who rejoiced in the appointment, no one could be more ardent than Sir Walter Scott. "Have you seen," he writes in a letter to George Ellis, "have you seen my friend Tom Thomson, who is just now in London? He has, I believe, the advantage of knowing you, and I hope you will meet, as he understands more of old books, old laws, and old history, than any man in Scotland. He has lately received an appointment under the lord-register of Scotland, which puts all our records under his immediate inspection and control; and I expect many valuable discoveries to be the consequence of his investigation, if he escapes being smothered in the cloud of dust which his researches will certainly raise about his ears." Speaking at a later period in conversation upon the subject of antiquarian studies in general, Scott observed—"It is common to laugh at such researches, but they pay the good brains that meddle with them; and had Thomson been as diligent in setting down his discoveries as he has been in making them, he might, long before this time of day, have placed himself on a level with Ducange or Camden."

The rest of his long literary life, which extended over nearly half-a-century, is best detailed by a list of the literary works which he published. And to begin with those which he prepared in his capacity of deputy clerk-register, and which were published under authority of the Commissioners in the Public Records of the Kingdom, they were the following:—*"Inquisitionum ad Capellum Domini Regis Retor-*

naturum, quæ in Publicis Archivis Scotiæ adhuc servantur, Abbreviatio." 1811–1816. 3 vols. folio. —*"Registrum Magni Sigilli Regum Scotorum in Archivis Publicis asservatum."* MCCCXVI.–MCCCXXIV." 1814. Folio.—*"The Acts of the Parliaments of Scotland."* Vol. ii. to vol. xi. MCCCXXIV.–MDCCVII." 1814 to 1824. 10 vols. folio. Of this series, the first volume, owing to many difficulties, chiefly arising from the remote and obscure period to which its "Acts" refer, remained unfinished so late as 1841, when Mr. Thomson's connection with the register-office ceased. It was completed and published, however, in 1844, under the superintendence of Mr. Innes.—*"The Acts of the Lords Auditors of Causes and Complaints."* MCCCCLXVI.–MCCCXCIV." 1839. Folio.—*"The Acts of the Lords of Council in Civil Causes."* MCCCCLXXVIII.–MCCCXCIV." 1839. Folio. In addition to these Mr. Thomson prepared the following abbreviates, of which only a limited number were published for the use of the register-office:—"A Continuation of the Retours of Services to the Chancery-office, from the Union, A.D. 1707, to the present time."—"An Abbreviate or Digest of the Registers of Sasines, General and Particular, arranged in Counties, with Relative Indexes, from the 1st of January, 1781, to the present time."—"An Abbreviate of Adjudications from the same period to 1830."—"An Abbreviate of Inhibitions, General and Particular, arranged in Counties, from the same period to 1830." Of an equally professional, and still more personal description, were the following:—"The First Five Annual Reports of the Deputy Clerk-register of Scotland," from 1808 to 1811. One vol. folio.—*"Annual Reports, from the Sixth to the Fourteenth (from 1811 to 1822)."* One vol. folio.

We now pass from the labours of the deputy clerk-register, to those of the member of the Bannatyne Club. This antiquarian institution, which was originated in 1823, unanimously elected Mr. Thomson to the honorary office of vice-president; and afterwards, in 1832, in consequence of the death of Sir Walter Scott, the distinguished president of the club, Mr. Thomson, with the same unanimity, was appointed to succeed him. His services in behalf of this important association were thus characterized by Lord Cockburn, its vice-president, in the funeral eulogium which he pronounced before the members, after the decease of Mr. Thomson:—"As one of our original founders, and deeply conversant with our objects and aims, he was, while absent from Edinburgh, unanimously chosen vice-president. After co-operating assiduously with Sir Walter Scott, our first president, in all the business of the institution, he became our second president on the death of that illustrious person; and throughout the whole of the succeeding twenty years was our master and our guide. With several powerful associates or competitors, in detached fields or subordinate walks, it was by his knowledge and sagacity that our general course was directed. The value of his superintendence is attested by its results. The publications of the Bannatyne Club form the greatest, the most difficult, the most important, and the most splendid disclosures that have ever been made of the latent historical treasures of our country. The merit of these works is certainly not due to him entirely; if it had at all been ascribed to him in his presence his candour would have at once disclaimed it, and given the proper part to its true owners. But those by whom the contributions, either of individuals or of the club, have been prepared, and who are best acquainted with the difficulties attending the execution of such undertakings, will acknowledge the aid which

they uniformly derived from the president's judgment and zeal. And never did any one apply to him for advice without feeling his accessibility, and his cordial disposition to assist. The hasty, and indeed sometimes even the patient, murmured occasionally at his slowness; and he had certainly no taste for vulgar rapidity; but this was the result of caution and fastidiousness—both good qualities; and though it sometimes wearied expectation, was generally rewarded by improved excellence in the end."

The literary exertions thus so highly and so justly commended, which Mr. Thomson performed in behalf of the Bannatyne Club, and which were published under its auspices, are comprised in the following list:—"Alex. Myln, Vite Dunkeldensis Ecclesiæ Episcoporum." 4to, 1823.—"Discours particulier d'Escoffe, escrit en 1559." 4to, 1824.—"The Historie and Life of King James the Sext." 4to, 1825.—"Memoirs of his own Life, by Sir James Melville, of Halhill." 4to, 1827. Speaking of this work while in progress, Sir Walter Scott thus alludes to it in his diary—"Thomson is superintending a capital edition of Sir James Melville's *Memoirs*. It is brave to see how he wags his Scots tongue, and what a difference there is in the form and firmness of the language, compared to the mincing English edition in which he has hitherto been alone known."—"Memoirs of his own Life and Times, by Sir James Turner." 4to, 1829.—"The History of Scotland, by John Lesley, Bishop of Ross." 4to, 1830.—"Collection of Ancient Scottish Prophecies, in Alliterative Verse." 4to, 1833.—"Diurnal of Remarkable Occurrences, from the Pollok MS." 4to, 1833.—"The Ragman Rolls, 1291-1296." 4to, 1834.—"The Booke of the Universall Kirk of Scotland, 1560-1618." 3 vols. 4to, 1839, 1840, 1845.—"The Accounts of the Great Chamberlains of Scotland, &c., 1326-1406." In 2 vols. 4to, 1817.—A third volume of do. 4to, 1845.—"A Diary of the Public Correspondence of Sir Thomas Hope of Craighall." 4to, 1843.—"Munimenta Vetustiora Comitatus de Mortoun, and Original Letters and Papers in the Archives of the Earls of Morton." 4to, 1852. In addition to the foregoing, Mr. Thomson edited the following works, which were chiefly printed for private circulation:—"A Compilation of the Forms of Process in the Court of Session during the Earlier Periods after its Establishment, with the Variations which they have since undergone." &c. 8vo, 1809.—"A Collection of Inventories, and other Records of the Royal Wardrobe and Jewelhouse; and of the Artillery and Munition in some of the Royal Castles, 1488-1606." 4to, 1815.—"The Chamberlain Rolls, 1306-1406." 4to, 1817.—"Inventory of Worke done for the State by [Evan Tyler] his Majesties Printer in Scotland, December, 1642—October, 1647." 4to, 1815.—"Ane Addiicoun of Scottis Cronikles and Deidis." Small 4to, 1819.—"Memoirs of the Affairs of Scotland from the Restoration of King Charles II., A.D. 1660, by Sir George Mackenzie, of Rosehaugh, Knight." 4to, 1821.—"Memoirs of the Lives and Characters of the Right Honourable George Baillie of Jerviswood, and of Lady Grissell, by their daughter, Lady Murray."—"Menu de la Maison de la Roynie fait par Mons. de Pinguillon. M.D.LXII." 4to, 1824.

This amount of antiquarian labour indicates an extent of reading, a patience of research, and a heroic pertinacity of purpose which it would be difficult fully to estimate. And this, too, be it remembered, was in a department of literature in which little fame is to be won, and the achievements of which are so often misprized and ridiculed. "No one," says Lord Cockburn, in his *Life of Lord Jeffrey*—when speak-

ing of Thomas Thomson—"no one has done nearly so much to recover, to arrange, to explain, and to preserve our historical muniments. He found them almost a chaos, and after bringing them into order, has left them on a system, of which the value will be felt the more every day that they accumulate. His real merit, great as it may seem now, will seem still greater 500 years hence." Adverting to Mr. Thomson's capacity for legal study, and the disinterestedness with which it was kept in abeyance, for the sake of that department in which he was so well qualified to excel, Lord Cockburn adds—"Had he not allowed his taste for antiquarian research to allure him from the common drudgery of his profession, he would have stood high in practice, as he always did in character, at the bar; and would now have been adorning the bench by his considerate wisdom and peculiar learning." In turning to Mr. Thomson's course as a barrister, we find his lordship's commendations fully borne out. His knowledge of ancient Scottish history and jurisprudence was so well known, even at the outset, that so early as 1805-7 he was employed in the famous Craighgillan case, in which a fair estate of about £12,000 per annum depended upon the old marriage laws of Scotland, and the kind of union that sufficed to establish a legal claim to legitimacy and inheritance. Another suit in which he was retained in 1816, was the case of *Cranstoun versus Gibson*, in which the principle of our northern elections had to be traced to its fountain-head, inasmuch as the franchise of Scotland, as connected with the valuation of old church-lands, was involved in the result. While his brethren of the long robe were utterly in the dark upon such questions of medieval and monastic lore, Mr. Thomson, as may easily be supposed, felt himself upon his own proper ground; he accordingly produced, in one of his memorials, such a lucid account of the origin of the taxation of land in Scotland, that Lord Glenlee, the presiding judge, could not help exclaiming, "It is just delightful! It is like reading a lost decade of Livy!" Mr. Thomson, indeed, did not secure a judge's gown, for that, as we have seen, was never at any time the mark of his ambition; but an office not greatly inferior in importance and emolument, was freely conceded to him in 1828, by his being appointed one of the principal clerks of session—an office which Sir Walter Scott himself held, and beyond which he sought no higher.

Amidst the various qualifications which Mr. Thomson possessed, we would greatly err if we confined the literary part of his character to his undoubted superiority in antiquities and black-letter. On the contrary, his general knowledge, as well as his talents and taste, were so fully recognized, that at the creation of the *Edinburgh Review* in 1802, he was one of that illustrious coterie who were wont to meet in solemn secrecy for the purpose of commencing it, and by whose joint labours that critical tribunal was silently built up, before whose dread awards the whole literary world was so soon compelled to bow and tremble. For this journal he also wrote several articles, and, during the occasional absences of Mr. Jeffrey, took charge of its editorship.

Mr. Thomson married Anne, daughter of Thomas Reed, Esq., formerly army agent in Dublin. He died at his residence at Shrubhill, between Edinburgh and Leith, on the 2d of October, 1852, and was interred in the Dean Cemetery. His character was thus appropriately summed up by Lord Murray at the ensuing anniversary of the Society of Antiquaries of Scotland:—"In the death of my old and valued friend Mr. Thomas Thomson, the Society has to deplore the loss of one whose contributions

to our antiquarian literature, and to the facilities of the historical student of the records of Scotland, have conferred a boon upon the country, such as it would be difficult to overestimate in value. He was a man of great and varied learning and a highly refined mind. His enthusiasm was undamped by the intricacy and forbidding aspects of one of the most perplexing and protracted labours which ever engrossed the life-labour of the legal antiquary; and yet, while devoting his fine mind to such labours in his study, he united to all the acquirements requisite for such pursuits, manners the most pleasing, and a warmth and geniality of feeling which have embalmed him in the memories of a numerous circle of friends and admirers."

THOMSON, DR. WILLIAM, an ingenious, versatile, and multifarious writer, was born in 1746 in the parish of Forteviot, in Perthshire. His father, though in humble, was in decent circumstances, earning a livelihood by uniting the businesses of carpenter, builder, and farmer. Young Thomson was instructed in the first rudiments of education by his mother, and was then sent to the parochial school. He afterwards attended the grammar-school of Perth, and on leaving it proceeded to St. Andrews, where his abilities attracted the notice and procured him the patronage of the Earl of Kinnoul, then chancellor of the university. This munificent nobleman, after satisfying himself by personal examination that young Thomson's high reputation as a classical scholar was not exaggerated, admitted him into his family in the capacity of librarian, and shortly after directed his views to the church, with the intention of presenting him to one of the livings in his gift.

Mr. Thomson prosecuted his theological studies, first at St. Andrews, and then at Edinburgh, and having obtained a license to preach, was appointed assistant to the minister of Monivaird. Unfortunately neither his tastes nor habits accorded with the clerical calling. His temper was irascible, and he delighted more in field-sports and jovial companionship than in the discharge of his professional duties. The complaints of the parishioners induced him to resign his office, and he resolved to try his fortune in London as a man of letters. In this he was at first far from successful. At length, through the influence of his distinguished friends Drs. Robertson and Blair, he was chosen to continue the *History of Philip III. of Spain*, a work begun by Dr. Robert Watson, principal of the United Colleges of St. Andrews, but which that gentleman left unfinished at his death, which happened in 1780. This work Dr. Thomson completed in a manner highly creditable to his talents, and so much to the satisfaction of the public, that he soon found himself surrounded with friends, and his hands filled with employment. The former procured him about this period, wholly unsolicited on his part, the degree of LL.D. from the university of Glasgow. Dr. Thomson now became a regular London author, being ready to write on any subject, and for any one who should employ his versatile talents. Business increased apace upon him, and from this period till near the close of his life, extending to upwards of five and thirty years, he continued in close connection with the press, and with the exception of poetry, went, in that time, creditably through every department of English literature. Nothing came amiss to him; history, biography, voyages, travels and memoirs, novels and romances, pamphlets and periodicals. In all of these he wrote largely, and wrote well. In his literary labours he was indefatigable. Night and day he wrought with unwearied perseverance, and by dint of this industry, associated with a remark-

able facility in composition, he accomplished in the course of his life a greater amount of literary work, and of a greater variety of character, than perhaps any English writer who preceded him. Amongst the most important of his avowed works are—*The Man in the Moon*, a novel; *Travels in Europe, Asia, and Africa*, a compilation from other works, published in 1782; a translation of *A History of Great Britain from the Revolution in 1668 to the Accession of George I. in 1714*, from the Latin of Cunningham, 2 vols. 4to, 1787; *Memoirs of War in Asia*, 1788; *Mammoth, or Human Nature Displayed on a Grand Scale*, a novel, 1789; *Travels in the Western Hebrides*, from 1782 to 1790, from notes by the Rev. John Lane Buchanan, A.M., missionary minister to the Isles from the Church of Scotland, 1793. Dr. Thomson also largely assisted in a work which appeared about this period, entitled *Travels into Norway, Denmark, and Russia*, by A. Smith, Esq.

Numerous as this list is, it comprises but a very small portion of our author's literary achievements, and gives but a faint idea of the extent and variety of his labours. He contributed largely, besides, to various newspapers, magazines, and other periodicals of the day. He also frequently acted as a reporter, and is said to have greatly excelled in this department of literary labour. For many years he published a weekly abridgment of politics in the *Whitehall Evening Post*, but lost this employment in 1798, in consequence of some political transgressions. In the latter years of his life he was engaged in bringing up the arrears of *Dodsley's Annual Register*, of which he compiled the historical part from 1790 to 1800 inclusive. Amongst the last of his literary performances (and it is a remarkable proof of the variety of his attainments) was a work entitled *Memoirs relative to Military Tactics*, dedicated to his royal highness the Duke of York, commander-in-chief of the forces. This work, which was begun in 1805 and finished in the ensuing year, was reckoned no inconsiderable addition to that department of literature to which it belongs, and is said to have been looked upon with favour by those competent to judge of its merits. Towards the close of his life Dr. Thomson wholly resigned his literary labours, and retired to Kensington, where he died in decent but not by any means affluent circumstances, on the 16th of March, 1817, in the seventy-first year of his age, leaving behind him a reputation very far from being proportioned either to the extent of his labours, or to the amount of his abilities and acquirements.

TOD, LIEUTENANT-COLONEL JAMES. Of the early life of this distinguished historian of the East we have been able to glean only a few particulars. Such, however, is frequently the case with his countrymen. Their talents and enterprise lead them to eminence, and place them full in the view of the world; but when the general curiosity is expressed in, Where was he born?—who were his parents?—how was he trained and educated for the place he so worthily occupies?—the biographer is compelled to confess his ignorance, or feel his way at haphazard and by conjecture.

With these remarks we judge it necessary to premise a notice of Lieutenant-colonel Tod, of the Honourable East India Company's service, and their political agent in the Western Rajpoot states. He was born in Scotland about the year 1782; but in what district, or of what parentage, we are unable to ascertain. In March, 1800, he went to India, being then only in his eighteenth year, and obtained a commission in the second Bengal European regiment. Although he commenced his career thus early,

he appears to have arrived in India an unbefriended adventurer; for instead of waiting for promotion like his brother officers who had patronage to back their merits, he volunteered for the Molucca Isles, was transferred to the marine service on board the *Mornington*, and afterwards, to use his own expression, "ran the gauntlet from Calcutta to Hurdwar." In the course of this run, however, he not only escaped the dangers that crossed it, but reached the starting-place of a new and better career. At the close of 1805, when he was nothing more than a subaltern in the subsidiary force at Gwalior, an embassy was to be sent at the close of the Mahratta war to Sindhia, at that time encamped at Mewar, in Rajpootana. Tod's friend, Mr. Græme Mercer, was sent as ambassador on this occasion, while Tod himself was to accompany him as assistant. The country of Rajast'han, of which it formed a part, was thenceforth to be the "home of his adoption," as he affectionately called it, and the place to which the best part of his life was to be enthusiastically and usefully devoted.

On settling down amidst the official duties with which he was intrusted, Tod, now scarcely twenty-four years old, resolved to be something more than a mere political resident. Great capacities, hitherto undeveloped, were struggling within him, which the new land of his abode was calculated to call forth; and under this inspiration he successively became geographer, historian, and archaeologist. As was natural, the geography of Rajast'han was the first subject of his inquiry, into which he threw himself with ardour almost as soon as he arrived; and for this there was urgent need—for large and important though the country was, it was still a mere *terra incognita* to his employers, the conquerors of the East. Once a vast cluster of provinces that composed an empire extending, in all probability, from the Jumna and Ganges to the base of the Himalaya, comprehending nearly eight degrees of latitude and nine of longitude, it still was a large territory, inhabited by a variety of interesting races, but who, from the misgovernment of their own chiefs, and the absence of European instruction, were fast sinking into hopeless barbarism. He therefore began the survey of the country, which hitherto in the maps of India had been almost a total blank, while the course of rivers and the position of capitals were in most cases utterly reversed. All this mass of ignorance and error was superseded by his ample and accurate map of Rajast'han, which he completed and presented to the Marquis of Hastings in 1815. To the country itself thus delineated he gave the name of Central India, and that name it has ever since retained. The value of the map was fully tested as a guide in the operations of the government only two years afterwards, as its information was adopted in the plan of operations by Lord Hastings in 1817.

It was not enough for Tod, however, that he should be the geographer of his adopted country: he resolved also to be its historian. It was a bold attempt. Hitherto it had generally been thought in Europe that Indian history was but a myth—a collection of opium dreams, more unreal than even the *Arabian Nights' Entertainments*—and therefore unworthy of a moment's attention. The names, indeed, of Alexander of Macedon and Timour, of Mahmoud of Gazni, Baber, and Acbar, were familiar as invaders and conquerors of India; but the peoples and heroes whom they slew or subjugated in the lands which they formed into new empires, were as unknown as if they had been the inhabitants of a different planet; and yet these people must have had a history of some kind or other, and perchance a history worth reading, if it were only written. This, he resolved, should

be done; but where were the materials? Rajast'han had abounded in poets and fabulists, and these, too, of the true eastern stamp; but it had not a Herodotus or a Xenophon, nor yet even a Bede or Fordun. These were all but insuperable difficulties, let the amount of research and talent be what it might. All this, however, he overcame. The labour which he endured in such a task, while it has a startling sound to European ears, gives a high idea of his indomitable zeal and perseverance. He began with the sacred genealogies contained in the Puranas, examined the Mahabharat, studied the historical poems of Chund, Jesselmer, Marwar, and Mewar, and the bardic lays containing the history of the Kheetchies, and that of the Hara princes of Kotah and Boondi. He also procured and carefully studied a large portion of the compilations of Jeysing of Amber or Jey-poor, the learned rajah of modern times, illustrating the history of his race. For ten years he was occupied with this mountain of recondit matter, being assisted in his labours by an erudite scholar of that eastern sect called the Jains, who made copious extracts from the above-mentioned mass, and translated them into those more familiar dialects of the East with which Tod was acquainted. He also mingled in frequent conversation with the most intelligent of the people; and having made himself master of their language, he extracted from them the knowledge of their historical traditions, whether in tales, allegories, or poems, and questioned them about their religious opinions and their daily habits and usages. His ardent enthusiasm, and the Asiatic character that was rapidly ingrafting itself upon his Scottish temperament, admirably fitted him for such a task; and seated amidst the ruins of ancient cities, with a group of these story-tellers around him, he listened for hours to their stirring tales of the wild chivalry of the East, and the patriotic deeds of their ancestors, until he felt as if he was a Rajpoot, and that the bleak northern country in which his boyhood had been spent was nothing more than a dream of the night. But still his hereditary caution—*canniness* if you will—did not desert him under such tempting circumstances; and therefore, independently of these sources of information, he studied every authentic monument, inscription, and architectural relic, by which he tested the innumerable legends that solicited his notice; and the result was his *Annals and Antiquities of Rajast'han*, of which the first volume was published in London in 1829. This splendid work at once demonstrated that India has actually a native history, while it became the text-book and authority of our most distinguished oriental scholars. It also gave an irresistible impulse to that study of Indo-Grecian antiquities which has since been so extensively prosecuted, and by which so much new light has been thrown upon ancient history, by revealing the connection between the European and Asiatic races.

And worthy, indeed, were the past achievements of the Rajpoots of such a commemoration. Proud of our northern chivalry of ancient days, and the national liberties which it established, we are too apt to lose sight of other nations that have struggled as bravely, though not so successfully, as ourselves. But Rajast'han, through the labours of Colonel Tod, has now a chronicle to unfold to the world, in which a patriotism as devoted, and sacrifices as great, and valiant deeds as illustrious are to be found as adorn the pages of Greece and Rome, or even our own Britain. "What nation on earth," he exclaims triumphantly, "could have maintained the semblance of civilization, the spirit or the customs of their forefathers, during so many centuries of overwhelming depression, but one of such singular character as the

Rajpoot? . . . Rajast'han exhibits the sole example in the history of mankind, of a people withstanding every outrage barbarity could inflict, or human nature sustain, from a foe whose religion commands annihilation; and bent to the earth, yet rising buoyant from the pressure, and making calamity a whetstone to courage. . . . Not an iota of their religion or customs have they lost, though many a foot of land." That so noble and gallant a people should have been overcome, and that in the midst of such achievements the country should still have continued to diminish, so that it became the very Poland of the East, can be easily explained, as in the case of Poland, by the defective nature of its government. Wherever the patriarchal system of rule predominates, the bravery, the devotedness, and patriotism of its people have been unavailing. They have furnished, indeed, a glorious and spirit-stirring history; but decay and downfall have been the inevitable close. Such was the fate of Rajast'han, a land of many tribes and many princes. The Parthians by whom they were overrun, and the Tartars by whom they were finally subdued, were united nations; and that single advantage made them victorious over a people braver perhaps than themselves, but divided by the feudality which prevented a united and universal resistance, and insured a piecemeal destruction.

Such was the nature of Tod's labours till 1817, when he was appointed political agent of government over that extensive country comprising the five principal states of Rajast'han, viz. Mewar, Marwar, Jessulmer, Kotah, and Boondi. It was a high office for one holding his subordinate military rank, although scarcely too high for his service and merits, and the confidence which the Rajpoots reposed in him. But the appointment seems to have given umbrage to those who perhaps thought themselves better entitled to promotion, irrespective of their fitness for such a peculiar office. The sympathy also which he felt for the people, and the influence which he possessed among the native princes, caused him for a short time to be regarded at head-quarters with suspicion and jealousy. But these unseemly feelings, although they annoyed him at first, he soon refuted by his conduct; while the excellence of his administration endeared him more and more every day to the people. This Bishop Heber found afterwards in his episcopal tour, when he passed through the province of Mewar. On this occasion the inquiries of the people as to the welfare of their "Tod Sahib" were incessant, and whether they should ever see him again. It is not often that the deputy who rules in the name of foreign masters is thus endeared to a subjugated but still high-spirited people. The nature of his administration, his attempts for the restoration of Rajpootana, and the estimation in which his labours were held, can be best understood from the following letter to a friend:—"Regarding Bhilwana, the work of my hands, in February, 1818, there was not a dog in it; in 1822 I left 3000 houses, of which 1200 were bankers and merchants; an entire street, arcaded, was built under my directions, and with my means. The merchants from Calcutta, Jessulmer, Delhi, Surat—from every mart in India—had their correspondents; and, in fact, it was becoming the chief mart of Rajast'han. The affection of these people a thousand times repaid my cares. The females met me at a distance with vessels of water on their heads, singing the *Sohaloh*, and the whole of the merchants and bankers advanced in a body to conduct me through it. The streets were crowded; brocades of gold silks were suspended from the shops—it made me proud, not vain. It was with difficulty I checked the determination to

call it *Todgunge*; but whatever I did was in the Rana's name. My conscience tells me I deserved their love. How health and comfort were spurned in their behalf! I have lain on my pallet with high fever, my spleen so enlarged as to be felt in every part of my ribs; fifty leeches at work, left to a servant to superintend, whilst I had the whole of the territorial officers of the district of Mondelgurh, consisting of 350 towns and villages, at the other side, taking the whole of their accounts, and separating the fisc and the lands of the chiefs, even to a beegah—all the while half-dead with inanition. But I had the principle of life strong within me. It appears now a dream. But a week before I was at the point of death; but it was vain to tell me to desist from work. A short time after I was knocked off my elephant in going to restore to the chief of the *Megawats* twenty-seven villages, alienated for forty-five years, which I recovered from the fangs of the *Mahrattas*. The animal ran off, crossing the wooden bridge of his moat, and the arch being too low carried me fairly off. That I was not crushed was a miracle. *That night the triumphal arch of the Megawats was levelled to the ground!* These are the men without gratitude! It was worth a broken limb, yet I escaped with bruises. But my head burns as did my heart for my Rajpoots."

In this short account we have the secret of that wondrous spell by which we retain the empire of the East. Compare Colonel Tod with a Roman prætor or pro-consul! It is only when Britain will impose rulers upon her Indian dependencies who will pillage rather than protect and benefit the people, that her rule over India will pass away into other hands, and leave nothing behind it but the glory and the shame of a historical remembrance.

The rest of Colonel Tod's proceedings among the Rajpoots may be briefly told. In 1819 he completed the circuit of Marwar, and visited its capital, Joudpoor, by the route of Komulmer, and returned to Oodipoor by the way of Mairta and Ajmer. In 1820 he visited Kotah and Boondi, and in the following year he revisited the latter province, in consequence of the death of his friend the Rao Rajah Ram Sing, who bequeathed to the colonel the guardianship of his son, the prince of the Haras. It was now time that his personal connection with India should cease, as after a residence of twenty-two years of incessant occupation in that climate, his broken constitution could withstand it no longer. He was accordingly released from his duties as British political agent of Rajast'han, which he had discharged during five years, and allowed to return to England. But instead of instantly availing himself of the opportunity, by hastening to embark when he left the valley of Oodipoor in June, 1822, he crossed the Aravalli to the sacred mountain of Aboo, and explored the remains of that district, so venerated in the religious traditions of Hindoostan. His interest in Rajpootana and love of travel being still unabated, he continued his journey of research, in which he discovered the ruins of an ancient city in the borders of Marwar, explored the ancient capital of the Balhara kings, and crossed the peninsula of Saurashtra, visiting in his way the towns, temples, and shrines that illustrated the ancient history of the country. This journey was so replete with interest that he drew up a full account of it after his return to England. He finally embarked at Bombay in the early part of 1823, and arrived in England the same year.

On returning home Colonel Tod by no means abandoned himself to a life of rest or recreation. His Indian studies and discoveries, carried over so long a period, and involving such important subjects,

were to be arranged and prepared for the press, and to this duty he turned his attention with all his wonted ardour. And how well he discharged his task the *Annals of Rajast'han* will sufficiently attest, independently of his other writings. It opened up new paths in the study of the history, philosophy, and religion of India, which subsequent scholars have entered with the happiest results. But these efforts, upon a constitution already all but exhausted, accelerated the process of decay, and a complaint in the chest obliged him to take up his residence in Italy, where he chiefly abode during the last twelve months of his life. Still his studies were continued, and during the winter while he stayed in Rome he employed himself daily in a work entitled *Travels in Western India*, containing his observations during a journey to the peninsula of Guzerat, which he had made before his departure for Britain. From Italy he returned to England in the beginning of September, 1835, and on the 14th of November he came from his mother's residence in Hampshire to London, ready to publish his work on Western India, and retire for the rest of his life to a property which he had lately purchased. But on the 16th, the anniversary of his marriage, while transacting business at his banker's, he was suddenly struck with apoplexy, under which he continued speechless and insensible for twenty-seven hours, when he expired on the afternoon of the 17th, 1835.

TRAILL, REV. ROBERT. The family of the Traills is of considerable antiquity, and was settled in Fifeshire, where they possessed the estate of Blebo. The first of the name who appears in Scottish history was Walter Traill, son of the laird of Blebo, who was appointed Archbishop of St. Andrews by king Robert III., about the year 1385. The father of Robert Traill, who was minister of the Grayfriars' Church, Edinburgh, was one of those bold witnesses for the Covenant who lived during the stormy period of the Commonwealth, and the still more trying season of the Restoration, in which, at the age of sixty, he was banished from Scotland for life upon the charge of holding a conventicle, because he had read and expounded Scripture to a few friends who were assembled in his house. In consequence of this sentence he retired to Holland, the usual place of refuge for the exiled Presbyterians of Scotland, and there spent the rest of his life.

It was in the midst of these troubles that the subject of the present memoir was ushered into the world. He was born at Elie, in Fifeshire, of which parish his father at first was minister, in May, 1642. Being destined for the ministry at a period when the office in Scotland possessed few secular attractions, and was best fitted to test the disinterestedness of its candidates, he prosecuted the usual course of study in the university of Edinburgh, and secured by his proficiency the approbation of the professors. While a divinity student, and as yet only nineteen years old, he evinced his sincerity and courage by attending James Guthrie of Stirling to the scaffold, when that faithful martyr was executed for his adherence to the persecuted Kirk of Scotland. It was easy to foresee from such a commencement that the course of the young man would be neither a profitable nor a safe one. On the banishment of his father two years afterwards, the circumstances of the family were so straitened that Robert Traill, who shared in all their trials, was often without a home. Matters in 1666 became even worse, in consequence of some copies of the *Apologetic Relation*—a work obnoxious to the prelates and privy-council—having been found in their house; for in consequence of this

discovery his mother, brother, and himself were obliged to hide themselves from pursuit. While he was thus a fugitive, the unfortunate rout at Pentland occurred; and—as in the trials that followed all the homeless and persecuted in Scotland were assumed as being more or less implicated in the insurrection—Robert Traill, whether truly or falsely, was said to have been in the ranks of the insurgents, in consequence of which charge he was liable every hour to be apprehended and executed as a traitor. In this difficulty he fled to Holland in 1667, and joined his father, who had been settled there four years. Here he resumed his studies in theology, and assisted Nethenus, professor of divinity at Utrecht, in publishing Rutherford's *Examination of Arminianism*.

The stay of Robert Traill in Holland must have been a short one, probably only till the close of 1668; for in April, 1669, he was preaching in London upon a Thursday previous to the administration of the Lord's supper. It is probable that having completed his theological studies in Holland, he had come to England in the earlier part of the year, and received ordination from the London presbytery. Here he preached for some time without any settled charge, and was afterwards permanently appointed to the Presbyterian church at Cranbrook, a small town in Kent. In this retirement he could exercise his calling in safety, as the Presbyterianism of England was not regarded as either so formidable or so important as to provoke the interposition of state persecution. But the case was very different in his native Scotland, which he visited in 1677. During his sojourn in Edinburgh he privately preached there, notwithstanding the severe laws against conventicles; and as the privy-council had their spies everywhere, he was soon arraigned for this highest of offences before their bar. His trial was a brief one. He was first accused as a holder of house-conventicles, and this he acknowledged to be true. He was then asked if he had also preached at field-conventicles, but as this was the trying question upon what was a capital offence, he gave no answer; and when required to clear himself by oath of having preached at or attended such meetings, he refused to comply. For lack of witnesses or proof they would oblige him to be his own accuser, and were prepared to punish him whether he confessed or remained silent! But such was the law of Scotland in those days against the persecuted children of the Covenant. On further questioning all that he acknowledged was that he had been ordained a minister in London, and that he had conversed with Mr. John Welch, one whom they had proscribed, upon the English border. For these offences he was sentenced to imprisonment in the Bass—a punishment only short of the gallows; and here he remained three months, at the end of which period he was released by order of government. It is not impossible that he had some influential friends in the English metropolis, otherwise he might have remained in the Bass for years, had his life endured it so long. On being released from his damp and dismal dungeon, that was scooped in the bowels of the sea-girt rock, Traill returned to Cranbrook, and resumed his ministerial duties over his little flock, until he was called to a wider sphere in London. There he lived and laboured as a Presbyterian minister until he died in May, 1716, at the ripe age of seventy-four, having witnessed before he closed his eyes the deposition of the Stuarts, the firm establishment of Presbyterianism in his native country, the union of the two kingdoms, and the prospect of peaceful days and more liberal principles of rule under the accession of the Hanoverian dynasty.

Such are the few particulars that can be ascertained of the life of Robert Trall; and from these it is evident that he was a man of peace, and that the persecutions he so manfully endured were not sought by him, but thrust upon him. It is easy, also, to perceive from his published works, that he was a thoughtful student, as well as one of large and vigorous intellect; and that his taste as a writer was greatly in advance of his contemporary countrymen. His writings are essentially English—clear, nervous, and Saxon—while the catholicity of their sentiments made them a favourite with every class of religious men both in England and Scotland. Although so well adapted, also, to obtain influence and distinction in authorship, he did not commit his first work to the press until he had attained the ripe age of forty, and even then, such was his modesty, that it was extorted from him by the importunity of his admirers; while his second publication did not follow till ten years after. The following is a list of his writings: Sermon on *How Ministers may best win Souls*.—Letter on *Antinomianism*.—Thirteen discourses on the *Throne of Grace*, from Heb. iv. 16. —Sixteen sermons on the *Prayer of our Saviour*, in John xvii. 24. These works obtained such high popularity, and were found so useful, that after his death the following were also published from his manuscripts: Twenty-one sermons on *Steadfast Adherence to the Profession of our Faith*, from Heb. x. 23.—Eleven sermons from 1 Peter i. 1-4.—Six sermons on Galatians ii. 21.—Ten sermons on various subjects. These were transcribed from family MSS., and issued by the Cheap Publication Society of the Free Church of Scotland in 1845.

TROTTER, THOMAS, M.D., who held at one time the important office of physician to the Channel fleet, was born in Roxburghshire, educated at the university of Edinburgh, and while still young was appointed surgeon in the royal navy in 1782. Finding occupation in his own particular department too scanty, or rival aspirants too numerous, he turned his attention to the African trade, and was, as he has informed us, the first of his professional corps who was obliged to betake himself to that humble and somewhat perilous vocation. Returning from Africa in 1785, he settled as a medical practitioner at a small town in Northumberland, and obtained the degree of M.D. at Edinburgh in 1788. Better days now began to dawn upon him; for in the following year he was appointed, through the patronage of Admiral Roddam, surgeon to that commander's flag-ship; in 1793 he was made physician to the Royal Hospital at Portsmouth, and in 1794 physician to the fleet.

This was high as well as rapid promotion for one who had been fain to commence his pursuit of fortune in a merchant-ship, and under the baneful sun of Africa; but the first step in his ascent once secured, Dr. Trotter soon showed his fitness for the eminence to which he was raised, for in 1790, only a year after his first appointment, he published a *Review of the Medical Department of the British Navy*. Such also was his care for the health of the naval service, the important improvements he introduced into its regulations, and his attention to the due promotion of merit among the navy surgeons, that all classes combined in acknowledging his worth. After having occupied the important charge of physician to the fleet for several years, he retired upon a pension of £200 per annum, and settled at Newcastle, where he practised with reputation till his death, which occurred in that town on the 5th September, 1832.

As an author Dr. Trotter was known to the medical world at large by the excellent works he pub-

lished, as well as the reforms he effected in the British navy. A list of these productions we here give in their order:—1. *Treatise on the Scurvy*.—2. *Thesis "De Ebrietate."* 1788. 3.—*Review of the Medical Department of the British Navy*. 1790. A work to which we have already adverted. 4.—*Medical and Chemical Essays*. 1796.—5. "*Medica Nautica, or an Essay on the Diseases of Seamen.*" 3 vols. 8vo, 1799.—6. *Essay on Drunkenness*. 1804. This was a translation with additions of his *Thesis* which he had written in 1788, and which had been highly commended by Dr. Cullen.—7. *An Address to the Proprietors and Managers of Coal-mines, on the Means of Destroying Damp*. 1806.—8. "*A View of the Nervous Temperament; being a Practical Treatise on Nervous, Bilious, Stomach, and Liver Complaints.*" 8vo, 1812.

Dr. Trotter was a poet as well as physician, and his productions in this department, forgotten though they now are, excited during their own day such an amount of respectful attention as mere common rhymes could scarcely have obtained. First in the list of these was his *Suspisia Oceani*, being a monody on the death of Earl Howe; the next, published in 1813, was a tragedy, entitled "*The Noble Foundling, or the Hermit of the Tweed.*" He also published a volume of his miscellaneous poetry, and was a frequent contributor at his leisure hours, not only to the *Medical Journal*, but also to the *European Magazine*, and other literary periodicals.

TURNBULL, WILLIAM, Bishop of Glasgow and Lord Privy-seal of Scotland, descended from the Turnbulls of Minto, in Roxburghshire, was born in the early part of the fifteenth century. Having been educated for the church, he entered into orders, and was appointed prebend of Balenrick (connected with which dignity was the lordship of Prevan) in the year 1440. In the year 1445 he was preferred to be secretary and keeper of the privy-seal; at which time, as appears by the act of council, he was called William Turnbull, Lord of Prevan. He was shortly after this inaugurated Doctor of Laws, and made archdeacon of St. Andrews, within the bounds of Lothian. By some writers he is said to have been about this time Bishop of Dunkeld; but this, we think, is doubtful. In the year 1447 he was promoted to the see of Glasgow, upon the death of Bishop Bruce, and was consecrated in the year 1448.

No sooner was Bishop Turnbull settled in the see than he set about erecting or founding a college in the city. For this purpose a bull, at the request of King James II., was procured from Pope Nicholas V., constituting a university, to continue in all time to come, in the city of Glasgow, "it being a notable place, with gude air, and plenty of provisions for human life." The pope, by his apostolical authority, ordained that the doctors, masters, readers, and students of the university of Glasgow should enjoy all the privileges, liberties, honours, exemptions, and immunities which he had granted to the city of Bononia. He likewise appointed William Turnbull, Bishop of Glasgow, and his successors in that see, chancellors of the university, and to have the same authority over the doctors, masters, readers, and scholars as the chancellors of the university of Bononia. This bull is dated at Rome, January 7, 1450. By the care of the bishop and his chapter, a body of statutes was prepared, and a university established the following year, 1451.

The university consisted, besides the chancellor, of a rector, and masters of the four faculties, who had taken their degrees in other colleges; and students who, after a course of study, might be promoted to

academical degrees. That the classes in the university might commence with some degree of celebrity, a bull had been procured from the pope, and was now published, granting a universal indulgence to all faithful Christians who should visit the cathedral of Glasgow in the year 1451. The first rector was David Cadzow, who was re-elected in 1452. During the first two years upwards of a hundred members were incorporated, most of them secular or regular clergy, canons, rectors, vicars, abbots, priors, and monks. The clergy attended the university the more willingly, that the bishop had procured royal charters and acts of parliament, exempting them from all taxes and public burdens, and from their residence in their own cures. The whole incorporated members, students, as well as doctors and masters, were divided into four parts, called the *Quatuor Nationes*, according to the place of their nativity. The whole realm of Scotland and the Isles was divided into four districts, under the names of Clydesdale, Teviotdale, Albany, and Rothesay; a meeting of the whole was annually called the day after St. Crispin's day; and, being divided into four nations, each nation by itself chose a procurator and intrant, and the intrants, meeting by themselves, made choice of a rector and a deputation of each nation, who were assistants and assessors to the rector. The rector and his deputation had various and important functions. They were judges in all criminal causes wherein any member of the university was a party. Every member who either sued or answered before any other court, was guilty of perjury, and incurred the penalty of expulsion. The ecclesiastics in the university, of course, to whatever diocese they belonged, could no longer be called before their rural deans. All members were incorporated by the rector and deputation, after taking an oath to obey the rector and his successors, to observe the statutes, preserve the privileges of the university, and keep its secrets, revealing nothing to its prejudice, whatever station in society they might afterwards attain. The rector and deputies were also the council of the college. It was their business to deliberate upon, and digest all matters to be brought before the congregation of the doctors and masters, whose determinations in such cases were accounted, in respect of authority, next to the statutes. Two other office-bearers were chosen annually, on the day after St. Crispin's, namely, a *bursarius*, who kept the university purse, and accounted for all his intromissions; and a *promoter*, whose business it was to see to the observation of the statutes, and to bring delinquents before the rector's court, which had power to enforce the statutes, or to dispense with them, in certain cases. The second division of the university was into its different faculties, four of which, in the pope's bull, are specified by name: Theology, Canon Law, Civil Law, and the Arts. All others are comprehended in a general clause, *quacunque licita facultate*. In these times the professions of theology, canon and civil laws, were denominated the three learned professions, as being the only ones in which learning was thought necessary. They alone fitted men for honourable or profitable employments, for being admitted to dignities in the church or the state; and to train men to eminence in these professions was the original intention of universities. The arts, however, under which were comprehended logic, physics, and morals, being considered as necessary to these professions, formed an indispensable part of study in every university. The universities were all incorporated by the popes, who appear to have borrowed their plan from that of incorporated towns and burghs, the university corresponding to the whole incorpora-

tion of the burgh, and the different faculties to the different companies of trades or crafts into which the burgh is divided. The companies in the incorporated towns were anciently called *collegia*, or colleges; and the whole incorporation, comprehending all the companies, was called the *universitas* of that town. These names, by analogy, were at first applied to corporations of the learned professions, and at length appropriated solely to them. The government of every faculty was similar to that of the university. Each had its own statutes, determining the time of study, and the exercises and examinations necessary for attaining degrees in that faculty. Each chose annually its own dean, its own *bursarius*, and sometimes four deputations, as a council to the dean. Of the three higher faculties in this university nothing is known, there being no record of their statutes or transactions extant. A third division in the college was made, according to the academical degree of every member. The highest degree in theology, canon and civil law, was that of doctor in the arts. In all the faculties there were two degrees by which a man rose to the highest. These were bachelor and licentiate. The degree of licentiate, as well as that of doctor or master, was conferred by the chancellor or vice-chancellor. The requisites to all the degrees were a certain time of study, having heard certain books prelected upon, and performed certain exercises and gone through certain examinations. The age of fifteen was necessary for being made a bachelor of arts, and twenty to become a master. It was forbidden, under a heavy penalty, to give any man the title of master, by word or writing, who had not attained that degree; and the penalty was still heavier if any man took it to himself, without having obtained it in the regular manner. Nor can we feel surprised at degrees being thus carefully guarded, seeing they were held to be of divine institution, and were always conferred by the chancellor, or vice-chancellor, in the name of the Father, of the Son, and of the Holy Ghost. Some years after the university was founded, a number of the students being young men to whom tuition as well as teaching was necessary, provision was made that they should live and eat in one house, which was called *Pedagogium*, or the college of arts. Here they were taught and governed by certain masters, called *regentes artibus*. This college was at first on the south side of the Rottenrow, near the cathedral; but afterwards a tenement was bequeathed for it by Lord Hamilton, the site of the college in High Street. There were at first in the university, three regents in the arts, viz. Alexander Geddes, a Cistercian monk; Duncan Burch, and William Arthurlie. Afterwards there were sometimes two, and sometimes only one. This seems to have been the most laborious and least coveted office in the university. Besides teaching and presiding in disputations every lawful day, the regents lived within the college, ate at a common table with the students of arts, visited the rooms of the students before nine at night, when the gates were shut, and at five in the morning, and assisted in all examinations for degrees in the faculties of arts. For many years the office had no salary, and the fees paid by the students were very small. All that held the office, two only excepted, kept it but for a short time; and often one who was not a member of the faculty was called to the office; which renders it probable that there was no competition in those days, either for the office itself, or for the patronage of it; but, on the contrary, some difficulty was experienced in finding persons qualified to fill it, or who were willing to take it. James II., the year after its foundation, granted a royal charter in favour of the university, by which

the rectors, the deans of the faculties, the procurators of the four nations, the masters, regents, and scholars, with the beadles, writers, stationers, and parchment makers, were exempted from all taxes, watchings and wardings, weapon-schawings, &c.; but it had no property, either of lands, houses, or rents. The *congregatio universitatis* was always held at the cathedral.

The doctors and masters met sometimes at the convent of the Dominicans, or *Predicatores*, as they were called, where all the lectures we find mentioned in theology, canon and civil law, were read. There was a university purse, into which perquisites paid on being incorporated at examinations and promotions to degrees were put. From this purse, after it had accumulated for some years, cups of ceremony were furnished; but to defray the expense of a silver rod or mace, to be borne before the rector on solemn occasions, it was necessary to tax all the incorporated members, on which occasion David Cadzow, the first rector, gave twenty nobles. The first property the college acquired was two or three chaplainies bequeathed by some of its first members. The duty of the chaplain was to perform certain masses at a specified altar for the souls of the founder and his friends, for which he was paid a small annuity. These chaplainies were commonly given to some of the regents of the college of arts, probably because they were the parent of the sacerdotal order in the university. This patronage and this purse, so far as appears, were all the property the university ever possessed; nor does it appear that the faculties of theology, canon and civil law, ever had any property. The individuals had each livings through all parts of the nation, abbacies, priories, prebendaries, rectories, and vicarages, but the community had nothing. Its privileges were the sole inducement to bring rich ecclesiastics into a society in which they lived at ease free of all taxes, and subject to no authority but that of their own rector. The college of arts, however, which the public even then had the good sense to see was the most useful part of the whole, and particularly entitled to public favour, as being intrusted with the education of youth, soon came to have some property.

In the year 1469, only eight years after its foundation, James Lord Hamilton bequeathed to Mr. Duncan Burch, principal regent of the college of arts, and his successors, regents, for the use of the said college, a tenement, with the pertinents lying on the north side of the church and convent of the Dominicans, together with four acres of land in the Dovehill, with a request that the regents and students every day after dinner and after supper should stand up and pray for the souls of him, Lord James Hamilton, of Euphemia, his spouse, Countess of Douglas, of his ancestors and successors, and of all from whom he had received any benefit for which he had not made a proper return. These four acres of land became part of the college garden, and from this date the faculty of arts from time to time were enabled to devote somewhat to the repairing, and even to make additions to the buildings of the college, furnishing rooms for the regents and students, with things necessary for the kitchen and a common table. Nearly thirty years after this Mr. Thomas Arthurdie bequeathed to the university another tenement adjoining to the college. By this time the students consisted generally of the youth of the nation, whose education was of the utmost importance to the public. They were distinguished according to their rank into sons of noblemen, of gentlemen, and those of meaner rank, and, with a degree of consideration which in modern times has been lost sight of, for the expenses of their education were taxed

accordingly. Such is the early history of the university of Glasgow, founded by Bishop Turnbull, probably in imitation of that established by Bishop Wardlaw at St. Andrews. Neither of those bishops, it may be remarked, bestowed any of their funds upon the colleges they were the means of establishing, and in this respect came far short of Bishop Elphinston of Aberdeen, who not only procured the foundation of a college in that city, but contributed largely to its endowment. Bishop Turnbull also obtained from James II. a charter erecting the town and patrimonies of the bishopric of Glasgow into a regality; and after he had done many acts highly beneficial to the age in which he lived, and worthy to be remembered by posterity, died at Rome, on the 3d day of September, 1454. His death was universally regretted; and his name must always bear a conspicuous place among the more worthy and useful clergy of the elder establishment in Scotland.

TYTLER, ALEXANDER FRASER, usually styled Lord Woodhouselee, was born in Edinburgh, on the 15th of October, 1747. He was the eldest son of William Tytler, Esq., of Woodhouselee, by his wife, Anne Craig. The earlier rudiments of education he received from his father at home; but in the eighth year of his age he was sent to the high-school, then under the direction of Mr. Mathison. At this seminary young Tytler remained for five years, distinguishing himself at once by the lively frankness of his manners, and by the industry and ability with which he applied himself to and pursued his studies. The latter procured him the highest honours of the academy; and finally, in the last year of his course, obtained for him the dignity of dux of the rector's class.

On the completion of his curriculum at the high-school, his father sent him, in his sixteenth year, to an academy at Kensington for the still further improvement of his classical attainments, and there he soon distinguished himself by his application and proficiency, particularly in Latin poetry, to which he now became greatly attached, and in which he arrived at great excellence. To his other pursuits, while at Kensington, Mr. Tytler added drawing, which soon became a favourite amusement with him, and continued so throughout the whole of his after life. He also began, by himself, to study Italian, and by earnest and increasing assiduity quickly acquired a sufficiently competent knowledge of that language to enable him to read it fluently, and to enjoy the beauties of the authors who wrote in it. The diversity of Mr. Tytler's pursuits extended yet further. He acquired, while at Kensington, a taste for natural history, in the study of which he was greatly assisted by Dr. Russel, an intimate friend of his father, who then lived in his neighbourhood.

In 1765 Mr. Tytler returned to Edinburgh, after an absence of two years, and his studies naturally assumed a more direct relation to the profession for which he was destined—the law. With this object he entered the university, where he began the study of civil law under Dr. Dick; and afterwards that of municipal law under Mr. Wallace. He also studied logic under Dr. Stevenson; rhetoric and belles-lettres under Dr. Blair; and moral science under Dr. Ferguson. Mr. Tytler, however, did not, by any means, devote his attention exclusively to these preparatory professional studies. He reserved a portion for those that belong to general knowledge. From these he selected natural philosophy and chemistry, and attended a course of each. While he was fortunate in having such eminent teachers, he was no less

fortunate, at this period of his life, in his acquaintance. Amongst these he had the happiness to reckon Henry Mackenzie, Lord Abercromby, Lord Craig, Mr. Playfair, Dr. Gregory, and Dugald Stewart.

In 1770 Mr. Tytler was called to the bar; and in the spring of the succeeding year he paid a visit to Paris, in company with Mr. Kerr, of Blackshields. Shortly after this, Lord Kames, who had seen from time to time some of his little literary efforts, recommended to him to write a supplementary volume to his *Dictionary of Decisions*. Inspired with confidence, and flattered by the opinion of his abilities on the part of Lord Kames, Mr. Tytler immediately commenced the laborious undertaking, and in five years of almost unremitting toil completed it. The work, which was executed in such a manner as to call forth not only the unqualified approbation of the eminent person who had first proposed it, but of all who were competent to judge of its merits, was published in folio, in 1778. Two years after this, in 1780, Mr. Tytler was appointed conjunct professor of universal history in the college of Edinburgh with Mr. Pringle; and in 1786 he became sole professor. From this period till the year 1800 he devoted himself exclusively to the duties of his office, in which his services were singularly efficient. His course of lectures was so remarkably comprehensive, that, although they were chiefly intended, in accordance with the object for which the class was instituted, for the benefit of those who were intended for the law, he yet numbered amongst his students many who were not destined for that profession. The favourable impression made by these performances, and the popularity which they acquired for Mr. Tytler, induced him, in 1782, to publish what he modestly entitled *Outlines* of his course of lectures. These were so well received, that their ingenious author felt himself called upon some time afterwards to republish them in a more extended form. This he accordingly did, in two volumes, under the title of *Elements of General History*. The *Elements* were received with an increase of public favour, proportioned to the additional value which had been imparted to the work by its extension. It became a text-book in some of the universities of Britain; and was held in equal estimation, and similarly employed, in the universities of America. The work has since passed through many editions. The reputation of a man of letters, and of extensive and varied acquirements, which Mr. Tytler now deservedly enjoyed, subjected him to numerous demands for literary assistance and advice. Amongst these was a request from Dr. Gregory, then (1788) engaged in publishing the works of his father, Dr. John Gregory, to prefix to these works an account of the life and writings of the latter. With this request Mr. Tytler readily complied; and he eventually discharged the trust thus confided to him with great fidelity and discrimination, and with the tenderest and most affectionate regard for the memory which he was perpetuating.

Mr. Tytler wrote pretty largely also for the well-known periodicals the *Mirror* and the *Lounger*. To the former of these he contributed Nos. 17, 37, 59, and 79; and to the latter Nos. 7, 9, 24, 44, 67, 70, and 79. The first of these were written with the avowed intention of giving a higher and sprightlier character to the work to which they were furnished; qualities in which he thought it deficient, although he greatly admired the talent and genius displayed in its graver papers; but he justly conceived, that a judicious admixture of a little humour, occasionally, would not be against its popularity. The circumstances in which his contributions to the *Lounger* were composed, afford a very remarkable

instance of activity of mind and habits, of facility of expression, and felicity of imagination. They were almost all written at inns, where he happened to be detained for any length of time, in his occasional journeys from one place to another.

On the institution of the Royal Society of Edinburgh, in 1783, Mr. Tytler became one of its constituent members; and was soon afterwards unanimously elected one of the secretaries of the literary class, in which capacity he drew up an account of the "Origin and History of the Society," which was prefixed to the first volume of its *Transactions*. In 1788 he contributed to the *Transactions* a biographical sketch of Robert Dundas of Arniston, lord-president of the Court of Session; and in the year following read a paper to the society on the vitrified forts in the Highlands of Scotland. The principal scope of this paper, which discovers great antiquarian knowledge and research, is to show that, in all probability, this remarkable characteristic of the ancient Highland forts—their vitrification—was imparted to them, not during their erection, as was generally supposed, but at their destruction, which its author reasonably presumes would be in most, if not all cases, effected by fire. With the exception of some trifling differences of opinion in one or two points of minor importance, Mr. Tytler's essay met with the warm and unanimous approbation of the most eminent antiquarians of the day.

The next publication of this versatile and ingenious writer, was an *Essay on the Principles of Translation*, published anonymously in 1790. By one of those singular coincidences which are not of unfrequent occurrence in the literary world, it happened that Dr. Campbell, principal of the Marischal College, Aberdeen, had, but a short while before, published a work entitled *Translations of the Gospel*; to which was prefixed a "Preliminary Dissertation on the Principles of Taste." Between many of the sentiments expressed in this dissertation, and those promulgated in Mr. Tytler's *Essay*, there was a resemblance so strong and close, that Dr. Campbell, on perusing the latter, immediately conceived that the anonymous author had pillaged his dissertation; and instantly wrote to Mr. Creech of Edinburgh, his publisher, intimating his suspicions. Mr. Tytler, however, now came forward, acknowledged himself to be the author of the suspected *Essay*, and, in a correspondence which he opened with Dr. Campbell, not only convinced him that the similarity of sentiment which appeared in their respective publications, was the result of mere accident, but succeeded in obtaining the esteem and warmest friendship of his learned correspondent. Mr. Tytler's *Essay* attained a rapid and extraordinary celebrity. Complimentary letters flowed in upon its author from many of the most eminent men in England; and the book itself speedily came to be considered a standard work in English criticism. He had now attained nearly the highest pinnacle of literary repute. His name was widely known, and was in every case associated with esteem for his worth and admiration of his talents. It is no matter for wonder then, that such a man should have attracted the notice of those in power, nor that they should have thought it would reflect credit on themselves to promote his interests.

In 1790 Mr. Tytler, through the influence of Lord Melville, was appointed to the high dignity of judge-advocate of Scotland. The duties of this important office had always been, previously to Mr. Tytler's nomination, discharged by deputy; but neither the activity of his body and mind, nor his strong sense of duty, would permit him to have recourse to such a subterfuge. He resolved to discharge the duties in

person, and continued to do so, attending himself on every trial, so long as he held the appointment. He also drew up, while acting as judge-advocate, a treatise on *Martial Law*, which has been found of great utility. Of the zeal with which Mr. Tytler discharged the duties of his office, and of the anxiety and impartiality with which he watched over and directed the course of justice, a remarkable instance is afforded in the case of a court-martial which was held at Ayr. Mr. Tytler thought the sentence of that court unjust; and under this impression, which was well founded, immediately represented the matter to Sir Charles Morgan, judge-advocate general of England, and prayed for a reversion of the sentence. Sir Charles cordially concurred in opinion with Mr. Tytler regarding the decision of the court-martial, and immediately procured the desired reversion. In the fulness of his feelings, the feelings of a generous and upright mind, Mr. Tytler recorded his satisfaction with the event on the back of the letter which announced it.

In the year 1792 Mr. Tytler lost his father, and by his death succeeded to the estate of Woodhouselee, and shortly after Mrs. Tytler succeeded in a similar manner to the estate of Balmain in Invernesshire. Being now in possession of affluence, and every other blessing on which human felicity depends, he began to realize certain projects for the improvement and embellishment of his estate, which he had long fondly entertained. From this period he resided constantly at Woodhouselee, the mansion-house of which he enlarged in order that he might enlarge the bounds of his hospitality. The felicity, however, which he now enjoyed, and for which perhaps no man was ever more sincerely or piously grateful, was destined soon to meet with a serious interruption. In three years after his accession to his paternal estate, viz. in 1795, Mr. Tytler was seized with a dangerous and long-protracted fever, accompanied by delirium. The skill and assiduity of his friend Dr. Gregory averted any fatal consequences from the fever, but during the paroxysms of the disease he had burst a blood-vessel—an accident which rendered his entire recovery at first doubtful, and afterwards exceedingly tardy. During the hours of convalescence which succeeded his illness on this occasion, Mr. Tytler employed himself in improving, and adapting to the advanced state of knowledge, Derham's *Physico-Theology*—a work which he had always held in high estimation. To this new edition of Derham's work, which he published in 1799, he prefixed a "Dissertation on Final Causes." In the same year Mr. Tytler wrote a pamphlet, entitled "*Ireland profiting by Example; or the Question considered, Whether Scotland has gained or lost by the Union.*" He was induced to this undertaking by the circumstance of the question having been then furiously agitated, whether any benefit had arisen, or was likely to arise, from the union with Ireland. Of Mr. Tytler's pamphlet the interest was so great that no less than 3000 copies were sold on the day of publication.

The well-earned reputation of Mr. Tytler still kept him in the public eye, and in the way of preferment. In 1801, a vacancy having occurred in the bench of the Court of Session by the death of Lord Stonefield, the subject of this memoir was appointed, through the influence of Lord Melville, to succeed him, and took his seat, on the 2d of February, 1802, as Lord Woodhouselee. His lordship now devoted himself to the duties of his office with the same zeal and assiduity which had distinguished his proceedings as judge-advocate. While the courts were sitting he resided in town, and appropriated

every hour to the business allotted to him; but during the summer recess he retired to his country-seat, and there devoted himself with similar assiduity to literary pursuits. At this period his lordship contemplated several literary works; but gratitude, and a warm and affectionate regard for the memory of his early patron, induced him to abandon them all, in order to write the life of Lord Kames. This work, which occupied him interveniently for four years, was published in 2 volumes quarto, in 1807, with the title of *Memoirs of the Life and Writings of Henry Home, Lord Kames*. Besides a luminous account of its proper subject, and of all his writings, it contains a vast fund of literary anecdote, and many notices of eminent persons, of whom there was hardly any other commemoration.

On the elevation of Lord Justice-clerk Hope to the president's chair in 1811, Lord Woodhouselee was appointed to the judiciary bench, and with this appointment terminated his professional advancement. His lordship still continued to devote his leisure hours to literary pursuits, but these were now exclusively confined to the revision of his *Lectures upon History*. In this task, however, he laboured with unwearied assiduity, adding to them the fresh matter with which subsequent study and experience had supplied him, and improving them where an increased refinement in taste showed him they were defective.

In 1812 Lord Woodhouselee succeeded to some property bequeathed him by his friend and relation Sir James Craig, governor of Canada. On this occasion a journey to London was necessary, and his lordship accordingly proceeded thither. Amongst the other duties which devolved upon him there, as nearest relative of the deceased knight, was that of returning to the sovereign the insignia of the order of the Bath with which Sir James had been invested. In the discharge of this duty his lordship had an interview with the prince-regent, who received him with marked cordiality, and from the conversation which afterwards followed, became so favourably impressed regarding him, that he caused an intimation to be conveyed to him soon after that the dignity of baronet would be conferred upon him if he chose it. This honour, however, his lordship modestly declined.

On his return from London his lordship, who was now in the sixty-fifth year of his age, was attacked with his old complaint, and so seriously, that he was advised and prevailed upon to remove from Woodhouselee to Edinburgh, for the benefit of the medical skill which the city afforded. No human aid, however, could now avail him. His complaint daily gained ground in despite of every effort to arrest its progress. Feeling that he had not long to live, although perhaps not aware that the period was to be so brief, he desired his coachman to drive him out on the road in the direction of Woodhouselee, that he might obtain a last sight of his beloved retreat. On coming within view of the well-known grounds his eyes beamed with a momentary feeling of delight. He returned home, ascended the stairs which led to his study with unwonted vigour, gained the apartment, sank on the floor, and expired without a groan.

Lord Woodhouselee died on the 5th January, 1813, in the sixty-sixth year of his age, leaving a name which will not soon be forgotten, and a reputation for taste, talent, and personal worth which will not often be surpassed.

TYTLER, JAMES, a laborious miscellaneous writer, was the son of the minister of Fearn, in the

county of Forfar, where he was born about the middle of the last century. After receiving a good education, he was apprenticed to a Mr. Ogilvie, a surgeon in Forfar, for whom he probably prepared the drugs which almost invariably form a part of the business of such provincial practitioners. He afterwards commenced a regular medical education at the university of Edinburgh, for which the necessary finances were partly supplied by two voyages which he made in the capacity of surgeon on board a Greenland whaler. From his earliest years, and during the whole course of his professional studies, he read with avidity every book that fell in his way; and having a retentive memory, he thus acquired an immense fund of knowledge, more particularly, it is said, in the department of history. If reared in easy circumstances, and with a proper supervision over his moral nature, it is probable that Tytler would have turned his singular aptitude for learning, and his prompt and lively turn of mind, to some account, either in the higher walks of literature, or in some professional pursuit. He appears, however, to have never known anything but the most abject poverty, and to have never been inspired with a taste for anything superior: talent and information were in him unaccompanied by any development of the higher sentiments: and he contentedly settled at an early period of life into a humble matrimonial alliance, which obliged him to dissipate upon paltry objects the abilities that ought to have been concentrated upon some considerable effort. Whether from the pressing nature of the responsibilities thus entailed upon him, or from a natural want of the power of application, Tytler was never able to fix himself steadily in any kind of employment. He first attempted to obtain practice as a surgeon in Edinburgh; but finding the profits of that business inadequate to the support of his family, and being destitute of that capital which might have enabled him to overcome the first difficulties, he was soon induced to remove to Leith, in order to open a shop for the sale of chemical preparations. For this department he was certainly qualified, so far as a skill in chemistry, extraordinary in that age, could be supposed to qualify him. But either from the want of a proper market for his commodities, or because, as formerly, he could not afford to wait till time should establish one, he failed in this line also. In the meantime, some literary efforts of Tytler had introduced him to the notice of the booksellers of Edinburgh, and he was employed by Messrs. Bell and Macfarquhar as a contributor to the second edition of the *Encyclopædia Britannica*, which began to be published in 1776. As noticed in the life of Mr. WILLIAM SMELLIE, the first edition of the *Encyclopædia* was chiefly compiled by that gentleman, and was comprised in three volumes quarto. Mr. Smellie having declined both a commercial and literary share in the second impression, on account of its including a biographical department, the proprietors appear to have engaged the pen of Mr. Tytler as the next most eligible person that was at their command as a compiler; and accordingly, a large proportion of that additional matter by which the work was expanded from three to ten volumes was the production of the subject of this memoir. The payment for this labour is said to have been very small, inasmuch that the poor author could not support his family in a style superior to that of a common labourer. At one time during the progress of the work he lived in the village of Duddingston, in the house of a washerwoman, whose tub, inverted, formed the only desk he could command; and the editor of this *Dictionary* has heard one of his children relate that she was frequently despatched to town

with a small parcel of copy, upon the payment of which depended the next meal of the family. It is curious to reflect that the proceeds of the work which included so much of this poor man's labours were, in the next ensuing edition, no less than £42,000. It is proper, however, to mention that the poverty of Tytler was chiefly attributable to his own imprudence and intemperate habits. A highly characteristic anecdote, related by an anonymous biographer,¹ will make this sufficiently clear. "As a proof," says this writer, "of the extraordinary stock of general knowledge which Mr. Tytler possessed, and with what ease he could write on any subject almost extempore, a gentleman in the city of Edinburgh once told me that he had occasion to apply to this extraordinary man for as much matter as would form a junction between a certain history and its continuation to a later period. He found him lodged in one of those elevated apartments called *garrets*, and was informed by the old woman with whom he resided that he could not see him, as he had gone to bed rather the worse of liquor. Determined, however, not to depart without his errand, he was shown into Mr. Tytler's apartment by the light of a lamp, where he found him in the situation described by the landlady. The gentleman having acquainted him with the nature of the business which brought him at so late an hour, Mr. Tytler called for pen and ink, and in a short time produced about a page and a half of letterpress, which answered the end as completely as if it had been the result of the most mature deliberation, previous notice, and a mind undisturbed by any liquid capable of deranging its ideas." "It is said," proceeds his biographer after relating the above anecdote, "that Mr. Tytler was perfectly regardless about poverty, so far as to feel no desire to conceal it from the world. A certain gentleman who had occasion to wait upon him on some particular business found him eating a cold potato, which he continued to devour with as much composure as if it had been the most sumptuous repast upon earth." It is mentioned elsewhere by the same writer that poor Tytler never thought of any but present necessities, and was as happy in the possession of a few shillings as a miser could be with all the treasures of India.

Besides his labours in the *Encyclopædia Britannica*, to the third edition of which he is said to have also contributed (particularly the article "Electricity," which was allowed to be excellent), he was employed in the compilation of many miscellaneous books of a useful character, and also in abridgments. At one time, while confined within the precincts of the Sanctuary of Holyrood, he had a press of his own, from which he threw off various productions, generally without the intermediate use of manuscript. In a small mean room, amidst the squalling and squalor of a number of children, this singular genius stood at a printer's case composing pages of types, either altogether from his own ideas, or perhaps with a volume before him, the language of which he was condensing by a mental process little less difficult. He is said to have, in this manner, fairly commenced an abridgment of that colossal work the *Universal History*: it was only carried, however, through a single volume. To increase the surprise which all must feel regarding these circumstances, it may be mentioned that his press was one of his own manufacture, described by his biographer as being "wrought in the direction of a smith's bellows," and probably therefore not unlike that subsequently brought into use by the ingenious John Ruthven. This machine,

¹ See *A Biographical Sketch of the Life of James Tytler*. Edinburgh, printed by and for Denovan, Lawnmarket, 1805.

however, is allowed to have been "but an indifferent one;" and thus it was with almost everything in which Tytler was concerned. Everything was wonderful, considering the circumstances under which it was produced; but yet nothing was in itself very good.

Tytler was at one period concerned in a manufactory of magnesia, which, however, was useless as long as he was connected with it, though it is said to have realized much money afterwards to his partner and successors. On the commencement of the balloon mania, after the experiments of Montgolfier, Tytler would try his hand also at an aeronautic voyage. Accordingly, having constructed a huge dingy bag, and filled it with the best hydrogen he could procure, he collected the inhabitants of Edinburgh to the spot and prepared to make his ascent. The experiment took place in a garden within the Sanctuary; and the wonder is that he did not fear being carried beyond it, as in that event he would have been liable to the gripe of his creditors. There was no real danger, however; the balloon only moved so high and so far as to carry him over the garden wall and deposit him softly on an adjoining dunghill. The crowd departed, laughing at the disappointed aeronaut, who ever after went by the name, appropriate on more accounts than one, of "Balloon Tytler."

During his residence in the Sanctuary Tytler commenced a small periodical entitled the *Weekly Review*, which was soon discontinued. Afterwards, in 1780, a similar work was undertaken by a printer named Mennons, and Tytler was employed in the capacity of chief contributor. This was a cheap miscellany, in octavo; and the present writer, who once possessed a volume of it, is inclined, on recollection, to say that it displayed considerable talent. Tytler also tried poetry, and was the author of at least one popular song—"I canna come ilka Day to Woo;" if not also of another, styled "The Bonnie Brucklet Lassie." Burns, in his notes on Scottish song, alludes with surprise to the fact that such clever ballads should have been the composition of a poor devil with a sky-light hat and hardly a shoe to his feet. One of the principal works compiled by Tytler was the *Edinburgh Geographical Grammar*, published by Mr. Kincaid as an improvement upon the work bearing the name of Guthrie, which had gone through numerous editions without any revision to keep it abreast of the march of information. In the year 1792 Mr. Tytler was conducting a periodical work, entitled "*The Historical Register*, or Edinburgh Monthly Intelligencer," and putting the last hand to a *System of Surgery*, in three volumes, which he had undertaken for a surgeon in Edinburgh, who wished to have the nominal credit of such a work, when he was suddenly obliged to leave his native country. Having espoused the cause of parliamentary reform, and joined the society entitled "Friends of the People," he published, at the close of the year 1792, a political placard, which, in that excited time, was deemed by the authorities to be of a seditious tendency. Learning that the emissaries of the law had been sent forth in quest of him, he sought refuge in the house of a friend in a solitary situation on the northern skirts of Salisbury Crags; whence, after a short concealment, he withdrew to Ireland; and thence, after finishing his *System of Surgery*, to the United States of America. Having been cited before the High Court of Justiciary, and failed to appear, he was outlawed by that tribunal, January 7, 1793. His family, which he necessarily left behind him, was for some time in great distress; nor did they ever rejoin him in the land of his adoption, poverty

on both sides perhaps refusing the necessary expenses. In America Tytler resumed the course of life which had been interrupted by political persecution. He was conducting a newspaper at Salem, when he died of a severe cold, in the latter part of the year 1803.

This extraordinary genius was, perhaps, a fair specimen of a class of literary men who lived in the latter part of the eighteenth century, and were characterized by many of the general peculiarities of that bad era, in a form only exaggerated perhaps by their abilities. They were generally open scoffers at what their fellow-creatures held sacred; decency in private life they esteemed a mean and unworthy virtue; to desire a fair share of worldly advantages was, with them, the mark of an ignoble nature. They professed boundless benevolence and a devotion to the spirit of sociality, and thought that talent not only excused all kinds of frailties, but was only to be effectually proved by such. The persons "content to dwell in decencies for ever" were the chief objects of their aversion; while, if a man would only neglect his affairs, and keep himself and his family in a sufficient degree of poverty, they would applaud him as a paragon of self-denial. Fortunately, this class of infatuated beings is now nearly extinct; but their delusion had not been exploded till it had been the cause of much intellectual ruin, and the vitiation of a large share of our literature.

TYTLER, PATRICK FRASER. This popular Scottish historian was the son of Alexander Fraser Tytler, Lord Woodhouselee, whose writings as a lawyer, professor of universal history, critic, and biographer, have been already enumerated; and grandson of William Tytler of Woodhouselee, the generous champion of Mary Queen of Scots, and successful investigator of our ancient national history and literature. Thus, for nearly a century, the labours of these distinguished three have followed in uninterrupted succession, and been almost exclusively devoted to the illustration of the annals of our country.

Patrick Fraser Tytler was born at Edinburgh, on the 30th of August, 1791, and was the fourth son of Lord Woodhouselee. His early education was commenced at the high-school of his native city, where he had for his preceptors Mr. (afterwards Professor) Christison, and Dr. Adam the rector of the institution. On leaving the high-school he entered the university of Edinburgh in 1805, and went through the usual course of literary and philosophical studies necessary for the study of the law, having chosen the Scottish bar for his destination. After having ended his studies at the university, Mr. Tytler underwent his public examinations, and was admitted into the faculty of advocates on the 3d of July, 1813. In his case, however, the law, as a profession, had few attractions compared with those of literature and historical research, and therefore, after some desultory practice, he finally abandoned the bar for the more congenial work of authorship. An event also occurred, after he had worn the barrister's gown scarcely a twelvemonth, that must have had some influence in confirming his choice. This was the peace of 1814, by which the Continent, and especially France, were thrown open to British tourists, and the spirit of travel set free to wander where it listed. Like many of our young inquirers who were eager in this way to finish their studies, Mr. Tytler availed himself of the opportunity, by making a tour through France and Belgium. His first attempts in authorship were a few articles in *Blackwood's Magazine*; but a mind so well stored could not long remain contented with the transient efforts of journalism; and

Mr. Tytler's first work, which was published in Edinburgh in 1819, clearly indicated the course of his studies, while it gave promise of the historical accessions which he was afterwards to contribute to the annals of his country. This was his "*Life of James Crichton of Cluny*, commonly called the Admirable Crichton"—a personage of whose learning and varied talents such wonderful tales had been told, that posterity had begun to class him with King Arthur, and the other mythic heroes of old British history, who people the fairy regions of Avalon. This work was so favourably received by the public, that a second edition of it, corrected and enlarged, with an appendix of original papers, was published in 1823.—The next literary production of Mr. Tytler was "*An Account of the Life and Writings of Sir Thomas Craig of Riccarton*, including Biographical Sketches of the most eminent Legal Characters from the Institution of the Court of Session by James V. till the Period of the Union of the Crowns." This was published in Edinburgh in 1823.—A third work, also biographical, was published by Mr. Tytler, but anonymously, in 1826. This was the *Life of John Wicks*, the English Reformer.

These productions, laborious though they were from the antiquarian toil and research they had occasioned, were considered by him as only light preludes to the far more important work which he now contemplated. The circumstances that first led to such an undertaking are worthy of notice. Mr. Tytler having, during the course of a summer excursion, paid a visit to Abbotsford, was received with that warm-hearted welcome, and ushered into that choice intellectual society, for which the illustrious owner and his hall were at all times so distinguished; and during the hours of that happy evening, tale, and song, and literary discussion, and old remembrances, followed each other in rich and rapid succession. Matters, however, of more lasting moment occupied, as usual, the mind of Sir Walter Scott, and during the evening he took Mr. Tytler aside for the purpose of some by-conversation. It was to advise him to write a HISTORY OF SCOTLAND. He had long, in common with many of our most distinguished countrymen, felt the want of such a work;¹ and several years before this period he had himself been almost persuaded by the publishers to undertake so congenial a task, and had thought that, by interspersing the narrative with romantic anecdotes, illustrative of the manners of his countrymen, he might produce a work such as the public would gladly welcome. He had, indeed, he added, made a partial commencement, in the form of an introductory essay—the same which was afterwards published in the *Quarterly Review* for January, 1816, as an article upon the Culloden Papers. But on thinking further on the subject, he found difficulties in his

way which, in his (Sir Walter's) case, could not easily be surmounted. He saw that a Scottish history must be something more important than a popular romance; and that although the materials for it were so abundant in the form of national records, old Scottish authors, public and private documents, and other such sources, yet the task of digesting, elucidating, and arranging these materials, would engross more time than he could spare. He also found that the task must be pursued not only in Scotland, but in London, among the national archives, and wherever else such information could be found—a kind of labour which his official duties and other avocations would completely prevent. Perceiving these difficulties he had abandoned the alluring enterprise, notwithstanding his conviction that a history of Scotland had still to be written, and his own wish to supply the deficiency; and he had at last settled into the purpose of attempting nothing more in this way than a collection of historical anecdotes for the young, such as might impress upon their memories the brave and good deeds of illustrious Scotsmen, and inspire them with sentiments of nationality.²

All this, as the reader may perceive, was preparatory to an advice—a request. It was nothing less than that Mr. Tytler himself should be the historian of Scotland. Here Sir Walter did not fail to urge upon his young friend such motives as might incite him to the attempt. It was one that would be most congenial to his previous studies and pursuits. It would concentrate upon one great aim those efforts which he had expended upon a variety of subjects. It would gratify his patriotic feelings as a Scot, as well as his predilections for historical writing. The work itself would indeed be long and laborious; but then he had the advantage of youth on his side, so that he might live to complete it; and if it were written under a deep conviction of the importance of historical truth, what a permanent benefit it would prove to his country! Finally, Sir Walter finished his persuasions, in his own kind, characteristic manner, by offering to Mr. Tytler all the assistance in his power, not only in obtaining admission to all the repositories in which the materials were contained, but his best advice in pursuing the necessary investigations.

This was a memorable conversation in the life of Mr. Tytler: it was the turning-point of his literary career, the bias by which his whole after-course was directed. Deeply and anxiously he mused upon it on his evening ride homeward to the mansion of Yair, where at that time he was sojourning; and it was after he had forded the Tweed at Bordside that he gave vent to his imprisoned feelings, by rehearsing to his friend who accompanied him, the whole tenor of the dialogue. On being asked how he liked the suggestion, he replied, that the undertaking had a very formidable appearance—and that though he had always been attached to historical pursuits, and was ambitious of becoming a historian, he had never conceived the idea of writing the history of his own country, from the peculiar difficulties that lay in the way of such an attempt, and in making it what he thought a history of Scotland ought to be; now, however, he felt otherwise, and would lay the suggestion to heart, not only on account of the quarter from which it had come, but the assistance that had been

¹ In a letter written upon this subject, A.D. 1823, Sir Walter Scott thus summed up our national deficiency:—"We are still but very indifferently provided with Scotch histories of a general description. Lord Hailes' *Annals* are the foundation-stone, and an excellent book, though dryly written. Pinkerton, in two very unreadable quartos, which yet abound in information, takes up the thread where Hailes drops it—and then you have Robertson, down to the union of the crowns. But I would beware of task-work, which Pinkerton at least must always be, and I would relieve him [his correspondent's pupil] every now and then by looking at the pages of old Pit-scottie, where events are told with so much naïveté, and even humour, and such individuality, as it were, that it places the actors and scenes before the reader. The whole history of James V. and Queen Mary may be read to great advantage in the elegant Latin of Lesly, Bishop of Ross, and collated with the account which his opponent Buchanan, in language still more classical, gives of the same eventful reigns. Laing is but a bad guide through the seventeenth century, yet I hardly know where a combined account of these events is to be had, so far as Scotland is concerned."

² This Sir Walter Scott accomplished by his *Tales of a Grandfather*, published in 1827. The precise year of this interview between Sir Walter and Mr. Tytler has been unfortunately forgot; but as the indefatigable author of *Waverley* was not accustomed to dally with a purpose he had once formed, the conversation probably occurred in the summer of the previous year.

so kindly promised. The resolution on which he finally settled he must have arrived at promptly, and followed up with almost immediate action, by which he stood committed to a lifetime of work in a new sphere of occupation, and to whatever, in the shape of success or failure, it might chance to bring him. The devotedness of a hero who saves his country, or of a legislator who regenerates it, may be matched by the devotedness of him who records their deeds. The historian who evolves the full truth of a Marathon or Bannockburn fight from the remote obscurity in which it is clouded, may have had as hard and heroic a task as he who has achieved it.

It was in the summer of 1828 that the first volume of Tytler's *History of Scotland* issued from the press. As it was only the first instalment of a large promise the public received it as such; and while its merits were felt, the language of criticism was cautious and measured, although both commendation and hopeful encouragement were by no means withheld. The rest of the work followed at intervals; and as each successive volume appeared, the general approbation was deepened: it was soon felt and acknowledged that a truly national history was now in progress, to supersede the fragmentary records in which the Scottish nationality had been hampered and confined. At length the whole was completed in the winter of 1843, when the ninth and last volume appeared. His task was ended, and the author thus gracefully bade it adieu in the last paragraph:—"It is with feelings of gratitude, mingled with regret, that the author now closes this work—the history of his country—the labour of little less than eighteen years: gratitude to the Giver of all good, that life and health have been spared to complete, however imperfectly, an arduous undertaking; regret that the tranquil pleasures of historical investigation, the happy hours devoted to the pursuit of truth, are at an end, and that he must at last bid farewell to an old and dear companion." The completed history was now before the world, but it had not needed to wait thus long to establish the lasting reputation which it now possesses. The generous labour, the indefatigable research, and lucid order by which it is so eminently distinguished—the always deepening interest of the narrative, and increasing eloquence of the style, by which the work gathers and grows in attractiveness to the last—were felt not only by the learned and critical, but the reading public at large, so that even those who could not coincide with the author in his views of the Scottish Reformation, and the agencies by which it was effected, were yet compelled to acknowledge the honesty, the modesty, and the disinterestedness with which his statements were announced, as well as the strong array of evidence with which they were apparently corroborated. With his Tory and high-church Episcopalian principles, and with the strange documents in his hands, which he had rescued from the dust of ages and brought for the first time to the light of day, they could not well imagine how he could have written otherwise. Such was the conviction even of those who entered the field against him, armed with opposite views, and counter-evidence to make them good. A sublimity history wholly divested of sublimity feelings would not be worth reading.

Although Tytler's *History of Scotland* is complete in itself, as far as the original aim and purpose of the author are concerned, yet when the whole was concluded, he felt, in common with many whose opinion he respected, that a still more ample field should have been comprised. Thus, he commenced with the reign of Alexander III., the prelude to the wars of Scottish independence, because it is only

from this point that our national history can be properly authenticated. Edward I., who made such wild havoc with the Scottish muniments, so that no trace of Scotland as an independent kingdom should ever be found, was unable to annihilate the memory of the prosperity he had destroyed, the cruelties he had perpetrated, and the gallantry with which his usurpation had been overthrown; these were burned in, as with a branding-iron, upon Scottish memory to the end of time, and Edward, by his work of demolition, only erected himself into a notorious pillar, to form a new starting-point for the national history to commence its glorious career. Tytler, however, knew that a stirring and eventful era had gone before, and that the early boyhood and youth of Scotland was not only full of interest, but a subject of intense curiosity; and doubly difficult though the task would have been, he had resolved, even long before the history was ended, to explore this mythic period, and avail himself of such facts and probabilities as it afforded, in the form of a preliminary dissertation. Such was his purpose, which his previous investigations had well fitted him to effect; and all that he required was only a breathing interval, after the nine volumes of his history had been finished. But that interval, in his case so needed, could not restore the active brain and buoyant spirit that had already accomplished their appointed duty, and accomplished it so well! He had also purposed to terminate his history, not at the union of the two crowns of England and Scotland under James I., but of the two kingdoms under Anne; but here he found the incidents so voluminous, and withal so difficult to sift, condense, and arrange, as would have formed a task equal to all his past labours, and required a new lifetime for its fulfilment, so that the design was abandoned.

During the long space of nearly eighteen years, in which Mr. Tytler was employed in the *History of Scotland*, this, although his greatest, was not his only literary production; and during occasional intervals he published the following works, which of themselves would have been reckoned a considerable amount of authorship:—*Lives of Scottish Worthies*, in three volumes 12mo. Published in Murray's *Family Library*. London, 1831–33.—*Historical View of the Progress of Discovery on the more Northern Coasts of America*. Published in the *Edinburgh Cabinet Library* of Messrs. Oliver & Boyd. 1832.—"*Memoirs of the War carried on in Scotland and Ireland, 1689–91*, by Major-general Hugh Mackay." This volume, which he edited in conjunction with Mr. Hog of Newliston, and Mr. Adam Urquhart, was presented to the Bannatyne and Maitland Clubs in 1833.—*Life of Sir Walter Raleigh*. Published in the *Edinburgh Cabinet Library*. 12mo. 1833.—*Life of King Henry VIII.* London, 1837.—"*England under the Reigns of Edward VI. and Mary*, with the Contemporary History of Europe; in a Series of Original Letters, never before Published; with Historical Introductions," &c. 2 vols. 8vo. London, 1839.—The article "Scotland," in the seventh edition of the *Encyclopædia Britannica*, which was afterwards published in a separate form, as a *History of Scotland* for the use of schools.

While Mr. Tytler thus occasionally unbent his mind with what to others would have proved a serious burden, he was also alive to the stir of the world around him, and felt sufficient interest in the passing events of the day. This was especially the case when that important ecclesiastical movement, the Disruption, occurred in Scotland in 1843. As a Christian, a Scotchman, and a historian, it was especially calculated to arrest his attention; while the

fact of his being an Episcopalian removed him from the turmoil, and enabled him to regard it with a cool, dispassionate eye. The sentiments, therefore, of one so situated, and so conversant with the historical facts and principles which were appealed to by the contending parties on this occasion, are well worthy of notice. These he fully and distinctly delivered in a letter, dated June 6th, 1843, to a friend, who had abandoned the Establishment, and joined himself to the Free Church. "I do not see," he writes, "how, consistently with your principles, and belief in what constitutes a true Presbyterian kirk, you could have acted otherwise. In our conversations on the subject I remember often saying, that had I been a Presbyterian, I must have done the same. Popular election of their ministers, and complete spiritual independence, were, from the first, the two great principles laid down by Knox as the foundation on which their whole superstructure rested, and, indeed, without the last, no church could stand. With the first—the right of the people to choose their ministers—I have no sympathies: with the last, every feeling of my heart and reason is on your side—and no one knows how soon the Church of England may have to contend for it. Let us hope that if it does come to this, there may be as much courage and conscience in England as across the border."

In his mode of study Mr. Tytler, although so deeply immersed in the absorbing research of history and antiquarianism, was no peevish recluse student, sheltering himself within the innermost recesses of his hermitage, and quarrelling with every sound above a gentle whisper: instead of this, his favourite place of work was the parlour or the drawing-room, surrounded by the society of his family and friends; and there he consulted his authorities, arranged his notes, and wrote out his copy for the printer, animated and cheered onward rather than disturbed by the society around him; listening to the music that might be going on, to which he was very partial, and mingling in the subjects of conversation. In this cheerful, genial fashion, he embodied into living form the materials of his anxious research, which he had gleaned among the MSS. of the British Museum or the State-paper Office. That he might be near these fountainheads also, he resided for a considerable period during the latter part of his life in the metropolis. During the present reign he was oftener than once a guest at Windsor, where he was received with honourable distinction; and during the administration of Sir Robert Peel, when literary merit was not thought unworthy of state recognition and reward, his high services as a national historian were attested by a pension of £200 per annum.

In everyday life, unconnected with his intellectual pursuits, the high moral worth, amiable gentle temper, and conversational powers of Mr. Tytler, endeared him to a wide circle of friends, by whom these qualities are still most affectionately remembered. But the characteristic by which he was especially distinguished was the deep-seated religious principle for which he was noted from his earliest youth, and by which his whole course of life was regulated to the close, both in his private and literary relationships. In subservience to this were his hilarity and wit, which were so pervaded with his own amiable temperament, that instead of repelling, they attracted all around him, and mesmerized the company for the time into happy beings like himself. In this way the historian, amidst the throngs and events of centuries, maintained and preserved to the end his own personal identity, instead of losing it among past ages—a trait of intellectual independence hard indeed to compass, and very rarely to be found

among those who have won for themselves a high literary reputation, especially among the more crabbed and abstruse departments of intellect. In the earlier part of his life Mr. Tytler served in the troop of the Midlothian Yeomanry Cavalry—a corps in which not only the highest rank but the best talent of Scotland was enrolled; and among such congenial spirits he soon took the lead, not only on account of the fascinating wit and cheerfulness of his conversation, but the songs which he composed and sung—for he was also a poet of no common mark; and the lyrics with which he was wont to charm the mess-table were connected with the military affairs of the regiment, and the duties with which his comrades were occupied. On one occasion, being desirous of retirement, probably for a holiday's recreation, and aware how his furlough would be apt to be invaded, he stole away to the house of his brother at Woodhouselee. But his absence was instantly felt in the next merry meeting of his comrades, at their headquarters of Musselburgh, and a corporal's troop, with a led-horse and a mock warrant for seizure, were despatched to apprehend and bring back the deserter. Tytler, who espied the coming of this band, escaped by a back-door, and took shelter in the wood above Woodhouselee. After he had remained there for such a length of time that he thought the danger must be over, he ventured to return to the house; but ill had he calculated upon the double sharpness of the lawyer-soldiers of the Lothian Yeomanry. He was captured at the very threshold by the ambush that awaited his return, deprived of his arms, mounted upon the led-horse, and carried off in triumph to the military encampment. This diverting pantomime, of what in the stern realities of war is often a moving tragedy, so greatly tickled his fancy, that on the same evening he composed a song, detailing, in most comic fashion, the circumstances of his capture, which he sang at the mess-table on the following day, amidst the applauding peals of his companions, who were thus well requited for their trouble. This song ever after continued to be the most popular of all his lyrical productions.

But we must hasten to the mournful termination—"the last scene of all." In 1843 Mr. Tytler had finished his *History of Scotland*; and although he had already written so much, and this too upon subjects where the apparent quantity of labour bears but a small proportion to the toil and research that have produced it, he was still earnest to accomplish more, and hopeful, after a period of rest, to be enabled to resume those occupations which had now become the chief element of his existence. But even already his literary life had drawn to a close. Although of a healthy vigorous constitution, active habits, and cheerful temperament, his over-wearied mind and exhausted frame had no longer power to rally; and after wandering over the Continent in a hopeless pursuit of health, he returned home to die. His death occurred on the morning of the 24th December, 1849, after several years of sickness and suffering, and when he had entered his fifty-ninth year.

Mr. Tytler was twice married. His first wife, who died in 1835, was Rachel Elizabeth, daughter of the late Thomas Hog, Esq., of Newliston, by whom he had two sons, Alexander and Thomas Patrick, who both entered the East India Company's military service, and one daughter. His second wife was Anastasia, daughter of Thomas Bonar, Esq., of Camden Place, Kent.

TYTLER, WILLIAM, of Woodhouselee, an eminent antiquarian writer, was born in Edinburgh on

the 12th October, 1711. His father, Alexander Tytler, was a writer by profession in the same city. His mother was daughter of Mr. William Leslie, merchant in Aberdeen, and grand-daughter of Sir Patrick Leslie of Iden.

The subject of this memoir received his education at the high-school and university of his native city, and in both distinguished himself by assiduity in his studies, and by an early and more than ordinary proficiency in classical learning. Having added to his other acquirements a competent knowledge of municipal law, which he studied under Mr. Alexander Bryce, professor of that science in the university of Edinburgh, he was, in 1744, admitted into the Society of Writers to his Majesty's Signet, in which capacity he practised with increasing success till his death.

Mr. Tytler's first appearance as an author took place in 1759, when he published an "*Inquiry, Historical and Critical, into the Evidence against Mary Queen of Scots, and an Examination of the Histories of Dr. Robertson and Mr. Hume with respect to that Evidence.*" In this work Mr. Tytler warmly espoused the cause of the unfortunate princess, and brought a force of argument, and an acuteness and precision of reasoning, to the discussion of the interesting question of her innocence or guilt, which had never been employed on it before. It was the first appeal in behalf of the Scottish queen which made any impression on the public mind, or which excited any feeling of particular interest in the charges which had been brought against her moral character. A similar attempt with this of Mr. Tytler's had been made some years previously by Walter Goodal, one of the under-keepers of the Advocates' Library in Edinburgh, but it was so indifferently written, and its matter so unskillfully arranged, that it entirely failed to attract any share of the public attention. Mr. Tytler, however, found it a useful assistant. He adopted many of Goodal's arguments, but he arranged them anew, and gave them that consistency and force which is so essential to efficiency. The first edition of the *Inquiry* was published in a single octavo volume; another, considerably enlarged, particularly in the historical part, soon afterwards appeared; and in 1790 a fourth edition was published in two volumes.

The ability displayed by this work acquired for Mr. Tytler a very high reputation in the world of letters. It was eagerly read throughout Britain, and was scarcely less popular in France, into the language of which country it was pretty ably translated. The interest which the *Inquiry* excited was also very great. There were a novelty and chivalry in the attempt eminently calculated to attract attention and to excite sympathy, and it obtained a large share of both. It was reviewed in many of the different periodicals of the day by some of the most eminent literary men then living; amongst these were Johnson, Smollett, and Douglas, Bishop of Salisbury. To the favourable testimony to the merits of the work borne by these competent judges was added that of Lord-chancellor Hardwicke, who said it was the most conclusive arrangement of circumstantial evidence he had ever seen.

Mr. Tytler's next literary production was the *Poetical Remains of James the First, King of Scotland*, in one volume 8vo, Edinburgh, 1783. In this publication Mr. Tytler, on very strong grounds, ascribes to that monarch the celebrated poems of "The King's Quair" and "Christ's Kirk on the Green." His reasoning here, as in the defence of Mary, is remarkable for cogency and conciseness, and if it is not always convincing, it is at least

always plausible. To the *Poetical Remains* there is added a "Dissertation on the Life and Writings of James," remarkable at once for profound antiquarian research, and the lucid arrangement of its facts.

Mr. Tytler was an ardent lover of music, especially of the music of his native country. He was himself a good performer, and his theoretical knowledge of the science was fully equal to his practical proficiency. This devotion to music, together with a fine sensibility, which subjected him in a peculiar manner to the influence of the pathetic strains of the national melodies of Scotland, led him to write a highly interesting, though in some respects fanciful, essay on Scottish music, which is appended to Arnott's *History of Edinburgh*.

The ability which these various publications displayed rapidly increased Mr. Tytler's reputation, and procured him the respect and esteem of men of taste and learning, especially of those of his native country, who felt and acknowledged the good service he was doing towards completing their national history by his industry, diligence, and patient research in the peculiar walk of literature he had chosen—a feeling which was yet further increased by his subsequent publications. The next of these, of the character alluded to, was a "Dissertation on the Marriage of Queen Mary to the Earl of Bothwell," published in the first volume of the *Transactions of the Society of Antiquaries* in 1791. In this "Dissertation," which is distinguished by all the merits displayed by Mr. Tytler's other productions, he defends, with much ingenuity, that unhappy step which united Mary to Bothwell; but it is to be feared that, with all its ingenuity and judicious remark, it can never be otherwise considered than as an attempt, generous and chivalrous indeed, but unavailing, to defend a thing in itself indefensible.

In the year following, viz. 1792, Mr. Tytler published, through the same channel with that by which the "Dissertations" had been given to the world, "Observations on the Vision, a Poem," first published in Ramsay's *Evergreen*. The object of these observations was the generous one of vindicating Ramsay's title to the merit of being the author of the poem in question, of which some doubts had been entertained.

The "Observations," &c., were soon after followed by a production of singular interest. This was "*An Account of the Fashionable Amusements and Entertainments of Edinburgh in the last (Seventeenth) Century*," with the plan of a Grand Concert of Music performed there on St. Cecilia's Day, 1695."

Mr. Tytler was also the author of a paper in the *Loanger*, No. 16, entitled the "Defects of Modern Female Education in Teaching the Duties of a Wife;" and with this terminates the catalogue of his published literary achievements, so far as these are known or acknowledged.

To Mr. Tytler's talents and acquirements his works will always bear evidence, but there are other merits which he possessed in an eminent degree, which it requires the pen of the biographer to perpetuate. His works sufficiently inform us of his profound and intimate acquaintance with Scottish history and antiquarian lore; of his zealous patriotism, and eminent knowledge of the science of music; but they do not inform us of his generous and benevolent disposition, nor of that delightful and enviable buoyancy of spirit which enabled him, at the latest period of a life protracted beyond the usual limit of human existence, to join, with the utmost glee, in all the pranks and follies of the young persons, his friends and relatives, who came to visit him, and whom he was always rejoiced to see. Mr. Tytler not only attained and

enjoyed himself a healthy and happy old age, but had a prescription ready for his friends which would confer the same blessing. This prescription was "short but cheerful meals, music, and a good conscience."

Mr. Tytler was one of the original members of the Musical Society of Edinburgh, and continued his connection with that body for nearly sixty years. He usually spent a portion of the summer at his beautiful country seat of Woodhouselee. Here in a private and shady walk he had erected an urn with the following inscription:—

Hunc lucum
Caris mortuis amicis
Sacrum dicat
W. T.

Some time before his death Mr. Tytler was seized with a slight paralytic affection, but it did not much

debilitate his frame, nor did it in the least degree affect his faculties, all of which remained unimpaired till the hour of his death, an event which happened on the 12th of September, 1792, in the eighty-first year of his age.

Mr. Tytler was married in 1745, to Miss Anne Craig, daughter of James Craig, Esq., of Costerton, in the county of Midlothian, one of the writers to his majesty's signet, by whom he left two sons—Alexander Fraser Tytler, afterwards Lord Woodhouselee, and Major Patrick Tytler, fort-major of the castle of Stirling. He left also one daughter, Miss Christina Tytler. It only remains to be added to this sketch—and the addition, though short, comprises one of the strongest eulogiums which was ever bestowed on human virtue—it is recorded of Mr. Tytler, that no one ever spoke ill of him.

U.

URE, DR. ANDREW, F.R.S., F.G.S., &c. This veteran of chemical science, whose studies in chemistry were so successfully employed in the improvement of arts and manufactures, was born in Glasgow, May 18, 1778. He first studied at the university of his native city, and afterwards at that of Edinburgh. That his student-life had been distinguished by application was shown by his literary attainments, which were those of a good linguist and fair classical scholar, while he was also deeply read in theology and biblical criticism, and was well acquainted both with foreign and English literature. But the study of chemistry, in which he was so greatly to distinguish himself, was his favourite pursuit. After having obtained the degree of A.M., he graduated as M.D. at the university of Glasgow in 1801, and in 1804 was appointed professor of chemistry at the Andersonian University in that city, which had been recently established under the presidency of Dr. Birkbeck. In 1809 Professor Ure visited London, being commissioned to make the scientific arrangements for the Glasgow observatory, then about to be established; and in the metropolis he acquired the friendship of Maskelyne, Pond, and Groombridge, and other celebrated astronomers, as well as of Davy, Wollaston, Henry, and several other distinguished chemists of the day. On the establishment of the Glasgow observatory Dr. Ure resided there for several years, and there was honoured with a most friendly visit by Sir William Herschel. In the meantime his duties as professor in the Andersonian Institution were prosecuted with ardour, and productive of important results. His well-attended class numbered at one time 400 students, and in teaching his pupils he directed their investigations with a reference to the appliance of chemistry to the improvement of arts and manufactures—an application of the resources of science which was readily taken up and zealously prosecuted in Glasgow, to which city the subject was of vital importance—and Dr. Ure has the credit of having headed that movement by which the sources of our national prosperity have been so well developed and abundantly increased. The influence of the professor on the manufactures of Glasgow was so important that the example extended to France, and there new courses of lectures were established upon the plan of those of Dr. Ure. Nor were these his valuable exertions confined to lecturing; the valuable papers which he contributed to several

societies are also to be taken into account, by which the benefits of his discoveries and improvements were more permanently established and more widely diffused. In 1818 a paper was read before the Royal Society, and published in the *Philosophical Transactions* for that year, announcing "New Experimental Researches on some of the Leading Doctrines of Caloric, particularly on the Relation between Elasticity, Temperature, and Latent Heat of different Vapours, and on Thermometric Admeasurement and Capacity"—and these new views were adopted by Mr. Ivory, Mr. Daniell, and other eminent men, as the basis of their meteorological theories. Another paper of his, "On Sulphuric Acid, and the Law of Progression followed in its Densities at different Degrees of Dilution," which was published in the *Journal of the Royal Institution*, 1817, was an admirable specimen of the useful application of logarithms to chemistry. In the *Journal* of the same year appeared his physico-geometrical paper on "Mean Specific Gravity," and in the next year "Experiments to Determine the Constitution of Liquid Nitric Acid, and the Law of Progression of its Density at various Degrees of Dilution." His tables of these acids, the two most important of chemical agents, have since been generally adopted by chemists. In a paper on "Muriatic Acid and Chlorine," published in the *Edinburgh Philosophical Transactions* for 1818, Dr. Ure described the eudiometer which bears his name. In the *Philosophical Transactions*, May, 1822, appeared his paper "On the Ultimate Analysis of Vegetable and Animal Substances." These were but a few of his more important communications, by which the science of chemistry, if not wholly revolutionized, was at least most materially improved. In 1821 he published his *Dictionary of Chemistry*, a standard work and leading authority on the subject, which has passed through many editions and been translated into most of the continental languages; and in 1822 he was elected a fellow of the Royal Society. He was also one of the original fellows of the Geographical Society, and a member of several scientific societies both at home and abroad. In 1824 Dr. Ure published a translation of Berthollet on *Dyeing and Bleaching*, in two volumes 8vo; and in 1829 a *New System of Geology*, remarkable as one of the last books on the subject which advocated the influence of the Noachian deluge on the surface of the earth. By this brief recapitulation we have not given a full

idea of the extent and variety of his scientific labours and services since his entrance into public life. In the Andersonian Institution he was not only professor of chemistry but also of natural philosophy, and in the last of these capacities he delivered lectures and performed experiments before crowds which the large hall of the building could scarcely contain. He also gave the lectures on *materia medica* in connection with the medical courses of the institution, and in 1813 published a *Systematic Table of Materia Medica*, with a dissertation on the action of medicines. He was, moreover, professor of astronomy, on which account he had his dwelling in the observatory of Glasgow, in the establishment of which his active services had been highly influential.

In 1830 Dr. Ure removed to London, and in 1834 he was appointed analytical chemist to the Board of Customs. In this capacity his important researches on sugar-refining, which he conducted for the government, led to the fixation of the then established duties on the different kinds of sugar. In 1835 he published the *Philosophy of Manufactures*, and in the following year his work entitled the *Cotton Manufactures of Great Britain compared with that of other Countries*. "By the perusal of this book," said William Fairbairn of Manchester, a competent authority on the subject, "any person might easily make all the machines required for the cotton manufactures." But the greatest and most important of all Dr. Ure's publications was the *Dictionary of Arts, Manufactures, and Mines*, which was first published in 1837; in 1839 a supplement was added to it, and the work was subsequently enlarged by recent inventions and discoveries in later editions. It was a dictionary comprising such an amount of scientific knowledge, and such a variety of subjects, that when the work was translated in France it was deemed necessary to employ nineteen *collaborateurs*, all of them of scientific reputation, in the undertaking.

Besides these valuable publications, Dr. Ure was occupied in London with the duties of his important appointment, which chiefly consisted in conducting chemical analyses for the government, or in consultation for commercial purposes. As an analytic chemist he was regarded as a sure authority, and it is alleged that none of the results he announced have ever been impugned. In this honourable and useful manner his life was spent, and although for some years before he died his health had been infirm, his cheerfulness and mental energy had scarcely been abated. We have written this short memoir in vain if we have failed to impart some idea of the multifarious scientific knowledge of Dr. Ure, his power of simplifying and popularizing it, his unwearied industry and energy in prosecuting its results, and the success with which he brought all his discoveries to bear upon the wealth, the comforts, and improvement of society at large. He died in his house, in London, on the 2d of January, 1857, in the seventy-eighth year of his age.

URE, REV. DAVID. So late as the close of the last century the science of geology was little studied, and still less understood, in Scotland. Its researches upon the Continent had been accompanied with such startling theories upon the date of the world and mode of its creation, that the orthodox believers in the Old Testament cosmogony were shocked, and geology itself was regarded with dread and aversion as a storehouse of heretical opinions that had better remain unopened. Two inquirers, however—and these also clergymen of unimpeachable orthodoxy—were honourable exceptions to the pre-

valent dislike. The first was the Rev. R. Wodrow, the distinguished historian of the Church of Scotland, who investigated the productions under the surface of the earth as carefully as the deeds that had been wrought upon it, and carried into *lithoscopy* (for thus he termed the science before it had obtained its present name) the same inquiring spirit which he had brought into history. The other clergyman, who appeared at a considerably later date, was the Rev. David Ure, author of the *History of Rutherglen and East Kilbride*, who not only dared to carry his explorations into these forbidden fields, but to publish what he had discovered.

David Ure was born in Glasgow, but in what year has not been stated. For this the lowliness of his origin perhaps may account, for his father was nothing more than an operative weaver, and David himself was brought up in the same occupation. His father dying while he was still very young, the support of his old mother was devolved upon him; but his industry not only provided for the household wants, but enabled him to prosecute his education first at the grammar or high school, and afterwards at the university of Glasgow, with the view of becoming a minister. His preparatory studies, although under so great disadvantages, were conducted with such perseverance as to insure success. "He generally laboured," we are told, "the greatest part of the night; and while his hands were throwing the shuttle, his eye would be intent on Virgil, Homer, or some ancient author." In this way, too, in the same city and about the same period, a young scholar, who was a cooper, generally studied the classics with the book concealed in the barrel on which he was operating, to the great annoyance of his father, who often saw the hammer of the youth suspended in a classical reverie, and was obliged to quicken him into action with a box on the ear. But that dreamy enthusiastic student was afterwards Professor John Young, one of the most accomplished classical linguists of his day. While Ure attended the Greek class, its professor, the celebrated Dr. Moore, noted his orderly behaviour and superior diligence in preparing his lessons, so that while scolding the other students for remissness, he often passed him over with the following laudatory couplet:—

"David Ure, he sits secure;
He'll ne'er be fined by Dr. Moore."

Such were the simple fashions towards the close of the last century in the university of Glasgow, and in a class where the majority of the pupils were little more than unfledged school-boys.

It was soon found, however, that Ure's inclination lay more towards science than literature. This was shown by the long pilgrimages he often made to investigate some antique production or natural curiosity, and in this unaided fashion he groped his way upon a path in which as yet there were few milestones or sign-posts. It was not wonderful also that he occasionally diverged into attempts to discover the perpetual motion and the philosopher's stone. Although these scientific delusions had disappeared, their shadows had not wholly been withdrawn, and that love of the marvellous which is never extinct in the human breast could still cling to them until they were superseded by modern wonders. David Ure ventured to consult Dr. Moore upon his projects, and got from him the following reply: "David, we have got a sufficient perpetual motion in you; and industry and perseverance are the true philosopher's stone, because, though they should not produce gold, they will produce what can be exchanged for gold."

While a student in divinity, Ure was for some time

assistant to the schoolmaster of Stewarton, in Ayrshire, and afterwards he taught a subscription school in the neighbourhood of Dumbarton. On being licensed as a preacher, he was employed as an assistant by the Rev. Mr. Connell, minister of Kilbride, upon the scanty salary of ten pounds a year and his board. This was a poor allowance, especially when the maintenance of his aged mother still in a great measure depended upon him. But he cheerfully undertook and faithfully discharged the duties of his office, and it was here also that he explored and brought to light that important mass of facts in natural science which he afterwards embodied in his *History of the Parishes of Kilbride and Rutherglen*. "He also," we are told, "made several practical discoveries, from which that district continues to derive considerable benefit." Such a result was certain sooner or later to follow from his careful explorations among its mineral strata, and in this way he discovered the philosopher's stone, if not for his own benefit, at least for that of posterity.

After having been some time assistant at Kilbride, Ure had the promise of succeeding to the incumbency, and on the death of Mr. Connell his succession was expected by the parishioners. But such obstacles had already risen that there was no chance of a harmonious call to the charge. How this obstacle had originated we are not informed, some imputing it to female manoeuvres which more or less enter into all such clerical elections; while others think that his political opinions, however conformed to those of the present age, were too far in advance of his own day and generation. He was, in short, a modern reformer; and in the wild commencement of the French revolution, reform, instead of being patriotism, was something not far off high-treason. Finding that there was no likelihood of unanimous acceptance, and unwilling to be the cause of dissension, Ure at once abandoned the field, and set off to Newcastle on foot, where he for some time officiated as assistant in a Presbyterian chapel. He was afterwards employed by Sir John Sinclair, who at that time had commenced his gigantic work, the *Statistical Account of Scotland*; and of this Ure executed the first sketch of the agricultural surveys of the counties of Roxburgh, Dumbarton, and Kinross. He also superintended the publication of several of the last volumes, and drew up the general indexes of the *Statistical Account*. Other miscellaneous work occurred during the publication, such as surveying and drawing up accounts of parishes from which no returns had been made, and in such cases he was always ready with assistance.

Whether in pursuing his own researches or executing the scientific commissions of others, Ure's equipments and style of travelling were those of a philosopher. He always went on foot, and though small of stature he was light, active, and capable of enduring much fatigue. Independent of inns, and simple in his diet, he usually carried bread and cheese in his pocket, on which he made his meals by the side of a spring; and when he could afford it, a glass of ale at the village ale-house was the highest of his luxuries. While his travelling cupboard was so light and convenient, his travelling apparatus for conducting his scientific investigations was equally simple, and is thus described by his biographer:—"His great-coat was furnished with a large pocket, in which he stored such minerals or other curiosities as had attracted his notice. He carried a tin box for stowing curious plants; a large cudgel, armed with steel, so as to serve both as a spade and pick-axe; a few small chisels and other tools; a blow-pipe, with its appurtenances, a small liquid chemical ap-

paratus, optical instruments, &c.; so that his friends used to call him a walking shop or laboratory." The account goes on to state—"In this way he braved all weathers; and heat or cold, wet or dry, seemed equally indifferent to him. He was a patient observer and accurate describer of nature. His descriptions were always taken down on the spot, in a hieroglyphical species of shorthand invented by himself, and which it is to be regretted no one else but himself understood."

The most important of the results of this exploratory spirit appeared in 1793, when he issued from the Glasgow press his work entitled the "*History of Rutherglen and East Kilbride*," published with a view to promote the Study of Antiquity and Natural History. By David Ure, A.M., Preacher of the Gospel." The volume was in demy 8vo of 334 pages, and illustrated with numerous excellent plates of the principal objects described in the work. The *History* was divided into two principal sections, the first consisting of four chapters devoted to the antiquities and the general and statistical account of the two districts; the second comprises in two chapters their natural history, classified in reference to their animal, vegetable, and mineral productions, and their fossil remains. As may be conjectured, this last portion, containing the natural history of Rutherglen and Kilbride, was the most important part of the work; it was into it that the author brought his whole power of geological investigation and discussion, and thereby opened up a field of research hitherto little prosecuted in Scotland. The public were impressed with the amount of scientific knowledge that might be contained within the circle of two paltry country parishes, or among the strata of their foundations, and the studious were tempted to explore those depths beneath the surface which hitherto had been to them as a sealed book. The *History of Rutherglen and Kilbride* was an authority in general demand and frequently consulted until within the last twenty years, when the progress of the science of which it had been a successful pioneer superseded it by new discoveries. And still its merits are recognized by the lovers of science, so that the work is sought after as an antiquarian reminiscence, and cherished as a valuable treasure.

Of the life of David Ure after this publication had appeared, on which his distinction mainly rests, little remains to be told. We have already seen how little he had been indebted to the gifts of fortune or to church promotion, and how contentedly he had continued to labour in poverty until the task for which he was especially fitted had been accomplished. At last, in 1796, he became the settled minister of a parish, by a presentation from the Earl of Buchan to the church of Uphall in Linlithgowshire. Here, however, his career was short, as he died of dropsy on the 28th of March, 1798.

URQUHART, SIR THOMAS, of Cromarty, as he designates himself, was a writer of some note in the seventeenth century, but is much more remarkable for the eccentricity than either the depth or extent of his genius. Of this singular person there is scarcely anything more known than that he was knighted, though for what service is not recorded, by Charles I. at Whitehall; and that having at an after period, viz. in 1651, accompanied his successor, Charles II., from Scotland in his invasion of England, he was taken prisoner at the battle of Worcester. After his capture he was detained in London on his parole; and this interval he employed in writing some of the extraordinary works which have perpetuated his name.

He appears to have travelled at some period of his life through the greater part of Europe, to have been well skilled in the modern languages of the Continent, and to have been tolerably accomplished in the fashionable arts of the times in which he lived.

Meagre and few as these particulars are, they yet comprehend all that is left us regarding the history of a person who, to judge by the expressions which he employs when speaking of himself in his writings, expected to fill no inconsiderable space in the eyes of posterity. Amongst Sir Thomas' works is a translation of *Rabelais*, remarkably well executed; but with this performance begins and ends all possibility of conscientiously complimenting him on his literary attainments. All the rest of his productions, though in each occasional scintillations of genius may be discovered, are mere rhapsodies, incoherent, unintelligible, and extravagantly absurd. At the head of this curious list appears, "*The Discovery of a most Exquisite Jewel, more Precious than Diamonds incased in Gold, the like whereof was never seen in any Age; found in the Kennel of Worcester Streets, the Day after the Fight, and six before the Autumnal Equinox, &c. &c., Anno 1651.*" This extraordinary work was written, as its author avows, for the extraordinary purpose of helping him, by the display of talent which he conceived it would exhibit, to the recovery of his forfeited estates in Cromarty. As may be readily conceived, however, it had no such effect; and it will be at once understood why it

should not, when it is mentioned that Cromwell was then protector of England. The *Jewel*, its author boasts, was written in fourteen days; there being a struggle between him and the printer which should get on fastest—a contest which sometimes bore so hard upon him that he was, as he tells us, obliged to tear off fragments from the sheet he was writing, in order to keep the press going. The *Jewel* contains, amongst other piquant matters, the adventures of the Admirable Crichton, and a pedigree of the author's family, in which he traces the male line with great precision and accuracy from Adam to himself, and on the female side from Eve to his mother; regulating, as he goes along, the great events in the history of the world by the births and deaths of the Urquharts; to which important events he, with a proper sense of the respectability and dignity of his progenitors, makes them quite subordinate.

This multilibrarian and elaborate work, although the most important of the learned knight's productions, was not the first in point of time. In 1645 he published in London a treatise on *Trigonometry*, dedicated in very flowery language to "the right honourable and most noble lady, my dear and loving mother, the lady-dowager of Cromartie." This work, though disfigured by all the faults of manner and style peculiar to its author, yet discovers a knowledge of mathematics, which, when associated with his other attainments, leaves no doubt of his having been a man of very superior natural endowments.

V.

VEDDER, DAVID. This warm-hearted enthusiastic sailor-poet was born in the parish of Burness, Orkney, in 1790. His father was a small proprietor near Kirkwall, but of him he was bereaved in early boyhood; his widowed mother, however, directed the first steps of his education with singular ability, and carefully led him into that good path which he followed out to the end of his days. Being left an orphan at the age of twelve, David chose the occupation most natural to an island boy and Orcadian—it was that of a sailor, and in the first instance as a cabin-boy; but at the age of eighteen he rose to the rank of mate, and only two years after to the command of a ship, in which he made several voyages to Greenland and other places. Afterwards he entered the revenue service as first officer of an armed cruiser, in which he continued till 1820, when he obtained the government appointment of tide-surveyor of customs, and officiated in that capacity at the ports of Montrose, Kirkcaldy, Dundee, and Leith till the close of his active and well-spent life.

Although the tempest-beaten shores and incessantly shifting skies of Orkney are so fitted to inspire poetical emotions—though its wild scenery is fraught with such romantic historical remembrances—and though its children are the descendants of those Vi-kings and Jarls who wrought such wondrous deeds in their day, and of those Scalds who recorded them in song—yet it is singular that so few Orcadians of the modern stock have distinguished themselves in the walks of poetry. A veritable Orkney poet, therefore, is the more valuable on account of the rarity of the species—and one of these few, as well as the choicest specimen of the whole, was David Vedder. The maternal education, although so early terminated, had not only made him a reader and a thinker, but had culti-

vated his poetical tendencies, so that the ocean storms, by which they might have been otherwise extinguished, only seem to have nursed them into full maturity. Even while a young sailor, and amidst the boisterous navigation of the northern seas, his chief recreation as well as delight was poetry, so that he ventured at the early age of twenty-one to launch his first published poem into the pages of a magazine. Thus committed to the destinies of the press, other similar attempts quickly followed; and encouraged by the favourable reception they experienced, he commenced authorship in earnest, with a volume entitled the "*Covenanter's Communion*, and other Poems," which was published by Blackwood in 1826. This work was so favourably received that the whole impression was soon exhausted.

We can only give a brief enumeration of David Vedder's other works. To the *Covenanter's Communion* succeeded his *Orcadian Sketches*—a production of prose and verse intermixed, in the strong sonorous poetry of which the ringing of his native storms predominates, while many of the events are reminiscences of his own early life. This was followed by a *Life of Sir Walter Scott*, which was much read and admired until it was superseded by the able and ample narrative of Lockhart. In 1841 he published a volume of his collected pieces, under the title of *Poems—Legendary, Lyrical, and Descriptive*. In 1848 he published, in conjunction with his son-in-law, Mr. Frederick Schenck, the distinguished lithographer, a splendidly illustrated volume, entitled *Lays and Lithographs*, the whole of the letter-press of which was supplied by Mr. Vedder. His last principal work was a new English version of the quaint old German story of *Reynard the Fox*, adorned with similar illustrations.

Besides these entire productions, Mr. Vedder was considerably employed, over a course of years, as a coadjutor in other literary undertakings. These, independently of numerous contributions to newspapers and magazines, consisted of additions to George Thomson's *Musical Miscellany*, Blackie's *Book of Scottish Song*, and Robertson's *Whistlebinkie*. He also contributed the greater part of the letter-press to Geikie's well-known volume of *Etchings*. As his authorship had commenced, in like manner it terminated with the Covenanters; for during his last illness he was employed in the composition of a beautiful ballad descriptive of their sufferings, founded upon an incident in the life of Andrew Grey, of Chryston, in Lanarkshire.

The estimate of Vedder's literary and intellectual character has been justly and briefly expressed by the Rev. George Gilfillan in the following words—

"As a poet and prose writer his powers were of no ordinary kind. He added to strong unrestrained sense much fancy and humour. If not a 'maker' in the full extent of that name, he had unquestionably a true natural vein. Dr. Chalmers used actually to electrify his class-room by reading those lines of Vedder's, entitled 'All Nature worships there;' and many parts of his *Covenanter's Communion* and his *Orcadian Sketches* display similar power and truth of genius. Although in a great degree self-taught, he managed not only to acquire an excellent English style, but an extensive knowledge of foreign tongues, and his translations from the German are understood to be exceedingly faithful and spirited."

The death of Mr. Vedder occurred at his residence in Newington, near Edinburgh, on the 11th of February, 1854, when he had reached his sixty-fourth year.

W.

WALKER, JAMES, LL.D., F.R.S., F.R.S.E. This excellent civil engineer, whose professional talents were attested by so many skilful erections of public utility, was born at Falkirk on the 14th of September, 1781. He received the earlier part of his education at the parish school of his native town, and was afterwards a student at the university of Glasgow. Having there completed his education so far as was necessary for his chosen occupation, he went to London and commenced the study of engineering under his uncle, Ralph Walker, also distinguished in that scientific profession, and at the time employed in constructing the West India Docks. Under such a teacher, and with such opportunities, the talents and aptitudes of James Walker were improved to the uttermost, so that he became one of the most distinguished civil engineers of his day.

After he had entered into public life, his history was chiefly to be traced in the works he planned and superintended—in docks, bridges, and lighthouses—those silent memorials which only reveal the name of their founder to such as are curious enough to inquire for it. The department of his profession to which he exclusively adhered was marine engineering, in which he had originally been trained; and although the character of his mind was not original or inventive, it was distinguished by qualities scarcely less useful—by intuitive sagacity, much caution, sound judgment, and especially the faculty of profiting by his large and varied experience; and thus, while he avoided those professional blunders into which theoretic enthusiasts are so apt to fall, his works were eminently successful, and obtained for him the high position of being the first authority of his time. These, however, were so varied in character, and so many in number, that it would be impossible to particularize them, more especially as they ranged over a long course of life that was in constant action to its close. Let it suffice to say, that at the time of his death he was conducting, as government engineer, the national harbours of refuge at Dover, Alderney, and Jersey, and the refuge harbour at the mouth of the Tyne. As engineer to the Trinity House of London, he constructed various lighthouses, especially that on the Bishop's Rock, a situation so exposed as to make the construction of a lighthouse there a work of peculiar difficulty. On navigation and canal works he was frequently consulted as a

special authority, and of his bridge-architecture a favourable specimen has been given in the Stockwell Street bridge at Glasgow. The talents and success of Mr. Walker in his professional career were acknowledged by correspondent honours. From the university of Glasgow, where in his early days he had been a student, he received the degree of Doctor of Laws; he was appointed president of the Institution of Civil Engineers on the death of Mr. Telford in 1834; he was a member of the Royal Society of London; and in 1824 he was elected a member of the Royal Society of Edinburgh.

After these labours had been continued unabated to a good old age, Mr. Walker, sometime before his death, had exhibited symptoms of declining health; but with a robust constitution, combined with an abundant flow of cheerfulness and spirit, he bore up against the growing lassitude, and even to the last continued his beloved occupation, which to him had become a second nature, so that even on the day before his sudden decease he was employed in writing a report to the Admiralty on the Alderney harbour of refuge. He died from a stroke of apoplexy on the 8th of October, 1862, in his eighty-first year.

WALLACE, JAMES, usually called Colonel Wallace, leader of the Covenanters at the battle of Pentland Hills, was descended from the Wallaces of Dundonald, a branch of the Wallaces of Craigie. Neither the place nor the year of his birth is known; but in the sentence of death, which was passed against him in absence after the battle of Pentland, he is styled "of Auchens," an estate situated in the parish of Dundonald, in Ayrshire, and which was the family-seat of his ancestors, and most probably his own birth-place. Of his education there is equally little known as of the other particulars alluded to. He appears, however, to have adopted the military profession at a very early period of life, and having distinguished himself in the parliamentary army was raised to the rank of lieutenant-colonel. He went to Ireland in the Marquis of Argyle's regiment in the year 1642, and in 1645 was recalled to oppose the progress of the Marquis of Montrose. At what period of the struggle Colonel Wallace joined the army of the Covenanters under General Baillie is unknown, but he was at the battle of Kilsyth, where he was taken prisoner.

In 1650, when Charles II. came from the Continent at the entreaty of the Scottish parliament, two regiments being ordered to be embodied of "the choicest of the army, and fittest for that trust," one of horse and another of foot, as his body-guards, Wallace was appointed lieutenant-colonel of the foot regiment, under Lord Lorn, who was colonel. Sir James Balfour, lord lyon king-at-arms, by his majesty's command set down the devices upon the ensigns and colours of these regiments. Those of the lieutenant-colonel [Wallace] were azure, a unicorn argent, and on the other side, in "grate gold letters," these words, "Covenant for religion, king, and kingdoms." At the battle of Dunbar Wallace was again made prisoner; and in the end of that year Lord Lorn, in a petition to the parliament, says, "In respect my lieutenant-colonel has, in God's good providence, returned to his charge, whose fidelity in this cause is well known both in Ireland and in this kingdom, and that his losses are very many and great, I do humbly desire that your majesty and this high court of parliament may be pleased in a particular manner to take notice of him, that he may not only have a company appointed him, but likewise something may be done for the satisfaction of his former losses." Upon this petition the committee of bills reported "that Lieutenant-colonel Wallace may be referred to the Committee of Estates, that he may be assigned to some part of the excise or maintenance forth of the shire of Ayr, or any other of the shires in the south."

Colonel Wallace seems to have lived in retirement from the Restoration till the month of November, 1666, when Maclellan of Barscob, and some other gentlemen who had been driven into hiding, happening to fall in with some soldiers whom they found maltreating a poor old countryman, immediately disarmed them, and thus gave occasion to that rising which, from the place where it was suppressed, has always been called the rising of Pentland. Having fairly committed themselves by their humane interference, these gentlemen conceived the design of anticipating the vengeance of Sir James Turner, by surprising him with his whole party where he lay, in the town of Dumfries, about sixteen miles distant. Accordingly, having assembled their friends, to the number of about fifty horse with a few foot, they marched into that town upon Thursday, the 15th of November, and made Sir James prisoner with his whole party, wounding only one man. The insurgents on this occasion were led by a Mr. Andrew Gray, a merchant in Edinburgh, who happened by chance to be in that part of the country at the time. Neilson of Corsack, however, was the leader, before whom Sir James Turner, upon being made prisoner, was brought. From this gentleman he obtained quarter and protection; but when Gray, the chief of the party, came up, he insisted upon having him shot upon the spot. They finally, however, set him upon a sorry beast, and carried him about with them in his *déshabillé*, and in this manner proceeded to the market-cross, where they drank the king's health and prosperity to his government. Sir James, however, for some days could not believe but that they intended to hang him when they should find time and place suitable.

While these things were transacting in Dumfries, the friends of religion and liberty kept up a correspondence by special messengers, and continued deliberating on what was best to be done. Among others, Wallace joined a consultation, which was held at the chambers of Mr. Alexander Robertson in Edinburgh, the same night that Sir James Turner was made prisoner. At this meeting it was resolved

to make common cause with the western brethren, and seek redress from government with arms in their hands. Colonel Wallace and a little band of adherents lost no time in proceeding to Ayrshire, in the hope of being joined by the friends of religion and liberty there. They visited successively Mauchline, Ayr, Ochiltree, Cumnock, Muirkirk, and other places on the route; but met with little encouragement in their enterprise. Mr. Robertson, who had been still less successful in procuring assistance, rejoined Wallace, along with Captain Robert Lockhart, and insisted that the undertaking should be abandoned. This counsel was unpalatable to Wallace, but he forthwith sent Maxwell of Monreith to consult with John Guthrie, brother to the celebrated minister of Fenwick, on the subject. Having been reinforced by a small party from Cunningham, under Captain Arot, the whole body marched to Douglas on Saturday the 24th, where at night, after solemn prayer, the proposal of Robertson and Lockhart was carefully considered. It was rejected without one dissenting voice, all being clear that they had a divine warrant for the course they were pursuing. They resolved, therefore, to persevere in it, although they should die at the end of it; hoping that, at least, their testimony would not be given in vain to the cause they had espoused. Two other questions were discussed at this meeting: the renewing of the covenants—to which all agreed; and what should be done with Sir James Turner, whom, for want of any place in which to confine him, they still carried about with them; and who, as a persecutor and murderer of God's people, it was contended by many, ought to have been put to death. As quarter, however, it was alleged, had been granted to him, and as he had been spared so long, "the motion for pistolling him was slighted." On the morrow, Sabbath, they marched for Lesmahagow, and passed the house of Robert Lockhart, where Mr. Robertson also was at the time; but neither of the two came out. This day they perfected as well as they could the modelling of their force; but few as their numbers were, they had not the half of the officers requisite: they had not above four or five that had ever been soldiers. At night they entered Lanark, crossing Clyde near the town. Next day, Monday the 26th, guards being set upon the water in a boat to prevent any surprise from the enemy, the covenants were renewed, Mr. John Guthrie preaching and presiding to one part of the army, and Messrs. Gilbert Semple and Crookshanks to the other; and the work was gone about "with as much joy and cheerfulness as may be supposed in such a condition." On this day considerable numbers joined them; and with the view of favouring the rising of their friends, who were understood to be numerous, in Shotts, West Calder, and Bathgate, they marched for the latter place, but did not reach it till late in the evening. Part of the way a large body of the enemy's horse hung upon their rear; the roads were excessively bad, and the place could not so much as afford them a cover from the rain, which was falling in torrents. The officers went into a house for prayer and to deliberate upon their further procedure, when it was resolved to march early in the direction of Edinburgh, in the hope of meeting their friends from that quarter, as well as those they had expected through the day. Scarcely, however, had the meeting broken up, when their guards gave the alarm of the enemy; and though the night was dark and wet in the extreme they set out at twelve o'clock, taking the road through Broxburn, and along the new bridge for Collington. Daylight appeared as they came to the bridge, in the most miserable plight imaginable. From their Edinburgh

friends there was no intelligence; and when they drew up on the east side of the bridge there was not a captain with the horse, save one, and the enemy were close at hand, marching for the same bridge. Wallace, however, was a man of singular resolution and of great self-possession. Even in these distressing circumstances he sent a party to occupy the bridge, and marched off the main body of his little army to a rising ground, where he awaited the enemy to give him battle.

It was at this critical juncture that Lawrie of Blackwood paid him a second visit, not to assist, but to discourage him, by proposing a second time that he should disband his followers and trust to an indemnity, which he assured him the Duke of Hamilton would exert himself to obtain for them. As he had no credentials to show, and seemed to be speaking merely his own sentiments without the authority of either party, Blackwood's proposal excited suspicions of his motives. He, however, remained with the party, which had now moved on to Collington, all night; and in the morning was the bearer of a letter from Colonel Wallace to General Dalzell, who sent it to the council, while he hastened himself to pursue the insurgents. Wallace in the meantime marched to Ingliston Bridge, at the point of the Pentland Hills, and was in the act of drawing up his little party to prevent straggling when he learned that Dalzell, with the advance of the king's troops, was within half a mile of him. There had been a heavy fall of snow through the night, but it was succeeded by a clear frosty day; and it was about noon of that day, the 28th of November, when the armies came in sight of each other. That of the insurgents did not exceed 900 men, ill-armed, worn out with fatigue, and half starving. The royal army, which amounted to upwards of 3000 men, was in the highest order, and well provided in all respects. Wallace disposed his little army with great judgment upon the side of a hill running from north to south. The Galloway gentlemen, on horseback, under McClellan of Barmagachan, were stationed on the south; the remainder of the horse, under Major Learmont, on the north; and the foot, who were exceedingly ill armed, in the middle. Dalzell seems to have been for some time at a loss how to proceed; having such a superiority, however, in numbers, he detached a party of horse, under General Drummond, to the westward, in order to turn Wallace's left wing. This detachment was met by the Galloway gentlemen, under Captain Arnot and Barmagachan, and completely routed in an instant; and had Wallace been in a condition to have supported and followed up this masterly movement, the king's army would inevitably have lost the day. A second attack was met by Major Learmont with equal spirit; and it was not till after sunset, when Dalzell himself charged the feeble unarmed centre with the strength of his army, horse and foot, that any impression was made upon them. This charge they were unable to resist, but were instantly broken and dispersed. The nature of the ground, and the darkness of the night, favoured their flight, and there were not more than 100 of them killed and taken by the victors; but they were in an unfriendly part of the country, and many of the fugitives were murdered by their inhumane countrymen, for whose rights and liberties they were contending.

Colonel Wallace after the battle left the field, in company with Mr. John Welch, and, taking a north-westerly direction along the hills, escaped pursuit. After gaining what they conceived to be a safe distance from the enemy they turned their horses loose, and slept the remainder of the night in a barn.

Wallace for some time concealed himself in different parts of the country, and at length escaped to the Continent, where he assumed the name of Forbes. Even there, however, he was obliged to wander from place to place for several years to avoid his enemies, who still continued to seek him out. When the eagerness of the pursuit abated, he took up his residence at Rotterdam, where Mr. Macward and Mr. John Brown had found an asylum, and were now employed in dispensing ordinances to numerous congregations; but on the complaint of one Henry Wilkie, whom the king had placed at the head of the Scottish factory at Campvere, who found his interests suffering by the greater resort of Scottish merchants at Rotterdam for the sake of enjoying the ministry of these worthy men, the states-general were enjoined by the British government to send all the three out of their territories. In the case of Wallace the states were obliged to comply, as he had been condemned to be executed as a traitor when he should be apprehended, and his lands forfeited for his majesty's use; but they gave him a recommendation to all kings, republics, &c. &c., to whom he might come, of the most flattering description. In the case of the other two the order seems to have been evaded. Wallace ventured in a short time back to Holland, and died at Rotterdam in the end of the year 1678, "lamented of all the serious English and Dutch of his acquaintance, who were many; and in particular the members of the congregation of which he was a ruling elder bemoaned his death, and their loss, as of a father." "To the last he testified his attachment to the public cause which he had owned, and his satisfaction in reflecting on what he had hazarded and suffered in its defence." He left one son, who succeeded to his father's property, as the sentence of death and of fugitation, which was ratified by the parliament in 1669, was rescinded at the Revolution.

Among the suffering Scottish exiles there were few more esteemed than Colonel Wallace. Mr. Brown of Wamphray, in a testament executed by him at Rotterdam, in 1676, ordered 100 guineas "to be put into the hands of Mr. Wallace, to be given out by him to such as he knoweth indigent and honest;" and while he leaves the half of his remanent gold to Mr. Macward, he leaves the other half to Mr. Wallace. Mr. Macward, who was honoured to close the eyes of his valued friend and fellow-Christian, exclaims, "Great Wallace is gone to glory; of whom I have no doubt it may be said, he hath left no man behind him in that church, minister nor professor; who hath gone through such a variety of tentations, without turning aside to the right hand or to the left. He died in great serenity of soul. When the cause for which he suffered was mentioned, when it was scarce believed he understood or could speak, there was a sunshine of joy looked out of his countenance, and a lifting up of hands on high, as to receive the martyr's crown; together with a lifting up of the voice, with an 'Aha,' as to sing the conqueror's song of victory."

WALLACE, DR. ROBERT, celebrated as the author of a work on the numbers of mankind, and for his exertions in establishing the Scottish Ministers' Widows' Fund, was born on the 7th January, 1697, o.s., in the parish of Kincardine in Perthshire, of which his father, Matthew Wallace, was minister.¹ As he was an only son his early education was carefully attended to. He acquired Latin at the grammar-school of Stirling, and in 1711 was sent to the university of Edinburgh, where he passed through the

¹ *Scots Magazine*, xxxiii. 340; lxxi. 291.

usual routine of study. He was one of the original members of the Rankenian Club, a social literary fraternity, which, from the subsequent celebrity of many of its members, became remarkably connected with the literary history of Scotland. Mr. Wallace directed his studies towards qualifying himself for the Church of Scotland. In 1722 he was licensed to preach by the presbytery of Dumblane, and in August, 1723, the Marquis of Annandale presented him with the living of Moffat.

Dr. Wallace had an early taste for mathematics, to which he directed his attention while a student at the university, and on that study he bestowed many of his spare hours during his ministry. He has left behind him voluminous manuscript specimens of his labours; but it will probably be now considered better evidence of his early proficiency, that in 1720 he was chosen assistant to Dr. Gregory, then suffering under bad health. Wallace was, in 1733, appointed one of the ministers of the Grayfriars' Church in Edinburgh. The countenance of the government, which he had previously obtained, he forfeited in 1736, by refusing to read in his church the act for the more effectually bringing to justice the murderers of Porteous, which the zealous rage of the ministry and the house of peers had appointed to be read from the pulpit. He was in disfavour during the brief reign of the Walpole ministry; but under their successors was intrusted with the conduct of ecclesiastical affairs. The revolution in the ministry happened at a moment when Dr. Wallace was enabled to do essential service to his country, by furthering the project of the Ministers' Widows' Fund. The policy of that undertaking was first hinted at by Mr. Mathieson, a minister of the High Church of Edinburgh; Dr. Wallace, in procuring the sanction of the legislature, and Dr. Webster, by an active correspondence and the acquisition of statistical information, brought the plan to its practical bearing, by apportioning the rates, &c., and afterwards zealously watched and nurtured the infant system. As the share which Dr. Wallace took in the promotion of this measure is not very well known, it may be mentioned, that it appears from documents in the office of the trustees of the Ministers' Widows' Fund, that he was moderator of the General Assembly in 1743, which sanctioned the measure. In the ensuing November he was commissioned by the church, along with Mr. George Wishart, minister of the Tron Church, to proceed to London and watch the proceedings of the legislature regarding it. He there presented the scheme to the lord-advocate, who reduced it to the form of a bill. The corrections of Messrs. Wallace and Wishart appear on the scroll of the bill.

In 1744 Dr. Wallace was appointed one of the royal chaplains for Scotland. He had read to the Philosophical Society of Edinburgh, of which he was an original member and active promoter, a *Dissertation on the Numbers of Mankind in Ancient and Modern Times*, which he revised and published in 1752. In this work he was the first to apply to purposes of investigation one of those truisms which, however plain, are never stated until some active mind employs them as foundations for more intricate deductions, that the number of human beings permanently existing in any portion of the earth must be in the ratio of the quantity of food supplied to them. The explanation of this truth by Dr. Wallace has been acknowledged by Malthus, and the work in which it was discussed has acquired deserved fame for the mass of curious statistical information with which the author's learning furnished it; but in the great theory which he laboured to establish, the

author is generally allowed to have failed. He maintained, as a sort of corollary to the truth above mentioned, that where the greatest attention is paid to agriculture, the greatest number of human beings will be fed, and that the ancients having paid greater attention to that art than the moderns, the world of antiquity must have been more populous than that of modern days. Were all food consumed where it is produced, the proposition would be true; but in a world of traffickers, a sort of reverse of the proposition may be said to hold good, viz. that in the period where the smallest *proportion* of the human beings on the surface of the earth is employed in agriculture, the world will be most populous, because for every human being that exists a quantity of food sufficient to live upon *must* be procured; for procuring this food the easiest method will always be preferred, and therefore when the proportion of persons engaged in agriculture is the smaller, we are to presume, not that the less is produced, but that the easier method of providing for the aggregate number has been followed. The great engine of facilitating ease of production is commerce, which makes the abundance of one place supply the deficiency of another, in exchange for such necessities and luxuries as enable the dwellers on the fertile spot to bestow more of their time in cultivation than they could do were they obliged to provide these things for themselves. Hence it is pretty clear that increase of populousness has accompanied modern commerce. Previously to the publication of this treatise, Hume had produced his invaluable critical essay on the populousness of ancient nations, in which, on politico-economical truths, he doubted the authenticity of those authorities on the populousness of antiquity, on many of which Wallace depended. In publishing his book Dr. Wallace added a long supplement, discussing Hume's theory with much learning and curious information, but leaving the grounds on which the sceptic had doubted the good faith of the authorities unconfuted. Wallace's treatise was translated into French, under the inspection of Montesquieu; and was republished in 1809, with a life of the author. Dr. Wallace's other published works are, "*A Sermon*, preached in the High Church of Edinburgh, Monday, January 6, 1745-6, upon occasion of the Anniversary Meeting of the Society in Scotland for Propagating Christian Knowledge;" in which he mingled, with a number of extensive statistical details concerning education, collected with his usual learning, and tinged with valuable remarks, a political attack on the Jacobite insurrection of the period, and the motives of its instigators; *Characteristics of the Present State of Great Britain*, published in 1758; and *Various Prospects of Mankind, Nature, and Providence*, published in 1761, in which he discussed the abstruse subjects of liberty and necessity, the perfectibility of human nature, &c. He left behind him a MS. essay on "Taste," of considerable length, which was prepared for the press by his son, Mr. George Wallace, advocate, but never published. From the new aspect which modern inquiries on this subject have assumed, in their adoption of the cumulative principle of association, this work can now be of little interest; but it may be worth while to know, that his "principles of taste," or sources from whence the feeling was perceived to emanate, were divided into, 1st, grandeur; 2d, novelty; 3d, variety; 4th, uniformity, proportion, and order; 5th, symmetry, congruity, or propriety; and 6th, similitude and resemblance, or contrast and dissimilitude.

Dr. Wallace died on the 29th of July, 1771, in consequence of a cold caught in being overtaken in a walk by a snow-storm. His son George, al-

ready mentioned, is known as the author of a work on the *Descent of Ancient Peorages*, and *Principles of the Law of Scotland*, which has fallen into obscurity.

WALLACE, WILLIAM, the celebrated assertor of the national independence, was born probably about the middle of the reign of Alexander III., or the year 1270. Part of the circumstances which called forth this hero from obscurity are already detailed under the life of Baliol; the remainder must here be briefly noticed.

After the deposition of that unfortunate sovereign in 1296, King Edward I. overran Scotland with his troops, and united it, as he thought, for ever to his native dominions. Many of the nobility who had taken part in the resistance of King John fell into his hands, and were sent prisoners to England, whither Baliol himself, along with his eldest son, had also been sent. He destroyed or took away all the public records, and endeavoured to obliterate every monument of the former independence of Scotland. He displaced those who had held important offices under Baliol, and bestowed them on Englishmen. Warenne, Earl of Surrey, was appointed governor, Hugh de Cressingham treasurer, and William Ormesby justiciary of Scotland; and having thus settled all things in a state of seeming tranquillity, he departed with the conviction that he had made a final conquest of the country.

Scotland was now fated to experience the most flagrant oppression and tyranny. The unlimited exactions of Cressingham, the treasurer, a voluptuous and selfish ecclesiastic, and the rigour of Ormesby the justiciary in exacting the oath of fealty, soon rendered them odious to the nobles; while the rapacity and barbarism of the soldiers laid the wretched inhabitants open to every species of wrong and insult. Those who refused to take the oath of allegiance to Edward were deprived of their estates, and in many cases of their lives. Whatever was valuable in the kingdom was seized upon by its oppressors; even the cause of female virtue was not held sacred under their unhallowed domination; and in short, the whole country was laid under a military despotism of the most unqualified and irresponsible kind. It was at this dark hour of Scotland's history, when the cry of an oppressed people ascended to heaven, and the liberty for which they had so long struggled seemed to have departed for ever from them, that **SIR WILLIAM WALLACE** arose to avenge the wrongs and restore the rights of his country.

Sir William Wallace was descended from an ancient Anglo-Norman family in the west of Scotland. His father was knight of Elderslie and Auchinbothie in Renfrewshire, and his mother daughter of Sir Raynald Crawford, sheriff of Ayr. Wynton, in his *Chronicle*, speaking of him, says,

"Hys Fadyere was a manly knyght,
Hys Modyere was a lady brycht,
Begothene and born in mariage;
Hys eldayre brodyere the herytage
Had and enjoyed in his dayes."

According to some writers, his father and brother were both slain by the English at Lochmaben; but from the above lines it would seem that the elder brother survived his father, and succeeded to the heritage. Sir William, who, as already mentioned, seems to have been born about the middle of the reign of Alexander III., received the rudiments of his education at Dunipace in Stirlingshire, under the guardianship of his uncle, a wealthy ecclesiastic there. This worthy man is said to have stored his nephew's mind with the choicest maxims from the ancients, and in particular to have imprinted upon

his memory the following Leonine verses, which Wallace often repeated in after-years:

"Dico tibi verum, Libertas optima rerum,
Nunquam servili sub nexu vivito, fili."

Thus translated by Monipennie:

"My sonne (I say) Freedom is best,
Then never yield to thrall's arrest."

From Dunipace Wallace was removed to a public seminary at Dundee, where he contracted a friendship with John Blair, a Benedictine monk, who afterwards became his chaplain. Blair, being an eye-witness to most of his actions, composed a history of them in Latin; but the work has not, unfortunately, come down to us, though a liberal use has evidently been made of it in the vernacular metrical work of Blind Harry.¹

It would appear that Wallace first displayed his intrepid temper in a quarrel at Dundee with a young English nobleman of the name of Selby, whom, provoked by some wanton indignity, he stabbed with his dagger, and slew on the spot. The consequence of this was, that he was obliged to seek for safety among the wilds and fastnesses of his country,² where by degrees he collected a little band, whom he inspired with his own patriotic sentiments.

Although deserted by their nobility, a spirit of determined hostility to the English government was strongly manifested by the great body of the people. Throughout the country numerous bands of armed peasants collected, and harassed in every possible way the English soldiers. A master-spirit was only wanting to guide them to the restoration of their country's independence—and such they found in Sir William Wallace. He had every personal and mental qualification to constitute him the leader of his countrymen at this period of oppression. In the fragment ascribed to Blair which is preserved, he is described as of a tall and gigantic stature, a serene countenance, a pleasant aspect, large and broad-shouldered, but of no unwieldy bulk; liberal in his gifts, just in his judgments, eloquent in discourse, compassionate to those in distress, a strong protector and deliverer of the oppressed and poor, and a great enemy to liars and cheats. Fordun and Buchanan also characterize him as superior to the rest of mankind in bodily stature, strength, and activity; in bearing cold and heat, thirst and hunger, watching and fatigue; valiant and prudent, magnanimous and disinterested, undaunted in adversity, modest in prosperity, and animated by the most ardent and unextinguishable love of his country. With these qualifications, and with a band of followers who confided in him, and who were stimulated by the same wish of rescuing their country from the tyranny under which it groaned, he soon became a terror to the English,

¹ The following lines occur near the conclusion of Blind Harry's performance:—

"Of Wallace' Life, who hath a better skeel,
May show forth more with wit and eloquence,
For I to this have done my diligence,
After the prose, given from the Latin book,
Which Master Blair in his time undertook,
In fair Latin compiled to an end," &c.

² "There is a respectable man in Longforgan, Perthshire, who has in his possession a stone, called *Wallace's stone*. It was what was formerly called in this country a *bear-stone*, hollow like a large mortar, and was made use of to unhulk the bear or barley, as a preparative for the pot, with a large wooden mell, long before barley-mills were known. Its station was on one side of the door, and covered with a flat stone for a seat when not otherwise employed. Upon this stone Wallace sat on his way from Dundee, when he fled after killing Selby, the governor's son, and was fed with bread and milk by the goodwife of the house, from whom the man who now lives there, and is the proprietor of the stone, is lineally descended; and here his forbears (ancestors) have lived ever since, in nearly the same station and circumstances, for about 500 years."—*Statistical Account of Scotland*, xix. 561.

and performed many daring feats of valour. His early and desultory enterprises against the enemy were almost all successful; and the result was, that numbers who had looked with indignation at the usurpation of the crown by Edward, and who only waited for an opportunity of asserting the independence of their country, flocked to his standard, until he found himself at the head of a great body of men, all fired with the same patriotic spirit.

As Wallace's party grew stronger, several of the Scottish nobles joined him. Among these were the steward of Scotland, and Sir Andrew Murray of Bothwell; Sir John the Grahame, who became Wallace's bosom friend and confidant; William Douglas, Lord of Douglasdale, designated the Hardy; Sir Robert Boyd; Alexander de Lindsay; Sir Richard Lundin; and Wisheart, Bishop of Glasgow. These either acted together or engaged in separate expeditions, as circumstances allowed. Ormesby, the English justiciary, was about this time holding his court at Scone. Wallace attacked him there, killed some of his followers, and took many prisoners; but the justiciary had the good fortune to escape. While Wallace was engaged in this expedition, or some other equally daring, Lord Douglas recovered the castles of Durisdeer and Sanquhar from the English.¹

About the same period a memorable adventure in the history of Wallace—the burning of the Barns of Ayr—is said to have taken place. According to prevalent tradition, the English governor of Ayr invited to a friendly conference many of the Scottish gentry, in some large buildings, called the Barns of Ayr, where, by a treacherous and premeditated stratagem, they were strangled to death. Among those slain in this base manner were Sir Raynald Crawford, sheriff of the county of Ayr, and maternal uncle to Wallace, Sir Neil Montgomerie, Sir Bryce Blair, and Crystal of Seton.² Wallace, on hearing of this circumstance, instantly set forward towards Ayr, accompanied by his confederates; and about midnight surrounded the barns where the English soldiers were cantoned, set them on fire, and either killed, or forced back to perish in the flames, all who endeavoured to escape. Many of the English soldiers who lodged in a convent were at the same time attacked and put to the sword by the friars: and this is still proverbially called the Friar of Ayr's Blessing. On returning from Ayr with a body, it is said, of 300 men, Wallace proposed to make an attack upon Glasgow, which was possessed by an English force of 1000 soldiers. With this purpose he divided his band into two, giving the command

of one of them to Boyd of Auchinleck,³ with instructions to make a circuit and enter the town at an opposite point, while he himself would engage in the front. Wallace came in contact with the English near the college site in High Street; a desperate and well-contested combat ensued: the leader of the English fell beneath the sword of Wallace; and on the appearance of Boyd, the English were thrown into confusion, and pursued with great loss as far as Bothwell Castle.

These, and similar gallant exertions in the cause of Scotland, at length roused the indignation of the English monarch, who had been at first inclined to treat them with disdain. Calling forth the military force on the north of the Trent, he sent Sir Henry Percy, nephew of the Earl of Surrey, and Sir Robert Clifford, into Scotland to reduce the insurgents, at the head of an army of 40,000 foot and 300 fully caparisoned horse. The English army marched through Annandale to Lochmaben, where, during the night, their encampment was suddenly surprised and attacked with great fury by Wallace and his party, who, however, in the end were obliged to retire. At break of day, the English advanced towards Irvine, and soon discovered the Scottish squadrons drawn up on the border of a small lake. The force of the latter was unequal to a well-appointed army; but Wallace was among them, and under his conduct they might have made a successful resistance. Discussions, however, arose among the chiefs as to precedence; and they were perhaps the more untractable from a conviction of their inferiority to the enemy. Sir Richard Lundin was the first to set the example. Exclaiming that he would not remain with a party at variance with itself, he left the Scottish camp, and went over with his retainers to the English. He was followed in this by Bruce (afterwards the hero of Bannockburn), who had lately joined the Scottish army; by the steward of Scotland and his brother; by Alexander de Lindsay; William, Lord of Douglasdale; and the Bishop of Glasgow. All these acknowledged their offences, and for themselves and their adherents made submission to Edward. A treaty⁴ to this effect, to which their seals were appended, was drawn up in Norman French, and a copy transmitted to Wallace; but this brave and patriotic man rejected it with disdain. It is supposed that Sir John Grahame and Sir Robert Boyd were not present on this occasion; their names are not in the treaty; and historians say that Sir Andrew Murray of Bothwell was the only baron who remained with Wallace after this disgraceful desertion.

Undismayed by the occurrence, Wallace retired to

¹ The manner of his taking the castle of Sanquhar is thus described by Hume of Godscroft in his *History of the House of Douglas*:—"There was one Anderson that served the castle, and furnished it with wood and fuel. The Lord Douglas directs one of his trustiest and stoutest of his servants to deal with him, or to find some means to betray the castle to him, and to bring him within the gates only. Anderson, either persuaded by entreaty or corrupted by money, gave my lord's servant, called Thomas Dickson, his apparel and carriages; who, coming to the castle, was let in by the porter for Anderson. Dickson stabbed the porter; and, giving the signal to my lord, who lay near by with his companions, set open the gates, and received them into the court. They, being entered, killed the captain and the whole of the English garrison, and so remained masters of the place. The captain's name was Beauford, who had oppressed the country that lay near him very insolently. One of the English that had been in the castle, escaping, went to the other garrisons that were in other castles and towns adjacent, and told them what had befallen his fellows, and withal informed them how the castle might be recovered. Whereupon, joining their forces together, they came and besieged it. Lord Douglas, finding himself straitened, and unprovided of necessaries for his defence, did secretly convey his man Dickson out at a postern or some hidden passage, and sent him to William Wallace for aid. Wallace was then in Lennox; and hearing of the

danger Douglas was in, made all the haste he could to come to his relief. The English, having notice of Wallace's approach, left the siege and retired towards England, yet not so quickly but that Wallace, accompanied by Sir John Graham, did overtake them, and killed 500 of their number before they could pass Dalswinton. By these and such like means Wallace, with his assistants, having beaten the English from most parts of their strengths in Scotland, did commit the care and custody of the whole country, from Drumlanrig to Ayr, to the charge of the Lord Douglas."

² Barbour, a credible author, says (alluding to Crystal of Seton),

"It was gret sorrow sekirly,
That so worthy persoun as he,
Suld on sic manner hangy be?
This gate endyt his worthynes,
And off Crawford als Schyr Kanald wes,
And Schyr Bryce als the Blar;
Hangyt in till a barne in Ayr."

The Bruce, iii. 260.

³ The father of this warrior, in consequence of the gallantry he displayed at the battle of Largs, obtained a grant of lands in Cunningham from Alexander III.

⁴ It is dated 9th July, 1297. See Rymer, *Fœdera*, vol. ii. p. 774.

the north, after venting his indignation on the castle and lands of the Bishop of Glasgow, who was the negotiator of the treaty, and who by his intrigues had the common fortune of being suspected by both parties. There are no authentic memorials regarding the particular actions of Wallace during the summer months that intervened between the treaty of Irvine and the battle of Stirling; but he seems to have been active and successful in raising a formidable army. The spirit of his countrymen was now roused. Knighton, an old English historian, informs us, that "although the nobility of Scotland had attached themselves to England, *THE HEART OF THE PEOPLE WAS WITH WALLACE*, and the community of the land obeyed him as their leader and their prince." The cause of this is obvious. Many or most of the nobles were Normans of recent connection with Scotland, still disposed to look rather to England than to Scotland as their country, and to the English monarch, than to the Scottish, as their sovereign; while the common people had no attachment but to their native soil and their native prince. Wallace was one of the Anglo-Normans who sided with the body of the people in this quarrel, and it is easy to see that much of the jealousy of the nobility towards him was excited by the reflection, that he deserted the cause of his kindred aristocracy for the sake of popular and national rights.

It was when Wallace had succeeded in expelling the English from the castles of Forfar, Brechin, Montrose, and nearly all their strongholds on the north of the Forth, and had just begun the siege of the castle of Dundee, that intelligence reached him of the English army, under the command of the Earl of Surrey and Cressingham the treasurer, being on its march to oppose him. Charging the citizens of Dundee to continue, on pain of death, the siege of the castle, he hastened with all his troops to guard the important passage of the Forth, before Surrey had passed the bridge at Stirling, and encamped behind a rising ground in the neighbourhood of the abbey of Cambuskenneth. His army at this time amounted to 40,000 foot and 180 horse. That of the English was superior in numbers, being 50,000 foot and 1000 horse. The steward of Scotland, the Earl of Lennox, Sir Richard Lundin, and others of the Scottish barons, were now with the English, and on the army reaching Stirling bridge, they requested Surrey to delay an attack till they had attempted to bring Wallace to terms. They soon returned with the information that they had failed in their efforts at a reconciliation, and that they had not been able to persuade a single soldier to desert. Surrey, who seems to have been aware of the danger of passing the bridge, as a last resource sent two friars to offer a pardon to Wallace and his followers, on condition that they would lay down their arms. But the spirit of Wallace was unsubdued. "Go back to your masters," he said, "and tell them that we stand not here to treat of peace, but to avenge the wrongs and restore the freedom of our country. Let the English come on—we shall meet them beard to beard." On hearing this defiance, the English impatiently demanded to be led to the attack; but Surrey, alive to the strong position occupied by the Scots, hesitated, until overcome by the taunts and impatience of Cressingham. "Why, my lord," cried this insolent churchman, "should we protract the war, and spend the king's money? Let us forward, as becomes us, and do our knightly duty."

The English army began to cross the bridge, led by Sir Marmaduke Twenge and Cressingham; and when nearly the half had passed, Wallace charged them with his whole force, before they had time to

form, and threw them into inextricable confusion. A vast multitude was slain, or drowned in the river in attempting to rejoin Surrey, who stood on the other side a spectator of the discomfiture. Cressingham the treasurer was among the first who fell; and so deeply was his character detested, that the Scots mangled his dead body, and tore the skin from his limbs.¹ Twenge, by a gallant struggle, regained the bridge and got over to his friends. A panic seized the English who stood with Surrey, spectators of the rout. Abandoning their waggons and baggage, they fled precipitately, burning the bridge (which was of wood) to prevent pursuit. The Earl of Lennox and the Scottish barons, perceiving this, threw off their mask of alliance with Edward; and being joined by part of the Scottish army, who crossed the river by means of a ford at some distance from the bridge, pursued the English with great vigour as far as Berwick, which was soon abandoned and taken possession of by the victorious army. It is not known how many of the English fell at this battle, but the slaughter must have been great, as few of those who crossed the bridge escaped; and the Scots, smarting under the cruel insolence and rapacity with which they had been treated, gave little quarter. On the side of the Scots few of any note were slain, with the exception of Sir Andrew Murray of Bothwell, the faithful companion of Wallace, whose son, some time after, was made regent of Scotland.

This decisive engagement took place on the 11th of September, 1297; and its consequences were important. The castles of Dundee, Edinburgh, and Roxburgh immediately surrendered to Wallace; and in a short time not a fortress or castle in Scotland remained in the hands of the English. Thus through the means of one man was Scotland delivered from the iron yoke of Edward, and her name and independence among the nations of the earth restored.

Wallace was now declared, by the voice of the people, governor and guardian of the kingdom, under Baliol.² About the same time a severe dearth and famine, the consequence of bad seasons and the ravages of war, afflicted Scotland; and Wallace, with the view of procuring sustenance for his followers and of profiting by his victory at Stirling, resolved upon an immediate expedition into England. For the purpose of raising a formidable army he commanded that from every county, barony, town, and village, a certain proportion of fighting men, between the ages of sixteen and sixty, should be levied; and although the jealousy of the Scottish nobility began to be more than ever excited, and many endeavours were made by them to prevent cordial co-operation, he soon found himself at the head of a numerous body of men, with whom he marched towards the north of England, taking with him as his partner in command Sir Andrew Murray of Bothwell, son of the gallant knight who fell at the battle of Stirling bridge. The approach of the Scottish army struck the inhabitants of the northern counties with terror: they abandoned their dwellings, and, with their cattle and household goods, took refuge in Newcastle. "At this time," says Hemingford, an English historian, "the praise of God was unheard in any church or monastery throughout the whole country, from New-

¹ It is said in an old MS. chronicle, that Wallace made a sword-belt of Cressingham's skin. This may be the origin of the story, that the Scots made *girths* of his skin; an absurdity upon which Lord Hailes is at the pains of passing a joke.

² His title runs thus in a document of his own time:—"Willelmus Walays, miles, custos regni Scotie, et ductor exercitus ejusdem, nomine præclari Principis Domini Johannis, Dei gratia, regis Scotie illustris, de consensu communitatis ejusdem."

castle-upon-Tyne to the gates of Carlisle; for the monks, canons regular, and other priests who were ministers of the Lord, fled with the whole people from the face of the enemy; nor was there any to oppose them, except that now and then a few English who belonged to the castle of Alnwick, and other strengths, ventured from their safe-holds, and slew some stragglers. But these were slight successes; and the Scots roved over the country from the feast of St. Luke's to St. Martin's Day, inflicting upon it all the miseries of unrestrained rapine and bloodshed.¹ All the tract of country from Cockermouth and Carlisle to the gates of Newcastle was laid waste; and it was next determined to invade the county of Durham. But the winter set in with such severity, and provisions became so scarce, that multitudes of the Scots perished through cold and famine, and Wallace was obliged to draw off his army. It seems that he endeavoured in vain to restrain many outrages of his followers. The canons of Hexham, a large town in Northumberland, complained to him that their monastery had been sacrilegiously plundered and that their lives were in danger. "Remain with me," he said; "for I cannot protect you from my soldiers when you are out of my presence." At the same time he granted them a charter, by which the priory and convent were admitted under the peace of the King of Scotland; and all persons interdicted, on pain of the loss of life, from doing them injury. This curious document still exists. It is dated at Hexham on the 8th of November, 1297.

After his return from England, Wallace proceeded to adopt and enforce those public measures which he considered necessary for securing the liberty of his country. With the consent and approbation of the Scottish nobility he conferred the office of constabulary of Dundee on Alexander, named Skirmis-chur, or Scrimgeour, and his heirs, "for his faithful aid in bearing the banner of Scotland."² He divided the kingdom into military districts, in order to secure new levies at any time when the danger or exigency of the state required them. He appointed an officer or sergeant over every four men, another of higher power over every nine, another of still higher authority over every nineteen; and thus in an ascending scale of disciplined authority, up to the officer or chiliarch, who commanded a thousand men. In other respects his administration was marked by justice and sound judgment. He was liberal in rewarding those who deserved well of their country, by their exertions during its late struggle for liberty; and strict in punishing all instances of private wrong and oppression. But the envy and jealousy of the higher nobility, who could ill brook the elevation of one whose actions had thrown them so much into the shade, perplexed the councils and weakened the government of the country, at a time when the political existence of Scotland depended on its unanimity.

Edward was in Flanders when the news reached him that the Scots, under Sir William Wallace, had entirely defeated Surrey, driven every English soldier out of their country, invaded England, and, in short, had thrown off effectually the yoke with which he had fettered them. Inflamed against them at this overthrow of his exertions and schemes, he issued orders to all the forces of England and Wales

to meet him at York; and, concluding a truce with France, hastened home to take signal vengeance on the assertors of their liberty, and to make final conquest of a country which had proved so contumacious and untractable. At York he held a parliament, on the feast of Pentecost, 1298, where, to secure the hearty co-operation of his subjects in his invasion of Scotland, he passed several gracious and popular acts, and came under a promise of ratifying more should he return victorious. He soon found himself at the head of an army, formidable in number, and splendid in equipment. It consisted at first of 7000 fully caparisoned horse and 80,000 infantry; and these were soon strengthened by the arrival of a powerful reinforcement from Gascony. A large fleet, laden with provisions, had orders to sail up the Frith of Forth as the army advanced.

The English rendezvoused near Roxburgh; and about midsummer advanced into the country by easy marches. A party under Aymer de Valloins, Earl of Pembroke, landed in the north of Fife. Wallace attacked and routed them in the forest of Black Ironside, 12th June, 1298. Among the Scots, Sir Duncan Balfour, sheriff of Fife, was the only person of importance who fell in this engagement.

This partial success, however, of the ever-active guardian of his country, could not affect the terrible array that was now coming against him. He had no army at all able to compete with Edward; and his situation was rendered more perilous by the mean fears and jealousies of the nobility. Many of these, alarmed for their estates, abandoned him in his need; and others, who yet retained a spirit of resistance towards the English supremacy, envied his elevation, and sowed dissensions and divisions among his council. Wallace, however, with a spirit equal to all emergencies, endeavoured to collect and consolidate the strength of the country. Among the barons who repaired to his standard, only the four following are recorded: John Comyn of Badenoch, the younger; Sir John Stewart of Bonkill; Sir John Graham of Abercorn; and Macduff, the grand-uncle of the young Earl of Fife. Robert Bruce remained with a strong body of his vassals in the castle of Ayr.³ As the army of Wallace was altogether unequal to the enemy, he adopted the only plan by which he could hope to overcome it. He fell back slowly as Edward advanced, leaving some garrisons in the most important castles, driving off all supplies, wasting the country through which the English were to pass, and waiting till a scarcity of provisions compelled them to retreat, and gave him a favourable opportunity of attacking them.

Edward proceeded as far as Kirkliston, a village six miles west of Edinburgh, without meeting any opposition, except from the castle of Dirleton, which, after a resolute resistance, surrendered to Anthony Beck, Bishop of Durham. But a devastating army had gone before him, and his soldiers began to suffer severely from the scarcity of provisions. At Kirk-

¹ In retaliation, Lord Robert Clifford twice invaded Annandale with an army of 20,000 men and 100 horses. In his second inroad, the town of Annan, which belonged to Robert Bruce, and the church of Gysborne, were burned and plundered. This is said to have determined Bruce to desert the English and join the party of Wallace.

² This grant is dated at Torphichen, 29th March, 1298.

³ The story told by Fordun of the interview between Wallace and Bruce on the banks of the Carron, after the battle of Falkirk, is not well borne out by the circumstances of the parties. Bruce was not present at the battle, and at that period did not belong to the English interest; which is proved by the fact, that after that fatal engagement he fled from his castle at Ayr on the approach of Edward. At the same time, it must be confessed that he held a suspicious neutrality with regard to Wallace; and if we can reconcile ourselves to the probability of a meeting between these two heroes, it is not difficult to suppose that it might be, in its general bearing, such as it is represented. About 1277 or 1282 an expatriated Scotsman offered a prize to any one who should write the best poem on this heroic interview. Mrs. Hemans, who afterwards distinguished herself by many beautiful effusions in verse, was the successful competitor.

liston, therefore, he determined to wait the arrival of his fleet from Berwick; but, owing to contrary winds, only a few ships reached the coast, and in the course of a month his army was reduced to absolute famine. An insurrection also arose among the English and Welsh cavalry, in which the latter, exasperated at the death of several of their companions, threatened to join the Scots. "Let them go," said Edward, courageously: "I shall then have an opportunity of chastising all my enemies at the same time." Worn out, however, by a daily increasing famine, Edward was at last obliged to abandon his prospects of ambition and revenge, and to issue orders for a retreat to the eastern borders. It was at this critical moment, when the English army began to break up their quarters, that Edward, through the treachery of two Scottish lords, Patrick Earl of Dunbar, and the Earl of Angus, received information that the Scots lay encamped in the forest of Falkirk; and that it was the intention of Wallace to surprise him by a night attack, and to hang upon and harass his rear. "Thank God," cried Edward, "they shall not need to follow me; I shall go and meet them." His army was immediately marched towards Falkirk, and on the evening of the day on which he received the information, encamped on a heath near Linlithgow.

Next morning (July 22d, 1298) the Scottish army was despatched forming on a stony field at the side of a small eminence in the neighbourhood of Falkirk. It did not amount in number to the third part of the English, and, weak as it was, is said by the Scottish historians to have been still further weakened by fatal dissensions. Wallace, however, seems to have availed himself of every advantage which his situation and circumstances permitted. He placed his army on the front of a morass, and divided his infantry into four compact bodies of a circular form. In these masses, composed of his spearmen, and called *shiltrens*,¹ consisted the strength of the Scottish army; for they were linked together so closely that it was extremely difficult to break them.² In the spaces between the shiltrens were placed the archers, commanded by Sir John Stewart of Bonkill, and at some distance in the rear was drawn up the cavalry, amounting to no more than 1000. When he had thus drawn up his little army, and the enemy appeared in view, Wallace said pleasantly to his men, "I have brought you to the ring; let me see how you can dance."³

The English monarch arranged his army into three divisions; the first headed by Bigot, earl-marshal, and the Earls of Hereford and Lincoln; the second by the Bishop of Durham and Sir Ralph Basset of Drayton; and the third by Edward himself, who, although wounded on the previous night by a kick

from his horse, was yet able to mingle in the engagement. The first division led on the attack; but was checked by the morass that stretched along the front of the Scottish position, and obliged to make a circuit to the west. Meanwhile the second line, under the command of the Bishop of Durham and Basset, inclined to the right, turned the morass, and advanced towards the left flank of the Scottish army. The bishop proposed to defer the attack till the rest of the army should advance. "Return to thy mass, bishop," said Basset, sneeringly. "Not so," answered the bishop, "we are all soldiers to-day; lead on!" At the same moment the first division made its appearance, having extricated itself from the morass; and they both attacked the Scottish shiltrens simultaneously. The shock was tremendous. The English cavalry was fully caparisoned and armed, and made desperate endeavours to break through the columns of the Scottish infantry; but were gallantly withstood. "They could not penetrate that wood of spears," says one of their historians. Their charges were repeatedly repulsed, notwithstanding that the Scottish horse, commanded by some of the nobles at variance with Wallace, either from mean jealousy towards him or fear at the number and force of the English, did not come to the assistance of the infantry, but left the field without striking a blow. Edward then brought forward his numerous body of archers, a class of soldiers for which England was long celebrated, and who, as a proverbial illustration of the accuracy of their aim, were said to carry each twelve Scotsmen's lives under their girdle, because they generally bore twelve arrows in their belt. These by thick and incessant volleys dreadfully galled the Scottish columns. The archers on the Scottish side were a small but select body from the forest of Selkirk,⁴ under the command of Sir John Stewart. In one of the charges Sir John was thrown from his horse. His faithful bowmen crowded around him, and tried to rescue him; but in vain. They all perished; and their bodies were afterwards recognized by the English as being the tallest and handsomest on the field. Still the infantry under Wallace did not give way, and still his sword flashed with terrific effect, amidst the throng of the English cavalry, and the unceasing shower of the English arrows. But the firm columns of the Scots were at length disunited by dreadful gaps of slain, and they could no longer withstand the overpowering numbers borne against them. Macduff and all his vassals from Fife were killed, and at last Sir John the Graham fell by the side of Wallace. To him, of all others, Wallace was particularly attached; and when he saw him fall he plunged with tenfold fury into the thickest of his enemies, dealing death and destruction around him. It was impossible, however, that with the handful of men to which his army was now reduced, he could for any length of time successfully oppose the strength brought against him. He was obliged at last to make good his retreat, and gained a neighbouring wood, leaving 15,000 of his followers dead on the field.⁵

¹ This word is used by Barbour in his description of the battle of Bannockburn:—

"For Scotsmen that them hard essayed,
That then were in a shiltren all."

² "Ther formost coureyr ther bakkis togidere sette,
Ther speres, point over point, so sare, and so thikke
And fast togidere joynit, to se, it was ferlike,
Als a castelle thei stode, that were walled with stone,
Thei wende no man of blode thourgh them suld haf gone."
Langtoft's *Chronicle*, book ii.

³ The words of Wallace were, "I haif brocht you to the ring; hap, gif you can." The ring means the *dansé à la ronde*. *Hap* is an old word for dance.

"The dansand priestis, clepit Salii,
Happand and singand."

Douglas' *Æneid*, viii. 21.

Lord Hailes supposes *cun* to be an obsolete verb of the noun and adjective *cunning*, still used, as, "Let my right hand forget its *cunning*," &c.; and translates "gif you cun," if you have skill. But we should imagine *cun* to be simply *can*, corruptly spelled:—"Gif you cun,"—if you can.

⁴ The *Foreste of Selkyrke* in those days comprehended not only the tract now known by that name, but also the upper parts of Clydesdale and Ayrshire.

⁵ The accounts of the loss on the Scottish side at the battle of Falkirk are extremely various. Fifteen thousand is stated above, on the authority of two English chronicles, viz. the *Norwich Chronicle* and the *Chronicle of John Eversden*. It seems nearer probability than any other account. Some of the English historians make it more than the actual amount of Wallace's army; Walsingham, 60,000; and Hemingford, 50,000. Trivet makes it 20,000; and Buchanan 10,000. From these accounts we may, at all events, conclude with certainty, that the Scots suffered severely. There is no account of the English loss. Only two men of note are mentioned as having fallen on their side: Sir Brian de Jaye and the prior of Torphichen.

According to Blind Harry, Wallace, when the English had removed to Linlithgow, returned to the field of battle, in order to obtain the body of his friend, Sir John the Graham. This is somewhat countenanced by the fact, that Sir John lies buried in the churchyard of Falkirk, having the following inscription on his gravestone, which has been several times renewed:—

"MENTE MANUQUE POTENS ET VALLAE FIDVS ACHATES,
CONDITOR HIC GRAMVS, BELLO IMPERFECTVS AB ANGLIS,
XXII JVLII ANNO 1295.

"Here lies Sir John the Grame, baith wight and wise,
Ane of the cheefis who rescowit Scotland thryse;
Ane better knight not to the world was lent
Nor was gude Grame of truth and hardiment." 1

Blind Harry's description of the distress of Wallace when he saw the body of his beloved friend and brother in arms, is touching in the extreme:—

"The corse of Graym, for whom he mured maist,
When thae him fand, and Gude Wallace him saw,
He lychtyt down, and hynt him frae thame aw
In armys up. Behaldand his pale face,
He kyssyt him, and cryt full oft, 'Alace!
My best brothir in warld that evir I had!
My afald freynd quhen I was hardest staid!
My hope, my heill!—thow was in maist honour!
My faith, my help, my strenghthener in stour!
In thee was wit, freedom, and hardiness;
In thee was treuth, manhood, and nobleness;
In thee was rewl; in thee was governans;
In thee was virtue, withouten varians;
In thee lawty; in thee was gret largeness;
In thee gentrice; in thee was stedfastness.
Thow was gret cause off winning off Scotland,
Thoch I began, and tok the war on hand,
I vow to God, that has the warld in wauld,
Thy dead sall be to Southerne full dear said!
Martyr thow art for Scotlandis rycht and me!
I sall thee venge, or els therefor sall dee!"

The remains of the Scottish army, in their retreat, burned the town and castle of Stirling. Edward, who had not recovered from the kick he received from his horse, took up his quarters for some time in the convent of the Dominicans there, which had escaped the flames; and sent a division of his army into Clackmannanshire, Monteith, and Fifeshire, who laid waste the country. He then marched to the west, through the district of Clydesdale to Lanark, and afterwards to Ayr, where he found the castle forsaken and burned by Robert Bruce. A want of provisions prevented Edward from pursuing Bruce into Galloway, as he intended. After capturing Bruce's castle of Lochmaben, he was constrained to march through Annandale into England, leaving Scotland only partially subdued, and ready to rise into a new revolt against him.

Wallace, after the defeat of Falkirk, feeling how little he was supported by the nobility, and how much jealousy and envy his elevation had occasioned, resigned the office of governor of Scotland, reserving to himself no other privilege than that of fighting against the enemies of his country, at the head of such friends as might be inclined to adhere to him. His resignation was followed by the election of a regency, consisting at first of John Comyn of Badenoch, the younger, and John de Soulis; to whom were afterwards added, as partners in administration, Bruce, Earl of Carrick, and William Lamberton, Bishop of St. Andrews.

The first enterprise of the new governors was against the castle of Stirling, which Edward had left garrisoned. To preserve that important place from falling into their hands, Edward determined upon

another expedition into Scotland, and with that purpose assembled his army at Berwick; but the English barons, to whom he had not confirmed certain privileges as he had promised, refused to go farther, urging the inclemency of the season and the danger of a winter campaign. He was therefore obliged to abandon his design, and to allow the English who were beleaguered in Stirling to capitulate.

In the course of the following year (1300) Edward, by confirming the charters of the barons, was enabled once more to prosecute his great object, the invasion and subjugation of Scotland. At the head of a great army he entered the country by the western marches, and penetrated into Galloway. He was here met by a petition from the governors and community of Scotland, requesting that John Baliol, their lawful king, should be permitted to reign peaceably over them; but he rejected it with disdain. The Scottish army, now profiting by experience, confined itself to cutting off the supplies of the enemy; and Edward, after spending five months in the southern part of the country, without effecting anything material, found himself compelled, by the approach of winter and the scarcity of provisions, to return to England. Before leaving Scotland, when no other alternative remained, he affected to listen to the mediation of France, and concluded a truce with the Scots at Dumfries, 30th October, 1300, to endure till Whitsunday, 1301.

Meanwhile a new competitor to the crown of Scotland arose in the person of his holiness Pope Boniface VIII. This singular claim had been suggested to the Roman see by certain Scottish commissioners, who wished his holiness to interpose in behalf of their distracted country. The arguments upon which it was founded were altogether absurd (such as, "that Scotland has been miraculously converted to the Christian faith by the relics of St. Andrew," &c.); but Edward's own pretensions were clearly and justly refuted. As it was dangerous for the English monarch to break with the pope at this time, owing to several continental arrangements, Edward laid the affair before his barons, who protested, with much spirit, that they would not allow the rights of their sovereign to be interfered with by any foreign potentate; and to soothe his holiness, he sent him a long letter in his own name, "not in the form (as he says) of an answer to a plea, but altogether extrajudicially;" wherein he enumerated all his claims to the superiority of Scotland, from the days of his "famous predecessor Brutus the Trojan," to his own.

In the ensuing summer, as soon as the truce had expired, Edward, accompanied by his son, the Prince of Wales, and a great army, marched again into Scotland, and spent the winter at Linlithgow, where he ratified another truce with the Scots, to endure until St. Andrew's day, 1302, and soon afterwards returned to London. On the expiry of this second truce, having gained Pope Boniface over to his interest, he sent Sir John de Segrave, a celebrated warrior, into Scotland, with an army of 20,000 men, chiefly consisting of cavalry. Segrave, when near Roslin, on his march to Edinburgh, separated his army into three divisions; the first led by himself, the second by Ralph de Manton, called from his office of paymaster the Cofferer, and the third by Robert de Neville. These divisions, having no communication established between them, were successively attacked and defeated at Roslin, on the 24th February, 1303, by a small body of 8000 horse, under the command of Sir John Comyn and Sir Simon Fraser. Ralph the Cofferer and Neville were slain. Segrave escaped, and fled, with the remains of his army, to England, leaving behind an immense booty.

¹ His grace the Duke of Montrose possesses an antique sword, on which is the following inscription:—

"Sir Ione ye Grame, verry vicht and wyse,
One of ye cheefis relievit Scotland thryse,
Favght vith ys svord, and ner thot schame,
Commandit nane to beir it bot his name."

Nimmo's *History of Stirlingshire*.

But while the Scots thus persevered in defence of their country, Philip le Bel, King of France, upon whose alliance they had confided, concluded a treaty of peace with Edward (20th May, 1303), in which they were not included; and the English monarch, being now freed from foreign wars, bent his whole force to make a complete conquest of Scotland, which had long been the ruling object of his ambition and exertions. His passions were now exasperated to the utmost by the repeated failures of his attempts, and he declared his determination either to subjugate it entirely, or to raze it utterly with fire and sword, and blot it out from existence in the list of nations. With this purpose he marched into Scotland at the head of an army too powerful to be resisted by an unfortunate people, already broken down by the accumulated miseries that attended their long-continued conflict with an unequal enemy. The inhabitants fled before him or submitted to his power, and his whole course was marked by scenes of slaughter, devastation, and ruin. The governor, Comyn, Sir Simon Fraser, and Sir William Wallace, with their followers, were driven into the fields and fastnesses of the country, from which they only issued in irregular predatory expeditions against detachments of the English. Edward continued his victorious progress as far as the extremity of the province of Moray, and the only fortress that opposed his course was the castle of Brechin, which, after an obstinate resistance, surrendered on the death of Sir Thomas Maule, its gallant commander, who was killed by a stone discharged from one of the besieging engines. Edward then returned to Dunfermline, where he spent the winter in receiving the submission of those who had not made their peace with him during his progress through the kingdom. Almost all the nobles gave in submissions. Bruce surrendered himself to John de St. John, the English warden; and at last Comyn, the governor, and his followers, delivered themselves up to Edward, under a stipulation for their lives, liberties, and lands, and a subjection to certain pecuniary penalties. From this stipulation Edward excepted the following, as being more obstinate in their rebellion: Wishart, Bishop of Glasgow, James, the Steward of Scotland, Sir John Soules, the late associate of Comyn in the government of the kingdom, David de Graham, Alexander de Lindesay, Simon Fraser, Thomas Bois, and William Wallace. The Bishop of Glasgow, the steward, and Soules, were to remain in exile for two years; Graham and Lindesay were to be banished from Scotland for six months; and Fraser and Bois for three years. "As for WILLIAM WALLACE," says the deed, "it is covenanted, that if he thinks proper to surrender himself, it must be unconditionally to the will and mercy of our lord the king."¹

¹ Langtoft, in his *Chronicle*, says that Wallace proposed, on certain terms, to surrender himself. These terms mark his bold and unsubdued spirit. Their effect upon Edward was to throw him into a fit of rage. The passage is as follows:—

"Turn we now other weyes, unto our owen geste,
And speke of the Waleys that lies in the foreste;
In the forest he lendes of Dounfermelyn,
He praised all his frendes, and other of his kyn,
After that Yole, thei wilde beseke Edward,
That he might yelde till him, in a forward
That were honorable to kepe wot or beste,
And with his scrite full stable, and seated at the least,
To him and all his to haf in heritage;
And none otherwise, als term tyme and stage
Bot als a propre thing that were conquest till him.
Whan thei brouht that tething Edward was fulle grim,
And bilaut him the fende, als traytoure in Lond
And ever-ilkon his frende that him susteyn'd or foud.
Three hundred marke he hette unto his warisoun,
That with him so mette, or bring his hede to toun.
Now flies William Waleis, of pres nouht he spedis,
In mores and marcis with robberie him fedis."

Soon after, an English parliament was held at St. Andrews, to which the king summoned all the Scottish barons and nobles. The summons were obeyed by all, except Sir William Oliphant, Sir Simon Fraser, and Sir William Wallace. Oliphant held the castle of Stirling, and refused to capitulate. It was the only stronghold of Scotland not in the hands of the English; and Edward brought all his force to besiege it. Every engine known in those days was employed in the attack. After an obstinate defence for three months, of which the English historians speak with admiration, Sir William Oliphant and his little garrison were compelled to surrender at discretion. Fraser, too, despairing of further resistance, at last accepted the conditions of Edward, and offered himself up to the conqueror. WALLACE ALONE remained unsubdued, amid this wreck of all that was free and noble, standing like a solitary monument among the ruins of an ancient dynasty—destined *then* to be the emblem of his country's independence; *now*, to be its watchword, its pride, and its praise.

Having gained the submission of the principal men of Scotland, and, in the capture of Stirling, reduced the last castle which had resisted his authority, Edward returned to England in the pleasing conviction that he had at length finally accomplished the object upon which so much of the blood and money of England had been expended. Yet, while Wallace still lived, he felt his possession insecure; and he used every possible means to obtain the person of this his first, most dangerous, and uncompromising opponent. After the battle of Falkirk, and his resignation of the governorship of Scotland, little is authentically known of the particular transactions of Wallace. Great part of the time between 1298 and 1305 was no doubt spent in desultory attempts to annoy the English garrisons and migratory parties. But that a portion was also devoted to a visit to France, as has been related by Blind Harry, and disputed by subsequent writers,² appears now to be equally certain, as a manuscript English chronicle, discovered some years ago by Mr. Stevenson in the British Museum, speaks of such a visit, without the intimation of any doubt upon the subject. Wallace was probably induced to visit the French court by a hope of obtaining some auxiliaries from Philip for the purpose of carrying on the war against Edward; or by a wish to urge the interests of Scotland in the treaty which that monarch formed in 1303 with the English king, and in which Scotland was overlooked. Finding no success in either of these objects, he seems to have returned to his native country, to renew that partisan warfare which was now the only method left to him of manifesting his patriotic feelings. That his deeds, however obscure, were of no small consequence, is shown by the eager solicitude which Edward evinced to secure his person, and the means which he took for effecting that end. Besides setting a great reward upon his head, he gave strict orders to his captains and governors in Scotland to use every endeavour to seize him, and sought out those Scotsmen who he had reason to think entertained a per-

² In the present narrative it has been our endeavour to go no further than the well-accredited histories of both countries warrant; and the numerous stories told by Blind Harry of the less conspicuous deeds of Wallace are completely overlooked. It is the opinion, however, of the celebrated historian of Scotland, Mr. P. F. Tytler, an opinion formed upon apparently the best grounds, that the Minstrel writes with a greater regard to the truth, and makes a much nearer approach to it, than has been generally supposed. We are indebted for the information, now given for the first time, in confirmation of the story of Wallace's French expedition, to the personal kindness of Mr. Tytler, who saw and copied the document alluded to in the text.

sonal pique at Wallace, in the hope of bribing them to discover and betray him. Sir John de Mowbray, a Scottish knight then at his court, was employed to carry into Scotland Ralph de Halibarton, one of the prisoners taken at Stirling Castle, with the view of discovering and seizing the deliverer and protector of his country. What these creatures did in this dishonourable affair, or with whom they co-operated, is not known; the lamentable fact alone remains, that Sir William Wallace was at last treacherously betrayed and taken, through the agency of one of his own countrymen, and one who had served under him against the English, Sir John Menteith, a baron of high rank, whose name, for this cause, is throughout Scotland, even unto this day, a by-word of scorn and detestation.¹ Wallace was made prisoner at Robroyston, in the neighbourhood of Glasgow, on the 5th of August, 1305.

The fate of this great man was soon decided. He was first taken to Dumbarton Castle,² then under the command of Menteith, and afterwards carried to London, heavily fettered, and guarded by a powerful escort. The people in the northern counties of England are said to have exulted greatly at the news of his capture; and as the cavalcade advanced, multitudes flocked from all quarters to gaze at its illustrious prisoner. On reaching London he was lodged for the night in Fenchurch Street, in the house of a citizen, by name William Delect;³ and next day (23d August) carried to Westminster Hall, accompanied by the mayor, sheriffs, and aldermen of the city, and there arraigned of treason. A crown of laurel was in mockery placed on his head, because, as was alleged, he had been ambitious of the Scottish crown. The king's justice, Sir Peter Mallorie, then impeached him as a traitor to Edward, and as having burned villages, stormed castles, and slain many subjects of England. "I could not be a traitor to the King of England," said Wallace, "for I was never his subject, and never swore fealty to him. It is true I have slain many Englishmen; but it was in

the defence of the rights and liberties of my native country of Scotland." Notwithstanding the truth and justice of his plea, Wallace was found guilty, and condemned to a cruel death. It is a stain on the character of Edward, and a reproach to the spirit of his age and country, that while he pardoned, and even favoured many who had repeatedly violated their oaths of allegiance to him, he not only bestowed no mercy on this brave and true-hearted man, who had never professed allegiance, but, with an enmity which showed how little sympathy he had for his noble qualities, added insult to injustice, and endeavoured to heap indignity on the head of him whose name shall be through all ages honoured and revered by every generous breast. Sir William Wallace was dragged at the tails of horses through the streets of London to a gallows in Smithfield, where, after being hanged a short time, he was taken down, yet breathing, and his bowels torn out and burned. His head was then struck off, and his body divided into quarters. His head was placed on a pole on London Bridge, his right arm above the bridge at Newcastle, his left arm was sent to Berwick, his right foot and limb to Perth, and his left quarter to Aberdeen. "These," says an old English historian, "were the trophies of their favourite hero, which the Scots had now to contemplate, instead of his banners and gonfalon, which they had once proudly followed." But he might have added, as is well remarked by Mr. Tytler, that "they were trophies more glorious than the richest banner that had ever been borne before him; and if Wallace already had been the idol of the people—if they had long regarded him as the only man who had asserted, throughout every change of circumstances, the independence of his country, now that his mutilated limbs were brought before them—it may well be conceived how deep and unextinguishable were their feelings of pity and revenge." Edward, assuredly, could have adopted no more certain way of canonizing the memory of his enemy, and increasing the animosity of the Scottish people. Accordingly we find, although the execution of Wallace may be said to have completed that subjugation of the country which the English monarch had been straining for, by force and fraud, during a period of fifteen years—that in *less than six months* from the death of her great champion, Scotland, roused to the cause now sealed and made holy by her patriot's blood, shook off the yoke of England, and became once more a free kingdom.

¹ Some attempt has been made (especially by Lord Hailes, who seems to have sometimes opposed ordinary facts and notions, under the vulgar delusion of being philosophical and unprejudiced) to deny that Sir John Menteith was the captor of Wallace. But no circumstance in history could be better corroborated than this. All the English and Scottish writers agree on the subject. The *Chronicle of Lanercost Priory*, a MS. of the thirteenth century, preserved in the British Museum, has this passage: "Captus fuit Willelmus Waleis, per unum Scotum, scilicet per Dominum Johannem de Menteith, et isque London ad Regem adductus, et adjudicatum fuit quod traheretur, et suspenderetur, et decollaretur." Another ancient MS. (the *Scala Chronicle*), preserved at Cambridge, says, "H' ylliam Waleis was taken of the Counte of Menteith about Glasgow, and sent to King Edward, and after was hangid, drawin, and quarterid, at London." *Langtoft's Chronicle* (another English authority) is also conclusive:—

"Sir Jon of Meneteste served William so nehi,

He took him when he went lest, on nyght his leman bi;

That was throught treson of Jak Short his man;

He was the encheson, that Sir Jon so him nam."

From which it appears that Menteith prevailed on Jack Short, Wallace's servant, to betray him; and came under cover of night and seized him in bed, "his leman bi." Our Scottish historians, too, Fordun and Wynton, who flourished not a hundred years after Wallace, speak in an equally decisive manner of his capture. "Anno Domini MCCCv." says Fordun, "Willelmus Wallace per Johannem de Menteith fraudulenter et proditorialiter capitur, Regi Anglie traditur, Londinis demembratur." Wynton's chapter on the subject is headed thus:—

"*Quhen Jon of Menteith in his dayis
Dissavit gude Willame Waleis.*"

And, further, he says:—

"A thousand three hundyr and the fyft yere
After the byrth of our Lord dere,
Schyre Jon of Menteith in the dayis
Tuk in Glasco Willame Waleis."

That Menteith was at one time a fellow-soldier of Wallace is proved by the following passage from Bower, preserved in the

Relationes Arnaldi Blair:—"In hoc ipso anno (1298) viz. 28 die mensis Augusti, Dominus Wallas, Scotie custos, cum Johanne Grahame, et Johanne de Menteith, militibus; necnon, Alexandro Scrymgeour, constabulario villæ de Dundee et vexillario Scotie, cum quinquaginta militibus armatis, rebelles Gallovidenses punierunt, qui Regis Angliæ et Cuminum partibus sine aliquo jure steterunt." As to any further intimacy between Menteith and Wallace there is no evidence beyond Blind Harry and popular tradition.

² A sword and mail are still shown in Dumbarton Castle as having belonged to Wallace.

³ The following passage occurs in *Stow's Chronicle*: "William Wallace, which had oftentimes set Scotland in great trouble, was taken and brought to London, with great numbers of men and women wondering upon him. He was lodged in the house of William Delect, a citizen of London, in Fenchurch Street. On the morrow, being the eve of St. Bartholomew, he was brought on horseback to Westminster; John Seagrave and Geoffrey, knights, the mayor, sheriffs, and aldermen of London, and many others, both on horseback and on foot, accompanying him; and in the great hall at Westminster, he being placed on the south bench, crowned with laurel, for that he had said in times past that he ought to bear a crown in that hall, as it was commonly reported; and being approached for a traitour by Sir Peter Mallorie, the king's justice, he answered that he was never traitour to the King of England; but for other things whereof he was accused he confessed them; and was after headed and quartered."

WALLACE, WILLIAM, LL.D. This talented mathematician was born at Dysart, Fifeshire, on the 23d of September, 1768, and was the son of a manufacturer of leather in that town. After having been taught to read at a private school, kept by an old woman, he was sent to a public seminary, where he learned to write; but the still more important branch of education in his case—that of arithmetic—he learned at home from the instructions of his father. His father having been unsuccessful in business, removed to Edinburgh, where William was bound apprentice to a bookbinder; still, however, dwelling under the paternal roof, and availing himself of his father's course of instruction. Besides this he was wont, when opportunity offered, to read such books as were placed under his charge for binding. His mind having been thus awoke to action, his favourite bias quickly took the lead: he purchased a few mathematical books, and pored over them till they could teach him nothing further. In this way, we are told, before he had reached his twentieth year he was a considerable proficient in elementary geometry and trigonometry, algebra with fluxions, conic sections, and astronomy. During this successful pursuit of scientific knowledge he was likewise so fortunate as to form an acquaintance with a man who assisted Dr. Robison in his class-room experiments, and who offered to introduce him to the professor. This offer Wallace, who had now finished his apprenticeship, gladly accepted. The doctor was not long in perceiving the earnest scientific zeal of the young man, and the proficiency he had made in mathematics, and therefore gave him permission to attend the course of lectures on natural philosophy gratuitously. To avail himself of such a welcome opportunity, Wallace, whose circumstances were those of a straitened journeyman, worked hard at his trade during a portion of the time that should have been devoted to sleep. Here, too, Dr. Robison's kind patronage did not terminate, for he introduced his protégé to Professor Playfair, who lent him scientific books, and gave him valuable suggestions for the study of the higher branches of mathematics. Dr. Robison also intrusted him with the tuition of one of his own pupils in geometry—a useful training to William Wallace for the important charges as a public instructor which he afterwards occupied.

Finding that the trade to which he had served a regular apprenticeship afforded too little time for study, and that he might advance himself to something better, Wallace became a warehouseman in a printing-office, where his opportunities of acquiring knowledge were more abundant. Here he mastered the difficulties of the Latin language by his own industry, aided by a few lessons from a college student, and afterwards studied French. He then exchanged the printing-office for the situation of shopman to one of the principal booksellers of Edinburgh—and approaching still nearer to the ultimate mark, he devoted his evenings to the teaching of mathematics as a private tutor. As this last occupation was more congenial than the other, he devoted himself to it entirely, having abandoned the shop for that purpose; and a short time afterwards he was appointed assistant teacher of mathematics in the academy of Perth. This was in 1794, when he had attained his twenty-sixth year, and acquired such a reputation that the most scientific men in Edinburgh welcomed him as a brother. Soon after he had settled in Perth he married, and for nine years after there was a lull in his hitherto changeable course, during which he quietly discharged the duties of his somewhat obscure and humble calling. But the time thus spent was not spent in idleness, as he

evinced when the fitting season arrived; and among the fruits of his studies at Perth, were three articles, which successively appeared in the respective publications for which they were intended. The first, which was presented to the Royal Society of Edinburgh in 1796, was entitled "Geometrical Porisms, with Examples of their Applications to the Solution of Problems." About the same period he contributed the article "Porism" to the third edition of the *Encyclopædia Britannica*. His third article, which he presented to the Royal Society of Edinburgh, contained a new method of expressing the co-efficients in the development of the formula that represents the mutual perturbation of two planets; to which was added an appendix, giving a quickly converging series for the rectification of an ellipse. The scientific men who were qualified to judge of these papers bore high testimony to their accuracy and originality.

The time at length arrived when Mr. Wallace was to be elevated to a more fitting sphere of action. From the obscurity of such a town as Perth, his reputation had so widely diffused itself, that in 1803 he was invited to stand as candidate for the office of mathematical master in the Royal Military College lately established at Great Marlow, in Buckinghamshire. He consented, moved to this by the advice of his venerated friend Professor Playfair; and in the examination of candidates, his qualifications were found so much superior, that he was immediately elected to the office. It is interesting to notice that, in the following year, his countryman, Mr. Ivory, who, like himself, had been the subject of struggle and change, and who had also fought his way to scientific reputation, was elected to the professorship of mathematics in the same college. On the removal of the institution to Sandhurst, in Berkshire, Mr. Wallace accompanied it, and continued to teach in a manner that secured the approbation of the directors. In 1818 his sphere of educational duty was extended, in consequence of a resolution of the directors of the college, that a half-yearly course of lectures on practical astronomy should be given to the students, and that Mr. Wallace should be the lecturer. As this course also was to be combined with instructions on the manner of making celestial observations, a small observatory was erected for the purpose, and furnished with the necessary instruments. This addition to the routine of a military education, has done much to remove the objections often brought against our bravest officers of the army, on account of their deficiency in the science of their profession.

Another movement was now to occur in the changeable career of Mr. Wallace. In 1819 Professor Playfair died; Mr. (afterwards Sir John) Leslie was appointed to succeed him; and by this transference the chair of mathematics in the university of Edinburgh became vacant, and open to competition. The height of Wallace's ambition was to obtain a Scottish professorship, and accordingly he threw himself into the contest with his whole heart and energy. In the trial of candidates, which was a keen one, he was successful; and he brought the maturity of his experience as a teacher, as well as his rich scientific acquirements as a mathematician, to a chair but too often filled with men unpractised in the common ways of life, and whose whole occupation is to muse and dream over a problem. Many of the scientific men of the present day can still remember, with gratitude, the efficiency with which Mr. Wallace discharged the duties of his professorship, and the impulse which his teaching imparted to their studies. He thus continued to labour till 1838, when he was obliged to retire from office in consequence of ill health;

and on his retirement government expressed its sense of the value of his services, both at Sandhurst and Edinburgh, by conferring on him a pension; and the university of Edinburgh, by making him a Doctor of Laws. Five years of private life succeeded, during which, however, his mind was not idle in his favourite pursuits, as was attested by his productions during this period, while he was unfitted by sickness for the usual intercourse of society. Having reached the age of seventy-five, he died at Edinburgh, on the 28th of April, 1843.

Besides those scientific articles which we have already mentioned, Professor Wallace, in the earlier part of his life, was a contributor to *Leybourne's Mathematical Repository* and the *Gentleman's Mathematical Companion*: he was also author of the principal mathematical articles in the *Edinburgh Encyclopedia* and the fourth edition of the *Encyclopædia Britannica*. To these productions the following may be added:—

In 1808 he presented to the Royal Society of Edinburgh an article entitled “New Series for the Quadrature of the Conic Sections, and the Computation of Logarithms.”—In 1823 he presented another, entitled “Investigation of Formulæ for finding the Logarithms of Trigonometrical Quantities from one another.”—In 1831 he presented another, entitled “Account of the Invention of the Pantograph, and a Description of the Eidograph.” Of this instrument called the eidograph—from *εἶδος*, a form, and *γράφειν*, to draw—he was himself the inventor; and, like the pantograph, it is used for the purpose of copying plans or other drawings, on the same or on different scales. Professor Wallace was also the inventor of the chorograph, an instrument for describing on paper any triangle having one side and all its angles given, and also for constructing two similar triangles on two given straight lines, having the angles given.—In 1836 he contributed a paper to the *Transactions of the Royal Astronomical Society*, entitled “Two Elementary Solutions of Kepler's Problem by the Angular Calculus.” He also contributed another, under the title of “Geometrical Theorems and Formulæ, particularly applicable to some Geodetical Problems,” to the Cambridge Philosophical Society, which was published in the sixth volume of their *Transactions*.—In 1838, when laid aside by sickness, he also composed a work upon the same subject, which he dedicated to his friend Colonel Colby.—In 1839 Professor Wallace gave his last contribution to the Royal Society of Edinburgh, under the title of “Solution of a Functional Equation, with its Application to the Parallelogram of Forces, and the Curve of Equilibrium,” which was published in the fourteenth volume of their *Transactions*.

WARDLAW, HENRY, Bishop of St. Andrews, and founder of the university there, was descended from the Wardlaws of Torry in Fife, and was nephew to Walter Wardlaw, Bishop of Glasgow, who was created a cardinal by Pope Urban VI. in the year 1381. The subject of this memoir, having received the usual education of a churchman, was appointed, not improbably through the interest of his uncle, to the office of precentor in the cathedral church of Glasgow. He afterwards went to Avignon, probably on some mission from his dignified relative. While residing at the papal court there, Thomas Stewart, son to Robert II., King of Scotland, who had been elected Bishop of St. Andrews, died, and the subject of this memoir was preferred to the vacant see by Pope Benedict XIII. in the year 1404. He returned to Scotland shortly after,

bearing the additional title and office of pope's legate for Scotland. Being a man of strict morals, his first care was to reform the lives of the clergy, which had become profligate to an extreme degree. In the meantime, King Robert III., having lost his eldest son David by the treacherous cruelty of his brother the Duke of Albany, to secure the life of his son James, sent him to the care of Bishop Wardlaw, who dreading the power and the cruelty of Albany, advised his father to send him to France to the care of Charles VI., on whose friendly dispositions he assured him he might confidently rely. On the seizure of James in 1404 by Henry IV. of England, the bishop was left at liberty to pursue his plans of improvement at his leisure; but from the unsettled state of the country, and the deplorable ignorance which prevailed among all classes of the community, with very little success. With the view of surmounting these obstacles he erected a college at St. Andrews in 1411, for which he procured a confirmation from Pope Benedict in the year following. His agent on this occasion was Alexander Ogilvy. On the return of this missionary in the year 1412 with the bull of confirmation, bouffres were kindled, bells were rung, and the night spent with every demonstration of joy. The next day was devoted to a solemn religious procession, in which there were 400 clergymen, besides novices of various orders and degrees. The model upon which the bishop formed this university was that of Paris, where it is probable he had received his own education; and he nominated Mr. John Shevez, his first official, Mr. William Stephen, afterwards Bishop of Dunblane, and Sir John Leister, a canon of the abbey, readers of divinity; Mr. Lawrence Lindores, reader of the canon, and Mr. Richard Cornwall of the civil law; and Messrs. John Gow, William Foulis, and William Croisier, professors of philosophy—“persons,” says Spotswood, “worthy of being remembered for being the first instruments that were employed in that service, and for the attendance they gave upon it, having no allowance for their labour.” Buchanan has not recorded their names, but he alludes to them when he says, “The university of St. Andrews was founded through the efforts of learned men, who gratuitously offered their services as professors, rather than from any stipendiary patronage either of a public or private character.” For sixty-four years after its foundation the lectures were read in a wooden building called the pedagogy, erected on the spot where St. Mary's now stands, the number of students amounting, if we may credit some authors, to several thousands. The professors had no fixed salaries, and the students paid no fees.¹

The bishop, though remarkable for the great simplicity of his character, for his piety and well meaning, was yet a greater enemy to what he believed to be heresy than to immorality. In 1422 John Resby, an Englishman, was apprehended by Lawrence Lindores, professor of common law in the newly-erected university of St. Andrews, who accused him in the ecclesiastical court of having denied the pope's vicar-

¹ Forty-four years after this, viz. 1455, while the pedagogy was yet standing, Archbishop Kennedy founded St. Salvador's College; and in 1512, 101 years after the foundation of the pedagogy, Prior Hepburn founded St. Leonard's. The pedagogy being taken down, St. Mary's or Divinity College was erected in its stead. Towards this erection the two Beaton's, David and James, contributed considerable sums, and lectures on theology were there first introduced by Cardinal Beaton's successor, Archbishop Hamilton, about the year 1557. St. Salvador's and St. Leonard's were in comparatively recent times conjoined, and go by the name of the United College. St. Mary's is still distinct, and by the favour of different individuals all of them have been pretty liberally endowed.

ship, &c. &c. For this Resby was condemned to be burned alive, and suffered accordingly. In the year 1432 Paul Craw, a Bohemian, was also apprehended in the university of St. Andrews, and accused before the bishops' court of following Wickliffe and Huss; of denying that the substance of bread and wine in the sacrament was changed by virtue of any words; of denying that confession should be made to priests, or that prayer should be offered up to saints. He likewise was condemned and burned alive at the instigation of the bishop. Notwithstanding this, Wardlaw was celebrated for his charity; and though he laboured to suppress the riotous living which had become so general in the kingdom, he was yet a man of boundless hospitality. It is recorded of him that the stewards of his household on one occasion complained to him of the numbers that resorted to his table to share in the good things which it afforded, and requested that out of compassion for his servants, who were often quite worn out with their labours, he would furnish them with a list of his intended guests, that they might know how many they should have to serve. To this he readily assented, and sent for his secretary to prepare the required document. The latter having arranged his writing materials, inquired who was to be put down. "Put down first," replied the bishop, "Fife and Angus" (two large counties). This was enough: his servants, appalled by anticipations of a list which began so formidably, instantly relinquished their design of limiting the hospitality of their generous master. For the benefit of his diocese the bishop built a bridge over the Eden near its mouth. Dempster charges him with having written a book, *De Reformatione Cleri et Oratio pro Reformatione conviviorum et luxus*; but this seems to have been simply a speech which he delivered in parliament on the sumptuary laws, and which by some miracle similar to that so often employed by Livy, has found its way into the Scottish histories.

Wardlaw departed this life in his castle of St. Andrews, on the 6th day of April, 1440, and was buried in the church of that city with great pomp and splendour, having held his dignified situation for nearly forty years.

WARDLAW, REV. RALPH, D.D. This able controversialist, eloquent preacher, and graceful popular writer, was born in the small but ancient and historical town of Dalkeith, on the 22d of December, 1779. It is not known whether his parents had been settled residents in that locality at the period of his birth, or merely temporary sojourners. Six months after that event they removed to Glasgow, and there his father was long known and honoured, not only as a prosperous merchant and civic magistrate, but an amiable, upright, consistent Christian. By his mother Ralph possessed a quartering in his escutcheon of which he was justly proud, for she was a descendant of Ebenezer Erskine, the father of the Scottish Secession Church. This ancestry, independently of his own personal worth and reputation, greatly endeared Dr. Wardlaw to the clergy and laity of that denomination. When he had nearly reached his eighth year, Dr. Wardlaw was sent to the grammar or high school of Glasgow, where he continued for four years. On finishing this preliminary course of scholarship he entered the university of Glasgow.

As the great-grandson of Ebenezer Erskine, and grandson of Mr. James Fisher, who succeeded Erskine, his father-in-law, as professor of theology to the Burgher or Secession Synod, it was natural that Ralph Wardlaw in early life should have directed

his wishes to the work of the ministry. Accordingly, when his academical curriculum at the college of Glasgow was finished, he entered the theological hall of the Secession Church, at that time under the superintendence of Dr. Lawson of Selkirk. But strong and unwavering though his adherence had hitherto been to the church of his fathers, events soon occurred by which the young student's views on the subject of ecclesiastical polity were completely changed. This was the new movement in favour of Independency, which the Haldanes had introduced from England, and were now supporting in their own country with such success that numerous conversions were the fruits. One of those who underwent this change was Ralph Wardlaw; and such was the effect upon his convictions, that when his course of study at the theological hall was ended, instead of taking license as a Secession preacher, he gave himself to the Independents, and joined their church in Glasgow, under the pastoral superintendence of Mr. Greville Ewing. It was certainly a most disinterested choice; for little indeed did it offer him either in the way of emolument or distinction, and as little could he calculate upon the future growth of Scottish Congregationalism, or the eminence which himself would obtain as the most influential of its ministers.

After having made so decisive a choice, Mr. Wardlaw was soon called to that sacred office for which he had hitherto been in training. A chapel was erected for him in Albion Street, Glasgow, chiefly through the exertions of his personal friends, and to the pastoral charge of the congregation assembling in that building he was inducted by Mr. Ewing, on the 16th of February, 1803. Soon after his ordination he married Miss Jane Smith, his cousin, who was his comforter and helpmate from youth to old age. As a child she had sat with him on the same form at school, where they mastered together their perplexing lessons in English reading and spelling. Nearly seventy years after, it was her mournful task to close his lifeless eyelids, and bewail his departure.

In Glasgow the cause of Congregationalism continued to grow so rapidly, under the care of Mr. Ewing and Mr. Wardlaw, that it was found necessary in 1811 to institute a theological academy in that city, for the regular training of an efficient ministry. Over this important charge these two were appointed as professors; and it would be difficult to tell whether the institution was most benefited by the biblical scholarship and profound exegetical theology of Mr. Ewing, or the clear logic, graceful eloquence, and critical tact of Mr. Wardlaw. The latter continued to discharge the duties of this important office till the close of his life, and for the greater part of that time wholly without remuneration. At length, when a salary was attached to it, the amount was so small as scarcely to defray the mere expenses involved in the labour. This parsimony was thought strange, considering how many wealthy members belonged to his flock; but, on the other hand, the numerous exigencies of a new and rising cause, and the expensive missionary enterprises in which it was engaged, may account for this stinted liberality to the professor of theology. In the enthusiastic affection of his pupils, however, who were proud of the growing fame of their teacher, as if it had been their own; in the proficiency they made under his charge, in consequence of which many of them took the highest prizes in the university of Glasgow; and in the eminence which several of them reached as ministers, both in Scotland and England, Mr. Wardlaw enjoyed a requital which no salary, however liberal, could have equalled. After Mr.

Wardlaw had continued for sixteen years to officiate as the minister of Albion Street Chapel, his congregation had increased so greatly that the building, though not a small one, was insufficient for their accommodation. They therefore erected a larger edifice in West George Street, where he continued to officiate till the close of his life. Soon after, his widely-spread reputation procured for him the degree of D. D. from one of the principal colleges in America, and this too at a time when literary degrees from that quarter were more rarely given than now, and therefore more worth having.

Allusion has already been made to the popularity of Dr. Wardlaw's ministry, and the steadiness with which this went onward to the end. And yet he was not a Boanerges, to take the popular mind by storm—a preacher that could strike, rouse, or astonish. His pulpit excellences, indeed, were of a far less obtrusive, but on that account of a more sure and permanent, character: he was contented to succeed by gentle persuasion and slow deliberate conviction. The following sketch from a biographical notice will give a full and accurate idea of the nature of his preaching:—"His main strength lies in his extensive acquaintance with Scripture, his argumentative distinctness and dexterity, his refined taste, his unimpeachable good sense, and the felicity with which he connects his subject with the personal interests and responsibilities of his audience. He seldom indulges in any ornament, or in any play of fancy, beyond the occasional introduction of some select figure or comparison for the sake of illustration. He is never dull or common-place; but his vivacity is that of the understanding rather than of the imagination. At times, and when handling suitable themes, a burst of feeling escapes him which is felt to be perfectly genuine, and which seldom fails to communicate its contagion to the hearers; but he spends no time on mere sentimentalities, and shows no ambition whatever to provoke a tear, except as that may be the sign of his arrow having touched the heart. His chief aim seems always to be, to convey fully and clearly to the mind of his hearers the truth presented by the part of Scripture from which he is discoursing. Hence he is eminently textual as a preacher, eminently faithful as an expositor. Hence, also, the practical character of all his discourses. With all his closeness of reasoning and nicety of discrimination, he never indulges in mere abstract speculation—never verges into the regions of transcendentalism—never amuses his audience by adroit defences of fanciful hypotheses, or by gymnastic displays of dialectical subtlety. All is serious, solid, earnest, practical; and though an effort of continuous attention is required on the part of the hearer, in order fully to apprehend the train of his reasoning and illustrations, such an effort will seldom be put forth without being rewarded by a large accession of valuable and sound scriptural knowledge."

From the foregoing account of the nature of his sermons, the diligence of Dr. Wardlaw in his pulpit preparations may be easily surmised. It was laborious investigation and careful well-weighed thought, expressed in apposite words and polished sentences; and when these extended, as they often did, to three discourses each Sabbath, instead of two, they constituted an amount of weekly study sufficient to establish the character of a truly painstaking divine. To this also must be added his duties as a theological professor, which occupied much of his time and attention, and were most diligently discharged. But our idea of his industry is wonderfully heightened by the recollection that he was also a voluminous author;

so that, during a course of forty years, his appeals to the public through the press were never intermitted for any great length of time. A separate enumeration of these would be difficult, and therefore we can only refer to them under their general classification, as it was given in the funeral sermon preached by Dr. Alexander:—"His writings may be classed under three heads—theological, homiletical, and biographical. To the first belong his *Discourses on the Socinian Controversy*, his *Christian Ethics*, his volume on the *Atonement*, his *Letters to the Society of Friends*, his *Treatises on Baptism and Congregationalism*, his *Lectures on Ecclesiastical Establishments*, and his *Essay on Miracles*, the latest but not the least important of his published writings. Under the second head may be ranked his sermons, of which, besides a connected series in a volume, a great number were published separately; his *Expository Lectures on Ecclesiastes*, his *Lectures on Prostitution*, and his *Exposition of the Narrative of the Last Days of Jacob, and the Life of Joseph*. To the third class belong his *Memoir of Dr. McAll of Manchester*, prefixed to the collected discourses of that eminent pulpit orator; his Introductory Essay to an edition of *Bishop Hall's Contemplations*, and his *Memoir of his Son-in-law*, the Rev. John Reid, late of Bellary. Besides these he contributed many articles to religious periodicals, chiefly of a practical kind. He was the author also of several hymns, which, in correctness of sentiment, beauty of expression, and sweetness of rhythm, have few to equal them in our language, and will long hold a primary place in our collections of sacred verse."

In this enumeration it is to be observed that the greater part of Dr. Wardlaw's writings were of a controversial nature. For this his peculiar intellectual character especially fitted him, as well as his devotedness to pure abstract truth, which he thought should be defended at all points, and against every gainsayer. His productions of this nature, therefore, may be divided into two classes—those which dealt with avowed opinions hostile to every, or some, important point of Christian doctrine, such as the Socinian controversy, which was one of his earliest appearances on the field; his *Discourses on Man's Responsibility to God for his Religious Belief*, and his *Letters on the Errors of Quakerism*, addressed to the Society of Friends. The other class comprised those doctrines upon which the different bodies of Christians are at variance, such as the nature and extent of the atonement, in which he strenuously opposed the views of a new party, headed by Mr. Marshall; his defence of infant baptism, and his series of lectures calling in question the necessity and propriety of national church establishments. In this way, as a Christian against unbelievers, as an orthodox Christian against those of a mixed creed, and as an Independent zealous for his own church, and ready to answer all or any other party that might attack it, he may be said to have fought his way, during nearly forty years, over the whole round of theological polemics. All this seems to constitute an amount of pugnacity not easily reconcilable with a meek and gentle spirit. But it must be remembered that Dr. Wardlaw did not step out of his way in quest of disputations; on the contrary, they met him in every street, and even knocked at his door, to call him out to fresh contest. Besides, in such a life of controversy no one perhaps has ever better shown the courtesy of a thoroughly refined gentleman, blended with the meekness and tolerance of the Christian. He writes not in hatred but in love; to convince and win, not to irritate and defeat; he writes to show the greatness and the excellence of

the truth he advocates, and not his own; and even when he runs most keenly upon his adversary it is to extinguish his garments that have caught fire, where another would have thrown him into the kennel. And thus, although he had assailed so many parties in turn, yet all united in esteeming or loving him, because all had experienced his warm-hearted catholic philanthropy, as well as been convinced of his sincerity. By such gentleness, too, he was no loser, for he was one of the most successful of disputants. Only on one of these occasions he suffered a signal defeat; this was in the well-known Apocrypha controversy, waged with such keenness nearly forty years ago, and which so completely divided the Christian world, that the wise, the learned, and the good were parted from each other, and only brought together for mutual conflict. In this terrible discussion—which was waged with a fervour, and even with a rancour, up to the fighting point of which Dr. Wardlaw could never, by any possibility, have been fully kindled—it is not wonderful that he should have failed, more especially when he adopted what is now recognized as the wrong side of the question, and had Dr. Andrew Thomson for his antagonist.

We must now hasten to the closing period of Dr. Wardlaw's uneventful but most useful and well-spent life. A rapid review of it was thus briefly but correctly given at the beginning of 1850, by the Rev. Dr. Alexander of Edinburgh:—"As a minister of the gospel, he has, for nearly half a century, laboured in connection with the same church with the most honourable diligence, the most judicious and blameless deportment, and the most gratifying success. As a theological professor, he has devoted the energies of his remarkable mind, and the resources of his extensive reading and thinking, to the education of the rising ministry in his own denomination, and that for more than a quarter of a century, without any remuneration from man, than the gratitude of his pupils and the thanks of the churches. As an author, he has long held the first rank among theological polemics, and no mean place in other departments of religious literature. Unrivalled as a master of logic, he has shown himself also possessed of eloquence of the purest order, and of a breadth and practicability of view which are often denied to great dialecticians. And as a man, he has passed through a long life, in a position where many eyes were upon him, with an unblemished reputation, and has descended into the vale of years surrounded by the love, the respect, and the confidence of all good and generous men." Will it be believed, however, that the occasion which called forth such an honourable and truthful testimony was an aspersion of the worst kind which was attempted to be fastened upon the character of Dr. Wardlaw. After having lived and laboured so well from youth to old age, an accusation was raised against him, more fit to be hurled against a sordid money-broker or fraudulent shop-keeper than a man of such high and well-tried excellence. But it fared as it deserved: it was met with universal scorn; and the answer everywhere was—"Dr. Wardlaw?—impossible!" The principal Congregational churches of Scotland held meetings on the occasion, to express their firm conviction in his integrity; the leading ministers of English Independency, to the number of sixty-six, signed a joint address to him to the same effect; while—what was perhaps more gratifying to his feelings—a meeting of the members of his own congregation was held in their chapel of West George Street, to testify their assurance of his innocence, and admiration of his worth. It was held on the 16th of January, and

was joined by ministers from far and near, as well as of almost every denomination, while the presentation of a rich and beautiful silver tea-service graced the occasion. In his address to the meeting he thus adverted to the stigma that had been cast upon him: "I have felt it not a little hard—I am far from meaning on the part of God, who has his own ways and his own instruments of trial to his servants and people, and who does all things well, but on the part of man—at this advanced period of my life and ministry, to be assailed as I have been. When a young man's character is maligned, he has time, as the phrase is, to live it down; but when one has come to be a septuagenarian, such a process of self-vindication seems next to hopeless, unless, indeed (if we may borrow a figure from our neighbours of the Emerald Isle), he may be so happy as to have lived it down before it came—by anticipation." This, indeed, was exactly his own case, notwithstanding the oddity of the expression, and his character only shone out the brighter from the cloud that had attempted to obscure it. In February, 1853, when he had completed the fiftieth year of his ministry, and when a great anniversary was held in the City Hall, Glasgow, on the occasion, he was thus enabled to advert to the harassing incident:—"It is just three years since I was called to pass through the heaviest trial of my life, and it is just three years since, mercifully to myself, and to others marvelously, that my strength for official duty was renewed. He whose it is to turn the shadow of death into the morning, has dispelled the darkness, and has made it only to contribute to augment the serenity and cheerfulness of the light which has succeeded."

It was with this renewed frame, and in this cheerful spirit, that he was visited only ten months after by his last sickness. That sickness was also of brief continuance, for only three weeks before his death he was able to discharge his usual pulpit duties, and administer the sacred rite of the Lord's supper to the members of his flock. He died on the 17th of December, 1853, at the age of seventy-four. A public funeral, attended by thousands, repaired to the Necropolis, where his remains were interred; while the harmonizing of all denominations of Christians in this last solemn duty, and the deep sorrow that was settled on every countenance, proclaimed that every heart felt the loss they had sustained—that a father in Israel had departed.

WATSON, DR. ROBERT, author of the *History of the Reign of Philip II. of Spain*, was born at St. Andrews about the year 1730. He was the son of an apothecary of that city, who was also a brewer. He studied successively at the universities of St. Andrews, Glasgow, and Edinburgh, with a view to the ministry, availing himself of the leisure which a course of theology leaves to the student to cultivate English literature and rhetoric, upon which subjects he delivered a series of lectures in Edinburgh to an audience comprising the principal literary and philosophical men of the day.

Soon after he had been licensed to preach, a vacancy occurred in one of the churches of his native city, and for this he became a candidate, but was disappointed. About this time, however, Mr. Rymer, the professor of logic in St. Salvador's College, feeling the infirmities of old age advancing upon him, was inclined to enter into a negotiation for retiring, and, according to a prevailing though not a laudable custom, Watson obtained his chair for the payment of a small sum of money, and on the condition that the retiring professor should continue to enjoy his salary. The subject of our memoir obtained at the

same time a patent from the crown, constituting him professor of rhetoric and belles-lettres. The study of logic in St. Andrews, as in most other places, was confined to syllogisms, modes, and figures. Watson, whose mind had been expanded by intercourse with the most enlightened men of his day, and by the study of the best modern literature, prepared and read to his students a course of metaphysics and logic on an improved plan; in which he analyzed the powers of the mind, and entered deeply into the nature of the different species of evidence of truth or knowledge.

After having fully arranged the course of his professional duties, Watson was induced by the success of Robertson and Hume in the composition of history, as well as by the natural tendencies of his mind, to attempt a work emulating theirs in labour and utility. The reign of Philip II. of Spain presented itself to him as a proper subject, not only on account of its intrinsic interest, but as a continuation of the admired work of Robertson on the preceding reign. Having therefore prepared this composition with all due care, it was published at London in 1777, in two volumes quarto. A periodical critic thus characterizes the work: "The style and narration of this history deserve much praise; it is easy, flowing, and natural, always correct, and well adapted to the different subjects which come under review; it possesses, however, more of the dignified simplicity and strength of the philosopher than the flowing embellishments of the poet. Watson rests none of his merit upon external ornament; he is chiefly anxious to relate facts clearly and completely in their due proportion and proper connection, and to please and interest rather by what he has to tell than by any adventitious colouring. But though he does not seem solicitous to decorate his narrative with beauty or sublimity of diction, we feel no want of it; we meet with nothing harsh, redundant, or inelegant; we can on no occasion say that he has not done justice to his subject, that his conceptions are ever inadequate, his views deficient, or his description feeble. . . . The whole series of events lies full and clear before us as they actually existed; nothing is heightened beyond truth by the false colourings of imagination, nor does anything appear without suitable dignity. The principal circumstances are selected with judgment, and displayed with the utmost perspicuity and order. On no occasion are we at a loss to apprehend his meaning, or follow the thread of his narrative; we are never fatigued with minute attentions, nor distracted with a multiplicity of things at once."¹

On the death of Principal Tullidolph, November, 1777, Watson, now graced with the degree of Doctor of Laws, was, through the influence of the Earl of Kinnoul, appointed to that respectable situation, and at the same time presented to the church and parish of St. Leonard, in St. Andrews, which had previously been enjoyed by Tullidolph. Dr. Watson died March 31st, 1781, leaving by his lady, who was a daughter of Mr. Shaw, professor of divinity in St. Mary's College, five daughters. He also left the first four books of a history of the reign of Philip III., being a continuation of his former work. The task of completing this by the addition of two books having been confided to Dr. William Thomson (see the life of that gentleman), the work was published at London in 1783, in one volume quarto. Both of this and of the history of Philip II. there were subsequent editions in octavo.

WATT, GREGORY. This specimen of early excellence too soon extinguished, was the son of the

illustrious James Watt, by his second wife, Anne, daughter of Mr. M'Gregor, Glasgow. He was born in 1777, and being distinguished even in childhood by great intellectual powers, the fostering care of such parents gave every promise of their development into a rich maturity. He was educated at the university of Glasgow; but while a student, and when he had only reached the early age of seventeen, he was adopted as a partner in the house of Boulton and Watt, along with his brother James. Still, however, he continued his studies in the university of Glasgow, and did not leave it until 1797, when he retired with the character of a student of the highest promise both in science and literature. On leaving the university he did not abandon the pursuit of knowledge, which, on the contrary, he continued to prosecute as ardently as ever. But being in a declining state of health, and recommended by his physician to take up his residence for some time in the west of England, he proceeded in the winter of 1797 to Penzance, and became a lodger in the house of Mrs. Davy, a widow, the mother of Humphry, afterwards the illustrious Sir Humphry Davy. It was impossible that an acquaintanceship at least should not originate between two such geniuses devoted to congenial scientific pursuits; but the commencement was somewhat ludicrous. Davy sought to make himself agreeable to his mother's lodger by addressing him on subjects connected with metaphysics and poetry; but these advances were met with cold indifference. In the course of conversation, however, an allusion was made to chemistry, when Davy boastfully asserted that he would undertake to demolish the French theory in half an hour. The right chord was struck at last; the subject was one in which they were both in unison; and Watt, in conversing with the other upon the science, was astonished and delighted at his sagacity. A warm friendship was the consequence, which continued to increase between them until it was terminated by the death of Watt; and one happy result of this friendship was the improvement of Humphry Davy in chemical science from the increasing facilities which he obtained for the study of it. The two friends were daily associated together in their rambles; they explored the adjacent country, and investigated its remarkable rocks and mines; and an introduction of Davy by Watt to Dr. Beddoes was one of the steps that led the future Sir Humphry to the appointment of chemical superintendent of the Pneumatic Institution for the preparation of gases used in the cure of consumption—an important step in the career of the great chemist towards the high distinction which he afterwards attained.

In 1800, when the venerable Mr. Watt retired from business, and resigned his shares in the manufactory of Soho to his two sons, James and Gregory, it was an appointment for which the latter had neither taste nor inclination. Instead of mechanical science he had devoted his rich intellect to the cultivation of literature and the study of chemistry and geology, which had no connection, however remote, with the construction of steam-engines. He also still continued to be a victim to that incipient consumption under which he was prematurely to succumb. In this case it was fortunate that the energy of James was sufficient for the management of the Soho establishment, and he generously allowed Gregory to follow his own intellectual bent, but still to retain his share in the profits of the steam-engine manufactory. Thus encouraged, Gregory resumed his favourite studies with fresh ardour, but especially his researches in science; and in 1804 he addressed to the Right. Hon. Charles Grenville, V.P.R.S., a paper

¹ *Bee*, vol. vii. viii.

1904

entitled *Observations on Basalt, and on the Transition from the Vitreous to the Stony Texture, which occurs in the gradual Refrigeration of Melted Basalt; with some Geological Remarks.* It is upon this single production that the high reputation of young Watt was founded, and it was a brilliant commencement of the distinction he might have won had his life been continued. Only a month after it was written it was read before the Royal Society, and published in the *Philosophical Transactions*.

In this remarkable paper Mr. Gregory Watt announces that having repeatedly tried the experiments of Sir James Hall on the regulated cooling of melted basalt, it had occurred to him that more might be learned by exposing a much larger mass of basaltic matter to the action of heat than had ever yet been subjected to experiment. It was successful, and the results constitute the foundation of nearly all that has as yet been known on the subjects to which it relates. Of the experiment itself and its author Sir Humphry Davy thus spoke in a lecture delivered at the Royal Institution in 1811, while explaining the phenomena and causes of volcanoes:—"Mr. Gregory Watt fused some [seven] hundred-weight of basalt; and suffering it to cool in a mass, examined the results by breaking it into pieces. The largest crystals were found in the interior, where the congelation must have been comparatively slow. His paper on this subject . . . abounds in acute observations and sagacious inferences. It was the first and only production of a mind full of talent and enthusiasm for scientific pursuits—of a mind which promised much for the philosophy of this subject; but death cut off the bloom and promise of this hope for the scientific world at the moment when it was brightest. No person attached to truth can read this paper without a feeling of regret; and I hope I may be excused for the strong expression of this regret—for whilst I admired him as a philosopher, I loved him as a man. He was the earliest and one of the dearest of my scientific friends."

Only six months after he had written this remarkable essay, Gregory Watt died at the early age of twenty-seven. This bereavement, so deeply deplored by the most distinguished leaders in science, occurred on the 15th of October, 1804.

WATT, JAMES, one of the most illustrious men of his time as a natural philosopher, chemist, and civil engineer, was born at Greenock, on the 19th of January, 1736. His father, James Watt, was a block-maker and ship-chandler, and for some time one of the magistrates of Greenock; and his mother, Agnes Muirhead, was descended from a respectable family. During boyhood his health was very delicate, so that his attendance at school was by no means regular; nevertheless, by assiduous application at home he soon attained great proficiency in reading, writing, and arithmetic; and by the perusal of books that came within his command he extended his knowledge beyond the circle of elementary instruction of the public schools, and cherished that thirst for information for which he was throughout life remarkable. An anecdote of his boyhood has been preserved, showing the early bent of his mind. His aunt, Mrs. Muirhead, sitting with him one evening at the tea-table, said, "James, I never saw such an idle boy! Take a book, or employ yourself usefully; for the last half-hour you have not spoken a word, but taken off the lid of that kettle and put it on again." With the aid alternately of a cup and a silver spoon, he was observing how the steam rose from the spout and became condensed, and was counting the drops of water. But there is little incident in

his life until he reached his eighteenth year, excepting that he manifested a strong predilection for mechanical and mathematical pursuits. In accordance with this natural bent, he departed for London in 1754, in order to learn the profession of a mathematical instrument-maker. When he arrived in London he placed himself under the direction of one of this occupation, and applied himself with great assiduity, and with such success that, although he was obliged from want of health to return to his father's roof in little more than a year, yet he persevered, and soon attained proficiency in his business. He made occasional visits to his mother's relations in Glasgow, a city at that time considerably advanced in that career of manufacturing industry and opulence for which it has in more recent times been so eminently distinguished. In that city it was his intention to settle as a mathematical instrument maker; but he was violently opposed by some corporations of the trades, who viewed him as an intruder upon their privileges, although the business which he intended to follow was at that time little practised in Scotland. By this occurrence the hopes of Watt had been well-nigh frustrated, and the energies of his inventive mind had probably been turned into a different channel, had it not been for the kind and well-directed patronage of the professors of the university. In the year 1757 this learned body, who had at that time to reckon among their number some of the greatest men then living—Smith, the political economist; Black, the chemist; and Simson, the geometer—conferred upon Watt the title of Mathematical Instrument Maker to the University, with all the privileges of that office, and chambers within the walls of their venerable seminary, adjoining the apartments occupied by the celebrated printers, the Messrs. Foulis. He continued to prosecute his avocation in this place for about six years, during which time, so far as health and necessary employment would permit, he applied himself to the acquisition of scientific knowledge. It was during this period, also, that he contracted a lasting friendship with Dr. Black, whose name will ever be conspicuous in the history of philosophy, for his valuable additions to our knowledge of the doctrine of heat; and also with Robison, then a student in Glasgow college, and who afterwards filled the natural philosophy chair in the university of Edinburgh.

This period of Watt's life was marked by an incident which in itself might appear trifling, and not at all out of the course of his ordinary business, but which was nevertheless productive of results that not only gave immortality to his name, but impressed a great and lasting change on the commerce and manners of his own country, and also of a great portion of the world. We here allude to a circumstance that shall shortly be mentioned, that led to the improvements of Watt on the steam-engine; and the events of his life are so intimately interwoven with the history of the perfection of this extraordinary machine, that it will be necessary in a brief and popular way to describe the leading principles of its action.

The steam-engine, at the time of which we speak, was constructed after the plan invented by Newcomen. The chief use to which these engines were applied was the pumping of water from coal-mines, one end of the pump-rod being attached to a long lever or beam supported in the middle. To the other end of this lever was attached the rod of a piston, capable of moving up and down in a cylinder, after the manner of a common syringe. The weight of the pump-rod, &c., at the one end of the beam having caused that end to descend, the other end was neces-

sarily raised, and the piston rising in the cylinder, steam was admitted from the bottom to fill the vacuity. But when the piston arrived at the top cold water was injected at the bottom, and by reducing the temperature of the steam, condensed it, forming a vacuum. In this state of things, the atmosphere pressing on the top of the piston forced it down, and raised the pump-rod at the other end of the beam. This operation being continued, the pumping of the mine was carried on. Such was the form of the steam-engine when Watt first found it; and such is its construction at many coal-mines even in our own day, where the economy of fuel is not a matter of any importance.

Anderson, the professor of natural philosophy, in the course of the winter of 1763, sent a model of Newcomen's engine to Mr. Watt, in order to be repaired. This was accordingly done, and the model set in operation, and with this an ordinary mechanic would have been satisfied. But the mind of the young engineer had, two years before this time, been occupied in researches into the properties of steam. During the winter of 1761 he made several very simple yet decisive experiments, for the most part with apothecaries' phials, by which he found that a cubic inch of water will form a cubic foot of steam, equal in elasticity to the pressure of the atmosphere; and also that when a cubic foot of steam is condensed by injecting cold water, as much heat is given out as would raise six cubic inches of water to the boiling point. To these important discoveries in the theory of steam he subsequently added a third, beautifully simple, as all philosophical truths are, and valuable from its extensive application to practical purposes: he found that the latent heat of steam decreases as the sensible heat increases, and that universally these two added together make a constant quantity, which is the same for all temperatures. This matter is commonly misrepresented, and it is stated not only in accounts of the steam-engine, but also in memoirs of Mr. Watt, that the discoveries of Dr. Black regarding the properties of heat and steam laid the foundation of all Watt's inventions. Dr. Black himself gave a correct statement of the matter, and frequently mentioned with great candour that Mr. Watt discovered, unaided, the latent heat of steam, and having communicated this to the doctor that great chemist was agreeably surprised at this confirmation of the theory he had already formed, and explained that theory to Mr. Watt; a theory which was not made public before the year 1762. During the same year Watt made some experiments with a Papin's digester, causing the piston of a syringe to move up and down by the force of steam of high temperature, on the principle of the high-pressure engine now employed for various purposes. But he gave up the idea from fear of bursting the boiler, and the difficulty of making tight joints. These facts are sufficient to prove that he had at this time some idea of improving the steam-engine; and he himself modestly says, "My attention was first directed in 1759 to the subject of steam-engines by Dr. Robison, then a student in the university of Glasgow, and nearly of my own age. Robison at that time threw out the idea of applying the power of the steam-engine to the moving of wheel-carriages and to other purposes; but the scheme was not matured, and was soon abandoned on his going abroad." His active mind, thus prepared, was not likely to allow the defects of the model which was put in his hands to pass unobserved. This interesting model, which is still preserved among the apparatus of the Glasgow university, has a cylinder whose diameter is two inches, the length of stroke being six. Having re-

paired it, he tried to set it agoing, the steam being formed in a spherical boiler, whose diameter was about nine inches. In the course of these trials he found the quantity of steam, as likewise that of the cold injection water, to be far greater in proportion than what he understood was required for engines of a larger size. This great waste of steam, and consequently fuel, he endeavoured to remedy by forming cylinders of bad conductors of heat, such as wood saturated with oil, but this had not the desired effect. At last the fact occurred to him, that the cylinder was never sufficiently cooled down in order to obtain a complete vacuum. For some time before this it had been found by Dr. Cullen that under diminished pressure there is a corresponding fall of the boiling point. It now became necessary to ascertain the relation which the boiling point bears to the pressure on the surface of the water. He was not possessed of the necessary instruments to try the boiling points under pressures less than that of the atmosphere; but having tried numerous points under increased pressures, he laid down a curve whose ordinates represented the pressures and abscissas the corresponding boiling points, and thus discovered the equation of the boiling point. These considerations led Watt, after much reflection, to the true method of overcoming the difficulties in the operation of Newcomen's engine. The two things to be effected were, first, to keep the cylinder always as hot as the steam to be admitted into it, and secondly, to cool down the condensed steam and the injection water used for condensation to a temperature not exceeding 100 degrees. It was early in the summer of 1765 that the method of accomplishing these two objects was first matured in his mind. It then occurred to him that if a communication were opened between a cylinder containing steam and another vessel exhausted of air and other fluids, the steam would immediately rush into the empty vessel, and continue so to do until an equilibrium was established, and by keeping that vessel very cool the steam would continue to enter and be condensed. A difficulty still remained to be overcome: how was the condensed steam and injection water, together with the air, which must necessarily accompany, to be withdrawn from the condensing vessel? Watt thought of two methods: one by a long pipe sunk into the earth, and the other by employing a pump wrought by the engine itself; the latter was adopted. Thus was laid open the leading principle of a machine the most powerful, the most regular, and the most ingenious ever invented by man.

Watt constructed a model, the cylinder of which was nine inches diameter, making several improvements besides those above alluded to. He surrounded the cylinder with a casing, the intervening space being filled with steam to keep the cylinder warm. He also put a cover on the top, causing the piston-rod to move through a hole in it, and the piston was rendered air-tight by being lubricated with wax and tallow, instead of water as formerly. The model answered the expectations of the inventor, but in the course of his trials the beam broke, and he set it aside for some time.

In tracing the progress of improvement in the steam-engine, we have been obliged to pass over some incidents in his life which took place during the same period, and which we now proceed to notice. In the course of the year 1763 Mr. Watt married his cousin Miss Miller, daughter of the chief magistrate of Calton, Glasgow; previously to which he removed from his apartments in the college, and opened a shop in the Saltmarket, opposite St. Andrew's Square, for the purpose of carrying on his

business as mathematical and philosophical instrument maker. Here he applied himself occasionally in making and repairing musical instruments, and made several improvements on the organ. He afterwards removed to Buchanan's Land in the Tron-gate, a little west of the Tontine; and in 1768 he shut shop, and removed to a private house in King Street, nearly opposite to the Green-market. It was not, however, in any of these residences that the interesting experiments and valuable discoveries connected with the steam-engine were made; the experiments were performed, and the model erected in the delft work at the Broomielaw quay, in which concern Watt soon after became a partner, and continued so to the end of his life.

In 1765 Dr. Lind brought from India a perspective machine, invented there by a Mr. Hurst, and showed it to his friend Mr. Watt, who, by an ingenious application of the principle of the parallel ruler, contrived a machine much lighter, and of more easy application. Many of these machines were made and sent to various parts of the world; and Adams, the eminent philosophical instrument maker, copied one of those sent to London, and made them for sale.

Mr. Watt, having relinquished the business of mathematical instrument maker, commenced that of civil engineer, and in the course of 1767 he surveyed the Forth and Clyde Canal; but the bill for carrying on this great and beneficial public work being lost in parliament, his attention was directed to the superintendence of the Monkland Canal, for which he had previously prepared the estimates and a survey. He likewise surveyed for the projected canal between Perth and Forfar, as also for the Crinan Canal, which was subsequently executed under the superintendence of Rennie.

In 1773 the importance of an inland navigation in the northern part of Scotland between the eastern and western seas became so great, that Mr. Watt was employed to make a survey of the Caledonian Canal, and to report on the practicability of connecting that remarkable chain of lakes and valleys. These surveys he made, and reported so favourably of the practicability of the undertaking, that it would have been immediately executed, had not the forfeited lands, from which the funds were to be derived, been restored to their former proprietors. This great national work was afterwards executed by Mr. Telford on a more magnificent scale than had originally been intended.

What Johnson said of Goldsmith may with equal justice be applied to Watt, "he touched not that which he did not adorn." In the course of his surveys his mind was ever bent on improving the instruments he employed, or in inventing others to facilitate or correct his operations. During the period of which we have been speaking he invented two micrometers for measuring distances not easily accessible, such as arms of the sea. Five years after the invention of these ingenious instruments, one Mr. Green obtained a premium for an invention similar to one of them from the Society of Arts, notwithstanding the evidence of Smeaton and other proofs that Watt was the original contriver.

Mr. Watt applied for letters-patent in 1768 for "methods of lessening the consumption of steam, and consequently of fuel, in the steam-engine," which passed the seals in January, 1769. Besides the improvements, or rather inventions, already alluded to, this patent contained in its specification methods to employ the steam expansively upon the piston, and, where water was not plentiful, to work the engine by this force of steam only, by discharging the steam into the open air after it has done its

office; and also methods of forming a rotatory steam-engine. Thus was completed Watt's single reciprocating engine; and while the patent was passing through the different stages, an engagement was entered into between the inventor and Dr. Roebuck of the Carron iron-works—a man equally eminent for kindness of heart, ability, and enterprise. The terms of this agreement were, that Dr. Roebuck, in consideration of his risk of capital, should receive two-thirds of the clear profits of the sale of the engines which they manufactured. Dr. Roebuck at this time rented the large coal-mines at Kinneil, near Borrowstounness, and under the superintendence of Mr. Watt an engine was erected at Kinneil House, the cylinder of which was made of block-tin, being eighteen inches diameter. The action of this engine far surpassed even the sanguine expectations of the proprietors. Preparations were accordingly made for the manufacture of the new steam-engine; but the pecuniary difficulties in which Dr. Roebuck became at this time involved threw a check on the proceedings. From this period till the end of 1773, during which time, as we have seen, Mr. Watt was employed in surveys, &c., little was done with the patent-right obtained in 1769. About the end of the year 1773, while Mr. Watt was engaged in his survey of the Caledonian Canal, he received intimation from Glasgow of the death of his wife, who left him a son and a daughter.

His fame as an engineer had now become generally known, and about the commencement of 1774 he received an invitation from Mr. Matthew Boulton, of the Soho foundry, near Birmingham, to enter into copartnership, for the manufacture of the steam-engine. Mr. Watt prevailed upon Dr. Roebuck to sell his share of the patent-right to Mr. Boulton, and immediately proceeded to Birmingham and entered on business with his new partner. This new alliance was not only exceedingly fortunate for the parties themselves, but forms an important era in the history of the manufactures of Great Britain. Few men were so well qualified as Boulton to appreciate the merits of Watt's inventions, or possessed of so much enterprise and capital to put them into operation. He had already established the foundry at Soho on a scale of magnificence and extent not at that time elsewhere to be found; and the introduction of Watt made an incalculable addition to the extent and regularity of its operation.

The length of time and great outlay necessary for bringing the manufacture of steam-engines to such a state as would yield a remuneration was now apparent to Mr. Watt, and he clearly saw that the few years of his patent which had yet to run would not be by any means sufficient to yield an adequate return. Early therefore in 1774 he applied for an extension of his patent-right, and by the zealous assistance of Drs. Roebuck and Robison he obtained this four years afterwards, the extension being granted for twenty-five years. The year following the first application for the extension of the patent the manufacture of steam-engines was commenced at Soho, under the firm Boulton, Watt, & Co. Many engines were made at this foundry, and licenses granted to miners in various parts of the country to use their engines on condition that the patentees should receive a third part of the saving of coals of the new engine compared with one of the same power on Newcomen's construction. An idea may be formed of the profits arising by this arrangement when we know that from the proprietors of three large engines erected at Chacewater in Cornwall, Watt and Boulton received £800 annually.

John Smeaton had for many years been employed

in erecting and improving the steam-engine on Newcomen's principle, and did as much for its perfection as beauty and proportion of mechanical construction could effect. The fame of Smeaton does not rest on his improvements on the steam-engine. What he has done in other departments of engineering is amply sufficient to rank him as one of the most ingenious men England ever produced. Yet even what he has left behind him in the improvement of Newcomen's engine is well worthy the study, and will ever elicit the admiration, of the practical mechanic. To a man of weaker mind than Smeaton it must have been galling to see all the ingenuity and application which he had bestowed on the subject of steam-power rendered almost useless by the discovery of a younger man. Yet when he saw Watt's improvement he was struck with its excellence and simplicity, and with that readiness and candour which are ever the associates of true genius, he communicated to Mr. Watt, by a complimentary letter, the high opinion he held of his invention; admitting that "the old engine, even when made to do its best, was now driven from every place where fuel could be considered of any value." How different this from the treatment he received from inferior individuals labouring in the same field! His right to the invention of a separate condenser was disputed by several, whose claims were publicly and satisfactorily refuted. Among others he was attacked in a strain of vulgar abuse, and a tissue of arrant falsehoods, by a Mr. Hornblower, who wrote the article "Steam Engine" in the first and second editions of Gregory's *Mechanics*. This Mr. Hornblower, not contented with giving his own shallow evidence against Watt, has, with the characteristic grovelling which pervades the whole of his article, endeavoured to give weight to his assertions by associating with himself a respectable man. Mr. Hornblower states that, in a conversation with Mr. S. Moor, secretary to the Society for the Encouragement of Arts, that gentleman had stated that Mr. Gainsborough was the true inventor of the separate condenser. Mr. Moor had doubtless an intimate knowledge of the true state of the matter; and fortunately for his reputation as a sincere and candid man, we find him controvert this upon oath at his examination in the case Watt and Boulton *versus* Bull, in 1792.

In 1775 Mr. Watt married for the second time. The lady, Miss M'Gregor, was the daughter of Mr. M'Gregor, a wealthy merchant of Glasgow, who, as will be seen hereafter, was the first in Britain, in conjunction with Mr. Watt, to apply chlorine in the process of bleaching. From this time Watt applied himself assiduously to the improvement of that powerful machine for which he had already done so much. In 1781 he took out a patent for the regulating motion, and that beautiful contrivance the sun-and-planet wheel. The short history of this latter invention gives an apt illustration of his exhaustless powers of contrivance. For the purpose of converting the reciprocating motion of the large beam into a rotatory movement for driving machinery, he had recourse to that simple contrivance the crank; but while it was preparing at Soho, one of the workmen communicated it to Mr. Steed, who immediately took out a patent, and thus frustrated Watt's views. Mr. Watt bethought himself of a substitute, and hit upon the happy idea of the sun-and-planet wheel. This and the like occurrences may have given him that fondness for patents with which he has frequently been charged.

During the course of the following year two distinct patents were granted to Mr. Watt, one in February, and the other in July, for an expansive

engine—six contrivances for regulating the motion—double-acting engine—two cylinders—parallel motion, by rack and sector—semi-rotative engine—and steam wheel. A third was granted in 1784 for a rotative engine—parallel motions—portable engine and steam-carriage—working hammers—improved hand gear—and new method of working the valves. The most important of these inventions are the double-acting engine, in which steam is admitted both below and above the piston alternately, steam pressure being thus employed to press on each side of the piston, while a vacuum was formed over the other. By this contrivance he was enabled to double the power of the engine without increasing the dimensions of the cylinder. To the complete effecting of this he was obliged to cause the piston-rod to move through a stuffing-box at the top of the cylinder—a contrivance, it must be stated, which had been some years previous applied by Smeaton in the construction of pumps. Simple as these additions may at first appear, they were nevertheless followed by many great advantages. They increased the uniformity of motion, and at the same time diminished the extent of cooling surface, the size of boiler, and the weight and magnitude of the whole machinery. Another vast improvement involved in these patents is the expansive engine, in which the steam was let fully in at the beginning of the stroke, and the valves shut when the piston had advanced through a part of its progress, the rest being completed by the expansion of the steam, which arrangement greatly increases the power. This engine was included in the patent for 1782, though Mr. Hornblower had published something of the same nature the year before. But an engine on the expansive principle was erected by Watt at Shadwell iron-works in 1778, and even two years before expansive engines had been manufactured at Soho—facts which secure to Watt the honour of the priority of discovery. That ingenious combination of levers which guided the piston-rod, and is called the parallel motion, was secured by patent of 1784, and remains to this day unsurpassed as a beautifully simple mechanical contrivance.

In 1785 a patent was granted to Mr. Watt for a new method of constructing furnaces, and the consumption of smoke. He likewise applied to the steam-engine the governor, or conical pendulum, the steam and condensation gauges, and the indicator. About the same time, in consequence of the delay and expense attendant on the numerous experiments towards the perfection of this vast creator and distributor of power, he found it necessary to apply to parliament for an extension of his patent, which was granted to the end of the eighteenth century. By this grant the proprietors of the Soho foundry were enabled speedily to realize a great fortune.

In the winter of the year 1786 the subject of this memoir, together with his able and active partner, went to Paris, at the solicitation of the French government, in order to improve the method of raising water at Marley. Here Mr. Watt met with most of the eminent men of science who at that time adorned the French metropolis; and among the rest, the celebrated chemist Berthollet. The French philosopher had discovered in 1785 the bleaching properties of chlorine, and communicated the fact to Mr. Watt, with the power of patenting the invention in England. This Mr. Watt modestly declined doing, on the ground that he was not the author of the discovery. Mr. Watt saw the value of this new process, and communicated the matter, through the course of the following year, to his father-in-law, Mr. M'Gregor, who at that time carried on a large bleaching establishment in the vicinity of Glasgow.

He sent an account of the process, together with some of the bleaching liquor, in March, 1787; and the process of bleaching by the new method was immediately commenced at Mr. M'Gregor's field, and 500 pieces were speedily executed to entire satisfaction. Early in the following year two foreigners made an attempt to gain a patent for the new bleaching process; but they were opposed by Mr. Watt, and Messrs. Cooper and Henry of Manchester, all of whom had already bleached by Berthollet's method. Notwithstanding the misrepresentations in several histories of bleaching, it is manifest from these facts, as well as from the dates of several letters of Mr. Watt and Mr. Henry, that the great improver of the steam-engine had also the honour of introducing the process of bleaching by chlorine into Great Britain; and though he was not the original discoverer, yet he greatly simplified and economized the process of obtaining the discharging agent employed, and the vessels and other arrangements used in the art of bleaching. Among other improvements may be mentioned his method of testing the strength of the chlorine liquor, by ascertaining how much of it is necessary to discharge the colour of a given quantity of infusion of cochineal. The benefits which Mr. Watt conferred on chemical science did not terminate here. From a letter written to Dr. Priestley in 1783, and in another to M. de Luc in the same year, he communicated his important discovery of the composition of water. But in the beginning of the following year Mr. Cavendish read a paper on the same subject, claiming to himself the honour of discovery; and in the histories of chemistry the claims of Cavendish are silently admitted. There is a confusion of dates in the documents on this subject, which at the present day it is impossible to reconcile; but from the characters of the two men, we are inclined to think that each made the discovery independently of the other, and that therefore the credit is due to both. Mr. Watt's letter to M. de Luc was read before the Royal Society, and published in their *Transactions* for 1784, under the title of "Thoughts on the Constituent Parts of Water, and of Dephlogisticated Air; with an Account of some Experiments on that Subject." Mr. Watt also contributed a paper on the medical properties and application of the factitious airs to the treatise of Dr. Beddoes on pneumatic medicine, and continued during the latter period of his life deeply to engage himself in chemical pursuits.

A patent was granted to Mr. Watt in 1780, for a machine for copying letters and drawings. This machine, which soon became well known and extensively used, was manufactured by Messrs. Boulton and Kier, under the firm of James Watt and Company. He was led to this invention from a desire to abridge the time necessarily spent in taking copies of the numerous letters he was obliged to write. It was constructed in two forms, on the principle of the rolling press, one of them being large, and fitted for offices; the other light and capable of being inclosed in a portable writing-desk. Through the course of the following year Mr. Watt invented a steam-drying apparatus for his friend Mr. M'Gregor, of Glasgow. For this machine he never took out a patent, although it was the first thing of the kind ever contrived; nor was there ever any drawing or description of it published during his lifetime.¹ During the winter of 1784 Mr. Watt made arrangements for heating his study by steam; which method has since been extensively applied to the heating of private houses, conservatories, hot-houses, and manufac-

tories. Concerning the history of this apparatus, it is but justice to state that Colonel Cook had, in the *Philosophical Transactions* for 1745, described a method of "heating apartments by means of the steam of water conveyed along the walls by pipes;" but there is no proof that this was known to Mr. Watt.

In the year 1800 Mr. Watt withdrew from the concern at Soho, delivering his share of the business to his two sons, James and Gregory, the latter of whom died in the prime of life, much regretted by all who knew him. After having given ample proofs of great mental endowments, Mr. Watt thus retired from business, with a well-earned competency, which enabled him to enjoy the evening of a well-spent life with ease and comfort in the bosom of his family. At no time had he taken any active share in the management of the business of the Soho foundry, nor were his visits to it, even while he was a partner, by any means frequent. Mr. Boulton was a man of excellent address, great wealth, of business habits, and full of enterprise, and contributed greatly to the improvement of the steam-engine, by taking upon himself the entire management of the works at Soho: he thus relieved from all worldly concern the mind of his illustrious partner, which was much more profitably employed on those profound and valuable researches by which he has added so largely to the field of science. As Dupin well observes, "Men who devote themselves entirely to the improvement of industry will feel in all their force the services that Boulton has rendered to the arts and mechanical sciences, by freeing the genius of Watt from a crowd of extraneous difficulties which would have consumed those days that were far better dedicated to the improvement of the useful arts."

Although Mr. Watt retired from public business, he did not relax in his ardour for scientific pursuits and new inventions. Towards the end of the year 1809 he was applied to by the Glasgow Water Company to assist them in pointing out a method of leading water across the river, from a well on the south side, which afforded a natural filter. From a consideration of the structure of the lobster's tail, he formed the idea of a flexible main, with ball-and-socket joints, to be laid across the bed of the river, and which was constructed according to his plan in the summer of 1810. This ingenious contrivance gave such satisfaction, that another precisely similar was added a short time afterwards. Two years subsequent to this he received the thanks of the Board of Admiralty for his opinion and advice regarding the formation of the docks then carrying on at Sheerness.

About the year 1813 it was proposed to publish a complete edition of Dr. Robison's works, and the materials were delivered, for the purpose of editing, into the hands of his able friend Playfair, who, not having sufficient leisure for such an undertaking, transmitted them to Sir D. Brewster. The latter gentleman applied to Mr. Watt for his assistance in the revision of the article "Steam Engine," for which article he had originally furnished some materials, when it first appeared in the *Encyclopædia Britannica*; and to the article in its new form he furnished many valuable corrections and additions.

In 1817 Mr. Watt paid a visit to his native country; and it surprised and delighted his friends to find that he enjoyed good health, his mind possessed its wonted vigour, and his conversation its wonted charms. During the last years of his life he employed himself in contriving a machine for taking copies of pieces of sculpture. This machine never received the finishing touch of its inventor's hand; but it was

¹ See *Edinburgh Ency.* xviii. "Steam Drying."

brought to such perfection that seven specimens were executed by it in a very creditable manner. Some of these he distributed among his friends, "as the productions of a young artist, just entering his eighty-third year." When this machine was considerably advanced in construction, Mr. Watt learned that a neighbouring gentleman had been for some time engaged in a similar undertaking; and a proposal was made to Mr. Watt that they should jointly take out a patent, which he declined, on the ground that from his advanced age it would be unwise for him to enter upon any new speculation. It was always Mr. Watt's opinion that this gentleman had no knowledge whatever of the construction of the machine.

The health of Mr. Watt, which was naturally delicate, became gradually better towards the latter period of his long and useful life. Intense headaches, arising from an organic defect in the digestive system, often afflicted him. These were often aggravated and induced by the severe study to which he commonly subjected himself, and the perplexity arising from the frequent lawsuits in which he had been engaged towards the close of the eighteenth century. It must not be inferred from this last statement that this great man, whose discoveries we have been recounting, was by any means litigiously inclined. His quiet and peaceful mind was ever disposed to shrink from the agitations of paper wars and law pleas, and to repose in the quiet retreats of science. Many attempts were made to pirate his inventions, and to encroach upon his patent-rights, against which he never made any other defence than that which becomes an honest man, *i.e.* an appeal for the protection of the law of the land. He lived to see all these attempts to rob him of the profits of his inventions, as well as the envy and detraction which are ever the followers of merit, silenced for ever, and terminated a long, useful, and honourable life in the full possession of his mental faculties, at his residence at Heathfield in Staffordshire, on the 25th of August, 1819, having reached his eighty-fourth year.

The fame of Watt will in future ages rest secure upon the imperishable basis of his many discoveries, and he will ever be ranked in the first class of those great men who have benefited the human race by the improvement of the arts of industry and peace. Even during his lifetime this was known and recognized, and he received several honorary distinctions. In 1784 he was elected a fellow of the Royal Society of Edinburgh, and the year following he became fellow of the Royal Society of London. In 1787 he was chosen corresponding member of the Batavian Society; in 1806 he received the honorary degree of LL.D. from the university of Glasgow; and ten years later he was made a member of the National Institute of France.

Respecting the private character of Watt it would be difficult to communicate an adequate idea of its excellence. Those who knew him will ever remember that in his private intercourse with society he elicited from them more love and admiration than they can ever express. He was benevolent and kind to all those who came about him, or solicited either his patronage or advice. His conversation was easy, fluent, and devoid of all formality; replete with profound and accurate information on all subjects, blended with pertinent and amusing anecdote—such that, when combined with his plain unaffected language, the mellow tones of his manly voice, his natural good humour and expressive countenance, produced an effect on those around him which will hardly ever fade from memory. He read much,

and could easily remember and readily apply all that was valuable of what he read. He was versed in several of the modern languages, antiquities, law, and the fine arts, and was largely read in light literature. His character was drawn up by his friend Francis Jeffrey with a fidelity and eloquence that has made it known to almost every one. We will, therefore, forbear to quote it here, and bring this memoir to a conclusion by placing before the reader what has been said of Watt by his illustrious countryman and friend, the author of *Waverley*. In the playful letter to Captain Clutterbuck in the introduction to the *Monastery*, Sir Walter Scott gives the following lively description of his meeting in Edinburgh with this remarkable man:—"Did you know the celebrated Watt of Birmingham, Captain Clutterbuck? I believe not, though from what I am about to state he would not have failed to have sought an acquaintance with you. It was only once my fortune to meet him, whether in body or in spirit it matters not. There were assembled about half a score of our northern lights, who had amongst them, Heaven knows how, a well-known character of your country, Jedediah Cleishbotham. This worthy person having come to Edinburgh during the Christmas vacation, had become a sort of lion in the place, and was led in leash from house to house along with the guizzards, the stone-eater, and other amusements of the season, which 'exhibit their unparalleled feats to private family parties if required.' Amidst this company stood Mr. Watt, the man whose genius discovered the means of multiplying our national resources to a degree perhaps even beyond his own stupendous powers of calculation and combination, bringing the treasures of the abyss to the summit of the earth; giving the feeble arm of man the momentum of an Afrite; commanding manufactures to arise, as the rod of the prophet produced water in the desert; affording the means of dispensing with that time and tide which wait for no man, and of sailing without that wind which defied the commands and threats of Xerxes himself. This potent commander of the elements—this abridger of time and space—this magician, whose cloudy machinery has produced a change on the world, the effects of which, extraordinary as they are, are perhaps only now beginning to be felt—was not only the most profound man of science, the most successful combiner of powers and calculator of numbers, as adapted to practical purposes—was not only one of the most generally well-informed, but one of the best and kindest of human beings.

"There he stood, surrounded by the little band I have mentioned of northern literati, men not less tenacious, generally speaking, of their own fame and their own opinions than the national regiments are supposed to be jealous of the high character which they have gained upon service. Methinks I yet see and hear what I shall never see and hear again. In his eighty-fifth year, the alert, kind, benevolent old man had his attention at every one's question, his information at every one's command. His talents and fancy overflowed on every subject. One gentleman was a deep philologist; he talked with him on the origin of the alphabet as if he had been coeval with Cadmus; another was a celebrated critic; you would have said the old man had studied political economy and belles-lettres all his life; of science it is unnecessary to speak, it was his own distinguished walk. And yet, Captain Clutterbuck, when he spoke with your countryman Jedediah Cleishbotham, you would have sworn he had been coeval with Clavense and Burley, with the persecutors and persecuted, and could number every shot the dragoons had fired at the fugi-

tive Covenanters. In fact, we discovered that no novel of the least celebrity escaped his perusal, and that the gifted man of science was as much addicted to the productions of your native country (the land of Utopia aforesaid); in other words, as shameless and obstinate a peruser of novels as if he had been a very milliner's apprentice of eighteen."

A highly characteristic statue of Watt, by Chantrey, adorns a Gothic monument reared to his memory by his son, Mr. James Watt, a sketch of whose life is given below. Three other statues of him by Chantrey have been erected—one of them, of colossal size, stands in Westminster Abbey, and bears an elegant inscription by Lord Brougham. The countenance of this statue has been characterized as the personification of abstract thought. Glasgow possesses the other two—one of marble, in the museum of the university, and the other of bronze, in George's Square. His native town of Greenock has also rendered appropriate homage to his genius, by erecting not only his statue, but a public library which bears his name. An admirable "éloge" on Watt and his inventions was pronounced before the National Institute of France by the late M. Arago. Lord Brougham has also celebrated his merits in his "Historical Account of the Composition of Water," which is published as an appendix to the *Eloge*.

WATT, JAMES. It is by no means a natural sequence that talented men should also be the fathers of talented sons. The contrary is perhaps more frequently the case, to the general surprise or disappointment of those who hope that moral worth and intellectual power must be as transmissible as ordinary chattels and movables. A happy exception, however, was afforded in the case of that illustrious personage whom we have just commemorated, by his being the parent of two sons who showed themselves worthy of such a father.

James Watt was the eldest son of him who discovered the vast and varied powers of the steam-engine. He was born on the 5th of February, 1769, and in his education his attention was early directed by his father to natural philosophy and chemistry. With these the younger Watt combined the practical study of mineralogy, and showed even in early life how well he was qualified to excel in this department of science. The Literary and Philosophical Society of Manchester having been newly founded, James Watt, although only in his twentieth year, was appointed one of the secretaries; and in 1789 he communicated to its *Memoirs* two important and talented papers—one on the mine at Anglezark, near Chorley, Lancashire, in which the aérate carbonate of barytes is found; the other on the effects produced by different combinations of the *terra ponderosa* [barytes] given to animals. Although he was not the discoverer of the carbonate, he was the first to describe the circumstances under which the discovery occurred, and to show how the muriate used in medicine had been obtained from it. He also made some of the earliest experiments on the poisonous effects of the combinations of barytes.

In consequence of the wish of his father that he should study science on the Continent, James Watt went to Paris, accompanied by his friend Thomas Cooper, one of the vice-presidents of the Manchester Society. But here other pursuits than those of science offered themselves to his notice. Although a philosopher he was also an enthusiastic young man, and the millennium of universal liberty in which the French revolution had commenced its career was so alluring, that the wisest heads were for a time unable to withstand the seduction. It is no wonder therefore

that young Watt was drawn within the vortex, and made giddy in its circumvolutions. He took part with the Girondists and Jacobins, attended their inflammable meetings along with his friend Cooper, and subsequently with Wordsworth the poet, and became so influential with the French leaders of the movement, that it is said he prevented a duel from taking place between Robespierre and Danton. The increasing frenzy of the revolution soon opened the eyes of the scientific young Scot to its tendencies, and his sympathies were now exerted in behalf of those who were likely to suffer as its victims. This was a change not likely to escape detection, and Robespierre denounced him and his friend Cooper in the Jacobin club as emissaries of Pitt, and in the pay of the British government; but Watt indignantly repelled this charge from the tribune in a speech delivered in excellent French, and so convincing that it was satisfactory to the audience. France, however, could no longer be a safe home for him; and on being warned that his life was not secure for a single day, he abruptly left Paris, and after considerable difficulty made his way to Italy.

Having thus escaped from such a deleterious political atmosphere, James Watt soon afterwards returned to England. In 1794 the sons of Messrs. Boulton and Watt were admitted to a partnership in their large and lucrative establishment; and in 1800, when the patent of Mr. Watt had expired, he resigned his share of the business to his two sons, James and Gregory. This change obliged James to relinquish his scientific pursuits for the management and direction of the steam-engine manufactory at Soho, and amidst its practical operations he had neither time to follow out his chemical and geological investigations, nor inclination to resume his political theories. The improvement of the steam-engine was now the chief subject of his thoughts, and especially in its application to steam navigation; and as the leading partner of the firm, he produced several engines adapted to this important purpose, by which his manufactory was increased in reputation, and the art of steam navigation improved. Henry Bell had already tried his bold and successful experiments in steamboats, and in these he was successfully aided and seconded by James Watt. Not content also with the mere navigation of rivers, the latter conceived the daring attempt of extending steam-power to sea navigation, for which trial an opportunity was not long in occurring. Among the steam-vessels which Henry Bell had started of his own construction was the *Caledonia*, of 102 tons burden, and thirty-two horse-power; but when launched in 1815, the vessel was found so defective in her engines as to be of little use. In 1817, however, the *Caledonia* was purchased by Mr. Watt, who after replacing the imperfect machinery by two engines from the Soho establishment, each of 14-horse power, ventured out in her to sea, and crossed the Channel to Holland, after which he directed her course to the Rhine, and ascended as far as Coblenz. The scientific world that was astonished at the hazardous nature of such a voyage was triumphant at its success, and the hope became prevalent that steam-navigation might be made as safe and as common by sea as it was upon rivers. On her return from Coblenz, the *Caledonia* entered the Scheldt and visited Antwerp, and was laid up for part of the winter to undergo repairs and alterations in the harbour of Rotterdam. The importance of the voyage is thus stated by Mr. Muirhead in his *History of Steam Navigation in Great Britain*:—"After her [the *Caledonia*]'s return to the Thames in the spring of 1818, Mr. James Watt made no fewer than thirty-one series of experiments with

her on the river (the whole number of those experiments amounting to 250), which resulted in the adoption of many most material improvements in the construction and adaptation of marine engines, and in an immense though gradual extension of that branch of the manufacture at Soho. The marine engines manufactured there down to the year 1854 were in number 319, of 17,438 *nominal*, or 52,314 *real* horse-power.³³

In this manner was James Watt, senior, the discoverer of the power of steam and its application, ably followed and successfully seconded by his eldest son and representative. The rest of the biography of the latter is to be found in his active career as managing partner of the Soho establishment, and the increasing facilities he continued to afford in the machinery for steam navigation. Amidst such an active and practical life he had little time for authorship, and his only publications were a life of his father written in 1823, which was published in Macvey Napier's *Supplement to the Encyclopædia Britannica*; and a letter in 1846 on his father's claims as to the composition of water, which is published in Muirhead's *Correspondence*. He died unmarried at his seat, Aston Hall, in Warwickshire, near Birmingham, on the 2d of June, 1848.

WATT, ROBERT, M.D., the author of the *Bibliotheca Britannica*, and of several medical treatises, was born in May, 1774. His father, John Watt, possessed a small farm called Muirhead, in the parish of Stewarton, Ayrshire, which had belonged to the family for several generations, but which was sold shortly after his death in 1810. Robert was the youngest of three sons; and, with his elder brothers, was employed during his boyhood in attending school, and in assisting his father in the management of the farm. His early life, it would seem, was subject to considerable hardships, and afforded few opportunities for cultivating his mind. Such however as he had he used so diligently, that he not only acquired a large fund of miscellaneous knowledge, but that eagerness in the pursuit of knowledge which was his characteristic through life. It was natural that such a mind should long for the advantages of a university education, and devise the means by which such a wish should be fulfilled. To prepare himself for its accomplishment he laid aside as much of his earnings as he could spare, and applied himself in the intervals of manual occupation to the Latin and Greek languages. It was not long ere he thus qualified himself for beginning his course at the university. In 1793, at the age of eighteen, he matriculated in the Glasgow College, under Professor Richardson; and from that period went regularly through the successive classes in the university, up to the year 1797. During the summer recesses he supported himself by teaching, at first as a private tutor, but latterly he took up a small public school in the village of Symington, in Ayrshire. It was his first determination to follow the clerical profession; but after he had attended two sessions at the divinity hall of Glasgow, he turned himself to the study of medicine; and in order to have every advantage towards acquiring a proficiency in that branch of knowledge, he removed to Edinburgh, which has been so long celebrated as a medical school. Here he remained until he had gone through the usual studies of the science.

In 1799 he returned to Glasgow, and after an examination by the Faculty of Physicians and Surgeons there, he was found "a fit and capable person to exercise the arts of surgery and pharmacy." In the same year he set up as surgeon in the town of Pais-

ley, and soon began to attain great popularity in his profession, and to reap the reward of his talents and perseverance. In a short time he had engrossed so much practice as to find it necessary to take in as partner and assistant Mr. James Muir, who had been his fellow-student at Edinburgh. This gentleman possessed considerable literary abilities, and was author of various pieces of a didactic character which appeared in the periodicals of the day. He was in particular greatly attached to painting, and spent much of his time and money upon that art. Dr. Watt, on the other hand, was chiefly attached to that department of human inquiry which comes under the denomination of experimental philosophy—particularly chemistry, to which science he for a considerable time devoted his leisure hours almost exclusively. Yet with these differences of pursuits, they lived in good harmony during a partnership of nearly ten years, each following his own course, and both holding the most respectable station of their profession in the place where they resided.

The period of Dr. Watt's residence in Paisley was perhaps the busiest in his life. He enjoyed during it a better state of health than he ever did afterwards; and had, besides, all the ardour and enterprise of one newly entered into a sphere for which he had long panted. The number and variety of manuscripts which he has left sufficiently attest the persevering activity of his mind during this period. The most important, perhaps, of these is one in quarto, entitled "*An Abstract of Philosophical Conjectures; or an Attempt to Explain the Principal Phenomena of Light, Heat, and Cold, by a few simple and obvious Laws.*" This volume contains some curious and interesting experiments; but, of course, since the date of its composition (1805) many new lights have been thrown on the subjects it embraces, which in a great measure diminish its importance, and render its publication unadvisable. The only work which he ventured to publish while at Paisley, amid the many he composed and contemplated, was one entitled "*Cases of Diabetes, Consumption, &c.; with Observations on the History and Treatment of Disease in General.*" This appeared in 1803, and excited considerable interest at the time among the learned of the profession. The method which the author adopted in treating diabetes was venesection, blistering, and an abstemious diet; and the various cases which he records were considered at the time as tending to establish the propriety of this mode of treatment. At the end of the volume observations are given upon different diseases, as asthma, English cholera, colic, &c.; and these are also illustrated by cases which came under his own observation.

Soon after the publication of this volume he felt a desire to remove to another quarter, and commence business for himself on a higher scale than he had hitherto done. There was no place, however, which he had particularly fixed upon; and before coming to any decision on this point he determined to make a tour through England, with the view of ascertaining whether that country might not afford an eligible spot. The journey would, at the same time, be favourable to his health, which was beginning to be impaired. In 1809, having furnished himself with letters of recommendation to many eminent in his profession throughout England, he went to London by a circuitous route, embracing on his way most of the principal towns in the country. It does not appear, however, that he found any situation there agreeable to his wishes; for on his return home, after an absence of several months, he determined on settling at Glasgow: and accordingly, in 1810,

as soon as matters could properly be arranged, he removed to that city. Previously to this he had received from the university of Aberdeen the title of Doctor in Medicine, and had been elected member of the Faculty of Physicians and Surgeons of Glasgow. He had also become pretty well known in the neighbourhood as an eminent practitioner, and had every reason to calculate upon success, whatever rank of his profession he should assume. He therefore commenced upon the highest scale, took a large house in Queen Street, and confined his profession to that of physician and accoucheur. In the same winter he began his lectures on the theory and practice of medicine; and thus at once placed himself in that station of life for which he was so eminently qualified.

His success in Glasgow was complete and immediate. As a physician he suddenly acquired a most respectable and extensive practice, and as a lecturer his popularity was equally gratifying. The continental war which was then raging, occasioned a great demand for surgeons, and increased the number of students much above the ordinary average. Dr. Watt's lecture-room was numerously attended; and he spared no pains or expense that might conduce to the advantage of his pupils. His lectures were formed on the best models and from the most extensive sources, and his manner of delivering them was easy and engaging. During the first course he read them from his MSS.; but he afterwards abandoned that method for extemporaneous delivery, assisting his memory merely by brief memorandums of the chief heads of discourse. He used to say that this method, by keeping his mind in a state of activity, fatigued him less than the dull rehearsal of what lay before him. With a view to the advantage of his students he formed a library of medical books, which was very complete and valuable, containing, besides all the popular works on medicine, many scarce and high-priced volumes. Of this library he published a catalogue in 1812; to which he appended an "Address to Medical Students on the Best Method of Prosecuting their Studies."

The *Bibliotheca Britannica* may be said to have originated with the formation of this library. Besides the catalogue of it, which was printed in the usual form, having the works arranged under their respective authors in alphabetical order, he drew out an index of the various *subjects* which the volumes embraced, making references to the place which each held upon the shelf; and thus brought before his eye, at one view, all the books in his possession that treated on any particular point. The utility of this index to himself and his students soon turned his mind to the consideration of one upon a more comprehensive scale, that would embrace all the medical works which had been printed in the British dominions. This he immediately set about drawing out, and devoted much of his time to it. After he had nearly completed his object he extended the original plan by introducing works on law, and latterly works on divinity and miscellaneous subjects. This more than tripled his labours; but it proportionably made them more useful. The extent of the design, however, was not yet completed. Hitherto all foreign publications had been excluded from it; and although a prospectus of the work had been published, containing very copious explanations and specimens, which might be supposed to have determined its nature and bounds, he resolved, when it was on the eve of going to press, to make the work still further useful by introducing the more popular and important of foreign authors and their productions; embracing at the same time the various continental editions of the classics. Thus was another mighty

addition made to the original plan; and it is thus that many of the most splendid monuments of human intellect and industry originate in trifling or small beginnings.

In 1813 he published a *Treatise on the History, Nature, and Treatment of Chincough*. He was led to investigate particularly this disease, by a severe visitation of it in his own family, in which four of his children were affected at the same time, the two eldest of whom died. The treatise contains not only the author's own observation and experience, but also that of the best medical writers on the subject. To the volume is subjoined, "An Inquiry into the Relative Mortality of the Principal Diseases of Children, and the numbers who have died under ten years of age, in Glasgow, during the last thirty years." In this inquiry the author was at infinite pains in comparing and digesting the registers of the various burying-grounds in the city and suburbs; and of these he gives numerous tables, so arranged as to enable the reader to draw some very important conclusions regarding the diseases of children, and their respective mortalities.

In 1814 he issued anonymously a small volume, entitled *Rules of Life, with Reflections on the Manners and Dispositions of Mankind*. The volume was published by Constable of Edinburgh, and consisted of a great number of apophthegms and short sentences, many of them original, and the others selected from the best English writers.

About this time his health began rapidly to decline. From his youth he had been troubled with a stomatic disorder, which attacked him at times very severely, and kept him always under great restrictions in his diet and general regimen. The disease had gained ground with time, and perhaps was accelerated by the laborious life which he led. He nevertheless continued to struggle against it, maintained his usual good spirits, and went through the various arduous duties of his profession. His duties, indeed, had increased upon him. He had become a member of various literary and medical societies, of several of which he was president, and had been elected physician to the Glasgow Royal Infirmary, and president of the Faculty of Physicians and Surgeons. These two latter situations involved a great deal of trouble and attention. He held them both for two successive years; the former he was obliged to resign on account of the state of his health, just at the period when a handsome compensation would have followed his holding it; the latter was resigned at the expiry of the usual term of its continuance.

Although he had long laboured under that painful disease which we have spoken of, and of which he eventually died, it was not until the year 1817 that he totally discontinued his professional pursuits. Nor would perhaps his active spirit have so soon submitted to this resignation, had not another employment engaged his attention. He had by this time brought his great work, the *Bibliotheca Britannica*, to a very considerable state of forwardness; had become interested in it, and anxious for its completion. He probably saw that from the state of his health the duration of his life must be but limited, and was desirous, while yet some strength and vigour remained, to place the work in such a state that even his death would not prevent its publication. He retired, therefore, with his family to a small country-house about two miles from Glasgow, engaged several young men as amanuenses,¹ and devoted himself exclusively to the compilation.

¹ Among those so engaged were Mr. William Motherwell, who distinguished himself by his beautiful ballads; and Mr. Alexander Whitelaw, editor of the *Casquet*, *Republic of Letters*, &c.

In this literary seclusion Dr. Watt was for some time able to make great progress in his undertaking; but though freed from worldly interruptions, he had to combat with a disease which was every day becoming more formidable, and which at last obliged him to discontinue all personal labour. He still, however, continued to oversee and direct his amanuenses; and nothing could exceed the kind attention which he paid to their comforts, even when suffering under his fatal malady. In his own retirement he practised every method which his knowledge or experience could suggest to stem the progress of the disease, but they were all unavailing. In the hope that travel and a sea-voyage might benefit him, he went in one of the Leith smacks to London, made a considerable tour through England, and returned more exhausted and emaciated than before. From that period until his death he was scarcely out of bed, but underwent with wonderful fortitude an afflicting and uninterrupted illness of several months. He died upon the 12th of March, 1819, aged only forty-five, and was interred in the Glasgow High Church burying-ground.

Dr. Watt's personal appearance was prepossessing. He was tall in stature, and in early life, before his health declined, robust. His countenance displayed great intelligence. In private life he was universally esteemed. His character was formed on the strictest principles of morality, with which was blended a general urbanity of manners that won at once the good-will of whoever he addressed. His conversation was communicative and engaging, apart equally from dulness and tediousness, as from what is quite as intolerable, a continued study at effect. In his habits he was extremely regular and persevering. There was nothing from which he shrunk, if usefulness recommended it and exertion made it attainable. This is particularly exemplified in his undertaking and executing such a work as the *Bibliotheca Britannica*, the bare conception of which would, to an ordinary or less active mind, have been appalling; but which, beset as he was by professional duties and a daily increasing malady, he undertook and accomplished. But laborious as the work is—beyond even what the most intelligent reader can imagine—it is not alone to industry and perseverance that Dr. Watt has a claim upon our notice. He was ingenious and original-minded in all his schemes; and while his great ambition was that his labours might be useful, he was careful that they should not interfere with those of others. His various works, both published and unpublished, bear this distinction. The whole plan of the *Bibliotheca* is new; and few compilations of similar magnitude and variety ever presented, in a first edition, a more complete design and execution. It is divided into two parts; the first part containing an alphabetical list of authors to the amount of above forty thousand, and under each a chronological list of his works, their various editions, sizes, price, &c., and also of the papers he may have contributed to the more celebrated journals of art and science. This division differs little in its construction from that of a common catalogue, only that it is universal in its character, and in many instances gives short biographical notices of the author, and critical opinions of his works. It also gives most ample lists of the various editions of the Greek and Roman classics, &c., and under the names of the early printers, lists of the various books which they printed. In the second part all the titles of works recorded in the first part, and also anonymous works, are arranged alphabetically under their principal subjects. This part forms a minute index to the first, and upon it the chief claim of the *Bibliotheca* to novelty and value rests; for it lays be-

fore the reader at a glance a chronological list of all the works that have been published on any particular subject that he may wish to consult, with references to their respective authors, or with the publisher's name, if anonymous. While, in short, the first part forms a full and comprehensive catalogue of authors and their works, the second forms an equally complete and extensive encyclopedia of all manner of subjects on which books have been written. The utility of such a work to the student and author in particular must be obvious; for, with the facility with which he can ascertain in a dictionary the meaning of a word, can he here ascertain all that has been written on any branch of human knowledge. Whatever may be its omissions and inaccuracies (and these were unavoidable in a compilation so extensive), the plan of the work, we apprehend, cannot be improved; and amid the numerous and laborious methods that have been offered to the public for arranging libraries and catalogues, we are ignorant of any system that could be adopted with greater advantage, both as to convenience and completeness of reference, without at the same time affecting the elegant disposal of the books upon the shelves, than the one upon which the *Bibliotheca Britannica* is founded.

Dr. Watt married, while in Paisley, Miss Burns, the daughter of a farmer in his father's neighbourhood, by whom he had nine children. At his death the publication of the *Bibliotheca* devolved upon his two eldest sons, who devoted themselves to its completion with filial enthusiasm. They were both young men of the most promising abilities; and it is to be feared that their lives were shortened by the assiduity with which they applied themselves to the important charge that was so prematurely laid upon them. John, the elder of the two, died in 1821, at the early age of twenty; James, his brother, lived to see the work completed, but died in 1829, leaving behind him the deep regrets of all who knew and could appreciate his high character and brilliant talents.

The printing of the *Bibliotheca* was completed in 1824, in four large quarto volumes. The first division or portion of it was printed in Glasgow, and the second in Edinburgh. Messrs. Archibald Constable and Company, of Edinburgh, purchased the whole for about £2000, giving bills to that amount, but before any of the bills were honoured the house failed, and thus the family of Dr. Watt was prevented from receiving any benefit from a work to which so many sacrifices had been made, and upon which all their hopes depended.¹

WAUGH, DR. ALEXANDER, an eminent divine of the United Secession Church, was born on the 16th August, 1754, at East Gordon, in the parish of Gordon, Berwickshire, where his father followed the occupation of a farmer.

The subject of this memoir, who was devoted by his parents from his infancy to the church, was put

¹ In connection with the misfortunes attendant upon the work we may mention here, in a note, one fortunately in this country of singular occurrence. Not long after Dr. Watt's death his country-house was broken into in the middle of the night by a band of ruffians, disguised with blackened faces, and armed with guns, swords, &c. While one party held their fire-arms over the unhappy inmates, another ransacked the house and packed up everything valuable of a portable nature, which they carried off, and which were never recovered. They even took the rings from Mrs. Watt's fingers. Among their ravages they unfortunately laid their hands on a portion of the unprinted MS. of the *Bibliotheca*, which they thrust into the fire with the purpose of lighting the apartment. It took nearly a year's labour to remedy the destruction of this MS. Four of the robbers were afterwards taken and executed for the crime at Glasgow in 1820.

to the parish school of Gordon, at which he remained till he had attained his twelfth year, when he was removed to that of the neighbouring parish of Earlstoun, where the schoolmaster was celebrated as a teacher of Latin and Greek. Here he remained till 1770, when he entered the university of Edinburgh, leaving behind him at Earlstoun a reputation for talents and piety which, young as he then was, made a deep impression on all who knew him, and led them to anticipate for him the celebrity he afterwards attained as a preacher.

Mr. Waugh continued at the university throughout four sessions prior to his entering on his theological studies, during which he attended the Latin, Greek, and natural and moral philosophy classes. He subsequently studied and acquired a competent knowledge of Hebrew. At the end of this period he was examined by the presbytery regarding his proficiency in philosophy and the learned languages, and having been found qualified, was admitted to the study of divinity, which he commenced in August, 1774, under the tuition of the Rev. John Brown of Haddington. Three years afterwards he repaired to the university of Aberdeen, and attended for one session the lectures of Dr. Beattie, professor of moral philosophy, and of Dr. Campbell, professor of divinity in the Marischal College. In the following year, having been found amply qualified by prior attainments, he received his degree of M.A. On the completion of his studies Mr. Waugh was licensed to preach the gospel by the presbytery of Edinburgh at Dunse, June 28, 1779, and in two months afterwards was appointed by the presbytery to supply the Secession congregation of Wells Street, London, left vacant by the death of the Rev. Archibald Hall. On this occasion he remained in London for about ten weeks, when he returned to Scotland, and soon after received a unanimous call from the congregation of Newton, which was sustained by the presbytery at their meeting on December 21, 1779, and on the 30th of August, 1780, he was formally inducted to this charge.

The effects of the favourable impression, however, which he had made upon his hearers in London reached him even in the retired and obscure situation in which he was now placed. A call to him from the Wells Street congregation was brought before the synod which met at Edinburgh in May, 1781, but he was continued in Newton by a large majority. He himself had declined this call previously to its being brought before the synod, and that for reasons which strikingly exhibit the benevolence of his disposition and the uprightness of his character. Amongst these were the unsettled state of his congregation, which was yet but in its infancy; the strong attachment which they had manifested to him; and the struggles which they had made for the settlement of a minister among them. But so desirous were the Wells Street congregation to secure his services, that, undeterred by the result of their first application, they forwarded another call to him, which was brought before the synod on the 27th November, 1781, when it was again decided that he should continue at Newton. The second call, however, was followed by a third from the same congregation, and on this occasion the call was sustained by the presbytery on the 19th March, 1782. Mr. Waugh received at the same time a call from the Bristo Street congregation of Edinburgh, but owing to some informality it did not come into direct competition with the former, and therefore was not discussed.

The presbytery of Edinburgh having been appointed to admit him to his new charge, this ceremony took place at Dalkeith on the 30th May, 1782;

and in June following he set out for London, where he arrived on the 14th of that month, and immediately commenced his ministry in the Secession Church, Wells Street. He soon extended the reputation which he had already acquired amongst the body of Christians in London to which he belonged, and became exceedingly popular at once by his singularly amiable character, his unwearied activity and unremitting zeal in the discharge of his ministerial duties, and by his fervid and impressive eloquence in the pulpit. He also took an active part in promoting the interests of the London Missionary and Bible societies; and even extended his benevolent exertions to many other religious and charitable institutions in the metropolis.

In 1815 he received the degree of Doctor of Divinity from the Marischal College of Aberdeen, and was much gratified by this mark of distinction from that learned body, which he did not deem the less flattering, that, although he had studied there in his youth, he was, when it was conferred, almost an entire stranger, personally, to all of them. Previously to this Dr. Waugh had been seized with a serious illness, which had compelled him to revisit his native country, with the view of benefiting by the change of air. From this illness he finally recovered; but in May, 1823, he received an injury by the fall of some scaffolding at the laying the foundation-stone of the orphan asylum at Clapton, from the effects of which he never entirely recovered. He, however, continued to preach with unremitting zeal till the beginning of 1827, when increasing infirmities, particularly an inability to make himself audible in the pulpit, rendered it necessary to procure an assistant to aid him in his labours, as well on his own account as on account of the spiritual interests of his congregation. In this year, therefore, he was relieved from a large portion of the laborious duties which had before devolved upon him. But this excellent man was not destined long to enjoy the ease which his affectionate congregation had kindly secured for him. In the last week of November he caught a severe cold, which finally terminated his useful and active life on the 14th of December, 1827, in the seventy-fourth year of his age, and the forty-fifth of his ministry in London.

The remains of Dr. Waugh were attended to the grave by an immense concourse of people, drawn together on that melancholy occasion by the celebrity and popularity of his character; and his congregation, as a testimony of their affection for his memory, erected an elegant tablet of marble, with a suitable inscription, in their chapel in Wells Street. They also claimed it as a privilege to defray the funeral expenses. But they did much more than all this: they secured an annuity for his widow, and expressed their sympathy in her bereavement by many other acts of generosity and kindness.

Dr. Waugh, in all the relations of life, was perhaps one of the most amiable men that ever existed. His character was pure and spotless; his benevolence unbounded; his philanthropy unqualified. His manners were mild, gentle, and highly prepossessing, and his piety sincere and ardent, and wholly without any portion of that gloominess which has been erroneously believed to belong to heart-felt religious feeling. So far from this, he was lively, cheerful, and humorous, and delighted in innocent mirth and railery. To those of his countrymen who came to London his house and table were ever open; and his advice, counsel, and assistance in furthering their views, always at their service. His kindness in this way, indeed, he carried to an almost blamable extent.

His talents, too, generally, and particularly as a preacher of the gospel, were of a very high order; and of this the London Missionary Society, in common with others, was so sensible that he was employed in frequent missions by that body, and always with eminent success. His whole life in London was one of continued and unremitting activity. He laboured early and late in the discharge of the important duties intrusted to him, and willingly undertook at all times, in addition to these, any others which had from their nature a claim upon his exertions.

WEBSTER, DR. ALEXANDER, an eminent divine and statistical inquirer, was born in Edinburgh about the year 1707, being the son of a clergyman of the same name, who, after suffering persecution under the reigns of the latter Stuarts, had become minister of the Tolbooth parish in that city, in which charge he acquired considerable celebrity as a preacher of the orthodox school. The subject of this memoir studied for the church, and after being duly licensed, was ordained minister of Culross, where he soon became noted for his eloquence in the pulpit, and the laborious zeal with which he discharged every duty of his office. The congregation of the Tolbooth Church, who had lost his father in the year 1720, formed the wish to have the son set over them, and accordingly in 1737 he received a unanimous call from them, and thus was restored to the society of his native city. Previously to this event he had obtained the affections of Miss Mary Erskine, a young lady of fortune, and nearly related to the family of Dundonald. He had been employed to bespeak the favour of Miss Erskine for a friend, and for this purpose paid frequent visits to Valleyfield, a house within the parish of Culross, where she resided. The suit of his friend he is said to have urged with equal eloquence and sincerity; but whether his own figure and accomplishments, which were highly elegant, had prepossessed the young lady, or she despised a suitor who could not make love on his own account, his efforts were attended with no success. At length Miss Erskine naively remarked to him that, had he spoken as well for himself, he might have succeeded better. The hint was too obvious to be overlooked, and its promise too agreeable to be neglected. Webster spoke for himself, and was readily accepted. They were married a few days after his accession to the pulpit of the Tolbooth Church. Though the reverend gentleman was thus prompted by the lady, it does not appear that he was in the least degree deficient in that affection which ought always to be the motive of the nuptial connection. On the contrary, he seems, from some verses composed by himself upon the occasion, to have been one of the most ardent of lovers, and also one of the most eloquent of amatory poets; witness the following admirable stanza:—

"When I see thee, I love thee, but hearing adore,
I wonder, and think you a woman no more;
Till, mad with admiring, I cannot contain,
And, kissing those lips, find you woman again."¹

With the fire of a profane poet, and the manners and accomplishments of a man of the world, Webster possessed the unction and fervour of a purely evangelical divine. The awakenings which occurred at Cambuslang in consequence of the preaching of Whitefield, he attributed in a pamphlet to the direct influence of the Holy Spirit; while the Seceders imputed the whole to sorcery and the direct influence of the devil. In the pulpit both his matter and his

manner gave the highest satisfaction. His voice was harmonious, his figure noble; the dignity of his look, the rapture of his eye, conveyed an electric impression of the fervent devotion which engrossed his soul. In prayer and in sacramental addresses his manner was particularly noble and august. The diction of his sermons was strong and animated, rather than polished, and somewhat lowered to the capacity of his hearers, to whose situation in life he was always attentive. To the best qualities of a clergyman he added an ardent but enlightened zeal for the external interests of the church, a jealousy of corruption, a hatred of false politics and tyrannical measures which sometimes exposed him to calumny from the guilty, but secured him unbounded esteem from all who could value independence of soul and integrity of heart. His sentiments respecting the affairs of both church and state were those of what may now be called an *old Whig*; he stood upon the revolution establishment, alike anxious to realize the advantages of that transaction and to prevent further and needless or dangerous changes. "Nature," says an anonymous biographer, "had endowed him with strong faculties, which a very considerable share of learning had matured and improved. For extent of comprehension, depth of thinking, and accuracy in the profoundest researches, he stood unrivalled. In the knowledge of the world and of human nature he was a master. It is not wonderful that the best societies in the kingdom were perpetually anxious to possess a man who knew how to soften the rancour of public theological contest with the liberality and manners of a gentleman. His address was engaging; his wit strong as his mind; his convivial powers, as they are called, enchanting. He had a constitutional strength against intoxication, which made it dangerous in most men to attempt bringing him to such a state: often when they were unfit for sitting at table he remained clear, regular, and unaffected."

Among the gifts of Dr. Webster was an extraordinary power of arithmetical calculation. This he began soon after his settlement in Edinburgh to turn to account in the formation, in company with Dr. Robert Wallace, of the scheme for annuities to the widows of the Scottish clergy.² From an accurate list of the ministers of the church, and the members of the three southern universities, compared with the ordinary ratio of births, marriages, and deaths in this and other kingdoms, he was enabled to fix on a series of rates to be paid annually by the members of these two departments, the amount of which rates was to supply a specific annuity to every widow whose husband should be a contributor, and a proportional sum for the children of the same. To forward this scheme he opened a correspondence with the different presbyteries in the kingdom; and in the year 1742 received for it the sanction of the General Assembly of the church, which, after suitable examination, approved of the whole plan, with the exception of a few immaterial particulars. Accordingly, the several presbyteries and universities concurred with the Assembly in petitioning parliament for an act enabling them to raise and establish a fund, and obliging the ministers of the church, with the heads, principals, and masters of St. Andrews, Glasgow, and Edinburgh, to pay annually, each according to his option, one of the following rates, viz. either £2, 12s. 6d., £3, 18s. 9d., £5, 5s., or £6, 11s. 3d., to be repaid in proportional annuities of £10, £15, £20, or £25

¹ "Webster's Lines," *Scottish Songs*, ii. 337. This fine lyric seems to have been first published in the *Scots Magazine*, 1747.

² The ensuing account of the Clergy's Widows' Scheme is taken from a memoir of Dr. Webster in the *Scots Magazine* for 1802. Some further particulars are given in the article DR. ROBERT WALLACE.

to their widows, or in similar provisions of £100, £150, £200, or £250 to their children. The act was obtained in terms of the petition (17 Geo. II.), with liberty to employ the surplus of the annual payments and expenses in loans of £30 apiece among the contributors, and to put out the remainder at interest, on proper security. A second act, amending the former, was procured in the twenty-second year of the same reign (1748), regulating the several parts of the management, and granting liberty to raise the capital to £80,000, including the sums lent to contributors.¹ The commencement of the fund is reckoned from the 25th of March, 1744, the whole trouble of planning, arranging, and collecting the revenues, and applying them to their immediate purposes, devolving on the original proposer, who, with a patience and perseverance nearly equal to the extreme accuracy of his calculations, at last completed the scheme. In the year 1770 a new act of parliament, procured by advice of Dr. Webster, prescribed the full form in which the fund is at present conducted. The loans granted to contributors were discontinued, as prejudicial to the parties concerned; liberty was granted to extend the capital to £100,000; the methods of recovering payments; the nomination and duties of trustees; the salaries of the collector and clerk; in short, the whole economy of the institution, were fixed and determined. A tax on the marriage of each contributor, amounting to one year's annual rate of his particular option; and if he were forty years of age at his accession to his benefice, and had children, the sum of two years and a half of his rate, besides his ordinary dues and marriage, were added to the revenue. Further, a sum of half his usual rate was declared due to the fund, out of the *ann*; or, in case of its not falling, out of his real or personal estate, on the death of a minister; and patrons were assessed in the sum of £3, 2s. for every half year's vacancy.

A report of the state of the fund was ordered to be made annually to the General Assembly by the trustees, and this afterwards to be printed. Dr. Webster, in the year 1748, had finished a series of calculations, in which he not only ascertained the probable number of ministers that would die annually, of widows and children that would be left, of annuitants drawing whole or half annuities, and the medium of the annuities and annual rates, but also the different annual states of the fund, in its progress to completing the capital stock. These calculations have approached the fact with astonishing precision. It would exceed our limits to insert the comparison between the calculations and the facts stated in the reports for the years 1762, 1765, and 1779, and printed again in those for 1790, &c.; but we shall only mention that in the second of these statements the comparison ran as follows: thirty ministers were calculated to die annually; *inde* for twenty-one years, from 1744 to 1765, the number by calculation is 630, the fact was 615, being only 15 of total difference. Twenty widows were calculated to be left annually in the forementioned period; there were left 411: the calculation was 420, and the difference 9. It was calculated that six families of children without a widow would be left annually; the calculated amount for the above period was 126, the fact 124, the difference 2. Four ministers or professors were calculated to die annually without either widows or children; the calculated number for the first twenty-one years was 84, the fact was 82. The differences for that period between the calculated mediums of the whole

number of annuities and of annual rates, compared each with its respective fact, was, for the number of annuities, 1s. 2d. $\frac{6}{13}$, and for the rates, 3s. 0d. $\frac{6}{13}$. On the 22d of November, 1799, in the fifty-sixth year of the fund, and the year which completed the capital stock fixed by act of parliament, Dr. Webster's calculations, after having approached the truth for a long series of years with surprising accuracy, stood in the following manner: the stock and surplus for that year were £105,504, 2s. 11d. $\frac{3}{13}$, and the calculated stock was £86,448, 12s. 10d. $\frac{3}{13}$; consequently the difference was £19,055, 10s. 0d. $\frac{17}{13}$.

In the year 1745, when the Highland army under Prince Charles Stuart took possession of Edinburgh, Dr. Webster manifested the sincerity and firmness of his principles, as well as his general vigour of character, by remaining in the city, and exerting his eloquence to support the people in their attachment to the house of Hanover. On the day afterwards appointed by the General Assembly for a thanksgiving for the victory of Culloden (June 23, 1746), he preached a sermon, afterwards printed, in which he made a masterly exposure of the new-born affection then manifested by the Tory party for the existing dynasty. This composition, however, is degraded by a panegyric on the infamous Cumberland, and a number of other allusions to secular persons and affairs, more consistent perhaps with the manners of the times than with the immutable principles of taste in pulpit oratory. It has only the negative merit of being less fulsome in its respect for the hero of the day than a similar composition by Dr. Hugh Blair, which contained the following passage:—"When the proper season was come for God to assert his own cause, then he raised up an illustrious deliverer, whom, for a blessing to his country, he had prepared against this time of need. HIM he crowned with the graces of his right hand; to the conspicuous bravery of early youth he added the conduct and wisdom which in others is the fruit only of long experience; and distinguished him with those qualities which render the man amiable, as well as the HERO great. He sent him forth to be the terror to his foes, and in the day of death commanded the shields of angels to be spread around him." At the time when this and similar eulogia were in the course of being pronounced, the subject of them was wreaking upon a defeated party the vengeance of a mean and brutal mind. He whom the shields of angels had protected on a day when superior strength rendered danger impossible, was now battenning with savage relish on the fruits of an easy conquest. Cottages were smoking in every direction for a hundred miles around him, a prey to conflagration, their tenants either murdered by cold steel or starved to death; while the dictates of law, of humanity, of religion were all alike unheard. Nor could these circumstances be unknown to the courtly preachers.

Dr. Webster had now become a conspicuous public character, and the utility of his talents and dignity of his character were universally acknowledged. The comprehensiveness of his mind, and the accuracy of his calculating powers, rendered him a desirable and most useful ally in almost all kinds of schemes of public improvement, of which, at that period of nascent prosperity, a great number were set in motion. As the friend of Provost Drummond, he aided much in the plan of the new town of Edinburgh, not scrupling even to devise plans for those public places of amusement which, as a minister of the Church of Scotland, he was forbidden by public opinion to enter. He was a most zealous encourager of the plan of civilizing and propagating religion in the Highlands; and in 1753 published a

¹ By this act the university of Aberdeen was included on request.

sermon on that subject, entitled *Zeal for the Civil and Religious Interests of Mankind recommended*. In the year 1755 he drew up, at the desire of Lord-president Dundas, for the information and service of government, an account of the number of people in Scotland, being the first attempt at a census ever made in the kingdom. His researches on this occasion were greatly facilitated by a general correspondence which he had opened in 1743, both with the clergy and laity, for the purposes of the Clergy's Widows' Fund. "Dr. Webster's well-known character for accuracy," says Sir John Sinclair, "and the success with which his calculations have been uniformly attended, ought to satisfy every one that the report he drew up may be safely relied on." Yet, as the means employed on the occasion were only calculated to produce an approximation to correctness, it must not be disguised that the census of 1755, as it is sometimes called, was in no respect comparable to those which actual survey has since effected.

Our limits will not allow us, nor our information suffice, to enumerate all the charitable institutions or projects of public welfare, temporary or lasting, in which Dr. Webster was engaged. As he lived to an advanced age, he had the pleasure of seeing many of them arrive at their maturity of usefulness—the best reward, perhaps, which merit ever enjoys. He preserved to the latest period of his course that activity both of mind and body which distinguished him in the prime of life; and, ripe like a sheaf in autumn, obtained his frequent wish and prayer, an easy and peaceful death, after a very short indisposition, on Sunday, the 25th of January, 1784. By his lady, who died November 28, 1766, he had six sons and a daughter: one of the former, Colonel Webster, fell in the American contest. The person of Dr. Webster was, as already mentioned, dignified and commanding. In latter life it became somewhat attenuated and bent. His countenance, of which a good memorial, by David Martin, is in the office of the Ministers' Widows' Fund, was of an elevated and striking cast, and highly characteristic of his mind. It is related to his honour, that the superior income which his wife's fortune placed at his command was employed with unusual bountifulness in behalf of the poor, to whom he thus proved himself a practical as well as theoretic friend.

WEDDERBURN, ALEXANDER, first Earl of Rosslyn, was born February 13, 1733, in the city of Edinburgh. His father was Peter Wedderburn, of Chesterhall, Esquire, an eminent advocate, who became in 1755 a judge of the Court of Session, with the designation of Lord Chesterhall. The grandfather of the latter was Sir Peter Wedderburn of Gosford, an eminent lawyer, and subsequently a judge, during the reign of Charles II., of whom Sir George Mackenzie speaks in terms of the highest panegyric in his *Characters of Scottish Lawyers*.¹ Sir Peter was descended from an old landed family in Forfarshire, which had produced several learned persons of considerable eminence.

The subject of this memoir was bred to the profession in which his father and great-grandfather had so highly distinguished themselves; and so soon were his natural and acquired powers brought into exercise, that he was admitted to the bar at the unusually

early age of nineteen. He was rapidly gaining ground as a junior counsel, when an accident put a sudden stop to his practice in his native courts. He had gained the cause of a client in opposition to the celebrated Lockhart, when the defeated veteran, unable to conceal his chagrin, took occasion from something in the manner of Mr. Wedderburn to call him "a presumptuous boy." The sarcastic severity of the young barrister's reply drew upon him so illiberal a rebuke from one of the judges, that he immediately unrobed, and, bowing to the court, declared that he would never more plead where he was subjected to insult, but would seek a wider field for his professional exertions. He accordingly removed to London, in May, 1753, and enrolled himself a member of the Inner Temple. A love of letters, which distinguished him at this early period of life, placed him (1754) in the chair at the first meeting of a literary society of which Hume, Smith, and other eminent men greatly his seniors, were members. Professional pursuits, however, left him little leisure for the exercise of his pen, which is to be the more regretted, as the few specimens of his composition which have reached us display a distinctness of conception, and a nervous precision of language, such as might have secured the public approbation for much more elaborate efforts. It is related, to his honour, that he retained to the close of his life, amidst the dignities and cares of his elevated station, a most affectionate attachment to all the literary friends of his youth.

Mr. Wedderburn was called to the English bar in 1757, and became a bencher of Lincoln's Inn in 1763. He early acquired considerable reputation and practice, which he greatly increased by becoming the advocate of Lord Clive, in whose cause he was triumphantly successful. He pleaded on the great Douglas case in 1768-9, when his acute reasoning, his deep reading, and his irresistible eloquence attracted the favourable notice of Lord Camden, and secured him ever after the protection and friendship of Lords Bute and Mansfield. If the squibs of his political opponents in after-life are to be trusted, his endeavours at the commencement of his career to forget his national accent were not very successful; while his friends asserted, perhaps truly, that he only retained enough of it to give increased effect to his oratory.

After having been called to the degree of serjeant-at-law, with the rank of king's counsel, he was promoted in January, 1771, to the office of solicitor-general, and in June, 1773, to that of attorney-general: the duties of these posts he is said to have discharged with a mildness and moderation which procured him universal approbation, though his inveterate hostility to Franklin, and the overwhelming bitterness of his language before the privy-council in 1774, are justly held to detract considerably from his merit. Mr. Wedderburn first sat in parliament for the Inverary district of burghs, and in 1774, being chosen simultaneously for Castle Rising and Oakhampton, made his election for the latter; in 1778 he was elected for Bishop's Castle. Throughout his career in the House of Commons he was a powerful support to the ministry of Lord North, not only by his eloquence, but by the great extent of his legal, jurisprudential, and parliamentary knowledge. His merits as a statesman are of course estimated very differently by contemporary party writers. Churchill has embalmed him in the well-known quatrain:—

"Mute at the bar, and in the senate loud,
Dull 'mongst the dullest, proudest of the proud,
A pert, prim prater, of the northern race,
Guilt in his heart, and famine in his face."

¹ "Wedderburnus morum probitate iudices, iudices clienti conciliabat, dicendum suavitatem eos corrumpere potuisset si voluisset; nihil autem ille in facto nisi quod verum, nec in iure nisi quod iustum, patheticè, urgebat; Cicerois lectioni semper incumbere; unde illi dicendi genus uniforme et flexanimum; ex junioribus tamen nullum illum eloquium decorabat, famaue fugientem prosequatur."

Yet even Junius has allowed that his character was respected, and that he possessed the esteem of society. Sir Egerton Brydges says: "Lord Rosslyn appeared to be a man of subtle and plausible, rather than solid talents. His ambition was great, and his desire of office unlimited. He could argue with great ingenuity on either side, so that it was difficult to anticipate his future by his past opinions. These qualities made him a valuable partisan, and a useful and efficient member of any administration." One public service of high value is always allowed to Mr. Wedderburn. During the celebrated metropolitan riots in 1780, when the municipal power had proved so inadequate to the occasion, and the conflagration of the whole capital seemed to be threatened, a privy-council was held by the king, who asked Mr. Wedderburn for his official opinion. Mr. Wedderburn stated in the most precise terms that any such assemblage of depredators might be dispersed by military force without waiting for forms or reading the riot-act. "Is that your declaration of the law as attorney-general?" asked the king; Mr. Wedderburn answering directly in the affirmative, "Then let it so be done," replied his majesty; and the attorney-general immediately drew up the order by which the rioters were in a few hours dispersed, and the metropolis saved.

In June of the year last mentioned Mr. Wedderburn was called to the privy-council, raised to the bench as lord chief-justice of the Court of Common Pleas, and to the peerage as Lord Loughborough, Baron of Loughborough, in the county of Leicester. He had occasion in his judicial character to charge the jury sitting under the commission for the trial of the rioters; and it is allowed that the address was one of the finest specimens of reasoned eloquence that had ever been delivered in that situation, though some have objected that, both on this and on other occasions, his Scottish education inclined him too much towards the principles and modes of the civil law, inculcating greater latitude than by the precision of the English law was warranted.

In April, 1783, Lord Loughborough united with his friend Lord North in forming the celebrated coalition ministry, in which he held the appointment of first commissioner for keeping the great seal; but the reflections so justly levelled at many of the coalesced leaders did not apply to the "wary Wedderburn," for he had never uttered any opinion depreciatory of the talents or character of Mr. Fox. From the breaking up of this ministry his lordship remained out of office till the alarm of the French revolution separated the heterogeneous opposition which its remnants had formed for nearly ten years against Mr. Pitt, under whom he accepted office, January 27, 1793, as lord high-chancellor. He filled that important station for eight years, "not perhaps," says Brydges, "in a manner perfectly satisfactory to the suitors of his court, nor always with the highest degree of dignity as speaker of the upper house, but always with that pliancy, readiness, ingenuity, and knowledge, of which political leaders must have felt the convenience, and the public duly appreciated the talent. Yet his slender and flexible eloquence," continues this elegant writer, "his minuter person, and the comparative feebleness of his bodily organs, were by no means a match for the direct, sonorous, and energetic oratory, the powerful voice, dignified figure, and bold manner of Thurlow, of whom he always seemed to stand in awe, and to whose superior judgment he often bowed against his will."

Lord Loughborough having been twice married without issue, and his first patent having been

limited to heirs-male, a new patent was granted to him in 1795, by which his nephew, Sir James Sinclair Erskine of Alva, was entitled to succeed him. On resigning the chancellorship in April, 1801, his lordship was created Earl of Rosslyn, in the county of Mid-Lothian, with the same remainders. He now retired from public life, but continued to be a frequent guest of his sovereign, who never ceased to regard him with the highest esteem. During the brief interval allowed to him between the theatre of public business and the grave, he paid a visit to Edinburgh, from which he had been habitually absent for nearly fifty years. With a feeling quite natural, perhaps, but yet hardly to be expected in one who had passed through so many of the more elevated of the artificial scenes of life, he caused himself to be carried in a chair to an obscure part of the Old Town, where he had resided during the most of his early years. He expressed a particular anxiety to know if a set of holes in the paved court before his father's house, which he had used for some youthful sport, continued in existence, and on finding them still there, it is said that the aged statesman was moved almost to tears.¹ The Earl of Rosslyn died at Bayles in Berkshire, January 3, 1805, and was interred in St. Paul's Cathedral. A portrait of his lordship, painted by Reynolds, was engraved by Bartolozzi. He wrote, in early life, critiques on Barclay's *Greek Grammar*, the *Decisions of the Supreme Court*, and the *Abridgment of the Public Statutes*, which appeared in the *Edinburgh Review*, 1755. In 1793 he published a treatise on the management of prisons, and subsequently a treatise on the English poor-laws, addressed to a clergyman in Yorkshire.

WEDDERBURN, DAVID, a poet of considerable eminence, was born probably about the year 1570. Neither the place of his birth nor his parentage has been ascertained. Of the latter all that is known is that his mother was buried in St. Nicholas Church at Aberdeen in 1635.² It is highly probable from various circumstances that Wedderburn was educated in the city just named, and that he studied either in King's, or in the newer institution, Marischal College. In 1602 a vacancy occurred in the grammar-school of Aberdeen, by the death of Thomas Cargill, a grammarian of great reputation, and author of a treatise on the Gowrie conspiracy, now apparently lost. After an examination which lasted four days and extended to "oratorie, poesie, and composition in prois and verss," Wedderburn and Mr. Thomas Reid, afterwards the well-known Latin secretary to James VI., were appointed "co-equal and conjunct masters" of the institution, with salaries of £40 yearly, and the quarterly fees of the scholars limited to ten shillings. They were inducted into this office by "delivery to thame of ane grammar buke."³ Early in 1603 Wedderburn appeared before the town-council, and stated, that being "urgit and burdenit be the lait provincially assamblee of ministers, hauldin at this burgh, to accept upon him the function of ane minister of Goddis word, he wes resolvit to enter in the said function and obey God, calling him thairto be the said assamblee, and to leave and desert the said schooll," and concluded by craving leave to demit his office. This the council granted, and accompanied it with a testimonial of his faithful discharge of his duty; but, from what cause is now unknown, Wedderburn in the same year resumed his

office. Before he had retained it twelve months, a complaint was lodged against him for making exorbitant claims on the scholars for fees, charity on Sundays, "candle and bent siller." These exactions were repressed by the magistrates, and in 1619 the quarterly fees were advanced from ten shillings to thirteen shillings and fourpence. Several years before this, in 1612, his scholars distinguished themselves by an act of mutiny of the boldest nature. In conjunction with the other scholars of the town, they took possession of the song or music school, and fortified themselves within it. Being armed with guns, hagbutts, and pistols, they boldly sallied forth as occasion required, and, attacking the houses of the citizens, broke open the doors and windows, "and maisterfullie away took their foulis, pultrie, breid, and vivaris." They also intercepted the supplies of fuel and provisions intended for the city markets, and continued in this state of open insurrection for two days, when they submitted to the authority of the magistrates, who punished the ring-leaders by imprisonment, and banished twenty-one of their associates from all the city schools.¹

In 1614, on the death of Gilbert Gray, principal of Marischal College, Wedderburn was appointed to teach "the high class" of the university, probably meaning the class then usually taught by the principal. In 1617 appeared the first of his publications, two poems on the king's visit to Scotland in that year, the one entitled *Syncephranterion in Reditu Regis in Scotiam*, 1617, and the other *Propempticon Caritatum Abredonensium*. Both these poems (along with five others by the author) were reprinted in the *Delitiae Poetarum Scotorum*, and the last of these, composed at the request of the magistrates, procured him a donation of fifty merks. In 1619 he was appointed to teach a lesson in humanity once a week to the students of Marischal College, from such authors as the magistrates might select, and also to compose in Latin, both in prose and verse, an essay on the common affairs of the city. For this he was to receive a salary of eighty merks per annum. In 1625 he wrote a poem on the death of James VI., which was printed at Aberdeen by Edward Raban, under the title of "*Abredonia Atrata sub Obitum Scruississimi et Potentissimi Monarchæ Jacobi VI.*, Abredoniae, 1625," 4to, pp. 12. This was dedicated "Ad Amplissimos Curie Abredonensis Primatus," and is now so rare as to be priced at two guineas. In 1630 he completed the writing of a new grammar for the use of his pupils, and received from the magistrates a reward of £100 Scots. It was found, however, that this work could "neither be prentit nor publisht for the use of young schollaris, whome the same concernis, unto the tyme the same resaiue approbatione frome the lordis of counsall." In consequence of this, the magistrates "thocht meit and expede, that the said Mr. David address himself with the said wark to Edinburgh, in all convenient diligence, for procuring the saidis lordis their approbation thairto, and ordanis the soume of ane hundred pundis moe to be debursit to him be the tounis thesaurar for making of his expens in the sudeward."² It is unknown whether Wedderburn succeeded in procuring the license of the privy-council; but if published no copy of this "gramer newly reformed" seems to have been preserved. In 1635 Wedderburn lost a friend and patron in the learned Patrick Forbes of Corse, Bishop of Aberdeen; and among the many distinguished contributors to that prelate's *Funerals* we find the name of "David Wedderburnus Latine

Scholæ in Urbe Nova Abredoniae Præfectus." In 1640 he was so borne down by bodily infirmity that he was allowed to retire from the rectorship of the grammar-school on a pension of 200 merks annually. The succeeding year he was called on to mourn the death of the celebrated Arthur Johnston, with whom he had lived in the closest friendship. One of the most beautiful of Johnston's minor poems was addressed "Ad Davidem Wedderburnum, amicum veterem," and drew forth a reply from Wedderburn of equal elegance. He thus speaks of their friendship:—

"Noster talis amor; quem non (pia numina testor)
Ulla procelloso turbine vincit hiems.
Absit! ut Æacides palmam vel fidus Achates
Hanc tibi præripiat, præripiatve mihi."

And Johnston dwells with much feeling on their early intimacy:—

"Aptius at vestræ, tu Wedderburne, senectæ
Consulis, et, quæ fert dura senectæ malis.
Dum mihi te sisto, dum, quos simul egimus annos,
Mente puto, mutor, nec mihi sum quod eram.
Æsona carminibus nutavit Colchis et herbis;
Hac juvenem tremulo de senec fecit opes.
Colchidis in morem, veteri tu reddes amico,
Qui pede veloci præteriere dies.
Tempora dum recole tecum simul acta juventæ
Me mihi restituens, ipsa juvenata redit.
Colchida tu vincis: longo molimine Colchis
Quod semel ausa fuit, tu mihi sæpè facis."

On the death of this valued friend, Wedderburn published six elegies, under the title of "*Sub Obitum Viri Clarissimi et Carissimi D. Arcturi Johnstoni, Medici Regii, Davidis Wedderburni Suspiria—Abredoniae, 1641.*" This tract has since been reprinted by Lauder in his *Postarum Scotorum Musæ Sacrae*, Edinburgh, 1731. Two years after the publication of his *Suspiria* he published, at Aberdeen, "*Meditationum Campestrium, seu Epigrammatum Moralium, Centuriæ Duæ;*" and in the following year, 1644, appeared *Centuria Tertia*. Both these works are from the press of Edward Raban, and are of great rarity. It is probable that they were the last compositions of their author which were printed in his lifetime, if we except some commendatory verses to a treatise *De Arte Conservandi Sanitatem*, published at Aberdeen in 1651. Though the precise year of Wedderburn's death has escaped our researches, it may be fixed within a few years from this last date. In 1664 his brother, Alexander, gave to the world "*Persius Enucleatus, sive Commentarius exactissimus et maxime perspicuus in Persium, Poetarum omnium difficillimum, Studio Davidis Wedderburni, Scoti Abredonensis—Opus Posthumum; Amstelodami,*" 12mo. Besides the works now enumerated, Wedderburn was the author of a great number of commendatory poems and elegiac verses. His learning has been celebrated by Vossius, who styles him "homo eruditissimus beneque promerens de studiis juventutis." His reputation is attested by the terms on which he lived with many of the most eminent persons of his time. His intimacy with Arthur Johnston and Bishop Patrick Forbes has been already mentioned; the well-known Secretary Reid was his coadjutor; and he counted among his friends Jameson the painter, William Forbes, Bishop of Edinburgh, Gilbertus Jacobæus, Duncan Liddel, Baron Dun, Ramsay, Ross, and many other illustrious individuals. His poems show in every line an intimate acquaintance with the classic writers, and are filled with happy allusions to ancient history and fable. His verses, indeed, are more to be admired for their learning than for their feeling; he has nowhere succeeded in reaching the highest flights of poetry, and has frequently sunk into common-place and bathos. But it is impossible to withhold admiration from the ease and elegance of his Latinity, the

epigrammatic vivacity of his style, or the riches of classical lore with which he has adorned his pages.

WEDDERBURN, JAMES, a poet of the sixteenth century, was born in Dundee about the year 1500, and is supposed to have belonged to the family which afterwards produced the Earl of Rosslyn. He wrote three poems, beginning respectively with the following lines: "My love was fals and full of flatterie," "I think thir men are verie fals and vain," "O man, transformit and unnaturall," which are to be found with his name in the Bannatyne Manuscript. Wedderburn appears to have early espoused the cause of the Reformation. In two dramatic compositions, a tragedy on the beheading of John the Baptist, and a comedy called *Dionysius the Tyrant*, which were represented at Dundee about the year 1540, he exposed to ridicule and execration the corruptions of the Church of Rome; both compositions, however, are now lost. It seems to have been before 1549 that he composed his celebrated "*Buik of Godlie and Spiritual Sangs*, collected out of Sundrie Parts of Scripture, with Sundrie of uther Ballates, changed out of Profane Sangs for avoyding of Sinne and Harlotrie;" as though no edition of it before that of Smyth in 1599 is in the hands of modern antiquaries, it seems to be denounced in a canon of the provincial council of the clergy held in 1549, and for certain is alluded to in a manuscript *Historie of the Kirk*, dated in 1560. The *Buik of Godlie and Spiritual Sangs*, though allowed to have been a most effectual instrument in expelling the old and planting the new religion, appears to modern taste as only a tissue of blasphemy and absurdity, the *Sangs* being chiefly parodies of the coarse and indecent ballads of the common people, retaining the general structure and music, with much of the very language of the originals, and thus associating the most sacred and the most profane images.

That extraordinary book, the *Complaynt of Scotland*, which appeared at St. Andrews in 1548, without the name of either author or printer, has been ascribed to Wedderburn in the *Harleian Catalogue*; nor does it appear that the claims of Mackenzie for Sir James Inglis, or those of Leyden for Sir David Lindsay, can stand for a moment against the probabilities of this supposition. Inglis, it is hardly possible to deny, was murdered in 1530, eighteen years before the composition and publication of the *Complaynt*; and so little confidence had Leyden himself in the theory which he employed nearly 300 pages to support, that he candidly confesses, at the close of his dissertation, "he scarcely expects his remarks to produce conviction."

Previously to the introduction of the version of Sternhold and Hopkins into Scotland, in 1564, the reformed congregations sang versions of twenty-one psalms, and paraphrases of the Lord's prayer, creed, and commandments, which had been executed for that purpose by the subject of this memoir. Two verses of his translation of the 137th Psalm may be given as a specimen of his manner:—

"At the rivirs of Babylon,
Quhair we dwelt in captivite,
Quhen we rememberit on Syon,
We weipit al full sorrowfullie.
On the sauch tries our harpes we hang,
Quhen thay requirit us an sang.
They hald us into sic thraldome,
They bad us sing sum psalme or hymme,
That we in Syon sang sum tyme:
To quhome we answerit full sunne:

Nocht may we outhir play or sing,
The psalmis of our Lord sa sweit,
Intill an uncouth land or ring [kingdom],
My richt hand first sall that forleit,

Or Jerusalem foryettin be:
Fast to my chafis my tung sall be
Claspit, or that I lit forget.
In my maist gladnes and my game,
I sall remember Jerusalem,
And all my hart upon it set."

Wedderburn is said to have ultimately gone to England, where he died in 1564-5.

WELCH, JOHN, a celebrated divine of the seventeenth century, was born about the year 1570. His father was a gentleman of considerable note in Nithsdale, where he possessed a pretty extensive and valuable estate called Collieston. The outset of Mr. Welch's career was an extraordinary one, and presents one of the most striking and singular contrasts of conduct and disposition in one and the same person at different periods of life which can perhaps be found in the annals of biography. This faithful and exemplary minister of the church (for he became both in an eminent degree) began the world by associating himself with a band of border thieves. While at school he was remarkable for the unsteadiness of his habits, and an utter disregard of the benefits of instruction and the admonitions of his friends and preceptors. He was also in the practice of absenting himself, frequently and for long periods, from school, a habit in which he indulged until it finally terminated in his not only abandoning the latter entirely, but also his father's house, and betaking himself to the borders, where, as already noticed, he joined one of those numerous bands of freebooters with which those districts were then infested. Whether, however, it was that a better spirit came over the young prodigal, or that he found the life of a border marauder either not such as he had pictured it, or in itself not agreeable to him, he soon repented of the desperate step he had taken, and resolved on returning to his father's house.

In pursuance of this resolution he called, on his way homewards, on one of his aunts, who lived in Dumfries, with the view of making her a mediator between himself and his offended father, an office which she undertook and accomplished in the course of an accidental visit which young Welch's father paid her whilst his son was still under her roof. The former, however, had anticipated a very different issue to his son's profligate courses, for, on a sort of trial question being put to him by the young man's aunt, previously to her producing him, whether he had heard anything lately of John, he replied, "The first news I expect to hear of him is, that he is hanged for a thief." On the reconciliation with his father being effected, young Welch entreated him, with many protestations of future amendment, all of which he afterwards faithfully implemented, to send him to college. With this request his father complied, and the young convert gave him no reason to repent of his indulgence. He became a diligent student, and made such rapid progress in the learning of the times that he obtained a ministerial settlement at Selkirk before he had attained his twentieth year. His stay here, however, was but short, as, for some reason which has not been recorded, he seems to have been an object of dislike and jealousy both to the clergy and lay gentlemen of the district in which he resided. It is not improbable that his former life was recollected to his disadvantage, and that this was, at least in some measure, the cause of their enmity. But whatever the cause was, it is certain that it is not to be found in his conduct, which was now exemplary, both in a moral and religious point of view. The latter, indeed, was of an extraordinary character. It was marked by an intensity and fervour, an unremitting and indefatig-

gable zeal, which has been but rarely equalled in any other person, and never surpassed. He preached publicly once every day, prayed, besides, for seven or eight hours during the same period, and did not allow even the depth of the night to pass without witnessing the ardency and enthusiasm of his devotions. Every night before going to bed he threw a Scotch plaid above his bed-clothes, that, when he awoke to his midnight prayers, it might be in readiness to wrap around his shoulders. These devotional habits he commenced with his ministry at Selkirk, and continued to the end of his life. Finding his situation a very unpleasant one, Mr. Welch readily obeyed a call which had been made to him from Kirkcudbright, and lost no time in removing thither. On this occasion a remarkable instance occurred of that unaccountable dislike with which he was viewed, and which neither his exemplary piety nor upright conduct seems to have been capable of diminishing. He could not find any one person in the whole town excepting one poor young man of the name of Ewart, who would lend him any assistance in transporting his furniture to his new destination. Shortly after his settlement at Kirkcudbright Mr. Welch received a call from Ayr. This invitation he thought proper also to accept, and proceeded thither in 1590.

Some of the details of this period of Mr. Welch's life afford a remarkably striking evidence of the then rude and barbarous state of the country. On his arrival at Ayr, so great was the aversion of the inhabitants to the ministerial character, and to the wholesome restraints which it ought always to impose, that he could find no one in the town who would let him have a house to live in, and he was thus compelled to avail himself of the hospitality of a merchant of the name of Stewart, who offered him the shelter of his roof. At this period, too, it appears that the streets of Ayr were constantly converted into scenes of the most sanguinary combats between factious parties, and so frequent and to such an extent was this murderous turbulence carried that no man could walk through the town with safety.

Among the first duties which Mr. Welch imposed upon himself after his settlement at Ayr, was to correct this ruthless and ferocious spirit, and the method he took to accomplish his good work was a singular, but, as it proved, effectual one. Regardless of the consequences to himself, he rushed in between the infuriated combatants, wholly unarmed, and no otherwise protected from any accidental stroke of their weapons than by a steel cap which he previously placed on his head on such occasions. When he had, by this fearless and determined proceeding, succeeded in staying the strife, he ordered a table to be covered in the street, and prevailed upon the hostile parties to sit down and eat and drink together, and to profess themselves friends. This ceremony he concluded with prayer and a psalm, in which all joined. The novelty of this proceeding, the intrepidity of its originator, and above all the kind and Christian-like spirit which it breathed, soon had the most beneficial effects. The evil which Mr. Welch thus aimed at correcting gradually disappeared, and he himself was received into high favour by the inhabitants of the town, who now began to reverence his piety and respect his worth. While in Ayr Mr. Welch not only adhered to the arduous course of devotional exercise which he had laid down for himself at Selkirk, but increased its severity, by adopting a practice of spending whole nights in prayer in the church of Ayr, which was situated at some distance from the town, and to which he was in the habit of repairing alone for this pious purpose. Among the

other objects of pastoral solicitude which particularly engaged Mr. Welch's attention during his ministry at Ayr was the profanation of the Sabbath, one of the most prominent sins of the place. This he also succeeded in remedying to a great extent by a similarly judicious conduct with that he observed in the case of feuds and quarrels. This career of usefulness Mr. Welch pursued with unwearied diligence and unabated zeal till the year 1605, when on an attempt on the part of the king (James VI.) to suppress General Assemblies, and on that of the clergy to maintain them, he, with several more of his brethren, was thrown into prison for holding a diet in opposition to the wishes of the court of delegates of synods, of which Mr. Welch was one, at Aberdeen. For this offence they were summoned before the privy-council, but declining the jurisdiction of that court in their particular case, they were indicted to stand trial for high-treason at Linlithgow. By a series of the most unjust, illegal, and arbitrary proceedings on the part of the officers of the crown, a verdict of guilty was obtained against them, and they were sentenced to suffer the death of traitors. The conduct of the wives of the condemned clergymen, and amongst those of Mrs. Welch in particular, on this melancholy occasion, was worthy of the brightest page in Spartan story. They left their families and hastened to Linlithgow to be present at the trial of their husbands, that they might share in their joy if the result was favourable, and that they might inspire them with courage if it were otherwise. On being informed of the sentence of the court, "these heroines," says Dr. M'Crie, "instead of lamenting their fate, praised God, who had given their husbands courage to stand to the cause of their Master, adding, that like him, they had been judged and condemned under the covert of night." If spirit be hereditary, this magnanimous conduct, on the part of Mrs. Welch at any rate, may be considered accounted for by the circumstance of her having been the daughter of John Knox. She was the third daughter of that celebrated person. Either deterred by the popularity of the prisoners, and the cause for which they suffered, or satisfied with the power which the sentence of the court had given him over their persons, James, instead of bringing that sentence to a fatal issue, contented himself with commuting it into banishment; and on the 7th November, 1606, Mr. Welch, accompanied by his wife and his associates in misfortune, sailed from Leith for France, after an imprisonment of many months' duration in the castles of Edinburgh and Blackness. So great was the public sympathy for these persecuted men, that though the hour of their embarkation was as early as two o'clock of the morning, and that in the depth of winter, they were attended by a great number of persons who came to bid them an affectionate farewell. The parting of the expatriated men and their friends was solemn and characteristic, prayers were said, and a psalm (the 23d), in which all who were present joined, was sung.

On his arrival in France Mr. Welch immediately commenced the study of the language of the country, and such was his extraordinary diligence, and his anxiety to make himself again useful, that he acquired in the short space of fourteen weeks such a knowledge of French as enabled him to preach in it. This attainment was soon after followed by a call to the ministry from a Protestant congregation at Nerac. Here, however, he remained but for a short period, being translated to St. Jean d'Angely, a fortified town in Lower Charente, where he continued to reside during the remainder of his stay in France, which was upwards of fourteen years.

While living at St. Jean d'Angely, Mr. Welch evinced, on an occasion which called for it, a degree of courage in the field not less remarkable than that which distinguished him in the pulpit. A war having broken out between Louis XIII. and his Protestant subjects, the former besieged the town in person. During the siege Mr. Welch not only exhorted the inhabitants to make a determined and vigorous resistance, but took his place upon the walls of the city, and assisted in serving the guns. When the town capitulated, which it finally did, in terms of a treaty entered into with the besiegers, the French monarch ordered Mr. Welch, who, with characteristic intrepidity continued to preach, to be brought before him. The messenger whom he despatched for this purpose was the Duke d'Espernon, who entered the church in which Mr. Welch was at the moment preaching, with a party of soldiers to take him from the pulpit. On perceiving the duke enter, Mr. Welch called out to him in a loud and authoritative tone to sit down and hear the word of God. The duke instinctively or unconsciously obeyed, and not only quietly awaited the conclusion of the sermon, but listened to it throughout with the greatest attention, and afterwards declared himself to have been much edified by it. On being brought into the presence of the king, the latter angrily demanded of Mr. Welch how he had dared to preach, since it was contrary to the laws of the kingdom for such as he to officiate in places where the court resided. Mr. Welch's reply was bold and characteristic. "Sir," he said, "if your majesty knew what I preached, you would not only come and hear it yourself, but make all France hear it; for I preach not as those men you used to hear. First, I preach that you must be saved by the merits of Jesus Christ, and not your own (and I am sure your conscience tells you that your good works will never merit heaven); next, I preach that, as you are king of France, there is no man on earth above you; but these men whom you hear subject you to the pope of Rome, which I will never do." This last remark was so exceedingly gratifying to the king, that it had the effect not only of disarming him of his wrath, but induced him to receive the speaker instantly into his royal favour. "Very well," replied Louis, "you shall be my minister;" and to these expressions of good-will he added an assurance of his protection, a pledge which he afterwards amply redeemed. When St. Jean D'Angely was again besieged by the French monarch in 1621, he ordered the captain of his guard to protect the house and property of "his minister," and afterwards supplied him with horses and waggons to transport his family to Rochelle, whither he removed on the capture of the town.

Mr. Welch was at this period seized with an illness which his physicians declared could be removed only by his returning to breathe the air of his native country. Under these circumstances he ventured, in 1622, to come to London, hoping that when there he should be able to obtain the king's permission to proceed to Scotland. This request, however, James, dreading Welch's influence, absolutely refused. Among those, and they were many, who interceded with the king in behalf of the dying divine, was his wife. On obtaining access to James the following extraordinary, but highly characteristic conversation, as recorded by Dr. M'Crie in his *Life of Knox*, took place between the intrepid daughter of the stern reformer and the eccentric monarch of England: His majesty asked her, who was her father. She replied, "Mr. Knox." "Knox and Welch," exclaimed he, "the devil never made such a match as that." "It's right like, sir," said she, "for we never spired his

advice." He asked her how many children her father had left, and if they were lads or lasses. She said three, and they were all lasses. "God be thanked!" cried the king, lifting up both his hands, "for an they had been three lads, I had never bruicked my three kingdoms in peace." She again urged her request that he would give her husband his native air. "Give him his native air!" replied the king. "Give him the devil!" a morsel which James had often in his mouth. "Give that to your hungry courtiers," said she, offended at his profaneness. He told her at last, that if she would persuade her husband to submit to the bishops, he would allow him to return to Scotland. Mrs. Welch, lifting up her apron and holding it towards the king, replied, in the true spirit of her father, "Please your majesty, I'd rather keep his head there."

Although James would not permit Mr. Welch to return to Scotland, he was prevailed upon by the friends of the latter, though not without much importunity, to allow him to preach in London. They had entreated this as an alternative in the event of his refusing him permission to return to his native country, and they eventually succeeded in obtaining from James a reluctant consent. On learning that this indulgence had been granted him, the dying preacher, for his complaint was rapidly gaining ground upon him, hastened to avail himself of it. He appeared once more in the pulpit, preached a long and pathetic sermon; but it was his last. When he had concluded his discourse he returned to his lodging, and in two hours afterwards expired, in the 53d year of his age. It is said that Mr. Welch's death was occasioned by an ossification of the limbs, brought on by much kneeling in his frequent and long-protracted devotional exercises. Like many of the eminently pious and well-meaning men of the times in which he lived, Mr. Welch laid claim to the gift of prescience, and his life, as it appears in the *Scots Worthies*, compiled by Howie of Lochgoin, presents a number of instances of the successful exercise of this gift; but no one now who has any sincere respect for the memory of such truly worthy persons and sincere Christians as Mr. Welch, can feel much gratified by seeing him invested, by a mistaken veneration, with an attribute which does not belong to humanity.

WELLWOOD, SIR HENRY MONCRIEFF, BARONET, D.D., an eminent divine, was born at Blackford near Stirling, in February 1750. He was the eldest son of Sir William Moncrieff, Bart., minister of the parish just named; a man of singular merits and virtues, and who possessed an influence over his parishioners and in the surrounding country which these alone could bestow.

The subject of this memoir was destined from an early age, as well by his own choice as the desire of his father, to the clerical profession; and with this view he repaired to the university of Glasgow, after completing an initiatory course of education at the parochial school of Blackford. Having given a due attendance on the literary and philosophical classes in the university, Sir Henry entered on the study of theology, in which he made a progress that raised the highest hopes of his future eminence; and these hopes were not disappointed. About this period he had the misfortune to lose his venerable father, who sank into a premature grave: but the esteem in which that good man was held did not die with him. All those who had any influence in the appointment of a successor to his charge, unanimously resolved that his son should be that person; and further, that as he had not yet attained the age at which he could,

according to the rules of the church, be licensed and ordained, the vacancy should be supplied by an assistant, until that period arrived. On the completion of this arrangement, which took place in 1768, Sir Henry removed to Edinburgh, where he prosecuted his studies to their close, distinguishing himself among his fellow-students by the superiority of his talents, and continuing to inspire his friends with the most sanguine hopes of the success of his future ministry.

Having attained the prescribed age, he was licensed to preach the gospel, although he had not yet completed the required term of attendance at the divinity hall; and immediately after was ordained, 15th August, 1771, to the church of his native parish. The singular talents of the young preacher, however, did not permit of his remaining long in so obscure a charge as that of Blackford. On the occurrence of a vacancy in the extensive and populous parish of St. Cuthbert's, Edinburgh, Sir Henry Moncrieff, whose personal worth and extraordinary abilities were already known and appreciated in the capital, was called upon to supply it. Into this charge he was inducted in October, 1775, about four years after his ordination and settlement at Blackford. The subsequent life of Sir Henry Moncrieff, though remarkable for an exemplary and unwearied diligence in the discharge of the laborious duties of his office, and for a continued display, on his part, of every excellence and virtue which can adorn the human character, presents little of which the biographer can avail himself. Holding on the "even tenor of his way," and neither turning to the right nor to the left, but still anxiously promoting the interests of religion by his eloquence, and of morality by his example, Sir Henry Moncrieff was one of those great and good men who are content to confine the exercise of their talents—of talents which, if they had been directed by ambition, might have procured them a more dazzling fame—to the immediate duties of their calling, and who think that the high intellectual powers with which they have been gifted cannot be more usefully or more appropriately employed than in extending the knowledge and promoting the happiness of those within the immediate sphere of their personal influence.

It was not inconsistent, however, with his duties as a minister of the Establishment, that he should take an active interest in the business of the church courts. At the period when he entered public life the Moderate party, headed by Drs. Robertson and Drysdale, had attained a complete and hardly resisted supremacy in the Scottish church. Sir Henry, however, instead of joining the party with which his secular rank might have been expected to connect him, took the opposite course, and soon rose, by the force of talent and character, assisted, but in no great degree, by his rank, to the situation of a leader in the more zealous party, over whom he ultimately acquired a control not more useful to their interests than it was honourable to himself. In 1780 he was proposed as moderator of the General Assembly, in opposition to Dr. Spens of Wemyss; the competition was keen, Dr. Spens being elected by a majority of only six votes: but in 1785 Sir Henry, being again a member of the General Assembly, was unanimously chosen moderator. Dr. Andrew Thomson, to whom in later life he yielded much of his influence in the church, has thus spoken, in his funeral sermon, of the public character of Sir Henry:—

"It was in early life that he began to take an active part in the government of our national church. The principles of ecclesiastical polity which he adopted as soon as he entered on his public career he adopted from full and firm conviction; and he

maintained, and cherished, and avowed them to the very last. They were the very same principles for which our forefathers had contended so nobly, which they at length succeeded in establishing, and which they bequeathed as a sacred and blood-bought legacy to their descendants. But though that circumstance gave a deep and solemn interest to them in his regard, he was attached to them on more rational and enlightened grounds. He viewed them as founded on the Word of God, as essential to the rights and liberties of the Christian people, as identified with the prosperity of genuine religion, and with the real welfare and efficiency of the Establishment. And therefore he embraced every opportunity of inculcating and upholding them; resisted all the attempts that were made to discredit them in theory, or to violate them in practice; rejoiced when they obtained even a partial triumph over the opposition they had to encounter; and clung to them, and struggled for them, long after they were borne down by a system of force and oppression; and when, instead of the numerous and determined host that fought by his side in happier times, few and feeble, comparatively, were those who seconded his manly efforts, and held fast their own confidence: but he lived to see a better spirit returning. This revival cheered and consoled him. Fervently did he long and pray for its continuance and its spread. Nor did he neglect to employ his influence in order to introduce pastors who would give themselves conscientiously to their Master's work, preaching to their flocks the truth as it is in Jesus, watching for souls as those that must give an account, and faithfully and fearlessly performing all the duties incumbent on them, both as ministers and as rulers in the church."

Sir Henry made a more successful opposition, especially towards the end of his life, to the dominant faction in the church than had been made for upwards of half a century before; and in more instances than one he left their leader, Principal Hill, in a minority. To his efforts, indeed, are to be ascribed, in a great measure, the introduction of evangelical doctrines into parts of the country from which they had for many years been excluded, the preponderance of evangelical ministers and elders in the church courts, and the consequent ascendancy of the popular party. Young men of piety and promise were always sure of his assistance and encouragement. In this respect many had reason to bless him; while the church at large has had reason to rejoice in his fidelity and wisdom. In the management of the Widow's Fund, established by act of parliament in the year 1744, Sir Henry took a deep interest, and acted as its collector for upwards of forty years. He was also one of the original members of the Society of the Sons of the Clergy, and by his influence and his exertions contributed largely to its success. He was, besides, a warm friend to every reasonably adjusted scheme that had for its object the amelioration of the moral and physical condition of mankind. In the year 1826 he was bereaved of his wife (Susan, daughter to Mr. James Robertson Barclay of Keavil, W.S., to whom he had been married in 1773, and who was his cousin); while his own health, which had been generally good, was also undergoing a decline. In the month of August of the following year (1827) Sir Henry himself died, after an illness of considerable duration. At the time of his death he was in the seventy-eighth year of his age, and the fifty-sixth of his ministry.

The personal character of Sir Henry Moncrieff was, in the highest degree, respectable, and his conduct, in every relation of life, most exemplary. He had thoroughly studied the whole scheme of the

1000

gospel; and from full and deliberate conviction, as well as from his experimental application to his own personal need, he threw himself, without pretension and without reserve, upon the peculiar doctrines of the church to which he belonged as those which could alone insure his eternal interests.

In his ministerial capacity he but rarely indulged in what is termed the pathetic; yet there was often, particularly towards the close of his life, a tenderness in his modes of expression, as well as in the accents of his voice, which came home to the heart with the energy of pathos itself. As an author Sir Henry was well known and highly esteemed. The works which give him a claim to this title are, a *Life of Dr. John Erskine*, three volumes of Sermons, and a small work on the *Constitution of the Church of Scotland*, which, as well as one of the volumes of sermons, was published posthumously. The first is an interesting record of the life of a most excellent and public-spirited minister, and contains much valuable information respecting ecclesiastical affairs in Scotland. The sermons abound with luminous expositions and practical applications of divine truth. All of these publications were well received by the public.

The following estimate of Sir H. Moncrieff's public character, by the late Lord Cockburn, in the *Life of Francis Jeffrey*, is too just and eloquent to be omitted:—"This eminent person was not merely distinguished among his brethren of the Church of Scotland, all of whom leaned upon him, but was in other respects one of the most remarkable and admirable men of his age. Small gray eyes, an aquiline nose, vigorous lips, a noble head, and the air of a plain hereditary gentleman, marked the outward man. The prominent qualities of his mind were strong integrity and nervous sense. There never was a sounder understanding. Many men were more learned, many more cultivated, and some more able. But who could match him in sagacity and mental force? The opinions of Sir Harry Moncrieff might at any time have been adopted with perfect safety without knowing more about them than that they were his. And he was so experienced in the conduct of affairs, that he had acquired a power of forming his views with what seemed to be instinctive acuteness, and with a decisiveness which raised them above being slightly questioned. Nor was it the unerring judgment alone that the public admired. It venerated the honourable heart still more. A thorough gentleman in his feelings, and immovably honest in his principles, his whole character was elevated into moral majesty. He was sometimes described as overbearing. And in one sense, to the amusement of his friends, perhaps he was so. Consulted by everybody, and of course provoked by many, and with very undisciplined followers to lead, his superiority gave him the usual confidence of an oracle; and this operating on a little natural dogmatism, made him sometimes seem positive, and even hard—an impression strengthened by his manner. With a peremptory conclusiveness, a shrill defying voice, and a firm concentrated air, he appeared far more absolute than he really was, for he was ever candid and reasonable. But his real gentleness was often not seen; for if his first clear exposition did not convince, he was not unapt to take up a short disdainful refutation, which, however entertaining to the spectator, was not always comfortable to the adversary. But all this was mere manner. His opinions were uniformly liberal and charitable, and when not under the actual excitement of indignation at wickedness or dangerous folly, his feelings were mild and benignant; and he liberalized his mind by that respectable intercourse

with society which improves the good clergyman, and the rational man of the world. I was once walking with him in Queen Street, within the last three years of his life. A person approached who had long been an illiberal opponent of his, and for whom I understood that he had no great regard. I expected them to pass without recognition on either side. But instead of this, Sir Harry, apparently to the man's own surprise, stopped, and took him by the hand, and spoke kindly to him. When they separated I said to Sir Harry that I thought he had not liked that person. 'Oh no! he's a foolish intemperate creature. But to tell you the truth, I dislike a man fewer every day that I live now.'" Lord Cockburn adds that Sir Harry's "great instrument of usefulness was his public speaking;" that he often rose in the pulpit into "great views and powerful declamation;" was "the noblest deliverer of prayers at striking funerals;" and in debate "a fearful man to grapple with;" that "his writing, though respectable, was feeble;" and that "had he not preferred his church to every other object, there was no public honour to which he might not have fought his way," as counsel, judge, head of public department, or parliamentary leader.

WELSH, REV. DAVID, D.D.—This distinguished scholar and divine, whom a great national event made the mark of general attention, notwithstanding his reclusive studious habits and unobtrusive disposition, was born at Praefoot, in the parish of Moffat, Dumfriesshire, on the 11th of December, 1793. His father, a substantial farmer and small landholder, had a family of twelve children, of whom David was the youngest. Being at an early period intended for the ministry, David, after receiving the earlier part of his education at the parish school of Moffat, went to Edinburgh, where he attended the high-school for a year, and afterwards became a student at the university. Here his progress, though considerable, was silent and retired, so that at first he was little noticed among his ardent competitors in Latin and Greek; it was not words, but thoughts, that chiefly captivated his attention, and therefore it was not until he had entered the classes of logic and philosophy that he began to attract the notice of his class-fellows. In the latter he was so fortunate as to have for his teacher Dr. Thomas Brown, the most acute and eloquent of metaphysicians, of whom he became not only the pupil, but the friend, and finally the affectionate biographer. The ardent attachment of the young student to such a preceptor, the enthusiasm with which he received his instructions, and docility with which he placed himself under the guidance of such a mind, not only already evinced the intellectual bent of David Welsh, but predicted his future eminence, and this more especially as he had already only entered his fifteenth year.

On joining the divinity hall, which he did in 1811, he brought to the study of theology all the reading and research of his former years; and although in substantial acquirements he was already considerably in advance of most young students of his early standing, they were accompanied with a shrinking bashfulness that prevented his superiority from being generally recognized. At this period it was of more than usual importance that divinity students should study the great questions of church polity, in refer-

¹There was really great justice (observes Lord Cockburn) in the remark of a little old north-country minister, who, proud both of himself as a member, and of the reverend baronet who was predominating in the Assembly, said to his neighbour, "Preserve me, sir! hoo that man Sir Harry does go on! He puts me in mind o' Jupiter among the lesser gods."

ence to their connection between the civil and ecclesiastical powers; for upon them, in their future character as ministers, that uncompromising conflict was to depend which was finally to end in the Disruption. But David Welsh had already embraced that party in the church to which he adhered through life. He was the descendant of a church-honoured line of Tweedsmuir sheep-farmers, who had suffered in the days of the Covenant for their adherence to the spiritual independence of the kirk against the domination of Erastianism and the Stuarts, and these principles had descended to him not only with a sacred but hereditary claim. After having studied theology during the prescribed period of four years, he was licensed as a preacher by the presbytery of Lochmaben in May, 1816. As he was still young, having only reached his twenty-second year, he was in no haste to enter upon the important duties of the ministry; instead of this, he resumed the work of self-improvement, and continued to add to his store of knowledge as well as experience of the world. Among these studies the exact sciences held a conspicuous place—geometry, algebra, and natural philosophy. Nor among these should the study of phrenology be forgot, to which he had become a convert through the arguments of its talented apostle Mr. Combe. There was something in this fresh and tempting science so congenial to his own favourite study of the human mind—and it was so felicitous, as he judged, in its plan of decomposing so complex a thing as a human character into its simple primitive elements—that he soon became one of the most distinguished as well as enthusiastic students of phrenology, while his name, after he was noted as a learned, philosophical, and orthodox country minister, was a tower of strength to the science, under the charges of infidelity and materialism that were brought against it. These charges indeed became at last too serious to be disregarded, and Mr. Welsh, in after-life, became a less zealous and open advocate of the cause. Still, however, he was not to be shaken from his belief in phrenology in consequence of the injudicious uses that had been made of it, and therefore to the end he continued a firm believer at least in its general principles and application. These he used in his processes of self-examination, and doubtless derived much benefit from the practice. Not content with feeling himself weak or sinful in the gross, and condemning himself in wholesale terms, he tasked himself sternly in particulars, and for this purpose took himself to pieces, and examined bit by bit the origin of the offence or deficiency. Conscience presented to him his own likeness mapped all over like a phrenological cast; and thus, while recording in his private journal whatever was amiss, each fault is specified, not by its general name, but by its number. It would be well if phrenologists in general would turn the science to such a good account.

After having been nearly five years a licentiate, Mr. Welsh was ordained minister of the parish of Crossmichael, on the 22d of March, 1821. His presentation was highly honourable to the patron as well as himself; for while the latter was a Whig, the former was a Tory, and at this time political feeling was near its height; so that the young minister owed his promotion to that superiority of character which he had already acquired, and which the patron showed himself well fitted to appreciate. On entering upon the duties of a country minister, Mr. Welsh had two weighty obstacles to encounter, which would have marred the popularity of most persons thus circumstanced. The first arose from the state of his health, which was always delicate;

so that the task of public speaking, so easy to the robust, was with him a work of labour, and often of pain. The other originated in the studious reflective habits he had already found so congenial to his nature, and which could ill brook the daily and hourly demands of commonplace parochial business. But the physical obstacles and intellectual predilections were equally sacrificed upon the altar of duty, and he soon became a most popular and useful preacher, as well as a painstaking minister. Independently, too, of his ministerial duties, in which he was so zealous and successful, Mr. Welsh still continued to be a diligent student, and one of his first, as well as the most distinguished of his literary labours, was his *Life of Dr. Thomas Brown*, professor of moral philosophy in the university of Edinburgh, who had been the guide of his early studies, and friend of his more advanced years. This congenial task he undertook not only from grateful affection, but in consequence of the urgent request of Dr. Brown's friends, who thought that the office could not be intrusted to better hands. It is enough to state respecting the merits of this biographical work, that it was worthy of the man whom it commemorated, as well as a profound and luminous exposition of the ethical and metaphysical principles which he had so eloquently taught as a professor; "and in holding converse," it may be added, in the words of a competent critic—"in holding converse through his memoir with the biographer himself, as well as with its interesting subject, one cannot avoid being infected with a portion of the same earnest and beautiful enthusiasm which animates so evidently alike the silent inquiries of the master, and kindles the admiration of his accomplished disciple." While engaged in writing this work, the author also resolved, when it was finished, to produce a treatise on logic, a design, however, which was never executed. In the meantime his studies were continued, not only among his old, but among new fields of research; and in the latter was political economy, one of the most important, but withal most difficult of modern sciences. The subject of education, also, as a science, engaged at this time his close attention, from the accident of the well-known Dr. Bell having become one of his neighbours and acquaintances; and in consequence of these inquiries, Mr. Welsh was enabled to turn his knowledge to an excellent practical account in the superintendence of schools, when his sphere of operation was transferred from a small secluded parish to the educational wants of a crowded city.

And that period of transference was not long delayed. It was soon evident, from the superior talents of the minister of Crossmichael, that he was fitted for a still more important situation than that which he now occupied. Accordingly, a vacancy having occurred in the church of St. David's, Glasgow, Mr. Welsh, whose reputation was already known, was invited by the town-council of Glasgow to occupy the charge. He accepted the offer, and was inducted toward the close of 1827. In this new field he found full scope for his talents, and was quickly distinguished, not only as an eloquent and useful preacher, but a most effective promoter of the interests of education, now become of paramount importance in such an overcrowded manufacturing city. Here also he found that cheering and strengthening intercourse of mind with kindred mind, which forms only an occasional episode in a country manse. He likewise married Miss Hamilton, sister of the lord-provost, and to all appearance had reached that comfortable termination in which the rest of his days were to be spent in peace. But his health, which had been always delicate, and the weakness

of his chest, made the task of preaching to large audiences, and the week-day duties of his office, so laborious and oppressive, that in a few years he would have sunk under them. Happily however, his labours were not thus prematurely to terminate; and the offer of the chair of church history in the university of Edinburgh, which he received from government in 1831, came to his relief. This was the boundary to which unconsciously all his past studies had been tending, while the weakly state of his constitution only hastened the crisis. It was more in accordance with his feeling of duty to accept such a charge, for which he had strength enough, than to break down in an office which was growing too much for him. And even setting this aside, he felt that the great work of training up an efficient ministry was of still higher importance than the ministerial office itself. These inducements were obvious not only to himself, but to his attached congregation; and they freely acquiesced in the parting, although with much sorrow and regret. He therefore left Glasgow in November, 1831, for his new sphere of action, and received the degree of Doctor in Divinity from the university at his departure.

The office into which Dr. Welsh was now inducted had hitherto in Scotland, for more than a century, been one of the least distinguished of all our university professorships. This was by no means owing either to the inferior importance of church history as a subject of study, or to any innate dryness and want of interest that belongs to it; on the contrary, we know that it embraces subjects of the highest import, and exhibits the development of the human mind in its strongest and most intense aspects—and is consequently of a more stirring and interesting character in itself, than either the rise and fall of empires, or the record of triumphs and defeats. But Scotland had been so exclusively occupied with her Solemn League and Covenant, that she had found little time to attend to the history of other churches; and even when better days succeeded, those classical and antiquarian studies upon which ecclesiastical history so much depends, had fallen so miserably into abeyance, that the evil seemed to have become incurable. What, indeed, could a student make of the history of the church for at least twelve centuries, when his “small Latin and less Greek” could scarcely suffice to make out the name of a bygone heresy, or decipher the text in the original upon which the controversy was founded? In this state any one or anything had sufficed as a stop-gap to fill the vacuum of such a professorship—and it had been filled accordingly. But now a new order of things had succeeded. A more ardent literary spirit had commenced among our students, a wider field of inquiry had been opened, and they could no longer submit to doze over a course of lectures as dark as the dark ages, among which they lingered for months, or listen to a teacher who perhaps knew less about the matter than themselves. It will be seen, therefore, that nothing could have been more opportune than the appointment of Dr. Welsh. His clear and vigorous mind, his varied acquirements and extensive reading, had not only furnished him with the requisite stores of knowledge, but given him the power of selecting what was fittest from the mass, arranging it in the most effective form, and expressing it in that perspicuous attractive style which insured attention and stimulated inquiry. And besides all this aptitude, he was so profoundly impressed with the importance of his charge, that he resolved to give himself wholly to its duties; and with this view he abstained from every engagement, either of literature or public business, that might in any way have

allured him from his work. The devout conscientious spirit, too, in which all this was undertaken and carried on, will be manifest from the following memorandum found among his papers. After mentioning what he regarded as shortcomings in the duties of his professorship, and confessing them penitently before the Lord, he adds: “In his strength I now bind myself, during the present session,—

“1. To set apart one hour *every Saturday* for prayer for my students, and for considering my failures and deficiencies in the past week, with corresponding resolutions of amendment in the succeeding week.

“2. To make it a distinct object *daily*, praying for assistance to supply the deficiencies and correct the errors mentioned in the preceding page.

“3. To make a study, as opportunity presents, of the passages in Scripture that relate to my duties as a teacher, and to the duties of the young.

“4. To add to my resolutions from time to time, as new light shines.

“5. To read the above at least once a-week—strictly examining myself how far my conduct corresponds, and praying that God may search and try me.

“In looking at a student, ask, How can I do him good, or have I ever done him good?”

In this spirit Dr. Welsh entered upon his duties; and perhaps it would be needless to add how distinguished he soon became as a professor of church history. In his hands, a course of teaching hitherto so uninteresting and unprofitable seemed to start into new life. At the close of each session he sat regularly in the General Assembly, as member for the presbytery of Lochcarron, but without taking an active part in its proceedings, as, from his delicate health, nervous temperament, and constitutional diffidence, he was neither a bold combatant in debate, nor a ready extemporaneous speaker. In the latter capacity, indeed, he jocularly compared himself to a narrow-necked bottle, from which the liquid is hurriedly discharged in jerks and gurgles. In the third session of his professorship (1834) he published a volume of *Sermons on Practical Subjects*, which he had preached during his ministry in Cross-michael and Glasgow; and although they were intended merely for private circulation among the two congregations, they at once went beyond these narrow bounds, and obtained a wide popularity. During the spring and summer of the same year he also went abroad, accompanied by his wife and two children, and resided at Bonn and Heidelberg, besides visiting other places in Germany. This trip, however, instead of being a mere pleasure tour, was undertaken by Dr. Welsh for the purpose of perfecting himself in German, in reference to the advancement of his studies in theology and church history; and to acquaint himself by personal examination with the educational system of Prussia, with a view to the introduction of its improvements into that of Scotland. Having now, by frequent rewriting and improvement, brought his course of college lectures to some conformity with his own rigid standard, and having become familiarized with the duties of his chair, Dr. Welsh at length ventured to take a larger share in the general business of the church than he had hitherto attempted. Accordingly, in 1838 he accepted the office of vice-convener of the Colonial Committee, and in 1841 that of convener. This situation, when conscientiously filled, involved an amount of study about the spiritual wants of our colonies, of extensive correspondence, and delicate influential management, as had hitherto daunted the

boldest, and made them pause perhaps too often; but in the case of Dr. Welsh these difficult duties were entered upon and discharged with the same unflinching zeal which he had so successfully brought to his professorship. He also took a very active and influential share in an important controversy of the day, regarding the monopoly in printing the Bible, which had so long prevailed in Scotland, but was now felt to be an intolerable religious grievance; and on the monopoly being abrogated, and a board of control and revision established for the new editions of the Scriptures, Dr. Welsh was ultimately appointed by government to be secretary of the board.

During this interval an under-current had been going on in the life of Dr. Welsh, that was soon to assume the entire predominance. We allude to those great church questions that had been agitated from year to year, and were now to end in the DISRUPTION. Upon these questions he had meditated deeply and conscientiously, at every step had gone along with the Evangelical party in the Church of Scotland, and at last had arrived with them at the conclusion, that further concession to the state was impossible; that all state advantages must be foregone by the church, in behalf of those principles that were part and parcel of her very existence. Such was the decision to which the controversy had come in 1842; and upon that memorable year the decision was to be announced, and the church committed on the issue. At such a solemn period of assize, the high estimation in which Dr. Welsh was held was fully shown by his election to the office of moderator of the General Assembly; and this office, now so fraught with difficulty and deep responsibility, he undertook with fear and trembling. The faithfulness and ability with which he discharged it is matter of history. Many important measures were passed at the sittings of this Assembly; but the most important of all was the "Claim, Declaration, and Protest," in which the spiritual rights of the church were announced, the assumptions of the civil courts abjured, and the resolution of foregoing all the benefits of an establishment distinctly declared, unless these rights were recognized, and the encroachments of the civil courts terminated.

Another year rolled on, and the General Assembly again met; but it could only meet for the final departure of such as still adhered to the protest of the former year—for the state had determined not to yield. All things were therefore in readiness for the meditated disruption, and nothing remained but to seize the proper moment to announce it. This was the trying duty of Dr. Welsh, as moderator of the former Assembly; and to be performed while he was labouring under the depression of that wasting disease which at no distant period brought him to the grave. But calmly and with an unaltered step he went through the preliminary duties of that great movement; and on Wednesday, the day previous to the opening of the Assembly, he signed the protest of his brethren, and afterwards dined, according to established rule, with the commissioner, to whom he announced the purposes of the morrow. On Thursday, he preached before the commissioner and a crowded auditory upon the text, "Let every one be fully persuaded in his own mind;" and after this solemn note of preparation, he repaired with the brilliant cortege and throng of divines to St. Andrew's Church, and opened the Assembly with prayer. This duty ended, the promised moment had come. While all were hushed with painful expectation, the pale sickness-worn face of Dr. Welsh was for the last time turned to the commissioner's throne, and in a voice that was soft and slow, but firm and articulate,

he thus announced the final purpose of his brethren: "According to the usual form of procedure, this is the time for making up the roll; but, in consequence of certain proceedings affecting our rights and privileges—proceedings which have been sanctioned by her majesty's government, and by the legislature of the country; and more especially, in respect that there has been an infringement on the liberties of our constitution, so that we could not now constitute this court without a violation of the terms of the union between church and state in this land, as now authoritatively declared, I must protest against our proceeding further. The reasons that have led me to this conclusion are fully set forth in the document which I hold in my hand, and which, with permission of the house, I shall now proceed to read." He then read the protest; and after bowing to the throne, he left the chair of office and proceeded to the door, followed by Dr. Chalmers, Dr. Gordon, and the fathers of this momentous secession. Thus the departure commenced; a long array succeeded; and the procession slowly wound its way to Tanfield, where a large hall had been hastily fitted up in expectation of the emergency; and there a new General Assembly was constituted by the new—or shall we say—by the *old* and long-forgotten, but now regenerated Church of Scotland.

Amidst the many sacrifices that were made on this occasion by the ministers of the newly constituted Free Church of Scotland—sacrifices which even their enemies will acknowledge were neither few nor trivial—those of Dr. Welsh were of no ordinary importance. In attaining to the professorship of church history in the university of Edinburgh, he had reached an office all but the highest to which a Scottish ecclesiastic could aspire. It was besides so admirably suited to all his past acquirements, and now matured intellectual habits, that perhaps no other could have been found over the whole range of Scotland so completely adapted to his likings. And yet this he knew from the beginning that he must forego, as soon as he abandoned the state patronage of the Establishment. In addition to his chair, he held the office of secretary to the Board for the Publication of the Bible, an office that yielded him a revenue of £500 per annum; but this comfortable independence, so rare among the scanty endowments of our national church, must also be sacrificed as well as his professorship. Both offices were quickly reclaimed by the state, as he had anticipated from the beginning. All this would have been enough, and even more than enough, for a bold and brave man in the full strength of manhood, and still eager for enterprise: but in the case of Dr. Welsh the fire of life was well-nigh exhausted; a mortal disease was silently and slowly, but securely drying up the fountain-head of his existence; and he had arrived at that state in which every effort is weariness and pain, while tranquillity is prized as the greatest of blessings. And yet he abandoned all, and braced himself anew for fresh action, so that the rest of his brief life was full of exertion and bustle. The chief department that fell to his share was that of education in connection with the Free Church; and his valuable services in the erection of schools and the establishment of a college will continue of themselves to endear his memory to the scholars of future generations. Of this new college, which commenced its labours immediately after the Disruption, for the training of an efficient ministry, Dr. Welsh was professor in ecclesiastical history, while Dr. Chalmers held the office of principal. Dr. Welsh also became editor of the *North British Review*, and by his able management contributed to raise that periodical to

the high literary standing which it quickly obtained. In 1844 he also published his *Elements of Church History*, in one volume, which was intended to be the first of a series extending to six or seven volumes, that should carry down the history of the church to the close of the sixteenth century. But his labours had already approached their close; and his inability to continue his college prelections at the close of the year was the last of many warnings which he had lately received that his departure was at hand, and might probably be in a single moment. The disease under which he laboured was one of those complaints of the heart now so prevalent, but still so little understood, that often make sickness so painful and death so sudden. And thus it was with Dr. Welsh. He had retired to Camis Eskin, on the banks of the Clyde, but without finding relief, and on the 24th of April, 1845, his troubles were closed. A passage of Scripture had been read to him, which he turned into a fervent prayer, and as soon as it was ended he stretched out his arms and expired.

Such was the departure of one of whom it was stated by Lord-advocate Rutherford, in his place in parliament, shortly after the event, that "within the last fortnight a gentleman had been carried to his grave, who had commanded more private affection and more public regard than perhaps any other man who had recently expired—a gentleman who had taken a high and prominent position in the great movement that had separated the Church of Scotland—a gentleman firm and determined in his line of action, but at the same time, of all the men concerned in that movement, the most moderate in counsel and the most temperate in language—a man who had never uttered a word or done a deed intended to give offence."

WILKIE, SIR DAVID. While the wondrous discovery of the power of steam was going on, and those experiments commencing by which our whole island was to be contracted into a day's journey, the doom of Scotland's nationality was sealed. It was evident that our country would soon be absorbed into England, and Edinburgh be converted into a suburban village of London. But while our distinctive national manners were thus about to pass away, and even our scenery to be moulded into new forms, three Scottish master-minds appeared, by whose genius the whole aspect of the country, as well as the character of the people, were to be electrotyped, before they had vanished for ever. Burns, Scott, Wilkie—these were the honoured three by whom the face and features, the life and expression of Scotland were limned at the best, and by whose portraits it will be known in future ages, however the original itself may change or wither. The strongly-marked and homely, but intellectual physiognomy of the Scot; his rural occupations and modes of life; his sports and pleasures, nay, even the Doric Saxon of his speech, will all continue as living realities, when the Scotchman himself will be as indiscernible as the native of Kent or Middlesex.

The third of this patriotic triumvirate, David Wilkie, was born at Cults, Fifeshire, on the 18th of November, 1785. His father, the Rev. David Wilkie, minister of the parish of Cults, was an amiable specimen of the Scottish divines of the old patriarchal school, who, besides attending to the duties of his sacred calling, was a most diligent student, as was shown by his *Theory of Interest*, a work which he published in 1794. As his stipend was one of the smallest in Scotland, amounting to only £113 per annum, out of which a family was to be maintained, as well as the hospitality of a country

manse supported, the painter learned from his earliest years those practices of honourable economy, self-denial, and independence that characterized the whole of his after-life. When his education had been continued for some time at home, David, at the age of seven, was sent to the parish school of Pitlessie, which was about a mile from the manse of Cults. But already he had found out more congenial occupations than learning the rules of grammar and arithmetic: even when a little child, his chief occupation was to sketch upon the floor with a piece of chalk such figures as struck his fancy; and when he went to school, his slate and paper were soon employed for other purposes than those of counting and penmanship. He became the portrait-painter of the school, and was usually surrounded by a group of boys and girls, all waiting to have their likenesses taken in turn. That which in others is a passing freak, a mere boyish love of imitation, was in him the commencement of the serious business of life: he was thus unconsciously training himself to his vocation while he was handling chalk, charcoal, keel, or ink, watching the effects of light and shade, or studying, with his hands in his pockets, the attitudes and expressions of his school-fellows when they were busy at their play. With this was combined that love of tale and history which characterizes the painter of life and action, while the narratives that most interested his fancy were those that related to Scotland. He thus showed that he was to be a national painter. In some cases enthusiastic young aspirants seem to start into excellence at a single bound, and produce works in their early boyhood which their more matured experience can scarcely amend. But with Wilkie the case was different. He was studying without a guide, while his standard was so high that every attempt was an effort which still fell short of the mark. In the meantime his memory and his scrap-book were gradually accumulating those germs which were afterwards to expand into such a rich harvest. From the school of Pitlessie Wilkie went to that of Kettle, and afterwards to the academy of Cupar; but his progress was still the same—a very *mediocre* proficiency in the ordinary departments of education, because they were held in check by one favourite pursuit. The minister of Cults at length perceived that his son would be a painter, and nothing else, and therefore yielded as to an unwelcome necessity; and therein he was right, as painting was a field new to Scottish enterprise, as well as of uncertain promise. But the chief difficulty was to find a school in which Wilkie should study his future profession, as the art academies of Rome and London were too expensive for his father's means. Fortunately, the Trustees' Academy of Edinburgh was accessible, and there he was admitted as a pupil at the age of fourteen, through the recommendation of the Earl of Leven, where he was so fortunate as to have John Graham for his teacher, and William Allan for his class-fellow. "The progress he [Wilkie] made in art," says the latter, "was marvellous. Everything he attempted indicated a knowledge far beyond his years, and he soon took up that position in art which he maintained to the last. He was always on the look-out for character; he frequented trystes, fairs, and market-places, where there is generally a large assemblage of the country people of all ages, bargaining or disposing of their various commodities. These were the sources whence he drew his best materials; there he found that vigorous variety of character impressed on his very earliest works, which has made them take such a lasting hold on the public mind."

After remaining in the Trustees' Academy five

years, and obtaining a ten-guinea prize, Wilkie returned to Cults, and resolved to commence his profession in earnest, by producing some original painting worthy of public attention. His choice was a truly Scottish subject—the “Fair of Pitlessie,” a village in his own neighbourhood. While the grouping and incidents were to be original, the characters were to be veritable persons; for “I now see,” he said, “how superior painting from nature is to anything that our imagination, assisted by our memory, can conceive.” But how to get these personages to sit—there lay the difficulty, for few men, and least of all Scotchmen, are ambitious of figuring in a picture where drollery or caricature is to predominate. At last a strange expedient suggested itself one Sunday at church, on marking one of his victims whom he had destined for the “Fair,” nodding in the midst of sermon. Wilkie at once secured the man’s likeness with a piece of red chalk on the blank-leaf of his Bible. In this way he went on from face to face, on successive Sabbaths, in the kirk; and not content with the sleepers, he next fell upon the wakeful—minister, elders, and precentor, until every countenance of note in Pitlessie was faithfully copied. These doings could not long escape notice; heavy complaints were made of the profanity of the young artist in thus desecrating the house of God—and we scarcely hold his apology a just one, that while his hand and eye were thus employed his ear was as open as ever to listen. It was the Scottish apology of one who imagines that the chief purpose of going to church is to hear a sermon. While he was thus procuring materials on the Sabbath, his week-days were employed in transferring them to the canvas, until the whole figures, 140 in all, were introduced and the “Fair of Pitlessie” completed. It was a wonderful production of art, independently of the youth of the artist, who as yet had only reached his nineteenth year; and as such he valued it when his judgment was ripener, and his power of colouring more complete, so that he thus wrote of it to a friend in 1812: “The picture of the country fair I saw when I was last in Scotland; and although it is no doubt very badly painted, it has more subject and more entertainment in it than any other three pictures I have since produced.” In the meantime the whole country-side rang with the fame of this wonderful picture, the like of which had never been seen in Scotland, so that the profanity of the painter was soon forgot; and an old woman, who was supposed to know more of futurity than a whole kirk-session, *spae’d* on the occasion, that as there had been a Sir David Lindsay in poetry, there would be a Sir David Wilkie in painting, and that she should live to see it.

All this praise was gratifying, but something more substantial was needed; and accordingly, after the “Fair” was finished and disposed of, Wilkie betook himself to the painting of portraits, in which he had several customers. At the same time he produced “The Village Recruit,” a painting in which a recruiting-sergeant, at a country inn, is doing his best to persuade three clodpoles to become heroes and generals. Having soon exhausted the “kingdom of Fife” as a mart of portrait-painting, and found it too limited for his ambition, as well as too penurious for his subsistence, he resolved to establish himself in London. Thither he accordingly repaired in May, 1805, and entered the Royal Academy as a probationer, where he was characterized by his compeers as a “tall, pale, thin Scotsman.” Here, also, he formed an intimate acquaintanceship with Haydon, a congenial spirit in talent and aspirations—but with what a different termination! Wilkie’s attendance at the Academy

was punctuality itself, while his diligence when there was such as to astonish his more mercurial companions—whom he outstripped, however, in the long-run. In the meantime, the small store of money which he had brought with him began to fail, while his letters of introduction had procured him no sitters. Fortunately he at this time became acquainted with Mr. Stodart, the pianoforte maker, who not only sat for his portrait but induced others to follow his example; and in this way the desponding artist was enabled to go on with fresh resources, although not without much economizing. “Among the many ways,” he writes to his father, “by which we try here to save expense, is that of cleaning our own boots and shoes; for you must know that the people of the house will not clean them, and when you send them out to the shoe-blacks in the street, they become expensive.” At the close of the year 1805 he passed from the condition of a probationer to that of a student of the Academy, by which his means of improvement were considerably enlarged, and his merits brought more fully into notice. Among those who now learned to appreciate him as an artist of high promise was the Earl of Mansfield, for whom he painted “The Village Politicians.” Other orders from persons of rank and influence followed, so that he was now on the fair highway to fame and fortune. And yet, with all this, there were very heavy drawbacks. His ambition for proficiency in his art was so great, that he felt as if all he had done in Scotland was a mere waste of time; while his modesty induced him to put such inadequate prices upon the pictures for which he was now commissioned, that he was not only in debt, but also a sufferer from sickness, occasioned by anxiety and incessant application. In the meantime his “Village Politicians,” which was placed in the exhibition of the Royal Academy, not only delighted the public, but astonished the artists, who universally felt that a bright particular star had risen in their horizon; and so loud was the applause, that it rang to the remotest nooks of Fife, and gladdened the old patriarch of Cults, who was justly proud of his son’s fame, “You cannot imagine,” he wrote to him in the joy of his heart, “how great a fervour of admiration these accounts have produced in your favour in this quarter of the country; in particular, the gentlemen for whom you painted pictures last year affirm that each of them is worth 100 guineas.” “I am now redoubling my application,” the young artist wrote in reply, “with the sure hopes of success. My ambition is got beyond all bounds, and I have the vanity to hope that Scotland will one day be proud to boast of your affectionate son.”

The next painting which Wilkie executed was “The Blind Fiddler.” This was undertaken for Sir George Beaumont, himself a painter and lover of the fine-arts, as well as the most generous and efficient of all the artist’s patrons. The great historical picture of “Alfred in the Neat-herd’s Cottage” followed. Here Wilkie had no model, and was therefore obliged, like the poet or novelist, to task his imagination. But to draw the most heroic and intellectual of sovereigns in the disguise of a Saxon peasant, was the great difficulty which Wilkie had to encounter. The power of language might so depict him even though thus shrouded, that any one would say, “Ay, every inch a king!” But the pencil has neither the same minuteness as the pen, nor yet the same universally intelligible power; and thus, let a sovereign in a painting be stripped of his robes and his crown, and how difficult it will be to read the tokens of royalty in his mere gesture and look! But Wilkie was proud of the task, for it was not only a great national subject, but its selection for his especial effort showed

the high confidence that was already reposed in his talents. This admirable production, which was finished at the close of 1806, and was the result of intense study and labour, justified, by its excellence and the reputation it acquired, the pains which had been bestowed upon it. It was at this time that Benjamin West declared of him, "Never in my whole experience have I met with a young artist like Wilkie: he may be young in years, but he is old in the experience of his art. I consider him an honour to his country." Thus rich in reputation, although still poor in purse, for it was almost wholly for fame that as yet he had worked, the artist paid a visit to his native country, in May, 1807, chiefly for the purpose of recruiting his health, which had suffered by the intensity of his labours. After languishing in the manse of Culterty till October, when he had only partially recovered, he hurried back to his little parlour-studio in London, which was now become his true home; and there his first effort was to finish "The Card-players," a painting for the Duke of Gloucester, which he had left on the easel at his departure.

"The Card-players" was succeeded by "The Rent Day," one of Wilkie's best productions. It was painted for the Earl of Mulgrave, who allowed him to choose his own subject; and that the selection was a happy one has been well attested by the excellence of the picture itself, and the admiration it excited. Of the various figures, indeed, which severally tell their tale with unmistakable distinctness, who can forget the harsh, overbearing, money-calculating, and money-counting factor, ready either to flatter or explode, as the rent may be forthcoming or not?—the old tenant seized with a fit of coughing, which actually seems to ring from the canvas?—the farmer eating, or rather cramming at the well-furnished table, and apparently mindful of the adage that fingers were made before knives and forks?—the butler, who struggles with the rebellious cork, which refuses to quit its hold?—the fortunate tenants who have paid up in full, and are regaling themselves at the table with beef and pasty; and the luckless tenants whose business is not yet despatched, and who either are unable to pay, or are prepared to pay with a protest? Even the little fat pug dog of the mansion, and the lean hungry dog of the rent-racked farmer, indicate the wealth and luxury of the landlord, and the means by which all this profusion is supplied. As soon as "The Rent Day" appeared, it was generally declared to be equal, if not superior, to anything that Wilkie had hitherto produced. And as yet, with all this full-grown celebrity, he had only reached the age of twenty-three! But the four years he had spent in London had been years of constant occupation and steady progress; and now that he had attained such excellence in his art, and so high a reputation, he was the same modest, unassuming, and painstaking student which he had been at his first entrance into the metropolis; and not a day, no, not an hour of abatement could be perceived in the diligence with which he still continued at his task of self-improvement, or the docility with which he received every suggestion that tended to promote it. All this is fully attested by the extracts that have been published from his London journal of this period. From these we find that he still attended the Academy, and took lessons as a pupil. At home he usually painted five hours a day; and if visited in the midst of work he conversed with his visitors, while his hand and eye were still busied with the canvas. Every kind of model also was used in his occupation; for he was of opinion, that however imagination might aggrandize the work of the painter,

nature must be his authority and exemplar. When the day's work of the studio was finished, his ramble for recreation or pleasure was still in subservience to his pursuits; and thus his visits were to picture-galleries and artists; his rambles into the country were in quest of picturesque cottages and their simple inhabitants; and even his walks in the streets were turned to profitable account, with here a face and there an attitude, amidst the ceaselessly revolving panorama. His chief indulgence in an evening was to repair to the theatre, where he enjoyed a rich treat, not merely in the play itself, but in the attitudes of the best performers, where grace and nature were combined in the living delineations of the drama. And still, go where he might, his affectionate heart never seems to have lost sight of his native home; and it may be fairly questioned, whether the delight which his success occasioned in the manse of Culterty was not as high a recompense, in his estimation, as anything that fame could bestow. There is something beautiful and touching in the fact, that while he was fighting his up-hill way in London, through the difficulties of scanty payments, his chief anxiety, besides that of becoming a great painter, was to be able to present his sister Helen with a pianoforte.

The year 1808 was a busy year with Wilkie, as he was then employed upon three paintings, each excellent in its kind and well fitted to advance his reputation. The chief of these, known as "The Sick Lady," was in a higher style of art than he had hitherto attempted, as well as of a very different character; it was an entire abandonment of humble and Scottish life and quiet humour, in which he had hitherto been without a rival, in favour of the graceful, the sentimental, and pathetic. The pains which he bestowed upon this picture, the anxiety with which he touched and retouched it, and the time that was suffered to elapse before it was completed, were the proper accompaniments of this bold attempt in a new field. It is enough to say, that this production, while equal to all its predecessors in point of artistic excellence, was not regarded with the same admiration. And how could it be otherwise? It was in Scottish life that the secret of Wilkie's strength lay, for there he painted as no other man could paint; but when he left this walk, of which he was so exclusively the master, and entered into that of the English artist, he could even at the best do nothing more than others had done before him. It was Burns abandoning his native streams and native dialect, for the banks of the Thames and the diction of Pope or Addison. "The Jew's Harp," which was his next production, was less ambitious, and more in his own natural manner. The same was also the case with "The Cut Finger," in which an old cottage matron is performing the part of chirurgeon to a bluff blubbering boy, who has cut his finger in the act of rigging a toy-boat. In the following year (1809) Wilkie, who had hitherto been contented to rank as a pupil of the Royal Academy, was made one of its associates. At the next exhibition of the Academy, however, he sustained such a slight, as somewhat damped the satisfaction he enjoyed in his election. He had painted a picture which he called "A Man Teasing a Girl by putting on her Cap," and sent it to the exhibition, but was requested by the members to withdraw it. The only cause they stated was that it was inferior to his other productions, and would therefore be likely to diminish his reputation. It was suspected, however, that the true reason was professional jealousy, and that the academicians were impatient that a Scotsman, who only dealt in the "pan-and-spoon style," as they scornfully termed it, should have maintained the ascendancy so long.

Wilkie withdrew his painting, and digested the affront in silence. This he could do all the better, that for a year he had been employed upon his picture of "The Alehouse Door," and was anxious to bring it to a termination.

This painting, which was injudiciously changed in its title to that of "The Village Festival," was a great effort of Wilkie's ambition, in which he wished to compete with Teniers and Ostade. He felt that it was a daring attempt, but his indomitable perseverance was fully commensurate with the courage of such an enterprise. And few indeed of the uninitiated in art can comprehend but a tittle of that diligence which he bestowed upon the work till it was finished. After having decided upon the subject he sallied out with Haydon in quest of an alehouse that might serve as the groundwork of the picture; and having found one to his mind at Paddington, he made occasional pilgrimages thither, until he had transferred it, with its accompaniments, altered and improved to suit its new destination, upon the foreground of his canvas. And then came the living models, which were to be sought in the streets of London, and hired to sit to him, sometimes for a whole figure, sometimes for a face or part of a face, and sometimes for nothing more than a neck, a hand, or a foot. Then succeeded the altering and improving, the rubbing out and replacing, the obliterating, the touching and retouching, such as the most fastidious poets—even Gray himself—never endured in the most finished and lengthened of their compositions. With all this his journal of 1809-10 is filled, and an astounding record it certainly is of the patience and labour bestowed upon a work of art—upon that which is commonly regarded as nothing higher than a mere object of pleasurable but passing excitement. At first he had purposed to paint nothing more than a group of rustics carousing at an alehouse door, and had gone onward, as Burns himself had often done after the muse had been fairly stirred, until

"Perhaps it may turn out a sang,
Perhaps it may be a sermon."

A sermon Wilkie's painting certainly became, both in its elaborate character and moral power. The figures multiplied under his creative hand, each assumed a language of its own, and the sum of all was a most eloquent exposition of the pleasures of social enjoyment, coupled with dissuaves against excess. No one, however unskilled in art, can fail to remark how the lesson is fully brought out in the faces before him, where every shade of the effects of drinking is caught, from the cheering look inspired by the incipient draught of ale, to the idiot inanity of him who lies prostrate in the mire, without even the power to wallow in it.

The close application of the artist, and the annoyance he experienced at the jealousy of his brethren, were followed by a fever, through which he was obliged to retire for some time to Ilamstead. But even under a tedious recovery he was unable wholly to relinquish his wonted pursuits, notwithstanding the ordeals of the physician and the entreaties of his friends. In 1811 the Academy repaired the injury they had done by electing him a royal academician. This was a high honour, especially when conferred upon one so young, for as yet he had only reached the age of twenty-six. As he had hitherto profited so little in a pecuniary point of view by his paintings, he now began to execute a plan which he had contemplated three years before, of collecting and exhibiting them on his own account. He therefore obtained the temporary use of them from their purchasers, hired a large room in Pall Mall, where they could be shown to advantage, and opened it with

a collection of twenty-nine pieces, the production of his pencil, extending from the years 1804 to 1811. But although the price of admission was only a shilling, the speculation failed to be profitable. A public exhibition of this kind requires an amount as well as variety which no single artist could accomplish. The success of his picture of "Blindman's Buff," which he afterwards produced, was well calculated to alleviate his disappointment. This was one of his happiest conceptions; for such a game not only drew out his peculiar artistic talents in their full force, but addressed itself to universal sympathy. For who, however great or grave, has not revelled at some time or other in the full enjoyment of blindman's buff? Most of the actors in Wilkie's game are full-grown children—happy peasants, who in the midst of their glee think neither of toil nor taxes, neither of yesterday nor to-morrow, but of the present hour alone, as if it were the only reality—while the attitudes, the blunders, and mischances of such a sport only heightened the fun, and make it more true to nature. His picture of "The Bagpiper" followed, and afterwards "The Letter of Introduction"—a painting, the subject of which was suggested by the untoward fate of his own introductory epistles which he brought with him to London eight years previous. The sheepish young country lad, who tenders his letter as if he were presenting it to an elephant—and the stately magnifico, who, while breaking the seal, eyes the youth askance, as if he doubted the safety of his silver spoons—all tell their own tale, without the necessity of a title to label the production. In the meantime, Wilkie's father having died, this event introduced a change in the artist's domestic condition. Hitherto he had lived in lodgings; but he now persuaded his widowed mother and his sister to reside with him in London, and for this purpose hired a house in Lower Phillimore Place, Kensington. On the arrival of peace in 1814, he availed himself of the opportunity, like many thousands of our countrymen, by making a trip to France, and studying the treasures of the Louvre, before they were restored to their proper owners. In this short journey, which scarcely extended over six weeks, he travelled with a disposition to be pleased, and was not disappointed.

The next great artistic effort of Wilkie was "The Distraining for Rent." The subject was suggested by the incident of his "Village Festival" having been distrained for the debt of a former tenant, while the picture was exhibited in the hall at Pall Mall. The indignation which this event excited in the mind of Wilkie was thus turned to the best account; and in sketching the principal characters of the group, he availed himself of what had occurred in the event itself, when the legal functionaries went to work with "Tis so nominated in the bond," while himself and his friends indignantly protested, but in vain. The work, when finished, was sent to the exhibition of the British Institution; and such was the pathetic tale which it told, that many thought it would bring both discredit and danger upon the task of levying a distraint ever afterward. After it had remained for some time in the exhibition, and attracted universal admiration as well as not a few candidates for its purchase, it was finally sold for 600 guineas to the directors of the British Institution. A more cheerful theme followed in "The Rabbit on the Wall," where a peasant, returned from his day's labour, is diverting his children by this curious phantasmagoria on the wall of his cottage. His state of health again requiring intermission, Wilkie in 1816 made a tour of the Netherlands, to examine its galleries and study the

rich colouring of the Dutch school of painting. He saw nothing, however, in its style to induce him to forego his own. At his return he painted "The Breakfast," for the Stafford Gallery. In 1817 he made a journey to Scotland, where he visited both Highlands and Lowlands, and was everywhere received with the most flattering distinction, while he had also the pleasure of associating with his illustrious contemporaries—Dr. Chalmers, Sir Walter Scott, and the Ettrick Shepherd. The latter, on being assured that the stranger now introduced to him was no other than "the great Mr. Wilkie," seized him by the hand, and rapturously exclaimed, "I cannot tell how proud I am to see you in my house, and how glad I am to see you are so young a man." When Scott heard of this, he declared "it was the finest compliment ever paid to man." While a guest of Sir Walter, Wilkie painted "The Abbotsford Family Picture," in which the poet, with his family and friends, are grouped together in the garb of south-country peasants in the act of planning a merry-making.

On returning to London, Wilkie, whose whole heart was revived by the sweet influences of his native heather, addressed himself to a Scottish subject, and produced his "Duncan Gray," founded upon the well-known song of Burns. He had tried his hand upon this theme three years before, and produced "The Refusal," of which the present painting was a fresh edition, with many alterations and improvements. In the following year (1818) his little picture called "The Errand Boy" appeared in the Royal Academy exhibition. Then succeeded "The Penny Wedding," a national work, intended to commemorate an old Scottish fashion only lately obliterated, and still freshly remembered. In this painting, which was executed to order for the prince regent, the artist admirably brought out the fun, frolic, and intense enjoyment which such a festival invariably engrafts upon the staid character and saturnine physiognomy of his countrymen. His next production was the "Death of Sir Philip Sidney," intended for a work about to be published by his friend Mr. Dobree. At this time also he was engaged to produce a painting upon which all his strength was to be employed, and from which much was expected, for he was to commemorate in it the crowning victory of Waterloo, and execute it for the Duke of Wellington himself, the hero of the fight. In this case it might have been expected that the artist would have repaired forthwith to the scene of action, for the purpose of sketching its peaceful scenery, and animating it with the heady charges of horse, foot, and cannon, and all the pomp and circumstance of a battle on which the fate of nations was depending. But Wilkie went no farther than Chelsea Hospital, and sought no other figures than the old, battered, and mutilated inhabitants with which that great asylum is stored. "E'en in our ashes live their wonted fires," says the poet; and upon this hint, whether he thought of it or not, Wilkie acted, by showing how these veterans could still be excited by the first tidings of such a victory. It was the "Reading of the Waterloo Gazette," and not the battle itself which he contemplated; and therefore he grouped the pensioners of Chelsea, men who had fought for Britain in every quarter of the world, and suffered every kind of mutilation and dismemberment, pausing in the midst of a jovial dinner, and ready to throw it to the dogs, that they might listen to the reading of the newspaper in which the tidings of Waterloo were first communicated to the nation. Never perhaps was heroic triumph so expressed before either in poetry or in painting—it was the last

huzzas of the dying on the field of victory. When this picture was finished it was sent to the exhibition of 1822; but such was the excitement of the visitors, and the eager crowding round it and against it, that for protection a railing had to be set up to fence it off from the pressure. It is proper to add that Wilkie's productions were now fairly remunerated as well as justly appreciated, and he received 1200 guineas for the "Reading of the Waterloo Gazette" from its illustrious owner, the Duke of Wellington.

During the long interval that occurred between the commencement and execution of this national work, the orders that flowed in upon Wilkie were so numerous that he was kept in incessant action, now upon one piece and now on another. In this way he produced "The China Menders," "The Nymphs Gathering Grapes," and "The Whisky Still." But more important than these was a commission from the King of Bavaria to paint for him a picture, the subject of which was to be left to the artist's own judgment. That which was selected was "The Reading of the Will," and upon this Wilkie acquitted himself so well, that when it was finished two royal candidates appeared for its possession, one being the King of Bavaria, by whom it was already bespoke, and the other George IV., who wished to have the original, or at least a duplicate. It was a sore dilemma between the rightful claimant on the one hand, and his own liege sovereign on the other, in which Wilkie stood like Garrick between tragedy and comedy, feeling how happy he could be with either, and yet knowing that one must be refused and disappointed. At length mercantile honesty carried the day against chivalrous loyalty, and "The Reading of the Will" was fairly domiciled in the splendid collection of Munich. "The Newsmongers," and "Guess my Name," which appeared in the exhibition of 1821, were produced during the same interval. To these may be added "The School," a painting that has been highly admired, though it was never finished.

The year 1822, in which the Waterloo picture was finished, was a busy period with Wilkie, when besides painting "The Parish Beadle" and a portrait of the Duke of York, he received two important commissions that required his attendance in Scotland: the one was a picture of "John Knox preaching before the Lords of the Congregation;" the other of the "Arrival of George IV. in Edinburgh." His majesty had not yet set sail to pay the promised visit; but Wilkie hastened to the Scottish metropolis to await the coming advent, and catch whatever incident of the great drama might be best fitted for his purpose. The choice was made by the king himself, and the subject was his admission into the palace of Holyrood. This painting, like the rest of Wilkie's productions, was admirably executed; but there were difficulties in the way which no genius could surmount. One was the taste of the king himself, who suggested alterations which the artist found himself obliged to follow; the other was the bizarre costume that predominated on the occasion, by which Edinburgh itself was converted into a huge bale of tartan. At this period also he was appointed limner to the king for Scotland, in consequence of the death of Sir Henry Raeburn. While fully occupied with the two great paintings above mentioned, Wilkie during the intervals painted the portrait of Lord Kellie for the town-hall of Cupar, drew an old Greenwich pensioner under the character of Smollett's Commodore Trunnion, and executed a scene from Ramsay's *Gentle Shepherd*, which he called "The Cottage Toilet." He also painted "Smugglers Offering Run Goods for Sale" for Sir Robert Peel, and "The

Highland Family" for Sir George Beaumont, his affectionate friend and munificent patron.

The pressure of severe work, aggravated by the death of his mother and brother, made travelling once more necessary; and accordingly in the middle of 1825 Wilkie set off to Paris, and afterwards proceeded to Italy. Milan, Genoa, and Florence were successively visited, and their galleries of paintings studied and admired. He then went to Rome, but the paintings in the Vatican failed to excite in him that supreme rapture which it was so much the fashion of our travelling artists to express. He seems to have been more highly gratified with the Sistine Chapel, from the ceiling of which Michael Angelo's "Last Judgment" looked down upon him in all its richness and with all its terrors. It was here that he especially loved to muse and study, while his journal of this period is filled with criticisms of this sublime production and its matchless author. Naples, Bologna, Padua, Parma, and Venice were also visited by the earnest contemplative tourist, and the remarks of his journal evince the profound attention he bestowed upon the paintings of the ancient masters that constitute the richest inheritance of these once illustrious cities. After a stay of eight months in Italy, Wilkie found his health no better than when he arrived, and resolved for change of air to make a visit to Germany. But indeed there were painful causes to retard his recovery, against which his heart could not easily rally. A company had become bankrupt in which the most part of his pecuniary savings for years had been invested; and in addition to this a bond by which he had engaged to be security for his brother, who became insolvent, was forfeited. He had thus, while languidly moving from place to place in quest of health, the prospect of ruin meeting him wherever he turned. Finding no remedy from the climate of Germany, or the use of the baths of Toplitz and Carlsbad, he again returned to Italy, by advice of his physicians, to winter there in 1826-7.

If anything could lighten the weight of such an amount of suffering, Wilkie must have found it in the universal respect with which he was treated abroad, both by countrymen and strangers. His fame as an artist had been wafted over Europe by the admirable engravings of Raimbach and Burnet, in which his best productions had been faithfully copied; and in Rome, where he now took up his abode, the "Eternal City" was moved through all its ranks to welcome him and do him honour. Alluding to a high festival made there by the British artists on his account, at which the Duke of Hamilton presided, he writes to his brother in London: "If my history shall ever be written, it will be found, though in a different way, quite as wonderful as that of Benvenuto Cellini." Taking heart, and rallying amidst such kindly encouragement, he ventured to resume his labours; and although his progress was, as he says, "by little and by little, half an hour at a time, and three half-hours a-day," he executed two small pictures and nearly finished a large one in the course of five months. As only two out of the three years had been spent during which he was to reside abroad for the recovery of his health, Wilkie, who had sufficiently studied the Italian school of painting, was now anxious to devote his attention to that of Spain, and to study especially the productions of Velasquez and Murillo. Furnished with letters of introduction, and having already friends at Madrid from whom he was sure of a hearty welcome, he set off upon this new journey, and arrived at Madrid in October, 1827.

This visit to Spain was in the highest degree influential upon Wilkie's future course as an artist, and

in his letters at this time we recognize a new principle acting upon him in full vigour. "The five months I have passed here," he thus writes to his sister, "have, in point of society, been dull, but in point of pursuit and occupation far otherwise. For what I have seen I may almost be the envy of every British artist; and from what I have been doing, weak as I am, have again the happiness to say with the great Correggio, though on a far more humble occasion, '*Anche io sono pittore.*'" To his brother he writes: "This winter, though as severely interrupted as ever by my malady, yet pictures are growing up under my hands with even greater rapidity than they used to do in Kensington; and if less laboured, the effect to the eye and impression on the mind seem not at all to suffer by it." The study of the Italian, and especially the Spanish school, had inspired him with the resolution to be less fastidious and more rapid in execution than before, and accordingly he dashed on with a fearlessness that formed a new trait in his character. The subjects also which he selected were in harmony with the inspiration, for they were Spanish, and connected with the war of independence. The first of three pictures on this subject he finished in ten short weeks, and then sat down astonished at his own rapidity. But he was heartened onward in this bold commencement of a new era in his life by the commendations of the artists and critics in Madrid; while his levee was crowded by dukes, counts, and solemn hidalgos, who looked on and worshipped his artistic doings, as if the old days of Spanish painting and Spanish national glory were returning side by side. All this adulation was gratifying in the highest degree; but still Wilkie had an occasional recoil of doubt and misgiving. How the innovation might be relished by his brother artists was also a trying question, and he thus feels his way upon the subject in a letter to one of the academicians: "I need not detail to you what I have seen in the Escorial, in Madrid, or Seville: it is general ideas alone I wish to advert to. Being the only member of our Academy who has seen Spain, perhaps it is to be regretted that I see it with an acknowledged bias or prejudice, in which I fear scarcely any will participate. With some of my kindest friends, indeed, much of what I have seen and thought will cast between us an influence like the apple of discord; and if some of our youths with less matured minds—while I write this with one hand, fancy me covering my face with the other—should venture, now that an entrance to the mysterious land has been opened, across the Bidasoa, what a conflict in testimony there would be!"

The return of Wilkie to England solved every doubt. Previous to his arrival rumours were afloat of the change that had occurred in his style of painting, and of the stir which his new productions had occasioned in Madrid; but on his return to London in June, 1828, his friends were delighted not only to find his health restored, but the character of his paintings improved. Still, however, his Spanish pictures executed under the first outburst of the new inspiration, beautiful and admired though they were, needed, as he well knew, an elaborate revision before they could be committed along with his name to the public and to posterity, and therefore he touched and retouched them with a careful hand in his studio at Kensington. Immediately on his arrival the king wished to see the fruits of his Italian tour, and was so pleased with them that he purchased "The Pifferari" and "The Princess washing the Female Pilgrims' Feet," two paintings which Wilkie had executed at Geneva. The three Spanish pictures were equally approved of by the royal critic, and

purchased for his own collection, besides a fourth which was still in preparation; and Wilkie felt not a little flattered by the resemblance which was traced in these paintings to Rembrandt, Murillo, and Velasquez. The public at large was soon after invited to judge in turn, as the pictures were sent to the Academy exhibition of May, 1829.

Of these productions, now so widely known by the art of the engraver, the most popular was "The Maid of Saragossa." This preference was occasioned not only by the romantic nature of the subject, which was still the theme of national eulogium, but the colouring and style of artistic execution in which the event was embodied; and the crowds that gathered before the picture knew not which figure the most highly to admire. Augustina stepping over the body of her fallen lover, to take his place at the gun—or Palafox (a correct likeness for which the hero himself sat) putting his shoulder to the wheel, to bring the gun into a right position—or Father Consolacion, the chief engineer in the defence, pointing out with his crucifix the object to be aimed at—or the martyred priest, Boggiero, writing the despatch which is to be intrusted to the carrier-pigeon. The second, called "The Spanish Posada," represented a Guerilla council of war, in which a Dominican monk, a Jesuit, and a soldier—emblematic of the character of the Spanish resistance—are deliberating on the best means of rousing and directing the national patriotism. The third painting was "The Guerilla's Departure," where a young peasant, after being armed for battle and shrived by his confessor, lights his cigar at that of the priest before he hies to the field. Besides these, there were four of Wilkie's paintings in the exhibition which he had executed in Italy, and the portrait of the Earl of Kellie, of which mention has been already made. And now the artist's dreaded ordeal had to be encountered and passed anew. It remained to be seen what the world at large, independently of the judgment of George IV., which was sometimes at fault upon the fine arts, would say of these paintings, and the new style of their author. The verdict was precisely what might have been expected from so marked a change. The many, who are pleased to be delighted without taking the trouble to analyze their feelings, only saw in the alteration a fresh source of admiration, and were accordingly both loud and unmeasured in their praise. But with the critical part of the public it was otherwise; and while some regretted that he had abandoned the minute and laborious finish of his earlier pieces, others thought that he was over-ambitious in thus seeking to occupy more than one field of excellence, and predicted nothing but failure. In such contrariety the aspirant for fame must listen to all or none, and Wilkie chose the latter alternative.

Allusion has already been made to two important commissions which Wilkie had received previous to his departure to Italy: the first of these was a picture of the entrance of George IV. into the palace of Holyrood; the second, of "John Knox preaching before the Lords of the Congregation." Upon these he had wrought for a considerable time before his tour commenced, until the state of his health obliged him to abandon them when they were little more than mere outlines. He now braced himself for the task of completing them, and in 1830 the "Entrance into Holyrood" appeared in the exhibition. It was successful both with the sovereign and the public, not only as a happily executed representation of a great public event, but a faithful portraiture of the living actors and feudal accessories that composed the well-known features of this splendid national ovation.

During the same year that it was completed, the great personage who formed the grand central object of this pageant, and in whose honour it had been created, passed away to the tomb, after he had outlived the pomps and pageantries of royalty, which no king had ever more highly enjoyed; and with George IV. passed away from us, and perhaps for ever, those regal triumphs and processions so little suited to this matter-of-fact and utilitarian era of British history. How different, and yet how gratifying the visits of royalty have now become to their long-forsaken home in Edinburgh! The Knox painting, which was finished after that of Holyrood, appeared in the exhibition of 1832. Into this painting, so truly Scottish in its subject, and so connected also with his own native country, Wilkie threw himself with his utmost ardour, and the result was a picture upon which the eye of Scotland will always rest with pleasure. The collection of so many personages renowned in the history of our Reformation—the tale which each countenance tells, as part and parcel of the great event—and the vehement impassioned preacher himself, whose sermon was the death-knell of the cathedral in which it was delivered, and the superstition of which that building was the great metropolitan representative—are now as generally known as the event itself, in consequence of the thousands of engravings that have been multiplied of the original. Besides this picture, which was painted for Sir Robert Peel, Wilkie sent to the exhibition a portrait of William IV., to whom he was now painter in ordinary, as he had been to his predecessor.

From 1832 to 1834 was a busy period with the artist, as every royal and noble personage was eager to sit for his portrait to such a limner, although Wilkie himself had no particular liking to portrait-painting. In the exhibition of 1834 his diligence appeared in six pictures, which had their full share of approbation. These were, 1. "The Portrait of the Duke of Wellington, as Constable of the Tower, with his Charger;" which he executed at Strathfieldsaye, where both hero and horse were accessible to the painter. 2. "Not at Home." This is a usual incident, where a disappointed dun is departing from the door on being told that the master is abroad, while the master himself is watching unseen from the corner of a window, and waiting until the coast is clear. 3. "Portrait of the Queen, in the Dress worn at the Coronation." 4. "Spanish Mother and Child." 5. "Portrait of Sir John Leslie, Professor of Natural Philosophy." 6. "Portrait of a Lady." In the following year (1835) he sent other six pictures to the exhibition, of which the foremost in point of merit and importance was, 1. "Christopher Columbus submitting the Chart of his Voyage for the Discovery of the New World to the Spanish Authorities." Here the great navigator, after being received in the convent, at the gate of which he had craved a morsel of bread and a cup of water for his child, who was wearied with the journey, is explaining at table to the prior his conviction that a new world yet remained to be discovered, and showing a chart of the voyage by which such a discovery might be effected. 2. "The First Ear-ring." Here a young girl, fluttering between love of finery and dread of pain, contemplates the glittering ornaments with which she is about to be adorned and the operator by whom her ears are to be pierced for the purpose. 3. "Portrait of Field-marshal the Duke of Wellington in the Dress he wore on Active Service." 4. "Sancho Panza in the Days of his Youth." 5. "Portrait of Sir James M'Grigor, Bart., Director-general of the Army Medical Department." 6. "Portrait of the Rev. Edward Irving."

After having done so much in the illustration of Scottish and Spanish character, the attention of Wilkie was now directed to Ireland, where the picturesque scenery and semi-barbarous condition of the people, already become so popular through the writings of Miss Edgeworth, had as yet failed to attract the notice of our artists. He accordingly repaired to Dublin in August, 1835, and in his rambles through the country drew ten sketches in pencil, which were designed for future paintings; but of these none was executed except "The Peep-o'-Day Boy." This, with "The Interview between Napoleon and the Pope in 1813," and four other paintings, was sent to the exhibition in 1836. On the 15th of June, the same year, Wilkie received the honour of knighthood—a title which, high though it be, could scarcely aggrandize him who was already so eminent in art. Such as it was, however, the artist received it with gratitude, and wore it with becoming gentleness. He was at this period so intent upon his professional labours, that on the removal of the Royal Academy from Somerset House to Trafalgar Square, in 1836, Wilkie had seven paintings in the first exhibition at the new buildings. These were, 1. "Portrait of William IV." 2. "Mary Queen of Scots Escaping from Lochleven;" this event was detailed according to the description of Sir Walter Scott in the tale of the *Abbot*, rather than the strict record of history. 3. "The Empress Josephine and the Fortune-teller." This was the well-known incident of the black prophetess, or obi-woman of St. Domingo, foretelling to Josephine that she should become a crowned empress, while she was still an undistinguished girl. 4. "Portrait of the Earl of Tankerville." 5. "The Cottar's Saturday Night." 6. "Portrait of Sir William Knight." 7. "Portrait of a Gentleman reading."

A still more important subject upon which Wilkie had been employed for some time past, was that of Sir David Baird discovering the body of Tippoo Saib under the gateway of Seringapatam, which he was commissioned to paint by Lady Baird. This task he had prosecuted at intervals since 1834, and his diligence in procuring the necessary materials for such a picture fully evinced the zeal with which he prosecuted it, and the importance he attached to it. For this purpose he sketched the trophies and arms connected with the event contained in Fern Tower, the habitation of Lady Baird; procured European arms from the cutlers' and gunsmiths' shops; and obtained the loan of a complete magazine of oriental dresses, ornaments, and jewelry, from such of his friends as were connected with the East Indies. He was even so fortunate as to get a pelisse and pair of breeches that had been worn by Tippoo himself. The chief difficulty was with the living models, a few native Indian soldiers, who happened to be in London, and were engaged for the task; but no sooner were they grouped, and placed in proper attitudes, than they were seized with a fit of horror at the thought of personating the death-scene of the mighty sultan, so that they would "play out the play" no longer. In spite of all difficulties, however, the painting was successfully finished at the close of 1838. Of this choice production of Sir David Wilkie, we would only notice one of the several striking incidents which the talent of the artist has brought out on this occasion. It is, that while Sir David Baird is contemplating with emotion the body of the tyrant who had so cruelly treated him when a captive, the feet of the dead man are lying beside the iron-grated door of the dungeon in which his conqueror had been unjustly immured.

Before this picture was finished important political

events had furnished Sir David with a new national subject. This was the death of William IV., and the accession of our present gracious sovereign, Queen Victoria. As Wilkie's appointment of painter in ordinary was once more renewed, it was fitting that his talents should be exercised for the occasion, and accordingly he was commissioned to paint "The Queen Holding her First Council." He boldly commenced the subject, though with a full anticipation of the difficulty, where every member was unwilling to be placed in the back-ground, or be overshadowed by his neighbour. Notwithstanding the number of portraits it contained, it was finished in little more than six months, and introduced into the exhibition of 1838, along with five other paintings, four of which were portraits; and not the least remarkable of these was one of Daniel O'Connell. But the most congenial of all his occupations for a considerable period had been a picture of "John Knox Administering the Sacrament in Calder House," which Wilkie designed as a companion to that of the "Reformer preaching before the Lords of the Congregation." Here he was again upon his own Scottish ground, and among congenial characters; so that from this, as well as the ardour with which he prosecuted the subject, and the maturity into which his artistic experience had ripened, it was hoped that it would prove the most successful of all his efforts. Nor was the hope unfounded, although he did not live to complete the picture; for in the two advanced sketches of it which appeared in the auction of his paintings after his death, the promise was already more than half fulfilled.

We have thus brought Wilkie to the year 1840, at the exhibition of which he had eight paintings—and to the age of fifty-five, at which either a rapid decay of life commences, or such an invigoration as holds out the promise that the full threescore and ten of a healthy old age will be attained. The autumn of this year found him in the full bustle of preparation for a long and adventurous journey, in which the Continent, Turkey, Egypt, and the Holy Land, were to be successively traversed. At the intelligence, not only his brother artists but the public were astounded. Was it as a painter or a pilgrim that he meant to travel? Was the search of health or the Holy Sepulchre the *ultimatum* of his wishes? In the midst of all this wonder and inquiry Sir David Wilkie departed—and his country saw him no more.

As this was the last, it was also the most important, of his journeys, and therefore cannot be briefly dismissed. He left England on the 15th of August, 1840, and was accompanied by Mr. William Woodburn, an attached friend, as well as a lover of the fine arts. Their place of landing was the Hague, after which they passed through Leyden, Haarlem, and Amsterdam, visiting every collection of paintings in their way, and studying the scenery and inhabitants in the true spirit of artists. They then arrived at Cologne, chiefly to inspect "The Crucifixion of St. Peter" by Rubens, which was placed over the altar of the church of St. Peter. Mayence, Nuremberg, and Munich were next visited, where Dutch and German paintings were in abundance; and in the latter city Wilkie's heart was warmed by the sight of his own production, "The Reading of the Will," which had once been nearly a bone of contention between the royalties of Britain and Bavaria. At Vienna, among several rich productions of art, he also saw his "Toilette of a Bride," and was pleased to find that the colours had acquired a richer tone. A rapid transit through Hungary brought the travellers into the Turkish dominions, and finally landed them in Constantinople, that city so enchant-

ing in the distance, but almost as delusive, when reached, as the Fata Morgana itself. While he was exploring through the streets of Constantinople, Wilkie saw, in the outer court of a mosque, a venerable-looking scribe who had just written a letter for two Turkish women, one of them very beautiful, to whom he was in the act of reading the finished scroll. The whole group was so picturesque that the painter comprised it at a glance, and afterwards transferred it to the canvas, and although unfinished, the picture was of such a superior character, that it was finally bought at the sale of his paintings for 425 guineas. Another sketch which he executed was that of "A Tartar narrating in a Turkish Café the Victory of the taking St. Jean d'Acre." Besides these he made no less than fifty-seven sketches of individuals or groups in Constantinople, and its infidel suburb Pera, during his residence in the Turkish capital—a period of little more than three months. This, indeed, was the busiest period of his life, for he was now in a country where nature was the only picture-gallery, while every object was worth copying. But the most important of his labours was a splendid portrait which he executed of the young sultan, who sat with a docility unwonted in an eastern sovereign, and was so well pleased with the result that he rewarded the painter with a rich gold snuff-box set with diamonds.

By the way of Smyrna, Rhodes, Beyrout, and Jaffa, Wilkie next proceeded to the Holy Land, occupying himself during the whole way in increasing that rich collection which was afterwards known under the title of his "Oriental Sketches;" and having in constant use, besides his sketch-book, a pocket Bible, which was the guide of his journey, as well as his director in the still more important pilgrimage of which, though unconsciously, he was already near the commencement. Every step in the land of revelation and miracle seemed to solemnize his thoughts, and on reaching Jerusalem he found among its hallowed ruins materials enough both for delineation and devout solemn meditation. After a sojourn of six weeks at Jerusalem, Wilkie proceeded to Egypt, and arrived at Alexandria on the 26th of April, 1841. He had not been long here when no less a personage than Mehemet Ali, the old and terrible, expressed a desire to sit to the distinguished British artist for his portrait. Wilkie, indeed, was told that in this most energetic of modern potentates he would also find the most restless of sitters; but the case proved otherwise, for the pasha was as compliant as a child, and was rewarded with a portrait that satisfied his utmost wishes.

Having finished his long-protracted and diversified journey, Wilkie now turned his face homeward, and embarked on board the oriental steamer. Besides the hope of meeting with his friends, who anxiously expected his return, he had collected such treasures of oriental scenery and costume as would suffice him for years of labour, as well as for such artistic productions as might raise his renown by surpassing all that he had yet accomplished. When the steamer reached Malta he was unwell; but as he had rallied so often in similar cases he felt no apprehension, and wrote to his sister a letter full of hopes of his return, and desiring that his home should be put in order for his arrival. Only four days after, he was no more! While at Malta he had eaten fruit and drank iced lemonade, which produced such a derangement of stomach that his whole system rapidly gave way; and notwithstanding the medical care of the surgeon on board, he sank into insensibility, and died without a struggle, on the 8th of June, 1841. The vessel that had started from Malta

only an hour previous, put back, and applied for permission to land the body; but as this was refused a coffin was made at sea, and the remains were committed to the deep. On the arrival of the vessel in England with its unexpected tidings, the report spread sorrow over the whole island, but especially over Scotland, where Wilkie was considered as one of the noblest of our national representatives—as the Burns of Scottish painting. In London a meeting was soon convened to do honour to his memory; and the result was a collection for a public statue of the artist, which was afterwards executed by Mr. S. Joseph, and erected in the inner hall of the National Gallery. May the eyes of our young Scottish artists be inspired with his spirit as they contemplate it; and may the chief memorial of Sir David Wilkie be a School of National Painting, such as Scotland, even to the remotest period, will be proud to cherish!

WILKIE, WILLIAM, D.D., the "Scottish Homer," as he has been called, from the circumstance of his having been the author of a poem in the style of the *Iliad*, entitled the *Epigoniad*, was born at Echlin, in the parish of Dalmeny, county of Linlithgow, on the 5th of October, 1721. His father was a farmer, and possessed a small property to which he succeeded by inheritance. He was an upright and intelligent man, but through a series of misfortunes became greatly reduced in circumstances in the latter part of his life.

The subject of this memoir received the earlier part of his education at the parish school of Dalmeny, then kept by a Mr. Riddel, a respectable and successful teacher. At this seminary young Wilkie gave many proofs of a lively and vigorous fancy, and of that genius for poetry which afterwards distinguished him. Before he had passed his tenth year he had written some little poetical sketches of considerable promise. At the age of thirteen he was sent to the university of Edinburgh. Here he also distinguished himself by the superiority of his talents, and in particular by the progress he made in classical acquirements, and in the study of theology. He had the good fortune, likewise, while attending college, to form intimacies with some of the most celebrated men of the last century. Amongst these were Dr. Robertson, David Hume, Adam Smith, and John Home. Mr. Mackenzie, in his life of the last-mentioned individual, says that Wilkie's friends all spoke of him as "*superior in genius to any man of his time*, but rough and unpolished in his manners, and still less accommodating to the decorum of society in the ordinary habits of his life. Charles Townsend, a very competent judge of men," continues the biographer, "and who, both as a politician and a man of the world, was fond of judging them, said, after being introduced to Wilkie, and spending a day with him at Dr. Carlyle's, that he had never met with a man who approached so near to the two extremes of a god and a brute as Dr. Wilkie."

While prosecuting his studies at Edinburgh Wilkie lost his father, who died in straitened circumstances, but left his son the stock and unexpired lease of a farm at Fishers' Tryste, a few miles south of the city, burdened, however, with the charge of maintaining his three sisters, who were otherwise wholly unprovided for. Wilkie, in consequence of this event, became a farmer; but unwilling to trust entirely to that profession for his future subsistence, he continued, while conducting the business of his farm, to prosecute his studies in divinity, and eventually was licensed as a preacher of the gospel, although some years elapsed before he obtained a church. Previously to his assumption of the gown he had made

himself an expert farmer, and so remarkable was he, in particular, for his successful culture of the potato, then but indifferently understood, that he obtained the facetious by-name of the *potato minister*. But while he claimed and really possessed the merit of being a superior agriculturist to any of his neighbours, he always acknowledged that he was their inferior in the art of trafficking; and the manner in which he made this boast and acknowledged this inferiority was characteristic of the man: "I can raise crops," he would say, "better than any of my neighbours, but I am always cheated in the market."

While pursuing his farming occupations at Fishers' Tryste, which he did with the most laudable industry and perseverance, labouring much and frequently with his own hands, he did not neglect those studies which his classical education had placed within his reach. It was here, and while labouring with scythe and sickle, ploughing and harrowing, that he conceived, and at intervals of leisure in part wrote, his poem of the *Epigoniad*; the work which acquired him what celebrity he possesses.

Through the influence of Mr. Lind, sheriff-substitute of Mid-Lothian, who resided in his neighbourhood, and who knew of and appreciated his abilities, Mr. Wilkie obtained the appointment of assistant and successor to Mr. Guthrie, minister of Ratho. To this office he was ordained by the presbytery on the 17th May, 1753. Three years afterwards, during all which time he continued to reside on and cultivate his farm, he succeeded to the entire living by the death of the incumbent.

In 1757 Mr. Wilkie published at Edinburgh "*The Epigoniad*, a Poem in Nine Books," 12mo; and in 1759 a second edition, corrected and improved, with the addition of "A Dream, in the Manner of Spenser." The *Epigoniad* obtained a temporary and local celebrity of no unenviable kind. It was read and admired by the learned of Scotland, and has been so frequently alluded to in contemporary literature, that even yet, when perhaps there is hardly a living man who has read it, nothing like oblivion can be said to have overtaken it. Mackenzie, in his life of Home, speaks of it as "a poem of great merit, not only as possessing much of the spirit and manner of Homer, but also a manly and vigorous style of poetry rarely found in modern compositions of the kind." The same critic, after remarking the want of feeling which characterized Wilkie, goes on to say, "Perhaps it is to a want of this poetical sensibility that we may chiefly impute the inferior degree of interest excited by Wilkie's *Epigoniad* to that which its merits in other respects might excite. Perhaps it suffers also from its author having the Homeric imitation constantly in view, in which, however, he must be allowed, I think, to have been very successful—so successful that a person ignorant of Greek will, I believe, better conceive what Homer is in the original by perusing the *Epigoniad* than by reading even the excellent translation of Pope."

After his establishment at Ratho, Mr. Wilkie became a frequent and welcome visitor at Hatton, the residence of the Earl of Lauderdale, the patron of the parish, who highly esteemed him for his worth and talents, and was particularly fond of his society.

In 1759 he became a candidate for the chair of natural philosophy in the university of St. Andrews, then vacant by the death of Mr. David Young, and was successful. After settling in St. Andrews, the poet purchased some acres of land and resumed his farming occupations, in which he succeeded so well as to leave at his death property to the amount of

£3000. Some time after his appointment to the professorship, the university conferred on him, as a mark of its sense of his merits, the degree of Doctor in Divinity.

In 1768 Dr. Wilkie published a series of sixteen *Moral Fables, in Verse*, 8vo; but these, though sufficiently ingenious productions, did not advance him much farther in public favour as a poet. With this circumstance the remarkable occurrences of his life terminate. After a lingering indisposition, he died at St. Andrews, on the 10th October, 1772, in the fifty-first year of his age.

Of Dr. Wilkie's personal peculiarities some curious anecdotes have been preserved. Amongst the most amusing and extraordinary of his eccentricities was a practice of sleeping with an immoderate quantity of bed-clothes, and a detestation which he entertained of clean sheets. He has been known to sleep with no less than four and twenty pairs of blankets on him; and his abhorrence of clean sheets was so great, that whenever he met with them in any bed in which he was to lie, he immediately pulled them off, crumpled them together, and threw them aside. On one occasion, being pressed by Lady Lauderdale to stay all night at Hatton, he agreed, though with reluctance, and only on condition that her ladyship would indulge him in the luxury of a pair of foul sheets!

He was of extremely parsimonious habits, although in the latter years of his life he was in the habit of giving away £20 annually in charity. His parsimony, however, did not proceed so much from a love of wealth as of independence. On this subject he was wont to say, "I have shaken hands with poverty up to the very elbow, and I wish never to see her face again." He was absent to a degree that placed him frequently in the most awkward and ludicrous predicaments. He used tobacco to an immoderate extent, and was extremely slovenly in his dress.

WILLIAM, surnamed **THE LION**, one of the most distinguished of our early monarchs, was born in the year 1143. He was the second son of Henry, Prince of Scotland, the son and heir-apparent of David I., but who predeceased his father in 1152. On the death of his son, David proclaimed his eldest grandson Malcolm as the heir of his Scottish dominions, and, destining William for a separate principality in Northumberland, caused the barons of that district to give him their promise of obedience, and took hostages for its performance. Malcolm accordingly succeeded David in 1153 as King of Scots, while William, then only ten years of age, became superior of the territory now constituting the northern counties of England.

In 1157 an agreement took place between Malcolm and Henry II. of England, by which Northumberland was ceded to the latter, who gave in return the earldom of Huntingdon—an exchange which produced great dissatisfaction in Scotland, and the utmost displeasure in the subject of this memoir. From this time Malcolm became unpopular in Scotland, and it is not improbable that William took advantage of the national prejudices to advance his own ambitious views. It is represented by the Scottish historians that in 1164 the people obliged him to undertake the regency of the kingdom, while the king his brother gave himself up to religious meditation—a very decent description of what must have been little else than a usurpation. On the 28th December, 1165, Malcolm died, and William succeeded to the crown.

William, having repeatedly but vainly solicited the restitution of Northumberland from Henry II.,

at length joined in a confederacy with his son, the celebrated *Cœur de Lion*, for the purpose of dethroning that monarch, Richard not only assuring him of the territory he desired, but also granting the earldom of Cambridge to his younger brother David. In 1174 William served the purposes of this confederacy by an invasion of Northumberland, which he spoiled without mercy. He was prosecuting the siege of Alnwick with a small party, when a large body of Yorkshire horsemen came upon him unexpectedly. Though he had only sixty horse to present against four hundred, he gallantly charged the enemy, crying out, "Now we shall see who are true knights." He was unhorsed, disarmed, and made prisoner, while his companions, and some others who were not then present, submitted to the same fate from a sentiment of duty. Henry did not make a generous use of this triumph. He caused the captive monarch to be brought into the presence of his court at Northampton, with his feet tied together under the belly of a horse, as if he had been a felon, and afterwards placed him in strict confinement in the castle of Falaise in Normandy. The Scots, towards the close of the year, recovered their monarch from captivity, but at the expense of a temporary surrender of their national independence. In terms of the treaty formed on this occasion, William was to do homage to the English king for the *whole of his dominions*—an object at which the latter had long unjustly aimed: and the castles of Roxburgh, Berwick, Jedburgh, Edinburgh, and Stirling were surrendered as pledges on the part of the King of Scots for the performance of his promise. The independence of the Scottish church was at the same time impignorated, but with certain cautious ambiguities of phrase that reflect great credit on the ingenuity of its dignitaries who managed this part of the treaty. The claims of the English church over Scotland, however, disturbed the hopes of the ensuing years of the reign of William, who, in resisting them, backed as they were by the pope and all his terrors, showed surprising fortitude and perseverance.

In 1189, Richard *Cœur de Lion* having acceded to the throne, and considering that William of Scotland had forfeited his independence in consequence of an attachment to his own interest, restored it to him, along with the castles of Berwick and Roxburgh. Perhaps it was not altogether from a generous or conscientious motive that the king performed this act of justice. He was about to commence his celebrated crusade, and it might be apparent to him that the King of Scots was not a neighbour to be left dissatisfied: he also stipulated for 10,000 marks as the price of the favour he was granting to his brother monarch. The treaty, however, which these mingled notions had dictated was the blessed means of preserving peace between the two countries for upwards of a century. When Richard was afterwards so unfortunate as to become a captive in a foreign land, William contributed 2000 marks towards his ransom. Such transactions afford a pleasing relief to the general strain of our early history.

After a long reign, of which the last thirty years appear to have been spent in tranquillity and without the occurrence of any remarkable event, William died at Stirling, December 4, 1214, in the seventy-second year of his age and the forty-ninth of his reign, leaving by his wife, Ermengarde de Beaumont, one son, who succeeded him under the title of Alexander II. William also had six illegitimate children. He is allowed by historians to have been a vigorous and judicious prince, not exempt of course from the vices of his age, among which must be reckoned a

rash valour, but adorned also by some of its virtues. William was the first Scottish sovereign who bore a coat armorial. He assumed the *lion rampant* upon his shield, and from this cause it is supposed he obtained the designation of *William the Lion*. A curious portrait of William has been preserved from time immemorial in the Trinity Hospital at Aberdeen, and was lately engraved and published in the *Transactions of the Antiquarian Society of Scotland*.

WILLOCK, JOHN, one of the earliest Scottish reformers, is supposed to have been a native of Ayrshire, and to have been educated at the university of Glasgow. He entered one of the monastic orders (that of the Franciscans, according to Spotswood, and of the Dominicans, according to Lesley) in the town of Ayr, and remained in it probably for several years; but the history of this period of his life is almost entirely unknown. Previously to 1541 he had become a convert to the Protestant faith, and retired from his native country into England. There, however, he did not receive the protection which he seems to have expected; for during the persecution for the Six Articles he was thrown into the Fleet prison. After his liberation he became one of the chaplains to the Duke of Suffolk, the father of the Lady Jane Grey; and during the reign of king Edward appears to have lived in tranquillity. But the hopes of the Protestants were soon blasted by the early death of that monarch; and Willock, with many others, was obliged once more to flee, on the accession of Mary to the throne. The town of Embden in Friesland was selected as the place of his retirement. Here he was enabled to turn his knowledge to account in the practice of medicine, which brought him into contact with persons of distinction, and among others with Anne Duchess of Friesland. The acquaintance which was thus formed was strengthened by subsequent intercourse, and Willock was sent by the duchess on several missions into Scotland. His visits to his native country, where he preached, whether in health or sickness, to all that came to his house, must have had a powerful effect in hastening the establishment of the Reformation. He seems to have ultimately determined upon residing in Scotland; and with this view returned in 1558, or early in 1559. The town of Ayr, in which he had formerly lived in monastic seclusion, was now destined to be the place of his public ministrations; and he mentions St. John's Church as the place where he taught his doctrine "oppinlye befor the pepil." Nor did he decline controversy with the Popish ecclesiastics: for in 1559 he became the opponent of Quentin Kennedy, the well-known abbot of Crosraguel;¹ and at a later period he had public disputes with Black, a Dominican friar, and with Robert Maxwell, a schoolmaster in Glasgow; but of neither of these has any account, so far as we are aware, been preserved. Early in 1559 Hamilton, Archbishop of St. Andrews, had summoned Willock and some of the other Protestant preachers to appear before him; but their trial was prorogued by the queen-regent's orders, and they were summoned to appear before the justiciary court at Stirling. In the meantime the gentlemen of the counties of Angus and Mearns, where the Protestant doctrines prevailed, assembled with their followers, with the avowed intention of accompanying the ministers to Stirling. The queen-regent became alarmed, and promised to Erskine of Dun "to take some better order." Upon the faith of this promise they retired, and the ministers did not, of course, consider them-

¹ See an account of their controversy, so far as it proceeded, in Keith's *History*, Appendix, 193-199.

selves as still bound to appear. But when the day of trial came, the regent ordered the summons to be called, the ministers outlawed, and their cautioners amerced.

It is fortunate when such instances of duplicity meet with "the skaith and the scorn" which they deserve. This was certainly the case in the present instance. While the breach of faith alienated the affections of some of the queen-regent's best supporters, it had not even the temporary effect of retarding the progress of the new doctrines. In the following July Willock preached in St Giles', Edinburgh, to large audiences; and in harvest the sacrament of the Lord's supper was publicly administered. The regent requested that mass might still be said, the church leaving it to the option of the people to attend the Popish or the Protestant service; but Willock and his party were sufficiently powerful to resist the proposal, and she had the mortification of seeing her wishes frustrated by the very men whom she had proclaimed rebels not two months before. She was to receive a yet more decided blow from them. In October the nobility, barons, and burghesses assembled at Edinburgh to discuss the question whether a regent who had contemptuously refused the advice of her born councillors,—who had infringed the laws both of the realm and of common good faith—and who had carried on a civil war in the kingdom—should be suffered any longer to rule tyrannically over them. After a statement of their opinions by Willock and Knox she was solemnly deposed, and a council, assisted by four ministers, of whom Willock was one, was appointed to carry on the government till the first meeting of a parliament.

The arrangements which followed the establishment of the Reformation, and the appointment of superintendents over provinces, have been noticed in several of the lives in this Work. In September, 1561, Willock was ordained superintendent of the west, at Glasgow, in presence of some of the most powerful of the nobility.¹ From this period ceases everything in his history that may be supposed to interest a general reader. He was now occupied, apparently, in the routine of his duties, and in the business of the General Assembly, of which he was several times (in 1563, 1565, and 1568) chosen moderator. In or before 1567 he seems to have gone to England; and the General Assembly, in testimony of their esteem, and of the value of his services, ordered John Knox to request him to return. This he did in a most affectionate letter, and it had its effect. Willock did return, and was appointed moderator of the next Assembly. For reasons which it is now in vain to conjecture, he is supposed to have returned to England almost immediately afterwards. With this period closes every authentic trace of this excellent man, of whose history throughout we unfortunately only know enough to excite, but not to gratify, our interest. A charge, apparently of a very absurd nature, has been brought against him by Mr. George Chalmers. In a MS. in the State Paper Office, that author discovered, that in April, 1590, "two men, the ane namyt Johnne Gibsonne, Scottishman, preacher, and Johnne Willockes, were convicted by a jury of robbery;" and he immediately concluded that this could be no one else but "the

reforming coadjutor of Knox:" a conclusion which could not fail to gratify his prejudices. Without troubling the reader with any lengthened defence of the supposition that there may have been more than one John Willock in broad England, we shall merely state, that as *our* Willock was a preacher in 1540, if not earlier, he must now have been at an age when robbers (when the gallows spares them) generally think of retiring from their profession.

Respecting the works of John Willison, we have not been able to learn anything. Dempster, in his account of him—one of the most bitter articles in his *Historia Ecclesiastica*—ascribes to him *Impia Quadam*; which, however, he had not seen when he pronounced this opinion of them.²

WILLISON, JOHN, an eminent divine, and author of several well-known religious works, was born in the year 1680. The singularly gentle and pious disposition which he evinced, even in his boyhood, together with the extraordinary aptness which he discovered for learning, determined his parents to devote him, from a very early period of his life, to the service of the church, and in this determination young Willison cordially acquiesced. It was the profession of all others which he himself preferred.

On completing a regular course of academical education he entered on the study of divinity, and prosecuted it with remarkable assiduity and success.

Having duly qualified himself for the sacred calling of the ministry, he was almost immediately thereafter invited (1703), by a unanimous call, to the pastoral office at Brechin. Here he acquired so great a degree of popularity by his abilities as a preacher, and by the simplicity and purity of his manners and conduct, and the benevolence of his disposition, that he was earnestly and unanimously called upon by the people of Dundee to fill a vacancy which shortly after occurred in that town. He accordingly removed thither, and remained there till his death.

Mr. Willison's abilities procured him a remarkable prominence in all public discussions regarding church matters in the period in which he lived, especially in the question of patronage, to which he was decidedly hostile. He was, indeed, considered the leader of the party who advocated the right of the people to choose their own pastors agreeably to the settlement of the church at the revolution in 1689, and was indefatigable in his exertions to restore the exercise of this popular right, which had been overturned by an act of parliament passed in 1712. In these exertions, however, both Mr. Willison and his party were unsuccessful till the year 1734, when they were fortunate enough to procure the co-operation of the General Assembly in their views. That body had hitherto strenuously seconded the enforcement of the system of exclusive patronage, but in the year just named it happened to be composed of men who entertained directly opposite sentiments on that subject to those avowed and acted upon by their predecessors;—so opposite, indeed, that they determined in the following year, 1735, to apply to parliament for a repeal of the patronage act. The known abilities, zeal, and activity of Mr. Willison suggested him as one of the fittest persons to proceed to London on this important mission, and he was accordingly appointed, with two other clergymen, Messrs. Gordon and Mackintosh, to perform that duty; but the application was unsuccessful.

Mr. Willison also distinguished himself by the strenuous efforts he made to keep the peace of the church, by endeavouring to prevent those schisms,

¹ Although the form of admission did not take place till that date, there is evidence that Willock was settled in the west, and had an allowance from the revenues of the archbishopric of Glasgow, as early as October, 1560, before the meeting of the first General Assembly. In the following January his wife, who appears to have resided in England during the struggles which preceded the Reformation, joined him.—Wodrow's *Biographical Collections*, printed by the Maitland Club, i. 450.

² Abridged from Wodrow's *Biographical Collections*, i. 99-116, 448-453.

and to reconcile those differences, which led to the separation of large bodies of Christians from the Established church, and which first began to manifest themselves about this period. His efforts were unsuccessful, but not the less meritorious on that account.

Besides being a popular preacher, Mr. Willison was also a popular author, and in the religious world his name in the latter capacity still stands, and will long stand, deservedly high. His principal works are the *Afflicted Man's Companion*, written, as he himself says, with the benevolent intention "that the afflicted may have a book in their houses, and at their bed-sides, as a monitor to preach to them in private, when they are restrained from hearing sermons in public;" and the work is admirably calculated to have the soothing effect intended by its able and amiable author; the *Church's Danger and Ministers' Duty*; *A Sacramental Directory*; *A Sacramental Catechism*; *An Example of Plain Catechising*; the *Balm of Gilead*; *Sacramental Meditations*; *Appendix to Sacramental Meditations*; *A Fair and Impartial Testimony*; *Gospel Hymns*; *Papery another Gospel*; and the *Young Communicant's Catechism*. An edition of these very useful and pious works, in one volume 4to, was published at Aberdeen in 1817.

Mr. Willison is described as having been most exemplary in all the relations of life, and singularly faithful and laborious in the discharge of the important duties of his sacred office, especially in visiting and comforting the sick. In this benevolent work he made no distinction between the rich and the poor, or if he did, it was in favour of the latter.

Neither did he confine his exertions in such cases to those of his own persuasion, but with a truly Christian liberality of sentiment, readily obeyed the calls of all in affliction, whatever their religious creed might be, who sought his aid.

Mr. Willison died at Dundee, on the 3d of May, 1750, in the seventieth year of his age, and the forty-seventh of his ministry.

WILSON, ALEXANDER, the celebrated ornithologist, was born in Paisley, on the 6th of July, 1766. His father was at that time a distiller in a limited way; poor in circumstances, but sober, religious, and industrious, and possessed of sagacity and intelligence much beyond most men in his sphere of life. From the period of his son's birth he entertained the project so fondly cherished by almost every parent among our Scottish peasantry, of rearing him up to be a minister of the gospel. There is no evidence to show that young Wilson displayed any unusual precocity of intellect or bias of disposition to justify so high a destination; but even if he had, he would have been compelled to relinquish his views by the death of his mother, which left his father embarrassed with the charge of a young family. Alexander was at this time ten years of age, and although his education had necessarily been restricted to the ordinary branches of writing, reading, and accounts, the judicious and careful superintendence of his father had even then imbued his mind with a passion for reading and a predilection for the beauties of nature, which continued to influence his character ever afterwards. In his correspondence at a later period of his life, Wilson often recurs with expressions of warm filial gratitude to the paternal anxiety with which his early studies were directed, to which he attributed all the eminence and honours he subsequently attained. In a letter dated February, 1811, he says:—"The publication of my *Ornithology*, though it has swallowed up all the little I had saved, has procured me the honour of many friends, eminent in

this country, and the esteem of the public at large; for which I have to thank the goodness of a kind father, whose attention to my education in early life, as well as the books then put into my hands, first gave my mind a bias towards relishing the paths of literature and the charms and magnificence of nature. These, it is true, particularly the latter, have made me a wanderer in life; but they have also enabled me to support an honest and respectable situation in the world, and have been the sources of almost all my enjoyments."

Wilson's father soon married again; and three years passed away, during which time Alexander seems to have had no other occupation but reading and roaming about, feeding in solitude habits of reflection and an ardent poetic temperament, which led him to shun the society of his frolicsome compeers. An American biographer erroneously attributed this disposition for solitary rambling, and his ultimate departure from the paternal dwelling, to the harsh treatment of his step-mother; but it has been clearly proved by subsequent writers, that she discharged her duty towards him with great tenderness and affection; and Wilson himself uniformly speaks of her with great respect.

At the age of thirteen—that is in July, 1779—Wilson was apprenticed for three years to William Duncan, a weaver, who had married his eldest sister. This occupation was quite at variance with his disposition and previous habits; yet he nevertheless not only completed his indenture, but afterwards wrought for four years as a journeyman, residing sometimes at Paisley, at other times in his father's house (who had then removed to Lochwinnoch), and latterly with his brother-in-law Duncan, who had shifted his quarters to Queensferry. Having much of his time at his own disposal during the last four years, Wilson gave a loose to his poetical disposition; his relish for the quiet and sequestered beauties of nature, which began to assume almost the character of a passion, he indulged more and more, giving utterance to his feelings in verses—chiefly descriptive—which, if exhibiting no great power of diction, certainly display an expansion of thought, a purity of taste, and a refinement of sentiment, that are very remarkable in one so young and so unfavourably circumstanced for the cultivation of literary pursuits. The only explanation which can be given of the fact is, that he possessed an insatiable thirst for reading; and with that and solitary musings passed the leisure hours which others generally devote to social amusements. An almost necessary consequent on this gradual refinement and elevation of mind was a disgust with the slavish and monotonous occupation of the loom; and the incongruity between his worldly circumstances and the secret aspirations of his soul frequently occasioned fits of the deepest melancholy. Unlike, however, but too many of the same sensitive character, and of similar position, he never sought relief from his morbid despondency in the deceitful stimulant of the bottle. He yielded to its influence, only in as far as he manifested an increasing aversion to his occupation; or, as more worldly-minded people would term it, a tendency to idleness. Nor did the circumstance of several of his juvenile pieces appearing about this time in the *Glasgow Advertiser* (now the *Glasgow Herald*), and which attracted no small attention amongst his townsmen, tend anything to reconcile him to the shuttle. This was immediately before his migration to Queensferry; on his removal to which place a circumstance occurred which had a strong influence upon his future fortunes and character. His brother-in-law Duncan, finding the trade of weaving inadequate to the support of his

family, resolved to attempt that of a peddler or travelling merchant for a while, and invited Wilson to join in the expedition. No proposal could have been more congenial to the young poet's mind, promising, as it did, the gratification of the two most powerful passions which he cherished—a desire for increasing his knowledge of men and manners; and a thirst for contemplating the varied scenery of nature. From a journal which he kept, indeed (he was in his twentieth year when he set out), during this expedition, it is evident that his sensations almost amounted to rapture; and he speaks with the most profound contempt of the “grovelling sons of interest, and the grubs of this world, who know as little of, and are as incapable of enjoying the pleasures arising from, the study of nature, as those miserable spirits who are doomed to perpetual darkness can the glorious regions and eternal delights of paradise!” For nearly three years did Wilson lead this wandering life, during which time it appears that he paid less attention to the sale of his wares than to gratifying his predilection for reading and composition, and indulging in a sort of dreamy meditation, little compatible with the interests of his *pack*. In fact, of all occupations, the sneaking, cajoling, and half-mendicant profession of a peddler was perhaps the most unsuitable to the manly and zealously independent tone of Wilson's mind; but he was consoled for his want of success by the opportunities he enjoyed of visiting those spots rendered classical, or hallowed by the “tales of the days of old.” He used to speak, for instance, with rapt enthusiasm of the exultation he experienced in visiting the village of Athelstaneford, successively the residence of Blair and Home. During this happy period—the only truly happy one, perhaps, of his whole life—his muse was so busy, that in 1789 he began to think of publishing. As he could get no bookseller, however, to risk the necessary outlay, he was compelled to advance what little gains he had stored up; and getting a bundle of prospectuses thrown off, he set out on a second journey with his pack, for the double purpose of selling muslins and procuring subscribers for his poems. In the latter object he was grievously disappointed; but Wilson was not a man to travel from Dan to Beersheba and say all is barren, even although foiled in the immediate purpose of his heart. His journal during this second journey indicates the strong and rapid growth of his understanding, and exhibits powers of observation and philosophic reflection remarkable in a young man of the immature age of twenty-three. Upon his return home he obtained the publication of his poems by Mr. John Neilson, printer in Paisley, when he again set out on his former route, carrying with him a plentiful supply of copies, for the benefit of those who might prefer poetry to packware. A less sanguine individual than Wilson might have anticipated the prejudice with which attempts at literary eminence, emanating from such a quarter, were likely to be viewed by the world. But our author was one to whose mind nothing but the test of experience could ever carry conviction—a characteristic which, in his subsequent career, proved one of the most valuable attributes of his mind. His expectations were soon resolved in the present instance. The amount of his success may be gathered from a passage in one of his letters from Edinburgh, wherein he says, “I have this day measured the height of a hundred stairs, and explored the recesses of twice that number of miserable habitations; and what have I gained by it? only two shillings of worldly pelf!” In short, poetry and peddlery proved equally unsuccessful in his hands; he had neither impudence, flattery, nor importunity

enough to pass off either the one or the other upon the public; and he returned, mortified and disappointed, to his father's house at Lochwinnoch, where necessity compelled him to resume the shuttle. But his was not a heart to sink into despair under the frowns of fortune; and accident soon furnished occasion for a display of the latent vigour of his mind. A few of the rising Edinburgh *literati*, having formed themselves into a debating society called the *Forum*, were in the habit of propounding questions for discussion, in which the public were admitted to take a share. It happened about the time we are speaking of, that one of the questions for debate was, “Whether the exertions of Allan Ramsay or Robert Fergusson had done most honour to Scottish poetry?” Wilson having accidentally got notice of this, became fired with the idea of making a public appearance upon a subject on which he felt confident he was capable of acquitting himself creditably, even although he had not then read the poems of Fergusson, and had only a fortnight to prepare himself. He accordingly borrowed a copy, read, and formed his opinion; composed a poem of considerable length for the occasion, labouring all the while double the usual time at the loom, in order to raise funds for his journey; and arrived in Edinburgh in time to take a share in the debate, and recite his poem, called the *Laurel Disputed*; in which, contrary to the opinion of the audience, he assigned the precedence to Fergusson. Wilson remained some weeks in Edinburgh, during which time he composed and recited in public other two poetical essays, and published his *Laurel Disputed*; a poem slovenly, or we should rather say hastily written, but marked by much rough vigour of thought. Some of his pieces about the same time appeared in Dr. Anderson's *Bee*; a fact sufficiently proving that his poetical talents were appreciated by those who constituted the high court of criticism in Edinburgh at the time; but from some cause or other—probably the poverty of his circumstances, together with his unobtrusive disposition—he met with no efficient patronage or encouragement to induce him to try his fortune in the metropolitan world of letters; and he returned home to the loom, with nothing else than some increase of reputation.

About this time an interesting incident took place in Wilson's career. The poems of Burns had then (1791) drawn their immortal author from his obscure situation into the full blaze of fame and popularity. Wilson, having obtained a copy of them, wrote to Burns, strongly objecting to the immoral tendency of several of the pieces. The latter replied, that he was now so much accustomed to such charges, that he seldom paid any attention to them; but that as Wilson was *no common man*, he would endeavour to vindicate his writings from the imputation laid against them, which he accordingly did. Wilson shortly afterwards made a peregrination into Ayrshire to visit Burns, and an intimacy commenced which probably would only have been terminated by death, but for the causes which shortly afterwards doomed Wilson to expatriation. The two poets, indeed, had many striking points of resemblance in their character, especially in the manly and dauntless independence of their minds, their love of nature, and their admiration of everything generous and noble, and intolerance of everything low and mean. Yet it is singular what a contrast their respective writings exhibit. While the passion of love was the main source of Burns' inspirations to the last, Wilson, even in the heyday of ardent youth, seldom alludes to such a feeling; and when he does, it is in the cool tone with which an unconcerned individual would speak of any other curious natural phenomenon.

In the following year (1792) appeared Wilson's admirable narrative poem, *Watty and Meg*. Being published anonymously, it was universally attributed to Burns; a mistake which, of course, the author felt as the highest acknowledgment of its merits. But this was the last gleam of sunshine he enjoyed in his native land. A violent dispute broke out between the journeymen and master-weavers of Paisley, and Wilson joined the ranks of the former, with all the determined energy which so peculiarly characterized him. Fierce and bitter anonymous satires appeared, the paternity of which was rightly assigned to Wilson; and one individual especially, a most respectable and benevolent man, but who was represented to the poet as a monster of avarice and oppression, was libelled by him in a manner too gross to be patiently borne. Wilson was prosecuted, convicted, imprisoned, and compelled to burn the libel with his own hands at the public cross of Paisley. In a badly regulated mind such an infliction would only have excited thoughts of retaliation, and the desire of revenge; but although Wilson must have smarted severely under the disgrace, he was a man of too correct and candid judgment to persist wilfully in an evil course. He deeply repented afterwards these wrathful effusions of his pen. Before setting out to America he called upon all those whom he had been instigated to satirize, and asked their forgiveness for any uneasiness his writings had occasioned; and many years afterwards, when his brother David, who went out to join him in the West, carried out a collection of these youthful satires, thinking they would be an acceptable present to him after the lapse of so long a period, Wilson, without once looking at them, threw the packet into the fire, exclaiming, "These were the sins of my youth; and had I taken my good old father's advice, they never would have seen the light." Such an anecdote is equally creditable to the father's good sense and the son's moral feeling. But other public events accelerated the most important crisis in Wilson's life. The French revolution, with all its delusive promises of a harvest of liberty, broke out; its influence spread over the surrounding nations, and Wilson was one of those ardent men, who, in our own country, conceived a favourable opportunity to have occurred for reforming the national institutions. His well-known zeal and determination of mind made him, of course, be looked upon as a man of most dangerous character; and his previous attacks upon the authorities of Paisley being yet fresh in their recollection, he was watched with a suspicion proportioned to the dislike with which he was regarded. From these causes Wilson's situation soon became intolerably unpleasant to him; and he then, for the first time, resolved upon emigrating to America. By what means he purposed to support himself there it is not very easy to conjecture; but having once resolved, he proceeded immediately to put his plan into execution. His chief if not his only obstacle was the want of funds; and to raise them he applied himself so indefatigably to the loom, that in four months he realized the amount of his passage money. He has himself recorded, that during this period his expenses for living did not exceed *one shilling per week*; so little does man actually require for the bare sustenance of life.

Having bid adieu to his friends and relatives, he walked on foot to Portpatrick, whence he passed over to Belfast, and there embarked on board a vessel bound for Newcastle in the Delaware state, being necessitated to sleep on deck during the voyage. He landed in America on the 14th July, 1794, with his fowling-piece in his hand, and only a few shillings in his pocket, without a friend or letter of

introduction, or any definite idea in what manner he was to earn his future livelihood. He nevertheless set out cheerily on foot towards Philadelphia—a distance of thirty-three miles—delighted with everything he saw; and it was curious enough, that almost his very first action was shooting a red-headed woodpecker, as if indicative of the nature of his future studies. It ought here to be remarked, that, previously to this time, Wilson had never manifested the slightest disposition to the study of ornithology. On arriving at Philadelphia an emigrant countryman, a copperplate printer (from motives of charity, we presume), employed him for some weeks at this new profession; but it is probable that both soon grew mutually tired of the agreement. Wilson at least speedily relinquished the occupation, and betook himself to his old trade of weaving, at which he persevered for about a twelvemonth. Having amassed some little savings, he resumed his old profession of peddler, chiefly with the view of exploring the scenery and society of the country, and traversed the greater part of the state of New Jersey, experiencing considerable success with his pack. Upon his return he finally abandoned the professions of weaver and peddler, and betook himself to an occupation which of all others it might be supposed he was the least fitted by education and disposition to undertake—that of a schoolmaster. But it is evident that Wilson adopted this profession as much as a means of self-improvement as of a livelihood. His first school was at Frankford, in Pennsylvania; thence he removed to Milestown, where he continued for several years, assiduously cultivating many branches of learning, particularly mathematics and the modern languages: thence to Bloomfield, New Jersey; where he had scarcely settled himself when (in 1802) he was offered and accepted an engagement with the trustees of a seminary in Kingessing, on the river Schuylkill, about four miles from Philadelphia; and this was the last and most fortunate of all his migrations. During all these eight years of shiftings and wanderings, Wilson's career was almost one continued struggle with poverty, the principal part of his income being acquired by occasional employment in surveying land for the farmers; yet his mind did not, as is usual with most men, become soured or selfish under the incessant pressure of difficulties. On the contrary, he continued to write home such flattering accounts of his adopted country, as to induce his nephew, William Duncan (whose father was then dead), to follow him across the Atlantic, with his mother and a large family of brothers and sisters. Wilson was at this time at Milestown; but when he heard of their arrival he set out on foot for New York, a distance of 400 miles, for the sole purpose of assisting in getting them comfortably settled. An American biographer says, that, by the kindness of a Mr. Sullivan, Wilson was enabled, in conjunction with his nephew, to purchase and stock a small farm, for the accommodation and support of his relatives; after which he returned again on foot to the ungracious labours of the school-room, accomplishing a journey of 800 miles in twenty-eight days. To this family he continued ever afterwards to pay the most unremitting and benevolent attention; keeping up a constant correspondence with his nephew, advising and encouraging him amid his difficulties, and even redoubling his own exertions, by keeping a night-school, and other laborious expedients, that he might assist in the support of the family. "Be assured," he says, in one of his letters to his nephew, "that I will ever as cheerfully contribute to your relief in difficulties, as I will rejoice with you in prosperity. But we have nothing to fear. One

hundred bushels of wheat, to be sure, is no great marketing; but has it not been expended in the support of a mother, and infant brothers and sisters, thrown upon your bounty in a foreign country? Robert Burns, when the mice nibbled away his corn, said, -

" 'I'll get a blessing wi' the lave,
And never mis't."

Where he expected one you may expect a thousand. Robin, by his own confession, ploughed up his mice out of 'ha' and hame.' You have built for your wanderers a cozie bield, where none dare molest them. There is more true greatness in the affectionate exertions which you have made for their subsistence and support, than the bloody catalogue of heroes can boast of. Your own heart will speak peace and satisfaction to you, to the last moment of your life, for every anxiety you have felt on their account." Nor did Wilson forget the ties of relationship that still united him to the land of his birth. To his father he wrote fully and regularly; and his letters, both to him and his brother David, are no less replete with sound sense than ardent affection and excellent moral feeling.

Wilson's removal to Kingessing was the first lucky step towards the attainment of that fame which hallows his memory. His salary was extremely inadequate to his labour, and almost to his subsistence; but this situation introduced him to the patronage of many kind and influential friends, and afforded him opportunities of improving himself which he had never before enjoyed. Amongst the former was William Bartram, the American Linnaeus of the period, in whose extensive gardens and well-stocked library Wilson found new and delightful sources of instruction and enjoyment; and Mr. Lawson, the engraver, who initiated him into the mysteries of drawing, colouring, and etching, which afterwards proved of such incalculable use to him when bringing out his *Ornithology*. About this time Wilson tasked his powers to their very utmost in the duties of his school and his efforts at self-improvement. This severe exertion and confinement naturally preyed upon his health and depressed his spirits; but Messrs. Bartram and Lawson, who seem to have known little, personally, of the exhausting process of "o'er-informing the tenement of clay," mistook the despondency and lassitude of body and mind thereby occasioned in their friend, for the symptom of incipient madness. This melancholy fact they attributed to his "being addicted to writing verses and playing on the flute;" and it would appear, that, in their efforts to wean him from such perilous habits, they were at little pains to conceal their opinion even from himself. While rambling in the woods one day Wilson narrowly escaped destruction from his gun accidentally falling against his breast when cocked; and in his diary (which he uniformly kept) he blesses God for his escape, as, had he perished, his two worthy friends would undoubtedly have loaded his memory with the imputation of suicide. He complied, however, with their request so far as to substitute drawing for poetry and music; but he attained not the slightest success until he attempted the delineation of birds. This department of the art, to use our old Scottish expression, "came as readily to his hand as the bowl of a pint-stoup," and he soon attained such perfection as wholly to outstrip his instructors. His success in this new employment seems to have first suggested the idea of his ornithological work, as we see from letters to his friends in 1803, that he first mentions his purpose of "making a collection of all our finest birds." Upon submitting his intentions to Messrs. Bartram and Lawson, these

gentlemen readily admitted the excellence of his plan, but started so many difficulties to its accomplishment, that had Wilson been a man of less nerve, or confidence in his own powers, he would have abandoned the idea in despair. But he treated their remonstrances with indifference, or something more like scorn: he resolved to proceed at all risks and hazards, and for some time afterwards busily employed himself in collecting all the rarer specimens of birds in his own neighbourhood. In October, 1804, he set out, accompanied by his nephew Duncan and another individual, upon an expedition to the falls of Niagara, which wondrous scene, according to his own account, he gazed upon with an admiration almost amounting to distraction. On their return the three friends were overtaken by the storms of winter. Wilson's companions successively *gave in*, and left him at different parts of their route; but he himself toiled on through the mud and snow, encumbered with his gun and fowling-bag, the latter of which was of course always increasing in bulk, and arrived safely at home, after an absence of fifty-nine days, during which he had walked nearly 1260 miles, forty-seven of which were performed the last day. Instead of being daunted by the fatigues and hardships of the journey, we find him writing an account of it to his friends with something like exultation, and delightfully contemplating future expeditions of the like nature; and this when his whole stock of money amounted to three-fourths of a dollar! For some time after his return he amused himself with penning a poetical narrative of his journey, called *The Foresters* (afterwards published); a piece much superior to any of his former descriptive poems, and containing many even sublime apostrophes. From this time forward Wilson applied his whole energies to his ornithological work, drawing, etching, and colouring all the plates himself, for he had in vain endeavoured to induce his cautious friend Mr. Lawson to take any share in the undertaking. In the spring of 1806 a favourable opportunity seemed to present itself for prosecuting his researches, by a public intimation being given of the intention of President Jefferson to despatch parties of scientific men to explore the district of Louisiana. At Wilson's request, Mr. Bartram, who was intimate with the president, wrote to him, mentioning Wilson's desire, character, and acquirements, and strongly recommending his being employed in the proposed survey. Wilson also wrote a respectful and urgent letter to Jefferson, detailing the extensive plans of his work, and explaining all his proceedings and views. To these applications the president *vouchsafed not one word in reply*; a circumstance which convinced Wilson more and more—nor did he shrink from the conviction—that he must stand self-sustained in the executing of his great national undertaking. But his intrinsic and sterling merits soon procured him a patronage which to his independent mind was perhaps infinitely more gratifying than the condescending favours of a great man. He received a liberal offer from Mr. Bradford, a bookseller of Philadelphia, to act as assistant editor in bringing out a new edition of Rees' *Cyclopaedia*, and he gladly relinquished the toilsome and ill-rewarded duties of a schoolmaster to betake himself to his new employment. Soon after this engagement he laid before Mr. Bradford the plan of his *Ornithology*, with the specimens of composition and delineation which he had already executed; and that gentleman was so satisfied of Wilson's ability to complete it, that he at once agreed to run all the risk of publication. All obstacles to the fulfilment of his great design being now removed, Wilson applied himself night and day to his double

task of author and editor, occasionally making a pedestrian excursion into various districts for the benefit at once of his health (which was beginning to decay) and of his great work. At length, in 1808, the first volume of the *American Ornithology* made its appearance, and much as the public had been taught to expect from the advertisements and prospectuses previously issued, the work far exceeded in splendour anything that had ever been seen in the country before. Immediately on its publication, the author set out on an expedition through the eastern states, with the design of exhibiting his book and soliciting subscribers. It is not our purpose to trace his course in this journey, wherein he encountered hardships, vexations, and disappointments innumerable, but insufficient to check his ardour. The extent of his journey may be guessed at from the following extract from one of his letters when about to return:—"Having now visited all the towns within a hundred miles of the Atlantic, from Maine to Georgia, and done as much for this bantling book of mine as ever author did for any progeny of his brain, I now turn my wishful eyes towards home." Upon the whole, the result of his expedition was unsuccessful, for although he received most flattering marks of respect wherever he went, the sacrifice of 120 dollars (for the ten volumes) proved a sad check upon the enthusiasm of his admirers. His letters to his friends, in which a full account of every part of this as well as his subsequent journeys is given, are in the highest degree interesting. In 1810 the second volume was published, and Wilson immediately set out for Pittsburg, on his way to New Orleans, for the same purpose as before. On reaching Pittsburg he was puzzled to think by what means he should descend the Ohio; but at last determined, in spite of the remonstrances of his friends, to voyage it in a small boat alone. He accordingly bought a *bateau*, which he named the *Ornithologist*, put in a small stock of provisions and water (he never carried spirits with him), with his never-failing fowling-piece and ammunition, and pushed off into the stream for a solitary voyage of between 500 and 600 miles. This was exactly such a situation as was calculated to arouse all the romantic feelings of Wilson's soul: the true lover of nature experiences a delight approaching to ecstasy when alone in the uninhabited desert. But the whole tract of his journey was rich with the objects most attractive to the lonely voyager; he collected an immense stock of ornithological riches for his future volumes, and amused his mind at his hours of repose with the composition of a descriptive poem entitled *The Pilgrim*. He reached New Orleans on the 6th of June, and arrived at Philadelphia on the 2d of August, having been travelling since the beginning of January; during which time his whole expenses did not amount to 500 dollars. This was the most extensive of all Wilson's excursions, and although he took several others to various districts, as the volumes of the *Ornithology* successively appeared, we do not think it necessary here to advert to them particularly. Writing to his brother David a year or two afterwards, in reference to these exertions to further the sale of his works, he says: "By the first opportunity I will transmit a trifle to our old father, whose existence, so far from being forgotten, is as dear to me as my own. But David, an ambition of being distinguished in the literary world has required sacrifices and exertions from me with which you are unacquainted; and a wish to reach the glorious rock of independence, that I might from thence assist my relations who are struggling with and buffeting the billows of adversity, has engaged me in an undertaking more laborious and extensive than

you are aware of, and has occupied every moment of my time for several years. Since February, 1810, I have slept for several weeks in the wilderness alone, in an Indian country, with my gun and my pistols in my bosom; and have found myself so reduced by sickness as to be scarcely able to stand, when not within 300 miles of a white settlement, and under the burning latitude of twenty-five degrees. I have, by resolution, surmounted all these and other obstacles in my way to my object, and now begin to see the blue sky of independence open around me."

Wilson's reputation, indeed, and the merits of his great undertaking, had now forced themselves into notice, not only in America, but throughout all Europe, and one of his biographers says, that there was not a crowned head in the latter quarter of the globe but had then become a subscriber to the *American Ornithology*. Honours as well as profit began to pour in upon him. In 1812 he was elected a member of the American Philosophical Society, and subsequently of other learned bodies. In 1813 the literary materials for the eighth volume of the *Ornithology* were ready at the same time that the seventh was published. But its progress was greatly retarded for want of proper assistants to colour the plates, those whom he could procure aiming rather at a caricature than a copy of nature. He was at last obliged to undertake the whole of this department himself in addition to his other duties, and these multifarious labours, by drawing largely upon his hours of rest, began rapidly to exhaust his constitution. When his friends remonstrated with him upon the danger of his severe application, he answered, "Life is short, and without exertion nothing can be performed." A fatal dysentery at last seized him, which after a few days' illness carried him off, upon the 23d of August, 1813, being then only in his forty-eighth year. According to the authority of an American gentleman who was intimate with him, his death was accelerated by an incident in singular keeping with the scientific enthusiasm of his life. While sitting in the house of one of his friends, he happened to see a bird of a rare species, and which he had been long seeking for in vain, fly past the window. He immediately rushed out of the house, pursued the bird across a river, over which he was compelled to swim, shot and returned with the bird, but caught an accession of cold which partly caused his death. He was buried next day in the cemetery of the Swedish church in the district of Southwark, Philadelphia, with all the honours which the inhabitants could bestow on his remains. The clergy and all the public bodies walked in procession, and wore crape on their arms for thirty days. A simple marble monument was placed over him, stating shortly the place and year of his birth, the period of his emigration to America, and the day and cause of his death.

The whole plates for the remainder of the *Ornithology* having been completed under Wilson's own eye, the letterpress of the ninth volume was supplied by his friend Mr. George Ord, who had been his companion in several of his expeditions, as also a memoir of the deceased naturalist. There have been few instances, indeed, where the glowing fire of genius was combined with so much strong and healthy judgment, warmth of social affection, and correct and pure moral feeling, as in the case of Alexander Wilson. The benevolence and kindness of his heart sparkle through all his writings, and it is cheering to the true Christian to observe that his religious principles became purified and strengthened in proportion to the depth of his researches into the organization of nature. He is said to have been

strikingly handsome in person, although rather slim than robust, with a countenance beaming with intelligence, and an eye full of animation and fire. His career furnishes a remarkable example of the success which, sooner or later, is the reward of perseverance. It is true he did not attain riches, but upon the possession of these his happiness was not placed. He wished, to use his own words, "to raise some beacon to show that such a man had lived," and few have so completely achieved the object of their ambition. Wilson's father survived him three years.

Three supplementary volumes of the *Ornithology*, containing delineations of American birds not described by Wilson, have been published by Charles Lucien Bonaparte. In 1832 an edition of the *American Ornithology*, with illustrative notes and a life of Wilson, by Sir William Jardine, was published in London, in three volumes.

WILSON, ANDREW, one of the most eminent landscape-painters of the Scottish school, was born in Edinburgh on the 19th March, 1778. He was the son of Mr. Archibald Wilson, a burgher of that city, who, descended on his mother's side from an old Jacobite family, the Shields of Inveresk, was through her the heir to their possessions; these were, however, for the most part dissipated before he succeeded, and consequently he was obliged to look to business for a livelihood. He selected house-painting, but being without training for such a pursuit, and educated for another position, he was not a fortunate practitioner of this humble branch of art. His calling, however, as it frequently has done, may have given a bent to the inclinations of his son Andrew, who desired to be an artist, and was in consequence apprenticed to Alexander Nasmyth, the distinguished portrait and landscape painter. Although little is known of this apprenticeship, there is evidence in Wilson's pictures of the influence of his first master, and of the thorough training which he received. Even his early works exhibit a certain mastery over materials and a perfection of execution plainly the result of careful instruction, whilst his skill as a draughtsman of the figure (a rare attainment among landscape-painters) was in all probability due to the same influence. From the studio of Nasmyth he proceeded to the school of the Royal Academy, London, where he was a fellow-student and friend of Turner, and where he acquired a greater insight into the resources of his art.

At an early age Wilson visited Italy, and there imbibed a strong predilection for classic composition in landscape-painting, and at same time laid the foundation of that knowledge of the works of the Italian masters for which he was afterwards distinguished. Early in the year 1803 several moneyed men in Glasgow, hoping to profit by his knowledge, engaged him to proceed to the Continent to purchase works of art, which could then be procured at very moderate prices owing to the state of uncertainty induced by the prevailing wars. In course of this journey he was arrested by the French at Turin, and, notwithstanding his manifestly peaceful occupations, was sent to Verdun as a prisoner of war. From Verdun he managed to make his escape, and after various adventures, amongst which he used to tell of his being cast over a precipice by his guide and falling into a fig-tree near a convent, whence he was rescued and cared for by the monks, Wilson at last reached Genoa. He continued to reside there for nearly three years in the exercise of his profession, during which time he was elected a member of the Ligurian Academy of the Fine Arts. The French, then in occupation of Genoa, did not molest

him. When Napoleon Buonaparte took occasion to visit the Academy of Genoa, Wilson was in attendance along with his fellow-academicians, and as Napoleon paused before one of Wilson's pictures, a fellow-artist, who bore him no good-will, whispered that it was the work of an Englishman then present. Napoleon sternly replied, "Le talent n'a pas de pays." It would have been well had he remembered this maxim when in 1803 he consigned so many peaceful British travellers to a hopeless imprisonment. During Wilson's residence in Genoa at this time, he purchased no less than fifty-four important pictures by the old masters, and almost succeeded in securing the altar-piece of San Stefano, the upper part of which is one of Raphael's finest works, but it was seized by the French just before he had completed the purchase. Amongst the pictures then obtained may be mentioned "Moses and the Brazen Serpent," by Rubens, now in the National Gallery, London, purchased on the 27th March, 1805, from Lorenzo Marana for 17,500 lire of Genoa, about £660. The "Adoration of the Magi," now in the National Gallery, Edinburgh, which, if it be the "Adoration" mentioned in the artist's accounts, cost a very small sum indeed, as he specifies "a small picture by Domenichino, 'Adoration of the Magi,' 'Holy Family' and 'Annunciation' by Procaccino, copy after Raphael, two landscapes by Tempesta, large picture by Piola, ditto of the 'Venetian School'—all for 2000 lire, about £70." It would appear from other statements in his accounts that the Genoese parted with their treasures of art for very inconsiderable sums. For example, a Murillo purchased from a Capuchin convent for 600 lire (the exchange varied from 47½ to 50 lire to the pound sterling), a portrait of Philip IV. of Spain, by Rubens, for 12 lire! A portrait by Raphael, "St. Jerome in the Desert," "Infant Christ and St. John" by Pierino del Vaga, acquired from G. Gentili—all for 950 lire! It must indeed have been desperate straits which induced a Genoese nobleman to part with his pictures at such prices. Leaving Genoa about the 16th March, 1806, Wilson proceeded to Leghorn, and there embarked for England, which he reached in safety.

In 1808 Wilson was married to an amiable lady of great personal attractions and respectable family. On her mother's side she was descended from a line of artists, as jewellers once were, and amongst them from James Inglis, the master and teacher of the famous George Heriot. The prospects of an artist in the first quarter of the present century were far from brilliant unless he were a portrait-painter, and Wilson experienced some difficulty in making a living as a painter of landscape only. His resources, however, were manifold; thoroughly well trained, and of excellent abilities, he could adapt himself to opposite and various branches of art, and thus he became professor of drawing in the Military College, Sandhurst, an appointment the duties of which did not hinder him from pursuing his own particular walk in art. While at Sandhurst his genial society was much sought after by his countrymen in the college, and by Scottish cadets; and his residence there, if not calculated to enrich him, was at least a pleasant period of his life. The position of master of the Trustees' Academy, Edinburgh, becoming vacant by the death of Graham, Wilson was in 1818 appointed his successor. During eight years he discharged the duties of this important trust with ability and fidelity, and trained a number of young artists, some of whom afterwards became famous. To his students he was ever kind, and ready to aid their progress; and his memory

is revered by those of them who are still alive. Wilson was also appointed manager of the Royal Institution for the Encouragement of the Fine Arts in Scotland, in which capacity he collected old pictures for the exhibitions originated by the Institution, and arranged the exhibitions of modern works of art which preceded those of the Royal Scottish Academy. Whilst thus actively engaged in promoting the interests of art, he personally supported the exhibitions by painting each year a number of admirable landscapes, which tended much to increase his reputation. About this time an accession of fortune by the death of his wife's eldest brother, one of the judges of the supreme court of Calcutta, enabled the artist to increase his home comforts, and appears also to have excited a desire to revisit the land of his early studies. Accordingly, in 1826 he proceeded with his family to Italy, and there he continued to reside for nearly the rest of his life, sometimes at Rome, sometimes at Florence, and latterly at Genoa. During this prolonged residence in Italy many of his finest pictures were painted. Among these may be named the following, which he contributed to the Edinburgh exhibitions of the years indicated:—

- 1828—Part of the Palace Ruins on the Palatine Hill, Rome.
Italian Travellers.
Monte Mario, Scene on the Tiber—Evening.
View from Bellosguardo—Vale of the Arno.
View of Florence—Evening.
- 1835—Vallombrosa—Tuscany.
- 1837—Genoa, from the Battery of La Cava.
- 1838—La Spezia, Coast of Genoa—Sunset.
- 1842—Moonlight—on the Lake of Perugia.
Scene from the Lucca Mountains, looking towards the Maremma.
Sunset—Coast of Genoa.
- 1843—La Spezia, Coast of Genoa.
La Magra, a torrent near Sarzana.
Tivoli and the Campagna, looking towards Rome.
The City and Port of Genoa.
St Peter's, Monte Mario, and the Tiber.
Sestri de Levante, Coast of Genoa.
- 1844—Tivoli.
Near Tivoli, Campagna Romana.
Villa Adriana—Composition.

It is to be regretted that no record exists of his contributions to the exhibitions of the Royal Academy in London, but they probably included his fine drawings of Rome and Tivoli—engraved—of the church St. John Lateran, and of the baths of Caracalla. His pictures of Scottish scenery are comparatively few in number, and were painted exclusively during the early part of his career.

During his lengthened residence in Italy Wilson purchased in various localities many pictures by the old masters for the Royal Institution, Edinburgh, and thus formed their collection, which is now merged in that of the Scottish National Gallery. This collection, acquired at a cost of about £2000 only, contains some fine pictures and some of less merit. The "Noble Vandyke," purchased from the Lomellini family, alone was worth the money before it was irreparably injured in Edinburgh by reckless cleaning, a proceeding which touched Wilson so keenly that he could not be induced to visit this gallery afterwards. On his return to Great Britain in 1848, during a short residence in London, he painted his last work, a small picture, "Scene on the Coast of Genoa," now in the possession of Mr. W. T. Thomson of Bonaly. The artist was now in very feeble health, and, much to his regret, was unable to accept the invitation from the Royal Scottish Academy to a public dinner intended to have been given in his honour. This tribute of respect and admiration was gratefully appreciated by the veteran artist, but was soon followed by his death, which took place at Edinburgh on 26th November, 1848.

Wilson's pictures are distinguished by beauty of

composition, correctness of drawing, and an elegant harmony of blended colour, rather than by force. He hardly ever painted nature except under her most sunny effects, and delighted especially in representing the glowing sunsets of Italy. He practised as a painter in water-colours as well as in oils, and was amongst the foremost reformers of that beautiful branch of art. His early pictures in water-colours have a power of handling, a breadth of effect, and a richness of colour, quite unequalled by those of any other artist, at the time when they were painted.

WILSON, FLORENCE, an author of some note, was born on the banks of the Lossie, near Elgin, about the year 1500. He is commonly known by his Latinized name of Florentius Volusenus, which has been usually translated Wilson, though it is doubted whether his name was not Wolsey, Willison, Williamson, or Voluzene. He studied at Aberdeen, and afterwards repaired to England, where Cardinal Wolsey appointed him preceptor to his nephew. Accompanied by the latter he went to Paris, where after the death of Wolsey and the consequent loss of his pupil, he found another patron in Cardinal du Bellai, Archbishop of Paris. Along with this prelate he intended to visit Rome, but was prevented by illness, and was left behind at Avignon. Here he recommended himself by his scholarship to Cardinal Sadolet, who procured for him the appointment of teacher of Latin and Greek in the public school of Carpentras. He is best known by his dialogue *De Animi Tranquillitate*, which was published at Lyons in 1543, and reprinted at Edinburgh in 1571, 1707, and 1751. Wilson died at Vienne, in Dauphiny, in 1547, when returning to his native land. Several other works have been ascribed to him besides the well-known dialogue, but the works themselves are not extant. His death was celebrated by Buchanan in the following epigram:—

"Hic Musis, Volusene, jaces carissime, ripam
Ad Rhodani, terra quam procul a patria!
Hoc meruit virtus tua, tellus quæ foret alitrix
Virtutum, ut cineres conderet illa tuos."

WILSON, GEORGE, M.D., F.R.S.E., F.R.S.S.A., regius director of the Industrial Museum of Scotland, professor of technology in the university of Edinburgh. This amiable, talented, and popular teacher of science was born in Edinburgh, on the 21st of February, 1818. "His parents were highly respectable, though not in such an elevated station as to diminish the credit due to his own exertions in attaining the position which he ultimately reached; but it deserves to be noticed, that he may be included in the number of distinguished men who have been in a great degree indebted for the development of their talents to the maternal character and influence."¹ His father, Mr. Archibald Wilson, was a wine-merchant in Edinburgh; his mother, Janet Aitken, was the youngest daughter of a land-surveyor in Greenock. George was one of a family of eleven children, of whom three only now survive, and he was a twin-brother. How greatly his after-life was influenced by the maternal affection and care, the following instance out of several may suffice to show. Every night it was the mother's custom to visit the cot of her twin-children, and repeat over them the prayer of Jacob: "The God which fed me all my life long, unto this day; the Angel that redeemed me from all evil, bless the lads!" So interesting was this blessing to George, that long afterwards he described to a friend how he used to lie

¹ Opening address of Lord Neaves to the Royal Society of Edinburgh, December 5, 1859.

awake watching for it, but pretending to be asleep, that he might enjoy it to the full.

After passing through the usual elementary education, George Wilson, when nine years of age, was sent to the high-school of Edinburgh; and here that desire for general knowledge, and aptitude in acquiring it, which distinguished his whole life, was already displaying itself. He had collected a little menagerie of pet animals, who instructed him in the elements of natural history. On Saturdays and holidays he made excursions in the neighbourhood of Edinburgh, exploring architectural ruins of historical interest, and bringing home geological and botanical specimens. Nor were the inanimate sources of knowledge sufficient for him; he laid the living also under contribution, while his questions were so pertinent and proposed with such winning gentleness, that it was impossible to withhold from him the desired information. A golden opportunity of this kind, when he was eleven years of age, occurred when he travelled to Glasgow by the canal, and a young fellow-traveller of his thus describes the way in which the opportunity was used: "George placed himself side by side with the greatest person on board (the captain), and plied him with question after question till the moment he left the boat. Before leaving he very politely went up to the captain and mate, and thanked them heartily for their attention and information. They both said they had never seen such a boy. Besides the captain he met on board a Miss Peacock, a most intelligent lady who had been in Ireland, England, &c. George did question her, and got quite in love with her, saying, 'she could speak about everything, just like his mother.' Before parting he gave her a cordial kiss." But although his appetite for knowledge was so omnivorous, he was not neglectful of the tasks of the school, so that he generally kept a high place in the class, and obtained a fair share of prizes. His teacher, Mr. Mackay, in his public class examinations, instead of confining himself wholly to Latin, would sometimes put unexpected queries on matters of history, science, or general literature; and on such occasions the subject of our memoir was so ready, that his class-fellows regarded him as a little encyclopedia, while the master applied to him on the entrance of visitors into the class-room, with "George Wilson, make ready!"

On quitting the high-school in 1832 his future profession was to be decided, and that of a physician was his own natural choice. It was the one that would bring him the most in contact with those branches of study to which he had already shown so strong a predilection. It was thought that the best training for the profession would be a four years' apprenticeship in the laboratory of the Royal Infirmary, and to this he was accordingly bound; but here the daily drudgery was so aggravated by the immoral companionships with which his situation brought him into contact, that he trembled in after-years when he recollected the dangers he had escaped. To this he alluded in his opening address as president of the Society of Arts in 1857: "Ah me! when I recall some of the enforced companions of my apprenticeship days, I feel that I would make the greatest sacrifices rather than permit a youth dear to me to encounter similar temptations." The pure mind of George Wilson however, instead of being corrupted, was confirmed in its purity by such an ordeal, and when he became an authority in his profession, he was earnest in warning his pupils of the dangers, and showing how they were to be surmounted. Another difficulty by which his gentle nature was assailed was almost as hard to overcome; this was the horror

of witnessing painful surgical operations in the infirmary. The first case of this kind at which he was present was the amputation of a sailor's leg above the knee. "Some days after the operation," he says, "when the horror of the first shock had passed away, I resolved to visit the poor fellow, who happened to be a namesake, and see if I could render him any little service. I went, however, with no little hesitation, expecting to find him in the same state of suffering and prostration as I had seen him in before, and fearing that I should only distress myself, without doing him any good. I was greatly surprised, however, and indeed amused, to find the invalid half propped up in bed, and intently occupied with a blacking-brush, borrowed from the nurse, polishing the single shoe which in six weeks, or a month at soonest, he might hope to wear. I could not help smiling in his face, and wishing him a speedy return to his shoe, which at once became the text of a cheerful conversation. The ludicrous inappropriateness, as it then seemed to me, of the patient's occupation relieved my feelings, and its perfect appropriateness, as it seemed to himself, relieved his; for as I learned more fully in subsequent conversations, his great concern was to count the hours, till he should reach a fishing village in the south of England, where his mother and sister longed for his return. He made an excellent recovery, and reached his home in safety." The same benevolent sympathy which seated him at the bedside of the patient, also inspired the boy-prentice of the infirmary in providing for the sailor in his journey home, although for such a purpose he was obliged to part with a sum of money which he had laid aside for the purchase of Coleridge's *Aids to Reflection*. Such was also the case on many other occasions, when he not only emptied his own purse, but—harder still—was obliged to crave the benevolence of others in behalf of his suffering clients. Even his outer coat might be called the garment of charity, for it was of ample volume, and provided with many pouches stored with comforts for the sick, while all were diverted at the sight of this singular cupboard.

Soon after he had entered on his duties in the infirmary, George Wilson commenced those studies which were to fit him for the calling he had chosen. He therefore became a student at the university, attending the classes of mathematics and natural philosophy during the winter session of 1832-3, and on Lizar's anatomical demonstrations during the ensuing summer. In 1833-4 he studied chemistry and anatomy, and in the following year added to them the studies of surgery and *materia medica*. These were succeeded in the winter session of 1835-6 by the institutes of medicine, the practice of medicine, and clinical surgery; and in summer he attended the class of botany, which was appropriately conducted in a lecture-room of the botanical garden, amidst the blooming of flowers and the singing of birds. The closing session of his curriculum was occupied with the study of natural history, clinical medicine, midwifery, and practical chemistry, with attendance on the hospital wards. Amidst such a variety of departments connected with his future profession, it was natural that he should form a preference, and chemistry accordingly had become his favourite pursuit. This science he had carefully studied under Dr. Hope and Dr. Kenneth Kemp, and in 1836-7 he had been engaged for eighteen months as chemical assistant in Dr. Christison's laboratory, which at that time was the best school of analytical chemistry in the university. In the latter part of the year 1837 he passed as surgeon, but as yet was too young to apply for the degree of M.D. Ambitious how-

ever to be useful in some difficult and important field, and struck with the defectiveness and unsubstantiality of female education, he chivalrously resolved to devote his first attempts to the mental improvement of the fair sex. In his MS. journal of this period he states, "I meet with scarcely one lady in ten or fifty who has sufficiently cultivated her natural powers."

Following out the proposal to amend the subjects of ladies' conversation and study, I assembled some of them in my father's house, and delivered a course of prelections on chemistry, especially the chemistry of nature. It was in the winter of 1837-8, so that I was then *æt.* 19; the majority of my audience were older by a year or two. I was greatly praised and encouraged, most kindly listened to, and assisted in many ways, especially by John Macgillivray, a generous, unselfish, happy fellow, without whose aid I should have come on very poorly. This course, which began in October, was first interrupted by the illness of my sister, and afterwards, in February, by the mournful indisposition of my cousin Catherine, so that only ten or twelve lectures were given." Foreseeing that this was but the commencement of his future career as a public lecturer, he adds: "I place here the names of those who smiled on a juvenile attempt, both because I would keep on record the titles of those persons who gave rise to many a happy thought, and that as I hope to address other audiences, I may not lose the recollection of my first, which was more kind, generous, and forgiving towards me than any future audience ever can be."

In consequence of a wish he had long entertained, and the hope of extending his knowledge, Wilson in the winter of 1838 went to London, and entered the laboratory of University College, under the superintendence of Professor Graham, late master of the mint. Among his fellow-students at the laboratory were some of his countrymen afterwards distinguished in the scientific world—such as Mr. James Young, subsequently of the Bathgate Chemical Works; Dr. John Lyon Playfair, afterwards professor of chemistry in the university of Edinburgh; and Dr. Livingstone, who, while qualifying himself to become an African missionary, was unconsciously preparing the way for being the most renowned of African explorers. During his attendance at the London university, he not only joined the students in their severe intellectual pursuits, but also in their literary fun, for his was not only a happy spirit continually effervescing with irreproachable mirth and wit, but enough of poetical inspiration to have made him a distinguished poet, had his ambition gone in that direction. He wrote for the periodicals of the university, and used for his *nomme de plume* the name of "Bottle Imp," or the initial letters "B. I." After his return to Edinburgh he passed his examinations, and obtained his diploma of Doctor of Medicine in June, 1839. His thesis was "On the Certain Existence of Haloid Salts of the Electro-negative Metals in Solution." The happy event of his passing he thus communicated in his own frolicsome fashion to his invalid sister in the country: "Yesterday, between the hours of one and three o'clock, I underwent the transformation, and emerged from my chrysalis state, leaving my case (*i.e.* £21) behind me, and soared aloft (that is, walked, I did not very well know how) into the blue empyrean (*i.e.* along the pavement leading from the college to Gayfield Square) in a mood of mind which only those who have tasted of the horrors of an eternal caterpillarity (*i.e.* of being a *sticked* doctor) hovering before them can appreciate. But I will close my wings, as yet unsoiled and unfeathered, and come down to the earth; that is to say, I will remember that 'this is my right hand and that is my left,' that

I am sitting in an arm-chair, writing to my dearly beloved sister Mary, who is recovering her health among the breezes that float over the rugged Ochils."

Being now an M.D. however was not enough; to live he must get patients, while the proverbial reluctance of people to become such is too well known to need further notice. Until these should therefore be found he resolved to commence public lecturing in Edinburgh, with his beloved chemistry for the subject of his course. In the same year he had taken a long pedestrian tour in the Highlands, from which he returned in so exhausted a condition that he was obliged to arrange his first course of lectures while confined to bed. Having obtained a license as a lecturer on chemistry from the Royal College of Surgeons, he entered on the laborious duties of an opening session in November, 1840, although scarcely convalescent, and laboured with an assiduity that would have tried the most robust strength. It was impossible for him to stand still, and during the first fortnight he not only lectured six days in the week, but taught besides a practical class, and instructed private pupils. This great amount of labour compelled him to sit up every night till two in the morning, and to rise at seven, so that in coming home in the afternoon he was generally so exhausted, as to fall asleep on the sofa while dinner was being served up. A teacher so earnest could not be otherwise than successful. His class consisted of thirty-one pupils, and he at once became a favourite lecturer; his ready command of appropriate language, his buoyant wit, and brilliant imagination lighted every subject on which he touched, and would have made the dullest theme attractive; while his clear voice and deliberate pronunciation made every word fall upon the ear with unmistakable distinctness. "Wilson," wrote Professor Forbes of him, "is one of the best lecturers I ever heard, reminding me more of the French schools than our humdrum English, and is a man of high literary taste and great general knowledge. Of his chemical views I know that Graham here [London] speaks in the highest terms, which he does not bestow on any other Edinburgh man." He had achieved such a triumph as might have insured the successful career of a lifetime, but it was henceforth to be a lifetime of sickness and pain, in which every success was to be accompanied by a record of fresh suffering. "How nobly, how sweetly, how cheerily he bore all those long baffling years; how his bright, ardent, unsparring soul lorded it over his frail but willing body, making it do more than seemed possible, and as it were by sheer force of will ordering it to live longer than was in it to do, those who lived with him and witnessed this triumph of spirit over matter will not soon forget. It was a lesson to every one of what true goodness of nature, elevated and cheered by the highest and happiest of all motives, can make a man endure, achieve, and enjoy."¹

The commencement of these maladies might be dated from Wilson's unfortunate pedestrian Highland tour, in which he had been dragged by his companion, against his own better judgment, into an amount of exertion and fatigue that were too much for him. An attack of rheumatism was the consequence, followed by disease of the ankle-joint; and after various remedies applied in vain, it was found that nothing short of amputation would avail. To amputate through the ankle-joint was a new process, and in the absence of chloroform an agonizing as well as dangerous one; but Wilson, who submitted to the medical decision, only required a week for preparation, which he chiefly spent in reading the Scriptures

¹ Brown's *Horæ Subsecivæ*, Part ii.

and prayer. He thought that the operation might be followed by a fatal issue, and that the short interval between might be so full of suffering as to unfit him for such a solemn transition. And innocent though his life had hitherto been, and so guileless in its daily course, he found that the great essential was still wanting without which all the rest would profit him nothing for eternity. But this he was now enabled to understand and realize, and the fearful ordeal was the beginning of a new life. It was not indeed that his character was changed: it was rather the entrance of a new principle of action that pervaded all his feelings, and gave all his actions a higher direction than before, so that he was henceforth to live for God and eternity rather than for time and for empty fame; while the effect of such a change was to make his enterprise more active, his cheerfulness more steadfast, and his fancy, wit, and humorous playfulness more brilliant than ever. An artificial foot covered with chamois leather and inclosed in an ordinary half-boot, enabled him to stand for hours, and even to take exercise, and as soon as the cure was completed he was again at work, and as buoyant of heart as ever. He was indeed to be henceforth the victim of feebleness and sickness, and the martyr of almost incessant pain; a film trembling between life and death which the wind was prematurely to carry away. But with all this there was in him a giant's strength that seemed impervious to weakness and decay, and a cheerful, merry spirit which neither pain could quell nor sickness subdue, so that his remaining work of a few years was equal in amount and excellence to that of a busy and well-spent life of threescore and ten years. The feeling that his time must be short at the best, and that at any hour he might be summoned to the world of spirits, instead of damping his ardour, only raised it into double activity, and every hour was spent as if at the close of it an account of how much had been done while it lasted might be required.

After recovering from the amputation of his foot, decided symptoms of pulmonic complaint succeeded; but on the arrival of winter he resumed his professional duties as if he had no time to be sick. These duties were further augmented by his appointment as lecturer on chemistry to the Edinburgh Veterinary College, and a similar appointment to the School of Arts. He also commenced a course of lectures on the Saturday of each week to young ladies at the Scottish Institution. These occupations comprised in all the delivery of ten lectures a week, delivered to various audiences; consisting of twenty students at his medical class, forty at his veterinary class, about a hundred young ladies at the Scottish Institution, and "some two hundred stout fellows" at the School of Arts. "It is sometimes difficult," he wrote to his sister, "to disentangle the one from the other, and accordingly I called the young ladies *gentlemen*, and made them all smile. Last Saturday, however, I took care to write on my notes at various places the word *ladies* to prevent mistakes, and as I had abundance of magnificent experiments, the bonny lasses looked bonnier, and were all well pleased." But the manner in which the halls were crowded, the enthusiasm that welcomed his lectures, and the taste which they inspired for the study of chemistry, it would be difficult to describe. But of these his Tuesday evening lecture was the most laborious of his duties, and on returning from it crowned with applause, but faint and weary, he frequently observed, "Well, there's another nail put into my coffin." The ten years of life that followed were so completely occupied not only with lecturing but publishing, that the wonder is how any man in so

short a time could do so much. But the wonder rises to almost absolute incredulity when we take into account the feeble frame of Wilson, and the constant attacks of pain and sickness through which all this was achieved. "While lecturing ten, eleven, or more hours weekly," writes his sister, "sometimes with pulse at 150, it was frequently with torturing setons and open blister wounds; and every holiday was eagerly seized for the application of similar 'heroic remedies,' or 'bosom friends,' as he named them. His keen appreciation of the pleasures of society, and of all beautiful things, was sternly put aside to meet professional claims; and all with such quiet simplicity or gay good humour, that few if any guessed the price at which the work was accomplished."

Of the spirit that bore George Wilson so constantly onward and upward, the following hymn, written by him on a Sabbath when detained from church by sickness, is such an admirable exposition, that notwithstanding its length we prefer to give it entire:—

"THE WINGS OF THE DOVE AND THE EAGLE.

(Psalm lv. 6; Isaiah xi. 31.)

"As I lay upon my bed,
Weeping and complaining,
Turning oft my weary head,
Hope and help disdaining;
Lo! before mine eyes there stood
Vision of an ancient wood
Full of happy birds pursuing
Each the other with keenest zest;
And I heard the plaintive cooing
Issuing from the turtle's nest,
Till I murmured at the sight,
And forgot God's high behest:
'Had I but your wings, I might
Fly away and be at rest.'

"Then the low, sweet, plaintive cooing
Of the fond maternal birds
Seemed itself with thoughts imbuing,
And at length flowed forth in words:
"'Plumes of doves and fluttering wings
Are but vain and feeble things;
Timidly the air they fan;
Scarcely would they serve to raise thee,
Need the truth at all amaze thee?
O'er this earth a little span.
Look thou there!' and, lo! an eagle,
From his nest amid the stars
Stood before me with his regal
Front and venerable scars.
In a moment, wide extending
His great wings (so seem'd my dream),
He was in the air ascending
With a wild, exulting scream.

"'Judge thou, then,' the voice said, 'whether
This or that's the better thing—
Rainbow-tinted dove's soft feather,
Or the eagle's ruffled wing?'
'That's the better!'—'Rest then still!
In thy heart of hearts abase thee;
Lose thy will in God's great will.
By-and-by he will praise thee,
In his own good time and season,
When 'tis meet that thou shouldst go,
And will show thee fullest reason
Why he kept thee here below.
Wings of doves shall not be given;
But to lift thee up to heaven
Thou shalt have entire dominion
O'er the eagle's soaring pinion,
Thou shalt mount to God's own eyry
And become a crowned saint,
Thou shalt run and not be weary,
Walk, and never faint;
Therefore utter no complaint.'

"Now I lie upon my bed
Saying, 'Be it even so,
I will wait in faith and hope
Till the eagle's wings shall grow.'"

The rare combination of talents possessed by Dr. Wilson as a lecturer in chemistry and economical science, the spirit with which he inspired his audi-

ences, whether in the Academic Hall, the Philosophical Institution, the various literary societies that were eager to secure his services, or even in his homely lecture-rooms in the Canongate and Cowgate, and the distinctness, eloquence, and illustrative power with which he popularized those sciences which had hitherto been studied by the select few, and made them intelligible as well as attractive even to the most ordinary capacities, were now to win their merited acknowledgment by an important public appointment. It was resolved to establish an industrial museum for Scotland, and on the government inquiring who was the fittest person to superintend it, the universal answer was, "Dr. Wilson." Accordingly he received his official appointment as director of the Scottish Industrial Museum in February 21, 1855, the same day being also his birthday. To this was afterwards attached a chair of technology in the university of Edinburgh, to which he was appointed in the ensuing autumn. And what is technology? This the new professor answered in his inaugural lecture. "Technology," he said, "is the sum or complement of all the sciences which either are or may be made applicable to the industrial labours or utilitarian necessities of man. While the subject has a connection with various subjects already taught in the university, it steers a course distinct from all, has a province of its own, and will not, when properly handled, interfere with the duties of any other professor." It was in accordance with this definition that he drew up his lectures, which extended over three sessions, and were divided into mineral, vegetable, and animal technology. Under the first of these were included the relation of the atmosphere, the ocean and tributary waters, and the earth to technology; and among special subjects, fuel, building material, glass and glass-making, pottery, earthenware, stoneware and porcelain, metal-techny, electrotechny, and magnetotechny. Under the second, or vegetable technology, were treated saccharo-amylaceous substances, sugar-making, albuminous substances and fermentations, distillation, wood and wood-fibres, textile tissues, bleaching, dyeing, calico-printing, paper-making, scriptorial or graphic industrial arts, caoutchouc, gutta-percha, and the resins, fats, and oils. Under the third section, or animal technology, were included the mechanical application and chemical products of bones, ivory, horns, hoofs, tortoise-shell, shells and corals; skins, tanning, fish-scales; hair, fur, wool, bristles, quills and feathers, animal refuse. These lectures upon so great a variety of subjects were copiously illustrated by drawings and experiments, and by specimens from the natural history collections and the Industrial Museum. During the course occasion was also taken to visit various manufactories. In collecting specimens for the Industrial Museum—his "dear museum," as he called it—Professor Wilson was indefatigable, while his powers of solicitation and persuasion few or none could resist. And his success was attested by the annual report of the museum in 1859. During the four preceding years the models and specimens collected were 10,350 in number. The immense correspondence to all quarters and on every subject which this kind of duty imposed is thus amusingly indicated by the professor in the form of a mock-advertisement: "Wanted, a monkey from the zoological gardens to write letters to a philosopher's friends. No ape or baboon need apply. The strictest references expected and given. Apply at Elm Cottage [Dr. Wilson's residence] in the writing of the applicants, inclosing a witty, a stupid, and a pathetic letter."

The new appointment he held, so unlike all other

professorships, and his acquaintance with its multiplied details as was exemplified by his lectures, obtained for Professor Wilson such a reputation for universal knowledge, that the popular estimate was often expressed in a most grotesque and unwonted fashion, and he was inundated with questions *de omnibus rebus et quibusdam aliis*, which Solomon himself could not have solved, by querists whose undoubting declaration was, "The professor knows everything." "It seems to be supposed here," wrote Wilson to a friend, "that on the day when I was made professor of technology there flowed into my head the whole cyclopedia of useful arts, and all the encyclopedias and other treasures of knowledge, and in a liquified condition formed a well full to overflowing somewhere in my pineal gland, so that whoever is ignorant need only to put down his bucket and draw it up full." One day in the pantomime season a pupil who had been enjoying its marvels at the theatre asked the professor what a harlequin's dress was made of? Wilson was posed, but as his character as a technologist was at stake, he promised a reply. While he was at a loss for the means, and thinking of applying to the stage harlequin himself, aid unexpectedly came from the theatre in the shape of the manager, who was about to bring out the opera of "The Prophet," but found that the sun would not shine rightly upon the play. Wilson furnished him with the required light by means of a lime-ball, and the grateful manager enlightened him in return, by informing him of the materials of harlequin's costume. When the Crimean war had ended, the town-council of Edinburgh wished to celebrate the return of peace by a splendid display of fireworks, and sent in all haste for the professor of technology, who must, by their reckoning, be *ex officio* the prince of pyrotechnists. Wilson was suddenly baited with the question, but acquitted himself so learnedly that the whole council was satisfied.

All this time that Professor Wilson was lecturing, publishing, corresponding, and amassing the rich stores of his industrial museum, his wonderful energy, by which he performed the work of three men in one, and his buoyant good-nature, which nothing could abate, made his friends imagine that his stamina, hitherto so miraculous, was still so strong that whole years of life and activity were in store for him. Little however did they calculate that this was but a life-in-death existence—a course of action in which a feeble sinking frame had been upheld and borne forward by a giant's resolute will—and that soon the body itself must fall in pieces, leaving the will to follow out its own life of immortality disencumbered of its earthly impediments. Before his appointment to the professorship his maladies had resolved themselves chiefly into hemorrhages of blood from the chest, which continued to become more frequent and alarming, and at the commencement of the session of 1859 he seemed to entertain the impression that his time on earth was drawing rapidly to a close. But not the less did he gird up his resolution for the coming duties, and commenced his lectures in November, his introductory one being so numerously attended that the class-room was crowded to the door. On the 4th of November he caught a cold that was followed by a suspicious pain in his side, but accustomed to brave such attacks, he ventured on the 18th to give two lectures, although the last had to be delivered sitting, as he was too feeble to stand. On getting home he went to bed, from which he never rose, and on the 22d he expired as calmly as an infant going to sleep. Thus he entered into that rest which he sought, and for which he was so well pre-

pared. Not merely the university, but the city of Edinburgh recognized the event as the loss of one of their brightest ornaments and best benefactors, and requests from the magistrates and the representatives of public bodies that his funeral should be a public one could not be refused. His remains were interred in the old Calton burial-ground, and over his grave an antique cross was erected bearing a modest inscription announcing his name and office, and the dates of his birth and death.

In this brief sketch we have chiefly considered Professor Wilson as an eloquent lecturer and an active practical man; and considered how much he effected during a short life that was comprised within forty years. But the estimate of his talents and activity is greatly increased when we take into account the number and variety of his published works during eighteen years of authorship. But these works, which of themselves would be sufficient to establish for their author a very high literary and scientific reputation, we can only dismiss with a brief catalogue of their titles.

The works of Professor Wilson published in the form of separate volumes were the following:—*"Chemistry: an Elementary Text-book."* W. & R. Chambers, Edinburgh. 1850.—*"The Life and Works of the Honourable Henry Cavendish; including a Critical Inquiry into the Relative Claims of all the Alleged Discoverers of the Composition of Water."* Printed for the Cavendish Society. 1851.—*"The Life of Dr. John Reid, late Chandos Professor of Medicine in the University of St. Andrews."* 1852. Sutherland & Knox, Edinburgh.—*The Traveller's Library*, No. 26. *Electricity and the Electric Telegraph* (reprinted from the *Edinburgh Review*). *The Chemistry of the Stars* (reprinted from the *British Quarterly Review*). 1852.—*Researches on Colour-blindness*. Sutherland & Knox, Edinburgh. 1855.—*The Five Gateways of Knowledge*. Macmillan & Co., London. 1857. The biographical sketches which Professor Wilson published in our principal periodicals were the following:—"Life and Discoveries of Dalton." *British Quarterly Review*. 1845.—"Sketch of the Life and Works of Wollaston." *British Quarterly Review*. 1846.—"Sketch of the Life and Works of the Honourable Robert Boyle." *British Quarterly Review*. 1849.—"A few Unpublished Particulars regarding the Late Dr. Black." *Transactions of the Royal Society of Edinburgh*.—"Sketch of James Wilson, Esq. of Woodville." *Edinburgh New Philosophical Journal*. Of Professor Wilson's papers on chemistry and physics, chiefly contributed to *Transactions* of scientific societies, the list is so large that we cannot afford room even for their titles. In date they range from 1839 to 1859, and consist of thirty-six papers upon the most important subjects in physical science. Of his published lectures and addresses the following is a list:—On the *Alleged Antagonism between Poetry and Chemistry*. Sutherland & Knox, Edinburgh. 1845.—On the *Sacredness of Medicine as a Profession*. 1849.—*Introductory Address delivered at the Opening of the Medical School, Surgeon's Hall, Edinburgh*. Edinburgh, 1850.—On the "Chemistry of Building Materials." *Transactions, Architectural Institute*. Edinburgh, 1854.—"Recent Scientific Ballooning." *British Quarterly Review*. 1854.—*What is Technology?* Sutherland & Knox, Edinburgh. 1855.—On the *Physical Sciences which form the Basis of Technology*. Sutherland & Knox, Edinburgh. 1856.—*The Objects of Technology and Industrial Museums*. Do., Edinburgh. 1856.—On the *Relation of Ornamental to Industrial Art*. Edmonston and Douglas, Edinburgh. 1856.—On

"Pharmacy as a Branch of Technology." *Pharmaceutical Journal*. 1856.—On the "Relations of Technology to Agriculture." *Transactions of Highland Society*. 1856.—"Chemical Final Causes." *Edinburgh University Essays*. A. & C. Black, Edinburgh. 1856.—On the *Character of God as inferred from the Study of Human Anatomy*. A. & C. Black, Edinburgh. 1856.—"Addresses as President of Royal Scottish Society of Arts." *Transactions, R.S.S.A.* 1856.—*The Industrial Museum of Scotland in its Relation to Commercial Enterprise*. Printed for private circulation. 1857.—The "*Progress of the Telegraph: being the Introductory Lecture on Technology for 1858-59.*" Macmillan & Co., London, 1858.—The "Education of the Pharmaceutical Chemist." *Pharmaceutical Journal*. 1859.—"Paper, Pen, and Ink: an Excursus in Technology." *Macmillan's Magazine*, 1859.

Although Professor Wilson was not only a lover of poetry, but capable of becoming a poet of high mark, he resisted the temptation, and kept his refined taste and high imagination in subservience to his more important duties. Nor was his self-denial without reward, for his poetical spirit thus repressed, flowed out in his lectures and writings, giving life and brightness to those scientific subjects which ordinary teachers are apt to make so cold or unintelligible. Of this, his work entitled the *Five Gateways of Knowledge*, which, notwithstanding its scientific character, obtained such rapid and wide popularity, is an especial proof. It has justly been characterized as "a prose poem, a hymn of the finest utterance and fancy—the white light of science diffracted through the crystalline prism of his mind into the coloured glasses of the spectrum—truth dressed in the iridescent hues of the rainbow, and not the less, but all the more true." Still, however, he could indulge occasionally in versification of a devout, grave, or comic character, and heighten the luxury, although very rarely, by permitting them to see the light. Of these were his poems "To the Stethoscope," in 1847, "To Professor Edward Forbes," in 1855, and the "Atlantic Wedding-ring," in 1858, published in *Blackwood*; and a poem entitled "The Sleep of the Hyacinth," published in 1860 in *Macmillan's Magazine*.

Wilson was outlived nearly five years by his venerable mother, whose prayers and instructions had such influence in the formation of his character, and to whom he had been a devoted loving son to the last moment of his life. It would be superfluous to add how fervently this affection was reciprocated, and how naturally after his death she often uttered the exclamation, "I did not think I could have lived so long without him!"

WILSON, RIGHT HONOURABLE JAMES. Among the "self-made" men who are more abundant in the biography of Scotland than in that of any other nation, an honourable place is due to the subject of this memoir. Although born a Quaker in the midst of a rigidly Presbyterian community—the son of a small trader in a Scottish town of little traffic, and himself commencing the business of life behind a humble counter—he successively became a wealthy London merchant, a distinguished political financier, a member of the British parliament, and finally an influential leader at the Council Board of India—and he probably might have risen to still higher rank and eminence had his years been continued to the usual term of old age. Such a career is worth tracing, notwithstanding the mercantile details with which it necessarily abounds.

James Wilson was born at Hawick, in Roxburgh-

shire, on the 3d of June, 1805, and was the fourth son of a family of fourteen children. His father, who was a thriving man of business in the woollen manufacture at Hawick, sent him, when he was ten years old, to a school at Ackworth reserved for the education of the children of Quakers—for to that persuasion the woollen manufacturer belonged. It was doubtless a grave seminary, where the pupils were taught, as an important duty, to weigh their words and suppress their juvenile fancies; and such a training may have aided in developing, if it did not originate, that considerateness and matter-of-fact disposition by which James Wilson's public life was distinguished. While he was at the school in Ackworth he was of a very studious disposition; and his devotedness to books having inspired him with the desire of becoming a teacher, he was transferred from thence, at the age of fourteen, to a seminary at Earlscombe, to qualify him for the duties of the vocation. Here, however, although his love of study continued, so that his reading often extended till late in the night, a change had come over his views which disinclined him to the drudgery and monotonous life of a schoolmaster, and his wish was to enter into business. The knowledge he had already amassed may have required digestion, and this could be best promoted by the study of living men and visible objects, and the bustle of active life. His books were now thrown aside, and the world became his favourite volume; and when the former were at any time taken up it was generally for a serious purpose, while every page was slowly and carefully considered. He could not "read with his thumb," as Napoleon expressed it, who by a few rapid glances could master the leading ideas of a volume: on the contrary, Wilson continued through life a slow and heavy peruser, and even a newspaper was conned by him as carefully as if it had been a treasury minute.

At the age of sixteen, in consequence of his choice of business rather than teaching, he was apprenticed to a small hat manufacturer at Hawick, and it was soon evident that his habits of observation and reflection had found their proper application. In consequence of this his father purchased his master's business for him and for an elder brother, William, and the two brethren conducted it successfully at Hawick for two or three years. In fact they were so successful that this little town was too limited for their enterprise, and they removed to London, where James Wilson entered into business; and his prosperous career for several years, the result of his diligence and prudent calculations, justified and encouraged his studies as a financier. In 1831 the original firm was dissolved by mutual consent, but he continued to carry it on for several years under the firm of James Wilson & Co. with success. On the following year he married Miss Elizabeth Preston of Newcastle, who survived him, and by whom he had a numerous family; and in the same year (1832) he ceased to be a member of the Society of Friends. This period of his life was a happy one. In 1824, when he commenced business in London, he had received from his father £2000, which in 1837 he had increased to nearly £25,000, and this not by lucky speculation, but a systematic attention to the common rules of business; he was respected by his own class as a prudent and prosperous man, and he had surrounded himself with a congenial society with whom he could discuss those subjects of finance and statistics to which his inclination so strongly prompted him. But to this there was an unfortunate interruption. In 1836 he had been induced to enter into a speculation in indigo which was success-

ful. Encouraged by this success he made several larger ventures, in which he risked nearly his whole capital, and they proved failures. A recoil upon the firm was the consequence, and would have been ruinous had not Mr. Wilson from his own resources paid off one half of its obligations in the name of himself and his three partners, while property belonging to the partnership, which was considered an amount equivalent to the remaining moiety, was also paid to the creditors, who gave them in return a complete and absolute release. Thus there had been no bankruptcy, nor even stoppage of business for a single hour. The business was continued under a new firm, of which Wilson was a partner, and was successful, and from which he retired in 1844 in comfortable circumstances. But during this interval the old affair had not been conclusively laid to rest. The property assigned by his partners in the disaster of 1836 had not realized its expected amount, and consequently a portion of the debt remained unpaid. Although no claim could be legally made for the deficiency, Wilson, considering this mercantile debt in the same light as a debt of honour, again had recourse to his own funds, and paid off the amount in full. This, too, he did so modestly that none but the recipients and the agents were privy to it. But this virtuous concealment did him little good, for afterwards, when he attained political distinction, his opponents twitted him with the taunt that he had belonged to a firm that had failed to implement its money engagements. It served as a vent for political obloquy, and somewhat detracted from his public utility.

From his reading and studious habits Mr. Wilson was able to write as well as converse upon those subjects which had so especially occupied his thoughts; and accordingly, while still in business, he gave his experience to the world in the form of several pamphlets. In 1839 he published one on the *Influences of the Corn-laws*; in 1840 another on the *Fluctuation of the Currency*; and in 1843 a third on the *Budget*. The *Examiner* being at this time the principal journal in which these subjects were temperately and philosophically discussed, he offered to the editor to contribute gratuitously a series of papers on the principal matters of political economy and finance; but this offer being refused, Mr. Wilson resolved to establish an organ of his own, and support it mainly by his own exertions. This he did in 1843 by starting the *Economist*, a paper devoted to political economy, and so ably and fully were his favourite subjects discussed in its columns, that it soon became the most popular journal of its class. Encouraged by this success, and the independent condition of his finances, Mr. Wilson withdrew himself altogether from business, that he might wholly attend to his new vocation of an expositor of political economy. And now, although retired from business, the work and toil of life were to commence in earnest. The plan of a newspaper so unique in its class that nothing of the kind as yet existed, and its establishment as an authority with the commercial world and the public at large, were of themselves a herculean task, and sufficient for the energies of any individual. But this was little compared with the toil of collecting, examining, and arranging the materials for its daily articles, the most of which were written by himself. At this toilsome work he was generally employed every night until far in the morning; while those friends who were cognizant of his labours marvelled that any human being could endure so well, and achieve so much. But to an iron constitution, which had scarcely been ever affected with sickness for a single

hour, he added an indomitable resolution which difficulties, however great, instead of daunting, only served to stimulate. Nor was this work the whole amount of his daily task, for while he was thus occupied with the multifarious and harassing demands of his own *Economist*, he used to write the city articles and leaders for the *Morning Chronicle*. Justly might Mr. Wilson declare, as he often afterwards did, that this period was far more exhausting than the most exhausting portion of his public life.

While he thus established himself as a teacher and political authority in that science upon which the British empire is founded, and in which its highest intellect has been tasked, many may wish to know how a man of small reading and equally limited learning could advance himself into the front-rank of such men as Adam Smith, Malthus, and Ricardo. But instead of mere theory and metaphysical subtleties, he only dealt in experience and reality, and was content to advance nothing but what he knew and understood. And hence their substantiality was felt and acknowledged by those who were weary of the schemes of impracticable dreamers. The character of his teaching is thus described:—"Mr. Wilson's predominating power was what may be called a business imagination. He had great power of conceiving transactions. Political economy was to him the science of buying and selling, and of the ordinary bargains of men he had a very steady and distinct conception. In explaining such subjects he did not begin, as political economists have been said to do, with, 'Suppose a man upon an island,' but 'What they *do* in the city is this.' 'The real course of business is so and so.' Most men of business will think this characteristic a great merit, and even a theoretical economist should not consider it a defect. The practical value of the science of political economy (the observation is an old one as to *all* sciences) lies in its 'middle principles.' The extreme abstractions from which such intermediate maxims are scientifically deduced lie at some distance from ordinary experience, and are not easily made intelligible to most persons; and when they *are* made intelligible, most persons do not know how to use them. But the intermediate maxims themselves are not so difficult; they are easily comprehended and easily used. They have in them a practical life, and come home at once to the business and the bosoms of men. It was in these that Mr. Wilson excelled. His 'business imagination' enabled him to see 'what men did,' and 'why they did it,' 'why they ought to do it,' and 'why they ought not to do it.' His very clear insight into the real nature of mercantile transactions made him a great and almost an instinctive master of *statistical selection*. He could not help picking out of a mass of figures those which would tell most. He saw which were really material; he put them prominently and plainly forward, and he left the rest alone. This method of resting science on the practical facts of the life that was passing around was very effective. People who would have turned away from a metaphysical treatise on political economy read and understood. Even men supposed to have mastered the science were influenced, and statesmen and administrators admitted that Mr. Wilson was worth hearing."

The field into which Mr. Wilson brought the exercise of such talents was well fitted for their exercise, and its difficulties are thus described: "At that time a vast field lay open before a thoughtful economist. An economical century has elapsed since 1839. The corn-laws were then in full force, and seemed likely to continue so; the agriculturists believed in them, and other classes acquiesced in them;

the tentative reforms of Mr. Huskisson were half-forgotten; our tariff perhaps contained some specimen of every defect—it certainly contained many specimens of most defects; duties abounded which cramped trade, which contributed nothing to the exchequer, which were maintained that a minority might believe they profited at the expense of the majority; all the now settled principles of commercial policy were unsettled; the 'currency' was under discussion; the Bank of England had been reduced to accept a loan from the Bank of France; capitalists were disheartened and operatives disaffected; the industrial energies which have since multiplied our foreign commerce were then effectually impeded by legislative fetters and financial restraints." These were questions full of difficulty, while they demanded a prompt and conclusive settlement; and upon each and all of them Mr. Wilson wrote with a convincing power that made itself be heard, so that his opinions had considerable influence upon the reforms and changes that were effected upon these great leading questions of the day.

His thorough acquaintanceship with these important subjects, and the influence of the journal through which he illustrated them, naturally expanded the desires of Mr. Wilson to the attainment of a seat in parliament, where his opinions could be more effectually enforced; and he was elected parliamentary representative for Westbury in 1847. The maiden speech of a new-fledged member is generally a faint one—the utterance merely of the key-note for future speeches, or a failure that dooms him ever after to a silent vote: but such was not the case when our merchant-senator first spoke in the House of Commons. The subject was an inquiry into the commercial distress at that time prevalent, and on this Mr. Wilson reasoned so ably as to show the inconclusiveness of some arguments advanced by Sir Robert Peel, by which that great statesman was compelled to "rise and explain." So effectual a first appearance, not often witnessed in that place, drew the general attention to Mr. Wilson, which his subsequent speeches did not tend to alienate. It is true he was no parliamentary orator; for this neither his intellectual character nor his education had qualified him; but in every debate which he joined he showed himself master of the subject, and brought forward such an array of well-arranged facts in its illustration as could always arrest the attention of the house. He had also the discretion to confine himself to those subjects which came within his peculiar province, so that his appearances were at long intervals; and this abstinence convinced his auditory, when he rose to speak, that there was good cause for his interference, and that his speech would be worth hearing. But it was in committees, untrammelled by the formality of debate, that his knowledge of mercantile and financial matters, and the readiness with which he could command its details, made him an invaluable assistant; and so convinced were the government officials of his worth that before six months of his parliamentary membership had expired he was offered one of the secretarieships of the Board of Control. After hesitating some time he accepted it; and while he continued in office his influence was felt in the introduction of railroads into India, the sugar question, the commercial distress, the bank acts, and the committee on life assurance. His secretaryship terminated with the change of the ministry in 1852.

On the formation of Lord Aberdeen's coalition ministry, Mr. Wilson was appointed financial secretary to the treasury, an office which he continued to hold for five years. It was one of immense difficulty

and responsibility, as the financial detail of our national expenditure was more or less under his control—and this situation was to be held by one who had commenced his active life as a apprentice in a little hatter's shop in Hawick! But the hat-maker's apprentice showed himself equal to the difficulties and duties of the office, for he brought to them a clear calculating head, a rapid power of decision, large practical experience, and invincible endurance. For these qualifications and their results we again have recourse to the writer of his biography in the *Annual Register*:—"He [Mr. Wilson] was perfectly sure to be right in a plain case; and by far the larger part of the ordinary business of the government, as of individuals, consists of plain cases. A man who is thoroughly sure to decide effectually and correctly the entire mass of easy obvious cases, is a safer master of practical life than one eminently skilled in difficult cases, but deficient in the mere rudimentary qualifications. In cases of greater complication the practical man, aided by a large experience, will most frequently come to a sound conclusion. With Mr. Wilson complication did not lead to indecision—the result was always straightforward and intelligible. In an arguable case it was never left in doubt what he decided, and why he had come to that conclusion. The countless minutes in the treasury are marked by one pervading excellence—clearness; no one could hesitate as to the opinion indicated and the course of action to be pursued. Another faculty Mr. Wilson possessed, which served him well in his official duties—a singularly retentive, accurate, and ready memory. By this he was enabled to recall instantly, and to state unerringly, any circumstance of his official work. This gave to his conduct of business an appearance of fairness and integrity, where another of equal honesty, but without this gift, would have seemed uncandid and evasive. His excellent memory was likewise assisted by a very even judgment. It was easier to him to remember what he had done, because, if he had to do the same thing over again, he would be sure to do it in precisely the same way. All these mental qualities taken together go far to make up the complete idea of a perfect administrator of miscellaneous financial business, such as that of the English treasury now is." After adding to these qualities an account of his power of mental application, based on a strength of constitution which nothing seemed capable of affecting, his biographer thus continues:—"By the aid of these powers Mr. Wilson was able to grapple with the miscellaneous financial business of the country with very unusual efficiency. Nor was his efficiency confined to the labours of his office. The financial secretary of the treasury has a large part of the financial business of the House of Commons under his control, and is responsible for its accurate arrangement. The passing a measure through the House of Commons is a matter of detail; and in the case of the financial measures of the government, the duller part and the most unenvied falls to the secretary of the treasury. He is expected to be the right hand of the chancellor of the exchequer in all the most wearisome part of the financial business of the House of Commons; he is expected to answer all questions asked in the house as to the civil estimates—a most miscellaneous collection of figures, as any one may satisfy himself by glancing at them. Mr. Wilson's astonishing memory and great power of lucid exposition enabled him to fulfil this part of his duty with very remarkable efficiency."

During his tenure of this very laborious office two officers were made to him: one, in 1856, was the chairmanship of inland revenue, to which a large

salary was attached. But this appointment he refused, and for a reason at which most people would have smiled or shrugged their shoulders: there was not enough of toil attached to it to keep him in constant exercise, and he said, that "although it was a good pillow, he had no wish to lie down." The other office, which was offered in 1855, was that of vice-president of the Board of Trade; but this also he thought fit to decline. In the general election of 1857 he was returned to parliament for Devonport, and on the following year he went out of office on the dissolution of Lord Palmerston's administration. On the return of his party to power, Mr. Wilson was asked to resume his office of financial secretary to the treasury; but having already occupied this place for five years, he wished for one in which the duties were less onerous, and in this case he accepted the vice-presidency of the Board of Trade, which, as we have seen, had been offered to him in 1855. After he had held this office for a short time, he was offered the appointment of financial member of the Council of India. The temptations to close with the offer were by no means strong, as the late Sepoy mutiny had left the Indian finances in a very complicated condition. Mr. Wilson was also rich enough, both in fortune and political consideration, while another step would have led him to a seat in the cabinet. But on the other hand, the difficulties of this Indian office, which would have deterred most men, only kindled his emulation, and he was eager to encounter obstacles which others sought to avoid. To the great joy of those who knew his wide mercantile experience, his business habits, and especially his knowledge of Indian finance, he accepted the appointment, and repaired to his new sphere of action. On arriving in India he found that the governor-general was making a tour of the Upper Provinces, and he judged it fitting to join him before commencing operations in Calcutta. This journey through the Upper Provinces was of great advantage to Mr. Wilson as a survey of his ground of operations; and he marked with an observant eye the characters of the various communities, and the condition of affairs in general, as a necessary addition to his theoretical knowledge of Indian finance. He saw the remarkable adaptation of our eastern empire for large taxation without the evils of oppression, if only two difficulties could be overcome. By an indirect tax upon consumable properties the natives would carefully avoid the use of the commodities subject to taxation. By a direct tax on property or income it would be impossible to obtain true returns of their value, as orientals have no such scrupulous ideas of truthfulness as the generality of Englishmen. Having arranged his plans for surmounting either difficulty, Mr. Wilson commenced operations on the 18th of February, 1860, by bringing his budget before the legislative council at Calcutta. The scheme of taxation was a heavy one, but it was also distinct and specific, so that, instead of being left in vague uncertainty, every man knew how much and for what he was liable. Its main feature also was an income-tax, which was modelled after the fashion of that in England. A new system of finance was now commenced in India, the principal points of which will be understood by the following extract from one of Mr. Wilson's letters to a friend in England:—

"I have set myself *five* great points of policy to introduce and carry out.

"1. To extend a system of sound taxation to the great trading classes who hitherto have been exempted, though chiefly benefited by our enormously increased civil expenditure.

"2. To establish a paper currency.

"3. To reform and remodel our financial system by a plan of annual budgets and estimates, with a pay department to check issues, and keep them within the authorized limits; and an effective audit.

"4. A great police system of semi-military organization, but usually of purely civil application, which, dear though it be, will be cheaper by half a million than our present wretched and expensive system, and by which we shall be able to reduce our native army to at least one-third, and by which alone we can utilize the natives as an arm of defence without the danger of congregating idle organized masses.

"5. Public works and roads, with a view to the increased production of cotton, flax, wool, and European raw materials."

In reference to these Mr. Wilson adds: "The first four I have made great progress in; the latter must follow. But you will call it a 'large order.' However, you have no idea of the increased capacity of the mind for undertaking a special service of this kind when removed to a new scene of action, and when one throws off all the cares of engagements, less or more trivial, by which one is surrounded in ordinary life, and throws one's whole soul into such a special service, and particularly when one feels assured of having the power to carry it out. I cannot tell you with what ease one determines the largest and gravest question here compared with in England; and I am certain that the more one can exercise real power, there is by far the greater tendency to moderation, care, and prudence."

Continuing this gratifying account of his progress, he adds: "I have now got a military finance commission in full swing; a civil finance commission also going: I am reorganizing the finance, pay, and accountant-general's department, in order to get all the advantages of the English system of estimates, pay-office, and audit—and this with as little disturbance of existing plans as possible. The latter is a point I have especially aimed at. On the whole, and almost without an exception, I have willing allies in all the existing offices. No attempt that I see is anywhere made to thwart or impede. You can well understand then how full my hands are. If to all these you add the new currency arrangements, you will not then wonder that my health has rendered it necessary to come down here for a day or two to get some fresh air."

It will be seen by the last sentence that the health of Mr. Wilson, after such long endurance, was showing symptoms of yielding. These do not however seem to have alarmed the patient, who talked of retirement and change only "for a day or two." Although a most unwonted change, he would quickly rally and recover, and be again at his wonted post. This too was all the more necessary, as no one else in India could at that time fill it, and the plans had but commenced which he was most anxious to mature. A famine in Upper India was also at hand, and to meet it his financial calculations must be altered. But the fatal climate of India had marked him for its victim, and the few days of indisposition from which he was so readily to recover were changed into weeks of suffering only to terminate in death. On the 2d of August, 1860, after a fortnight of illness, he went to bed, from which he was never to rise again, but although aware of the result, his heart was still in his duties, for which he made the necessary arrangements. It was resolved that the effects of a sea-voyage should be tried upon him as a last resource; but when the opportunity arrived he was too weak for removal. On the 11th of August he expired at Calcutta, surrounded by his

bereaved wife and family. Seldom was such a calamity so bewailed in India, and the universal cry was, "That he should have come out to die here!" that he should have left a great English career *for this!* It was the more grievous, that with such strength of constitution, he was still in little more than the prime of life, having only completed his fifty-fifth year. His funeral was the largest ever known in Calcutta, all ranks of people, from the governor-general to the humblest artisan, being present on the occasion.

We have hitherto considered the Right Honourable James Wilson in his public capacity as tradesman, merchant, and political financier, but his social and domestic character was equally commendable. "His private life," writes his biographer, "had many remarkable features. His enjoyment of simple pleasures, of society, of scenery, of his home, was very vivid. No one who saw him in his unemployed moments would have believed that he was one of the busiest public men of his time. He never looked worn or jaded, and always contributed more than his share of geniality and vivacity to the scene around him. Like Sir Walter Scott, he loved a bright light, and the pleasantest society to him was that of the cheerful and the young."

WILSON, JOHN, Professor of Moral Philosophy, Edinburgh. He was born in or near Paisley, on the 18th May, 1785. He was the eldest, we believe, of three brothers. As his father was a thriving Paisley manufacturer, in which occupation he realized a considerable fortune, while his mother was of a wealthy Glasgow family, the early youth of the future Christopher North was not subject to those privations that crush the weak, and nurse the strong into greater hardihood. Of the first stages of his education at a Paisley school he has left no account; but we learn from his *Recreations* that at a more advanced period he was placed under the tuition of a country minister, who in those days of scanty teinds eked out his stipend by receiving pupils into the manse as boarders. In this rural situation, the boy conned his lessons within doors; but the chief training for his future sphere consisted of many a long ramble among the beautiful scenery with which he was surrounded, and the frolics or conversation of the peasantry, among whom he soon became a general favourite. On reaching the age of fourteen he was sent to the university of Glasgow, where he studied Greek and logic during three sessions under Professors Young and Jardine. Few literary minds could pass under the training of such teachers, and especially the last, without finding it constitute a most important epoch in their intellectual history; and it was to Jardine that Wilson's great rival in critical literature—Jeffrey—acknowledged those first mental impulses which he afterwards prosecuted so successfully. In 1804 John Wilson went to Oxford, and was entered into Magdalen College as a gentleman-commoner; and there his diligence was attested by the knowledge of the best classical writers of antiquity which he afterwards displayed, and his native genius by the production of an English poem of fifty lines for the Newdigate prize of £50, in which he was the successful competitor. In other kinds of college exercises he was also particularly distinguished, such as leaping, running, and boxing, and the sports of boat-rowing, cricket-playing, and coursing, with other amusements of a more boisterous and perhaps more questionable nature. But in the days of "town-and-gown," and with such iron strength of limb and fierce effervescence of animal spirits as Wilson possessed, the case could scarcely have been otherwise. It was hard therefore

that these curious escapades while an Oxford student should have been numbered up against him when he sought at a future period to become the guide and preceptor of students. On one occasion, it was said, he joined, during the college recess, a band of strolling players, with whom he roamed from town to town, enjoying their merry vagabond life, and playing every character from the lover "sighing like furnace," to the "lean and slipped pantaloon." This we can easily believe; the event is no unfrequent recoil from the strictness of a college life; and more than one grave personage is yet alive, in whose venerated position, as well as awe-inspiring wrinkles, no one could read the fact that once on a time they had drank small beer with King Cambyzes, or handed a cracked tea-cup of gin to Cleopatra. On another occasion he became waiter at an inn, that he might be within the sphere of one of its fair female residents, and in this capacity so endeared himself by his inexhaustible glee to the whole establishment, that they were disconsolate when he cast off his slough and disappeared. But the oddest of all the adventures attributed to him was his having fallen in love with a daughter of the sovereign of the gipsies, of whom he would fain have been the King Cophetua, and for whose sake he transformed himself into an Egyptian, and took a share in the wanderings of the tribe, until the successful pursuit of his friends restored him to civilized life. This incessant restlessness and love of desperate enterprise was accompanied with many a purpose of foreign travel; and while at one time he calculated upon a tour over the Peninsula in the rear of the British army, or a run through Turkey, at another he meditated an African exploration that was to extend to Timbuctoo. But he was not destined to tread the same path with Thomas Campbell or Byron, or even the humble missionary John Campbell, and these resolutions ended like dissolving views or day-dreams. It is curious that one of such a stirring spirit was at last contented with Britain, beyond the limits of which he never carried his peregrinations. Having succeeded at the age of twenty-one to a considerable fortune by the death of his father, he purchased in 1808 the small but beautiful estate of Ellerray in Cumberland, embosomed amidst the picturesque lakes, with their distinguished poets for his neighbours and companions.

Thus settled for the time as a border laird, Wilson was as yet too young to subside into regular study or peaceful meditation; and on many occasions the turbulence of life within him only burst out the more violently from the compression of such narrow limits. One specimen of his desperate frolics at this period is thus recorded: "A young man, name not given, had taken up his abode in the vale of Grasmere, anxious for an introduction to Mr. Wilson, and strolled out early one fine summer morning—three o'clock—to that rocky and moorish common (called the White Moss) which overhangs the vale of Rydal, dividing it from Grasmere. Looking southward in the direction of Rydal he suddenly became aware of a huge beast advancing at a long trot, with the heavy and thundering tread of a hippopotamus, along the public road. The creature soon arrived within half a mile of him, in the gray light of morning—a bull apparently fleeing from unseen danger in the rear. As yet all was mystery; till suddenly three horsemen emerged round a turn in the road, hurrying after it at full speed, in evident pursuit. The bull made heavily for the moor, which he reached; then paused, panting, blowing out smoke, and looking back. The animal was not safe, however; the horsemen, scarcely relaxing their speed, charged up hill, gained the rear of the bull, and drove him at full gallop over

the worst part of this impracticable ground to that below; while the stranger perceived by the increasing light that the three were armed with immense spears, fourteen feet long. By these the fugitive beast was soon dislodged, scouring down to the plain, his hunters at his tail, toward the marsh, and into it; till, after plunging together for a quarter of an hour, all suddenly regained *terra firma*, the bull making again for the rocks. Till then there had been the silence of phantasmagoria, amidst which it was doubtful whether the spectacle were a pageant of aerial spectres, ghostly huntsmen, imaginary lances, and unreal bull; but just at that crisis a voice shouted aloud—"Turn the villain—turn that villain, or he will take to Cumberland." It was the voice of Ellerray [Wilson], for whom the young stranger succeeded in performing the required service, the villain being turned to flee southwards; the hunters, lance in rest, rushed after him, all bowing their thanks as they fled past, except of course the frantic object of chase. The singular cavalcade swiftly took the highroad, doubled the cape, and disappeared, leaving the quiet valley to its original silence; while the young stranger, and two grave Westmoreland statesmen just come into sight, stood quietly wondering, saying to themselves, perhaps,

'The earth hath bubbles, as the water hath,
And these are of them.'

It was no bubble however; the bull was substantial, and may have taken no harm at all from being turned out occasionally for a midnight run of fifteen or twenty miles—no doubt to his own amazement, and his owner's perplexity at the beast's bedraggled condition next day." Thus far goes the account of one of Wilson's early frolics; and certainly it was "very tragical mirth;" but thus to hunt a poor domestic bull that from its earliest calfship has been snubbed and cudgelled into submission has almost as little of the romantic in it as the flight of a terrified dog with a pan tied to its tail, and the whole village school in close pursuit. If a man must needs taurize, let it be in the appointed lists, where

"Spanish cavaliers with lances,
At once wound bulls and ladies' fancies."

There the chances are pretty fairly balanced between the bull and his bold antagonist, and when the career commences it is difficult to tell whether lance or horn shall have the better of it.

These rural pursuits of Wilson were oddly enough combined with the study of law, for on leaving the university of Oxford he had resolved to betake himself to the Scottish bar. Such was the case with many young gentlemen at this time, who, although of independent fortune, were desirous of passing as advocates, on account of the specific rank and literary standing with which the title was accompanied. Having finished the usual terms Mr. Wilson was enrolled among the advocates in 1814. It will scarcely be imagined however that he was either the most anxious or the most industrious of barristers; the "Stove School," if it then existed in the outer court of Parliament House, was more likely to enjoy his presence than the solemn atmosphere of the inner halls. But already he had commenced his public literary career, and in the character of a poet, by a set of beautiful stanzas entitled the "Magic Mirror," which were published in the *Annual Register* for 1812. During the same year he also published, but anonymously, an elegy on the death of James Graham, author of the *Sabbath*, with which Joanna Baillie was so highly pleased, that she applied to Sir Walter Scott for the name of the author. Sir Walter sent the desired information, and added, "He is now engaged on a poem called the *Isle of Palms*, some-

thing in the style of Southey. He is an eccentric genius, and has fixed himself upon the banks of Windermere, but occasionally resides in Edinburgh, where he now is. . . . He seems an excellent, warm-hearted, and enthusiastic young man; something too much, perhaps, of the latter quality places him among the list of originals." During the same year the *Isle of Palms* and other Poems was published, a work that at once stamped their author as one of the poets of the Lake school—a class after which the whole host of critics were at present in full cry. It was much, therefore, that at such a period Wilson should have produced a poem that, according to the Edinburgh reviewers, promised "to raise its name, and advance its interests, even among the tribes of the unbelievers." Much, however, as the *Isle of Palms* was admired and beloved in its day, and abounding though it unquestionably did in touches of true feeling and passages of great poetical power, it has been unable to endure the test of time, and therefore it was quietly consigned to general forgetfulness long before the author himself had passed away. Such indeed has also been the fate of Southey's *Curse of Kehama*, upon which the versification of the *Isle of Palms* was evidently modelled. Still, the approbation which his effort excited was enough to encourage Wilson to a renewed effort in poetry; and accordingly, in 1816, he produced the *City of the Plague*, a dramatic poem of a higher as well as more masculine character than his former production. But it too has failed to secure that enduring popularity which has been accorded to the productions of the highest and even the second-rate poets of his own period. Perhaps he was unfortunate in the subject of his choice, which was the great plague of London in 1665. But indeed it would require the powers of a Milton, or even of a Shakspeare, to invest such a theme with fresh interest, after the descriptions of De Foe. In the same volume, among other smaller productions, was a dramatic fragment entitled the "Convict," in which Wilson was more successful, perhaps because the subject was less daring and more within the usual scope of poetry.

Whatever might be his poetical merits a sufficient proof had now been given that Wilson could scarcely establish a permanent celebrity by these alone. But he was fitted for greater excellence in a different sphere, and that sphere he was now to find. *Blackwood's Magazine* had been started as the champion of Tory principles in opposition to the *Edinburgh Review*; and as Thomas Pringle, its amiable and talented editor, was a Whig, he was obliged to abandon its management after the publication of a few numbers. On the disruption that ensued between the two rival publishers Constable and Blackwood, Wilson, in company with Hogg and Lockhart, took part with the latter; and soon after the "Chaldee Manuscript" appeared, a production, the remarkable wit of which was insufficient to redeem it from merited condemnation on account of its profanity. Its first draught in the rough had been drawn up by the Ettrick Shepherd, in which form it is said to have scarcely amounted to more than a third of its published bulk; but the idea being reckoned a happy one, it was expanded, chiefly, as has been supposed, by Wilson and Lockhart, until it finally grew into an article that raised the public excitement into an absolute uproar. After the storm had been successfully weathered, the character of the *Magazine*, notwithstanding its manifold trespasses, which on more than one occasion led to cudgelling, and even to bloodshed, continued to grow in reputation, until it reached the highest rank in the world of literature and criticism. And who was the veiled editor under

whose remarkable management all this success had been achieved? The question was a universal one, and the answer generally given was—"John Wilson." The high reputation he had already won, and his well-known connection with Maga, made the public voice single him out in preference to all the other writers by whom its pages were enriched. It was a natural mistake, but a mistake after all. This important part of the business was retained by Ebony himself, who selected the articles, corresponded with the contributors, and discharged all the business duties of the editorship. But the living soul and literary spirit was Wilson himself, so that in spite of every disclamation he was proclaimed by the public voice the editor of *Blackwood's Magazine* until within a few years of his death.

While he was thus holding onward in his meteoric course, at one part of the year at Ellera and the other in Edinburgh—alternately running down bulls on the Scottish border and *bored* in the metropolis—and becoming loved, dreaded, or wondered at in his various capacities of hospitable country gentleman, rough-riding sportsman, gay civic symposiarch, Abbot of Misrule, and Aristarchus of reviewers and magazine writers, his means of settled domestic tranquillity and happiness had been such as seldom fall to the lot either of meditative poets or belligerent journalists. For in 1810, after he had set his beautiful home among the lakes in order, and furnished it with all the comforts that wealth, directed by a classical taste, could devise, he married an English lady of great beauty, accomplishments, and amiable disposition, who further enriched him with a fortune of £10,000. But only ten years thereafter, Wilson, now the father of two sons and three daughters, was reduced to a very limited income compared with his former resources. As profuse of his money as of his ideas, he had flung both about with reckless prodigality; but while the latter stock, like the purse of Fortunatus, underwent no diminution let him squander it as he pleased, it was otherwise with the former, which had dissolved he knew not how. Thus it was with him to the end of his days: he made little or no account of money while it lasted, and was one of those happy uncalculating spirits, to whom the difference between £10 and £100 is a mere *nothing*. Something more than the scanty relics of his fortune, with the additional profits of authorship, was necessary; and in 1820 a favourable prospect occurred, in consequence of the death of Dr. Thomas Brown, by which the chair of moral philosophy in the university of Edinburgh became vacant. Wilson presented his name among the candidates for the charge, and his friends commenced an active canvass in his behalf. But the proposal took Edinburgh aback. Wilson a teacher of morals! The religious remembered the unlucky "Chaldee Manuscript," and the grave and orderly bethought them of his revels. Even those who took a more tolerant view of the subject could not comprehend how the president of Ambrose's *Noctes* could be fitted for the chair of Brown and Dugald Stewart. But what, perhaps, weighed more heavily with the citizen-electors was the fact of his Toryism, to which, like the generality of shopkeepers and merchants, they were decidedly hostile. All these obstacles Sir Walter Scott, who had long known and admired the genius of the applicant, fully calculated, and thus expressed in his usual tolerant manner: "You are aware that the only point of exception to Wilson may be, that, with the fire of genius, he has possessed some of its eccentricities; but did he ever approach to those of Henry Brougham, who is the god of Whiggish idolatry? If the high and rare qualities with which he is invested are to

be thrown aside as useless, because they may be clouded by a few grains of dust which he can blow aside at pleasure, it is less a punishment on Mr. Wilson than on the country. I have little doubt he would consider success in this weighty matter as a pledge for binding down his acute and powerful mind to more regular labour than circumstances have hitherto required of him; for indeed, without doing so, the appointment could in no point of view answer his purpose. . . . You must of course recommend to Wilson great temper in his canvass—for wrath will do no good. After all, he must leave off sack, purge and live cleanly as a gentleman ought to do; otherwise, people will compare his present ambition to that of Sir Terry O'Fagg when he wished to become a judge. 'Our pleasant follies are made the whips to scourge us,' as Lear says; for otherwise, what could possibly stand in the way of his nomination? I trust it will take place, and give him the constance and steadiness which are all he wants to make him the first man of the age." The nomination did take place according to Sir Walter's wish, notwithstanding an amount of opposition seldom offered in such elections; and Wilson, to the general surprise of all classes, became professor of moral philosophy, a grave and important charge which he occupied thirty-two years.

In this manner, at the early age of thirty-four, a man esteemed so reckless in temper and unfixed in purpose, so devoted to the whim of the passing hour and careless of the morrow, had yet by sheer force of talent fought his way to an eminence of the highest literary as well as moral responsibility. As a reviewer his dictum in the world of authorship was the guide of thousands, who received it as an oracle; as a general essayist he directed the public taste, and imbued it with his own feelings; and now, as a national teacher of moral truth he was to train the characters and direct the minds of those who were in turn to become the guides and instructors of a future generation. Was this the same man who but yesterday was the midnight *torreador* upon the wilds of Cumberland? That the old spirit had neither died nor become deadened within him, his *Noctes Ambrosianæ*, to speak of no other token, were sufficient evidence. As a professor his elevation introduced a remarkable change in the chair of moral philosophy in Edinburgh. Hitherto metaphysics, that science so congenial to the Scottish intellect, had there obtained full predominance, whether propounded according to Aristotelian rule or the innovations of Locke and Bacon; but Wilson, though he could dream like Plato himself, was no practised metaphysician. It also behoved him to establish a theory of morals, and demonstrate it with all the exactness and nicety of a mathematical problem; but with Wilson it was enough that he knew what was right—and was not wholly ignorant of its opposite. Whence, then, was he to derive those materials for which his pupils were hungering and thirsting? Even from the resources of that fertile mind which as yet had never failed him. He could enter into the very pith and marrow of a subject, and detect truth or error however concealed. And all this he could illustrate with a poetical array of imagery and eloquence of language, such as has seldom issued from the lips of an expounder of hard things in ethical and metaphysical philosophy. Such was the kind of teaching in which his classes delighted—a suggestive and impulsive course, in which, after having been kindled with his ardour, each pupil might start off upon the career of inquiry best suited to his own tastes and capacities. This, indeed, was not science, properly so called—but was it not some-

thing as good? The toils of lecturing during each session were combined with the more onerous labour of examining some hundreds of class essays; and it is perhaps needless to add, that in such a work Professor Wilson was completely in his element. In this way he taught the young ideas how to shoot; and if they did not produce rich fruits, the cultivator at least was not to blame. At the close of the season the official gown was thrown off and Christopher North was himself again. He hied away during the spring to Ellera, and spent the summer and autumn in the districts of the Tweed or the Highland hills, while his exploits in fishing and shooting, or his musings among the varied scenery, came pouring in close succession and rich variety into the pages of his magazine.

Among these recreations by land and water which were so dear to the heart of Wilson, we must not omit that from which he derived his title of "Admiral of the Lake." This he enjoyed in consequence of his taking the lead in those splendid regattas which were held upon the lake of Windermere, when his yacht was commonly to be seen at the head of the gay armada. One of these, held in honour of a visit from Mr. Canning, the premier, and Sir Walter Scott, in 1825, is thus chronicled in the life of the latter by his son-in-law:—"There were brilliant cavalcades through the woods in the mornings, and delicious boatings on the lake by moonlight; and the last day 'the Admiral of the Lake' presided over one of the most splendid regattas that ever enlivened Windermere. Perhaps there were not fewer than fifty barges following in the professor's radiant procession, when it paused at the point of Storrs to admit into the place of honour the vessel that carried kind and happy Mr. Bolton and his guests. The bards of the lakes led the cheers that hailed Scott and Canning; and music and sunshine, flags, streamers, and gay dresses, the merry hum of voices, and the rapid splashing of innumerable oars, made up a dazzling mixture of sensations as the flotilla wound its way among the richly-foliaged islands, and along bays and promontories peopled with enthusiastic spectators." On one occasion Wilson's rank of admiral promoted him to an office at which Nelson, Collingwood, Howe, and Jervis would have laughed with sailor-like merriment: it invested him with the command of a real fleet, instead of an armament of cockle-shells. "I remember," he said in his old days, "being with my friend Sir Pulteney Malcolm when he commanded the experimental squadron in the Channel—in 1832, I think—one day on the flag-ship's quarter-deck, amidst the officers and ladies, Sir Pulteney suddenly took me rather aback by saying, in his loudest official tone, 'Professor Wilson will now put the ship about!' It was really expected of me, I believe; so setting the best face upon it, and having previously paid attention to such evolutions, I took voice, and contrived to get through it very creditably—in a fine working breeze, when the worst of it was that the eyes of thousands of people were upon us, and the whole column of ships were to follow in regular succession. The flutter of that critical moment when the helm was put down, and the least error in seizing it must have hung the noble line-of-battle ship in stays, I shall never forget. I had rather have failed in carrying the class—nay, ten thousand classes—through a point of casuistry in moral philosophy. Yet the sensation was glorious; there was a moral grandeur in the emotion. The feelings of a great admiral in difficult weather bringing on a battle must, in some respects, surpass even those of Shakspeare imagining Hamlet or Lear!"

In this way the life of Wilson went onward for

years. After the death of Blackwood, in 1834, he took little further concern in the magazine; indeed, he had already done so much for it, and placed it in so firm a position, that he may have felt as if his task in that department had ended, and might be safely entrusted to younger hands. His class also was sufficient to occupy his full attention, more especially when the increase of intellectual demand, and the growing improvements in public education, required every teacher to be up and doing to his uttermost. His private life, tamed down to the gravity of age without losing its health or vivacity, continued to be enlivened with the society of the learned and talented, of whom a new generation was fast springing up, and among whom he was venerated as a father, while he was loved as a companion and friend. His chief public exhibitions were now at the Burns' festival, where he was a regular attendant as well as chief orator. In 1851 that profitable literary distinction now so generously accorded by government in the form of a substantial pension was bestowed upon him, amounting to £300 per annum; and in the spring of the following year he resigned his professorship, after holding it thirty-two years, and without making the usual claim of a retiring allowance. After this he was almost daily to be seen upon his accustomed walk in Princes' Street until the beginning of 1854, when paralysis and a dropsical affection laid him wholly aside, and he died in his house in Gloucester Place on the morning of the 3d of April. His remains were interred in the Dean Cemetery on the 7th, and the funeral, which was a public one, was attended by thousands, consisting of every rank and occupation, who thus indicated their respect for one so universally known and esteemed. A more permanent indication is a public monument in the form of a colossal bronze statue, which was erected in 1865 in East Princes' Street Gardens, Edinburgh, which will convey to posterity the likeness of the man whom the present age delighted to honour.

The poetical productions of Wilson by which he commenced his career as an aspirant for the honours of authorship we have already enumerated. The oblivion into which they are even already sinking shows that it was not by his poems that he was to build for himself a name, admired though they were at their first appearance before the public. They satisfied a certain temporary taste which at that time happened to be predominant; and having done this, they had fulfilled their purpose, and were therefore quietly laid aside. Neither was the matter greatly amended by his subsequent attempts as a novelist; and his three productions in this capacity—the *Lights and Shadows of Scottish Life*, the *Foresters*, and the *Trials of Margaret Lyndsay*—have been placed by public estimation in the same category with the *Isle of Palms* and *City of the Plague*. In fact, he lacked that quality of inventiveness so essential for the construction of a tale, whether in poetry or prose, and therefore his narratives have little or no plot, and very few incidents—a defect which neither fine writing nor descriptive power is sufficient to counterbalance. It is upon *Blackwood's Magazine* that his claims to posthumous distinction must fall back; for there we find his whole heart at work, and all his intellectual powers in full action. Of these productions, too, his critical notices can scarcely be taken into account—vigorous, just, and often terrible though they were; nor even his *Noctes Ambrosianæ*, though these for the time were by far the most popular of all his writings. But it is as Christopher North, whether in his shooting-jacket, or with his fishing-rod, or “under canvas,” that he will

be best remembered and most highly valued. The scenery which in that character he has so beautifully painted, and the deep emotions to which he has given utterance, are not things of a day, but for all time, and will continue to be read, admired, and cherished when the rest of his numerous writings have passed away.

WINRAM, JOHN, superintendent of Fife and Strathern, was descended of the Fifeshire family of the Winrams of Ratho. He is supposed to have entered the university of St. Andrews (St. Leonard's College) in 1513, and in 1515 he took the degree of B.A., on which occasion he is designated a *pauper*; that is, one who paid the lowest rate of fees. From that period till 1532 no trace has been discovered of him, but at the last-mentioned date he is noticed under the title of “*Canonicum ac Baccalarium in Theologia*” as one of the rector's assessors, and in a deed dated the same year he is called a canon regular of the monastery of St. Andrews. Two years afterwards he is mentioned as third prior, and in 1536 as subprior, in which situation he continued till the Reformation.

The first occasion on which we have found Mr. John Winram making a public appearance was the trial of George Wishart, the martyr. On that occasion he was appointed to open the proceedings by a sermon, and he accordingly preached on the parable of the wheat and tares: he mentioned that the Word of God is “the only and undoubted foundation of trying heresy without any superadded traditions,” but held that heretics should be put down—a position strangely inconsistent with the command to let the tares and wheat grow together till harvest. About the same period Archbishop Hamilton ordered the subprior to call a convention of Black and Gray Friars for the discussion of certain articles of heretical doctrine. At this meeting John Knox demanded from Winram a public acknowledgment of his opinion whether these heretical articles were consistent or inconsistent with God's word; but this the wary subprior avoided. “I came not here as a judge,” he replied, “but familiarly to talk, and therefore I will neither allow nor disallow, but if ye list I will reason;” and accordingly he did reason till Knox drove him from all his positions, and he then laid the burden upon Arbuckle, one of the friars. Winram attended the provincial councils of the Scottish clergy, held in 1549 and 1559, and, on the first of these occasions at least, took an active part in the proceedings. Thus, up to the very period of the establishment of the Reformation he continued to act a decided part with the Catholic clergy. “There have been, and are,” says Wodrow, “some of God's children, and hidden ones, in Babylon, . . . and no doubt Mr. Winram was useful even in this period.” May it not be asked whether he did not, by a bad example and a pertinacious adherence to a system which he knew to be erroneous, greatly more weaken the hands of his brethren than he could possibly strengthen them by his private exertions?

Winram, as prior of Portmoak, attended the parliament of August, 1560, which ratified the Protestant Confession of Faith. The first General Assembly held in December following declared him fit for and apt to minister the word and sacraments; and on Sunday, April 13, 1561, he was elected superintendent of Fife, Fotherick, and Strathern, “be the common consent of lordis, baronis, ministeris, elderis, of the saidis bowndis, and othereis common pepill,” &c. The transactions in which he was engaged in this capacity present so little variety that we shall merely take a short general view of them.

One of Winram's earliest acts as superintendent was the reversal of a sentence of condemnation which had been passed on Sir John Borthwick in 1540 for heresy. This gentleman had saved himself by flight, but appears to have returned to Scotland in or before 1560, for at the first General Assembly we find one of the members "presented by Sir John Borthwick to the kirks of Aberdour and Torrie." It is sufficiently singular that Winram was one of "those plain enemies to the truth" described in the reversal of the sentence who had assisted at the trial and condemnation of the man whom he even then must have considered as a friend, although he had not the courage or the honesty to avow it. The notices of Winram in the records of the General Assembly consist, almost without exception, of complaints against him for negligence in visiting the district or diocese committed to his charge.¹ This is a charge which was brought more or less frequently against all the superintendents: the people on the one hand seem to have been unreasonable in their expectations, and the government, beyond all question, gave the clergy but little encouragement by a liberal or even moderate provision for their wants. In Winram's case, however, the frequency of these complaints leaves on the mind a suspicion that he was to a considerable extent in fault, and, on one occasion at least, the complaint was accompanied with a charge of a covetous, worldly-minded disposition—a charge which circumstances we shall mention in our general remarks on his character lead us to conclude were not unfounded. He was several times employed in reconciling party and private disputes. In 1571 he was ordered by the General Assembly to inhibit Mr. John Douglas, who was appointed Archbishop of St. Andrews, to vote in parliament in name of the church. In January, 1572, he attended the convention at Leith at which tulchan bishops were authorized, and in the following month he was employed, as superintendent of the bounds, to inaugurate the Archbishop of St. Andrews. There are no subsequent notices of him of the slightest interest or importance. He died on the 18th or 28th of September, 1582 (the date seems uncertain), leaving by his will James Winram and John Winram of Craigton, sons of Mr. Robert Winram of Ratho, his brother, his principal heirs.

The character of Winram is by no means free from suspicion. He was an early convert to the Protestant doctrines, but he neither abandoned his situation nor emoluments in the Catholic church; he did not, like almost all his brother superintendents, expose himself to danger or to suffering by a public profession of his sentiments, and when Knox, at the meeting of the Black and Gray Friars, demanded whether he conscientiously considered the doctrines then called heretical contrary to God's word, he not only evaded the question, but argued on the Popish side; he assisted at the trials of at least two of the reformers, of whom one suffered, and the other only saved himself by flight. It may perhaps be said that Winram expected to be thus able to advance the Reformation more effectually than by an open abandonment or opposition of the Popish church, but this is an argument which would in any case be liable to strong suspicion, and which in Winram's is rendered everything but inadmissible by the other facts which are known respecting him. The truth seems to be, and candour requires that it should be stated, that he generally displayed a covetous, interested disposition. On this account he was sometimes treated with no

great respect, even by persons of inferior rank: one person, indeed, was charged in 1561 before the kirk-session of St. Andrews with saying that he was a "fals, dissaitful, greedy, and dissemblit smaik, for he wes one of thaim that maist oppressed, smored, and held down the word (kirk?) of God, and now he is cum into it and professes the same for greediness of geir, lurkand and watchand quhill he may se ane other tym." Nor does he seem to have possessed in any considerable degree the confidence of his clerical brethren. It has been remarked that, in the records of the proceedings of the first General Assembly, his name appears but seventeenth on the list of persons considered fit to minister, and is placed after those of men greatly his juniors. This is a circumstance which mere accident may have occasioned, and is not of itself entitled to much consideration; but of one fact there can be no doubt, that in the whole course of thirty-six Assemblies, which, according to Wodrow, he attended, he was never appointed moderator, nor intrusted even with a share in the management of their more important transactions.

Winram married Margaret Stewart, widow of — Ayton of Kinnaldy, but she predeceased him without having any family except by her first husband. Many passages in the books of the commissariat of St. Andrews show that the superintendent and his wife's sons were on indifferent terms, and leave one not without suspicion that he made some attempt to deprive them of their just rights or property. In the remarks which we have made on this and other parts of his conduct we have been actuated by no other motive but a desire to draw a fair and impartial conclusion from the facts which time has spared to us. At the same time we are sensible, and we mention it in justice to the memory of Winram and many others, that, did the history of the period admit a fuller investigation, considerations might arise which would probably place many transactions in a different point of view.² The only work known to have been written by Winram is a catechism, which has long disappeared, and of which not even a description is now known to exist.

WISHART, GEORGE, a distinguished Protestant martyr, was probably the son of James Wishart of Pitarro, justice-clerk to James V. He is supposed to have studied at Montrose, where he himself gave instructions for some time in the Greek language—a circumstance which, considering the state of Greek learning in Scotland at the time, reflects distinguished honour on his literary character. But there were men in power by whom it was reckoned heresy to give instructions in the original language of the New Testament. Owing to the persecution he received from the Bishop of Brechin and Cardinal Beaton, he left the country in 1538. His history during the three following years is little known. It appears that, having preached at Bristol against the worship and mediation of the Virgin, he was condemned for that alleged heresy, recanted his opinions, and burned his fagot in the Church of St. Nicholas in that city. Probably he afterwards travelled on the Continent. In 1543 he was at Cambridge, as we learn from the following description quoted by the biographer of Knox,³ from a letter of Emery Tylney:—"About the yeare of our Lord a thousand, five hundreth, forty and three, there was, in the university of Cambridge, one Maister George Wishart, commonly called Maister George of Benet's colledge, who was a tall man, polde headed,

¹ These charges were brought forward in December, 1562; December, 1564; December, 1565; December, 1567; July, 1569; July, 1570; March, 1572.

² Abridged from Wodrow's *Biographical Collections*, printed by the Maitland Club, i.

³ Dr. M'Crie, *Life of Knox*.

and on the same a round French cap of the best. Judged of melancholy complexion by his physiognomie, black haired, long bearded, comely of personage, well spoken after his country of Scotland, courteous, lowly, lonely, glad to teach, desirous to learne, and was well travailed. Having on him for his habit or clothing never but a mantill frieze gowne to the shoes, a black milliard fustian dublet, and plain black hosen, coarse new canvase for his shirtes, and white falling bandes and cuffs at the hands. All the which apparell he gave to the poore, some weekly, some monthly, some quarterly, as he liked; saving his French cappe, which he kept the whole year of my being with him. He was a man, modest, temperate, fearing God, hating covetousnesse; for his charitie had never ende, night, noone, nor daye. He forbore one meale, one day in four for the most part, except something to comfort nature. Hee lay hard upon a pouffe of straw, coarse new canvase sheetes, which, when he changed, he gave away. He had commonly by his bedside a tubbe of water, in the which (his people being in bed, the candle put out, and all quiet) hee used to bathe himself. He taught with great modestie and gravitie, so that some of his people thought him severe, and would have slaine him; but the Lord was his defence. And hee, after due correction for their malice, by good exhortation, amended them, and he went his way. O that the Lord had left him to me his poore boy, that he might have finished that he had begunne! His learning, no less sufficient than his desire, always prest and readie to do good in that he was able, both in the house privately, and in the school publicly, profusing and reading diverse authors."

Wishart returned to Scotland in July, 1543, in company with the commissioners who had been despatched for the negotiation of the marriage treaty with Henry VIII.¹ From these individuals, many of whom were attached to the reformed doctrines, he had probably received assurances of safety for his person: it is at least certain that, from the time of his entering the country till his death, he was under their protection, and usually in the presence of one or more of them. The chief laymen of the Protestant party at this period were the Earls Cassillis, Glencairn, and Marischal, Sir George Douglas, and the lairds of Brunstain, Ormiston, and Calder. They were in secret alliance with the King of England, and at his instigation several of them formed designs for assassinating Cardinal Beaton, whose powerful genius was the chief obstacle to their views.

Thus countenanced, Wishart preached to large audiences in Montrose and Dundee, causing at the latter of these places the destruction of the houses of the Black and Gray Friars. The authorities having interfered to preserve the peace, Wishart left the town, but not till he had given a public testimony to the friendly nature of his intentions, and the danger that would be incurred by those who refused to hear the truth which he proclaimed. He then proceeded to the west of Scotland, and for some time preached successfully. But in the town of Ayr he found the church preoccupied by the Bishop of Glasgow; in consequence of which he proceeded to the market-cross, "where," says Knox, "he made so notable a sermon, that the very enemies themselves were confounded." He also preached frequently at Galston and Bar. At Mauchline he was prevented from officiating by the sheriff of Ayr "causing to man the

church, for preservation of a tabernacle that was there beautiful to the eye." Wishart, refusing to yield to the solicitations of some who urged him to enter forcibly, exclaimed, "Christ Jesus is as mighty upon the fields as in the church; and I find that he himself, after he preached in the desert, at the seaside, and other places judged profane then, he did so in the temple of Jerusalem. It is the word of peace that God sends by me—the blood of no man shall be shed this day for the preaching of it." Thereafter he preached in the neighbourhood, so as to produce a wonderful reformation on a gentleman of abandoned character. But while engaged in this part of Scotland, he heard that the plague was raging in Dundee. The devoted preacher hastened thither. In the midst of the disease and misery of the people he preached so as to be heard both within and without the town, many of the sick being beyond the gate, on these appropriate words, "He sent his word and healed them," adding, "It is neither herb nor plaster, O Lord, but thy word healeth all." This discourse produced a very general and powerful impression. He continued to preach and visit the sick with singular benevolence; and besides the infection of the disease, to which he was constantly exposed, he was, on one occasion, liable to danger from a priest, who had been commissioned to assassinate him. The people, on discovering the dagger which he held in his hand at the conclusion of one of Wishart's sermons, were inflamed with passion, but the latter embraced him with these friendly words, "Whosoever troubles him shall trouble me, for he hath hurt me in nothing; but he hath done great comfort to you and me, to wit, he hath let us to understand what we may fear: in times to come we will watch better." The truth appears to be, that Beaton, being fully apprised of the designs of Wishart's friends against his own life, had thought proper to form similar designs against that of a preacher, whose eloquence was threatening his church with destruction. Whether this was the case or not, there can be no doubt that the cardinal now made all possible efforts to apprehend Wishart. The preacher therefore never moved in any direction without a tried adherent, who bore a two-handed sword before him; nor did he ever preach except under a strong guard of friendly barons and their retainers. Knox at one time officiated in the character of sword-bearer to his friend.

From Dundee he returned to Montrose, where he spent some time, occupied partly in preaching, "but most part in secret meditation." At Dundee, which he now revisited, he uttered a memorable prediction of future glory to the reformed church in Scotland. "This realm," said he, "shall be illuminated with the light of Christ's gospel as clearly as ever any realm since the days of the apostles. The house of God shall be builded in it; yea, it shall not lack, whatsoever the enemy may imagine in the contrary, the very keystone." For this and other anticipations of the future Wishart received the credit of a prophet among his followers; nor have writers been wanting in the present age to maintain that he really possessed this ideal accomplishment. It is impossible, however, for a reasonable mind to see anything in the above prediction beside the sanguine expectations of a partisan respecting his own favourite objects.

While at Dundee, Wishart received a message from the Earl of Cassillis and the gentlemen of Kyle and Cunningham, requesting him to meet them in Edinburgh, where they intended to make interest that he should have a public disputation with the bishops. On arriving at Leith he did not, as he ex-

¹ Knox, in his *Historie of the Reformation*, says 1544; but it is satisfactorily proved that the commissioners returned in 1543; and hence, as it is more likely that a mistake would arise in the date than in the circumstance, we assume the latter year as a correction upon Knox's statement.

pected, immediately find his friends, so that, "beginning to wax sorrowful in spirit," from the inactive life to which he was submitting, he preached in Leith, from which, as the governor and cardinal were expected in Edinburgh, he went to the country, residing successively in Brunstain, Longniddry, and Ormiston, the proprietors of which, as well as many other gentlemen of Lothian, were zealous in the cause of reformation. At this time he preached with much effect in Inveresk and Tranent, and during the holidays of Christmas, 1545, he proceeded to Haddington. Here he preached several sermons. Before delivering the last of them he received information that the conference to which he had been invited in Edinburgh could not be fulfilled. This greatly distressed him, and the smallness of his audience on the present occasion added to his depression. Having for more than half an hour walked about in front of the high altar, he proceeded to the pulpit, where his sermon commenced with the following words: "O Lord, how long shall it be that thy holy word shall be despised, and men shall not regard their own salvation? I have heard of thee, Haddington, that in thee would have been, at any vain clerk play, two or three thousand people; and now to hear the messenger of the Eternal God, of all the town or parish, cannot be numbered one hundred persons. Sore and fearful shall the plagues be that shall ensue upon this thy contempt; with fire and sword shalt thou be plagued." He then proceeded to particularize the kind of troubles which should fall on Haddington, and which actually did befall it shortly afterwards. Parting with several of his friends, and even with John Knox, to whom, on his wishing to accompany him, he said, "Nay, return to your children, and God bless you; one is sufficient for one sacrifice," he went with the proprietor to Ormiston. At night the Earl of Bothwell came to the house, and, intimating the approach of the governor and the cardinal, advised Ormiston to deliver Wishart to him, promising that he should be safe. Wishart was willing to accede to these terms. "Open the gates," said he, "the blessed will of my God be done!" Bothwell's promises were renewed, and his attendants joined him in his protestations. But they proceeded with Wishart to Elphinston, where Beaton was; and the preacher having been sent to the capital, and thence brought back to Hailes, Lord Bothwell's seat, was at last committed to ward in the castle of Edinburgh. He was soon after sent to St. Andrews by the cardinal, who, assisted by Dunbar, Archbishop of Glasgow, prepared for the trial of the reformer.

On the 1st of March, 1545-6, the dignitaries of the church assembled at St. Andrews, when Beaton, being refused the presence of a civil judge by the governor, determined to proceed on his own authority. The alleged heretic, being arraigned on a series of charges, defended himself meekly but firmly, and with a profound knowledge of Scripture. The result, as was to be expected, was his condemnation to the stake. On the 28th he was led from the prison, with a rope about his neck, and a large chain round his middle, to the place of execution, in front of the castle, which was the archiepiscopal palace of the cardinal. "Here a scaffold had been raised,¹ with a high stake firmly fixed in the midst of it. Around it were piled bundles of dry faggots; beside them stood an iron grate containing the fire, and near it the solitary figure of the executioner. Nor did it escape the observation of the dense and melancholy crowd which had assembled, that the cannon of the fortress were brought to bear directly on the platform, whilst the gunners stood

with their matches beside them—a jealous precaution, suggested perhaps by the attempt of Duncan to deliver the martyr Hamilton, and which rendered all idea of rescue in this case perfectly hopeless. On arriving at the place Wishart beheld these horrid preparations, which brought before him the agony he was to suffer, with an unmoved countenance; mounted the scaffold firmly, and addressed a short speech to the people, in which he exhorted them not to be offended at the word of God by the sight of the torments which it seemed to have brought upon its preacher, but to love it, and to suffer patiently for it any persecution which the sin of unbelieving men might suggest. He declared that he freely forgave all his enemies, not excepting the judges who had unjustly condemned him." Having signified his forgiveness to the executioner, he was tied to the stake, and the flame began to encompass the holy martyr. "It torments my body," said he to his friend the captain of the castle, "but no way abates my spirit;" then, looking up to a window from which the cardinal was contemplating the scene, he said, "He who in such state, from that high place, feedeth his eyes with my torments, within a few days shall be hanged out at the same window, to be seen with as much ignominy as he now leaneth there in pride." On this the executioner drew a cord which had been fastened round the neck of the sufferer, who shortly afterwards expired amidst the flames. The prediction of the dying martyr was literally fulfilled within three months after by the violent and ignominious death of his persecutor. The admirable biographer of Knox and Melville has recorded this just and comprehensive eulogium on the character of the martyr:—"Excelling," says Dr. M'Crie, "the rest of his countrymen at that period in learning; of the most persuasive eloquence; irreproachable in life, courteous and affable in manners; his fervent piety, zeal, and courage in the cause of truth were tempered with uncommon meekness, modesty, patience, prudence, and charity."

WISHART, or WISEHEART, GEORGE, a learned divine and admired writer of the seventeenth century, was of the family of Logy in Forfarshire. He is said to have been born in East Lothian in 1609, and to have studied at the university of Edinburgh. Previously to the breaking out of the religious troubles in the reign of Charles I. he was one of the ministers of St. Andrews.² Being prepossessed, like the most of the men of family connected with the east coast of Scotland, in favour of Episcopacy, he refused to take the covenant, and was accordingly deposed by the Assembly of 1639, in company with his colleague Dr. Gladstones, the celebrated Samuel Rutherford and Mr. Robert Blair coming in their places. Having been subsequently detected in a correspondence with the royalists, Wishart was plundered of all his worldly goods, and thrown into a dungeon called the Thieves' Hole, said to have been the most nauseous part of one of the most nauseous prisons in the world—the old tolbooth of Edinburgh. Wishart himself tells us that, for his attachment to royalty and Episcopacy, he thrice suffered spoliation, imprisonment, and exile before the year 1647. In October, 1644, he was taken by the Scottish army at the surrender of New-castle, in which town he had officiated professionally. On this occasion he suffered what appears to have been his third captivity. In January, 1645, he is found petitioning the estates from the tolbooth for maintenance to himself, his wife, and five children,

¹ We here quote the animated description of Mr. Tytler.

² Keith in his *Catalogue of the Scottish Bishops* says North Leith; but this appears to be a mistake.

who otherwise, he says, must starve!¹ the petition was remitted to the committee of monies, with what result does not appear. A few months afterwards, when Montrose had swept away the whole military force of the Covenanters, and was approaching the capital in triumph, Wishart was one of a deputation of cavalier prisoners whom the terrified citizens sent to him to implore his clemency. He seems to have remained with the marquis as his chaplain during the remainder of the campaign, and to have afterwards accompanied him abroad in the same capacity. This connection suggested to him the composition of an account of the extraordinary adventures of Montrose, which was published in the original Latin at Paris in 1647. His chief object in this work, as he informs us in a modest preface, was to vindicate his patron from the aspersions which had been thrown upon him by his enemies; to clear him from the charges of cruelty and irreligion which had been brought against him by the Covenanters, and show him as the real hero which he was. Whatever might be the reputation of Montrose in Scotland, this work is said to have given it a very enviable character on the Continent. "To the memoir," says the publisher of the English translation of 1756, "may be in a great measure ascribed that regard and notice which was had of Montrose, not only in France, where the proscribed queen then held her thin-attended court, and where it was first published, but likewise in Germany and most of the northern courts of Europe, which he soon after visited. That peculiar elegance of expression and animated description with which it abounds, soon attracted the regard of the world, and in a few years carried it through several impressions both in France and Holland."

Proportioned to the estimation in which the work was held by the persecuting party, was the detestation with which it was regarded by the Scottish Covenanters. Those daring and brilliant exploits which formed the subject of its panegyric could never be contemplated by the sufferers in any other light than as inhuman massacres of the Lord's people; and he whom Cardinal de Retz likened to the heroes of Plutarch, was spoken of in his own country in no other terms than as "that bloody and excommunicate traitor." An appropriate opportunity of showing their abhorrence of the book was presented within a very few years after its publication, when Montrose, having fallen into their hands, was ordered to be executed with all possible marks of odium and degradation. Over the gay dress he assumed on that occasion they hung from his neck the obnoxious volume, together with the declaration he had published on commencing his last and fatal expedition; the one hanging at the right shoulder, and the other at the left, while a cincture, crossing the back and breast, kept them at their proper places. As this ceremonial was made matter for a parliamentary decree, there can be little doubt that the Scottish Presbyterians conceived it to be a not unbecoming mode of expressing contempt for the eulogies of the biographer. Upon Montrose, however, it produced no such effect as they had calculated on. His remark, long since become a part of history, is thus given by Wishart in the sequel to his memoir: "That though it had pleased his majesty to create him a knight of the Garter, yet he did not reckon himself more honoured thereby than by the cord and the books which were now hung about his neck, and which he embraced with greater joy and pleasure than he did the golden chain and the garter itself when he first received them."

¹ Balfour's *Annals*, iii. 261.

While his work was receiving this memorable honour, the author remained at the Hague, where a body of commissioners from Scotland were endeavouring to induce the young and exiled king (Charles II.) to assume the government of that kingdom upon the terms of the covenant. To these personages Wishart, as might be supposed, was by no means an agreeable object, particularly as he happened to enjoy the royal favour. Clarendon, who was there at the time, relates the following anecdote:—"A learned and worthy Scotch divine, Dr. Wishart, being appointed to preach before the king, they [the commissioners] formally besought the king, 'that he would not suffer him to preach before him, nor to come into his presence, because he stood excommunicated by the Kirk of Scotland for having refused to take the covenant,' though it was known that the true cause of the displeasure they had against that divine, was, that they knew he was author of that excellent relation of the Lord Montrose's actions in Scotland which made those of his majesty's council full of indignation at their insolence; and his majesty himself declared his being offended by hearing the doctor preach with the more attention."

Dr. Wishart subsequently wrote a continuation of the memoirs of Montrose, bringing down his history till his death: this, however, was never published in its original form. The original book was printed oftener than once, and in various places on the Continent. A coarse translation appeared in London in 1652, under the title of *Montrose Redivivus*, &c., and was reprinted in 1720, with a translation of the second part, then for the first time given to the world. A superior translation of the whole, with a strong Jacobite preface, was published at Edinburgh by the Ruddimans in 1756, and once more in the same place, by Archibald Constable and Company, in 1819.

After the fall of Montrose, Dr. Wishart became chaplain to Elizabeth, the electress-palatine, sister of Charles I.; he accompanied that princess to England in 1660, and being recognized as one who had both done and suffered much in the cause of royalty, was selected as one of the new bishops for the kingdom of Scotland, being appointed to the see of Edinburgh. He had now, therefore, the satisfaction of returning to the scene of his former sufferings, in the most enviable character of which his profession rendered him capable. He was consecrated Bishop of Edinburgh, June 1, 1662. It is recorded of Wishart, that after the suppression of the ill-concerted rising at Pentland, he interested himself to obtain mercy for the captive insurgents; and remembering his own distresses in the prison which they now occupied, never sat down to a meal till he had sent off the first dish to these unfortunate men. From these anecdotes it may be inferred that whatever were the faults of his character, he possessed a humane disposition. Bishop Wishart died in 1671, when his remains were interred in the Abbey Church of Holyrood, where a handsome monument, bearing an elaborate panegyric inscription in Latin to his memory, may yet be seen.

Bishop Keith says of Wishart that he was "a person of great religion." Wodrow speaks of him as a man who could not refrain from profane swearing, even on the public street, and as a known drunkard. "He published somewhat in divinity," says the historian, "but then I find it remarked by a very good hand, his lascivious poems, compared with which the most luscious parts of Ovid *De Arte Amandi* are modest, gave scandal to all the world." It is not unlikely that Dr. Wishart had contracted some rather loose habits among the cavaliers with whom he

associated abroad; for both Burnet and Kirkton bear testimony to the licentious manners by which the royalists were too often characterized, more especially during the reckless administration of the Earl of Middleton.

WITHERSPOON, JOHN, D.D., LL.D., an eminent divine and theological writer, was born February 5, 1722, in the parish of Yester. His father, who was minister of that parish, was a man of singular worth, and of much more than ordinary abilities. Young Witherspoon received the earlier part of his education at the public school of Haddington, where he distinguished himself by his diligence, and by the rapid proficiency he made in classical attainments. He was also, even at this early period of his life, remarkable for that soundness of judgment and readiness of conception which aided so much in procuring him the favour he afterwards enjoyed. On completing the usual initiatory learning observed at the school of Haddington, he was removed to the university of Edinburgh, where he continued to attend the various classes necessary to qualify him for the sacred profession for which he was intended, until he had attained his twenty-first year, when he was licensed to preach the gospel. He was soon after this invited to become assistant and successor to his father; but held this appointment for a very short time only, having received a presentation in 1744, from the Earl of Eglinton, to the parish of Beith, of which he was ordained minister, with the unanimous consent of the people, in the following year.

An incident in the life of Mr. Witherspoon, too curious to be passed over, occurred soon after this. On learning that a battle was likely to take place at Falkirk, between the Highlanders and royal troops, during the rebellion of 1745-6, the minister of Beith hastened to the anticipated scene of conflict to witness the combat. This he saw; but in a general sweep which the victorious rebels made around the skirts of the field after the battle, Mr. Witherspoon, with several others whom a similar curiosity had brought to the neighbourhood of the field, was made a prisoner and thrown into the castle of Doune, where he was confined until he effected his escape, which he did with considerable difficulty, and not without great peril.

Mr. Witherspoon first assumed the character of an author in 1753, by bringing out an anonymous publication, entitled *Ecclesiastical Characteristics, or the Arcana of Church Policy*. This work, which discovers a rich vein of delicate satire, was directed against certain flaws in the principles and practice of some of the ministers of the Church of Scotland of the period. It excited a great sensation, and became so popular as to reach a fifth edition in less than ten years after its publication. This successful debut was followed soon after by another able performance, entitled *A Serious Apology for the Characteristics*, in which Dr. Witherspoon acknowledged the authorship of the latter. Three years afterwards, in 1756, he published at Glasgow his admirable essay on the *Connection between the Doctrine of Justification by the Imputed Righteousness of Christ and Holiness of Life*.

The diligence, industry, and regular habits of Dr. Witherspoon enabled him to reconcile the character of a prolific author with that of an attentive and faithful pastor; and while discharging the duties of the latter with an exemplary fidelity, he continued to instruct and enlighten the public mind by his literary labours. His industry enabled him to give to the world in the year following that in which his essay

on the *Connection* appeared, his still more celebrated work, entitled *A Serious Inquiry into the Nature and Effects of the Stage*. On this subject there is much difference of opinion; but there can be none regarding the ability which Dr. Witherspoon's work evinces. The reputation which he had now acquired as a zealous minister and profound theologian procured him one of those spontaneous calls which so strikingly mark the public sense of a clergyman's usefulness and merits. In the year 1757 he was solicited by the people of Paisley to accept the pastoral charge of the Low Church of that town. Here, as at Beith, he diligently prosecuted his literary labours, and still continued to associate them with a faithful discharge of his pastoral duties. During a portion of the time of his ministry in Paisley, he employed himself in preparing sermons for the press, several of which were published in 1758 and 1759, and were received with marked approbation. His next publication, unfortunately, though written with the best intentions, and well calculated to attain the ends proposed by its author, involved him in difficulties which pressed hard upon him for several years afterwards. The publication alluded to was a discourse, entitled *A Seasonable Advice to Young Persons*, published in 1762. The subject of this discourse was suggested, at the particular moment it appeared, by an account which had reached Dr. Witherspoon of a riotous and extremely disorderly meeting which had taken place in Paisley on the night before the celebration of the Lord's Supper. To this discourse the author had prefixed a prefatory address, in which he incautiously set forth at full length the names of the persons said to have been concerned in the indecorous meeting alluded to; and the consequence of this unguarded proceeding on the part of Dr. Witherspoon, was an action of damages, in which, being unable to adduce sufficient proof of the accuracy of his information, he was defeated, and involved in serious expenses.

In 1764 he received a degree from one of the Scottish universities, and in the same year went to London to superintend the publication of his *Essays on Important Subjects*, in three volumes. This work, with the exception of his admirable treatise on "Regeneration," which was included in these volumes, was merely a reprint, in a collected form, of the detached essays which he had from time to time published in Scotland. Their republication, however, had the effect of greatly extending Dr. Witherspoon's fame as an able theologian and useful minister: and its appearance was soon after followed by three different calls to as many different new charges. The first of these was from a large congregation in Dublin; the second, to the Scottish church at Rotterdam; and the third, from the town of Dundee. Dr. Witherspoon's attachments in Paisley, however, were too numerous and too strong to permit of his accepting of either of these invitations. But one of a more remarkable description soon after prevailed with him to leave not only Paisley, but his country. This was an invitation from the trustees of the college of Princeton, New Jersey, in America, to become president of that institution. He at first declined this appointment, but on a second application being made to him, thought fit to comply. A sufficient proof that this compliance did not proceed from interested motives, is found in the circumstance of his having been promised by a gentleman, a relation of his own, who possessed considerable property, that he should be made his heir if he would remain at home. This promise weighed nothing, however, with Dr. Witherspoon, when put in opposition to the sense of duty

which called him to an extensive and peculiarly interesting field for ministerial exertion. Having come to the resolution of crossing the Atlantic, he preached a farewell sermon to his affectionate people in Paisley on the 16th of April, 1768. This sermon was immediately after published, under the title of *Ministerial Fidelity in declaring the Whole Counsel of God*. Before leaving his native shores he also published at Glasgow, *Discourses on Practical Subjects*; and at Edinburgh, *Practical Discourses on the Leading Truths of the Gospel*.

Dr. Witherspoon now prepared for his departure for America, and at length sailed for that country in the month of July, 1768, and arrived there in safety with his family in the following month. Immediately after his arrival he entered upon his new appointment, and began to discharge the important duties with which it was associated. The reputation of Dr. Witherspoon had gone before him; and the result to the college over which he presided, was a great and rapid increase of its prosperity. Previously to his arrival the institution, which was chiefly supported by private liberality, was in a very indifferent situation with regard to finances; these, however, were quickly placed in a flourishing condition by the spirit of liberality which the new president's abilities and zeal excited. Nor were either these or the value of his services overrated. The latter were singularly important and beneficial, not only to the college over which he presided, but to the general interests of education throughout America. At Princeton he effected a total revolution in the system of instruction practised there previously to his arrival. He greatly extended the study of mathematical science, and introduced important improvements into the course of instruction in natural philosophy. In a few years afterwards his career of usefulness was not only interrupted, but, for a time, altogether terminated, by the occurrence of the American war of independence. In this struggle he took a decided part in favour of the insurgents; and on the 17th May, 1776, preached a sermon at Princeton, on the occasion of a general fast appointed by the Congress, in which he expressed his sentiments fully on the subject of the great political questions then agitated between the mother country and the revolted colonies. This discourse was afterwards published under the title of the *Dominion of Providence over the Passions of Men*. Dr. Witherspoon's conduct on this occasion greatly displeased his friends at home; and an edition of the sermon above alluded to was published at Glasgow, with severe and abusive notes and remarks by its editor, in some of which the author was stigmatized as a rebel, and a traitor to his country. In America, however, it produced a very different feeling towards Dr. Witherspoon; and the nature of this feeling is sufficiently evinced by the circumstance of his having been, soon after, elected by the citizens of New Jersey as their delegate to the convention in which the republican constitution was formed. In this capacity he acquired, by the versatility of his talents and the soundness of his judgment, a political reputation not inferior to that which he enjoyed as a man of letters. In the early part of this year, 1776, he was sent as a representative of the people of New Jersey to the Congress of the United States, and continued for seven years an active and zealous member of that body. He was consulted on all momentous occasions; and it is known that he was the writer of many of the most important state papers of the period.

On the final settlement of the question of American independence, in the early part of the year 1783,

Dr. Witherspoon resumed his college duties, and two years afterwards paid a short visit to his native country. The object of this visit was to obtain benefactions for the college over which he presided, and which had nearly been exterminated by the war; but party feeling still ran too high in the mother country to allow of such a mission being very successful: and although the doctor made every exertion in London, and in several other parts of the kingdom, to excite an interest in and sympathy with his views, the result, on the whole, was by no means favourable. After a short stay in Paisley, during which he preached repeatedly in the Low and Middle churches, he took a final farewell of his friends, and returned to America, where he continued for several years more to maintain, and even increase, the reputation he had already acquired. The infirmities of age, however, began at length to steal upon him. Two years previous to his death he was totally deprived of sight; yet such was the activity of his mind, and the greatness of his anxiety to be useful, that even under this grievous affliction he did not desist either from the exercise of his ministry or from his duties in the college, although he had on all occasions to be led to the pulpit and rostrum. This affecting condition was but of short duration. He was released from it, and from all other afflictions, on the 15th of November, 1794, in the seventy-third year of his age.

Dr. Witherspoon's merits as an author, preacher, and philosopher, have been the theme of much and frequent eulogium by men themselves eminent for the attainments they so much admired in him; and we cannot conclude this brief memoir better than by quoting the language of one of those eulogists alluded to. "Of Dr. Witherspoon's character as an author," says Dr. Rogers, senior minister of the United Presbyterian Churches in the city of New York, "it is not necessary to say much. His writings are before the public; and to every serious and intelligent reader they discover an uncommon knowledge of human nature, and a deep and intimate acquaintance with the Holy Scriptures. They generally strike us as being at once elegant and convincing, grave and attractive, profound and plain, energetic and simple. They evidently show that the author's learning was very extensive; that God had given him a great and understanding mind, a quick apprehension, and a solid judgment. And, as a preacher, he was in many respects one of the best models on which a young orator could form himself."

WODROW, ROBERT, the faithful and laborious author of the *History of the Sufferings of the Church of Scotland*, was born in Glasgow in the year 1679. He was the second son of Mr James Wodrow, professor of divinity in the college of that city, a man of singular piety and learning. His mother, Margaret Hair, was the daughter of William Hair, the proprietor of a small estate in the parish of Kilbarchan, Renfrewshire. In this parent he was equally fortunate as in the other. To all the piety of her husband she added a degree of strength of mind not often associated with her sex.

In 1691 young Wodrow was entered a student in the university of his native city, and went through the usual course of academical education then adopted there, and which included several of the learned languages and various branches of philosophy. Theology he studied under his father, and while engaged in this pursuit was appointed librarian to the college; a situation to which the peculiar talent which he already displayed for historical and bibliographical inquiry had recommended him. This

office he held for four years; and it was during this time that he acquired the greater part of that knowledge of the ecclesiastical and literary history of his country which he applied during the course of his after-life to such good purpose, as to have the effect of associating his name, at once honourably and indissolubly, with those interesting subjects. At this period he imbibed, also, a taste for antiquarian research and the study of natural history, which introduced him to the notice and procured him the friendship of several of the most eminent men of the day. But all these pursuits were carefully kept subordinate to what he had determined to make the great and sole business of his life—the study of theology, and the practical application of its principles. To the former he devoted only his leisure hours; to the latter, all the others that were not appropriated to necessary repose.

On completing his theological studies at the university, Mr. Wodrow went to reside with a distant relation of the family, Sir John Maxwell of Nether Pollock; and while here offered himself for trials to the presbytery of Paisley, by whom he was licensed to preach the gospel in March, 1703. On the 28th of October following he was ordained minister of the parish of Eastwood, near Glasgow, through the influence of the family with which he resided. Eastwood was at that period one of the smallest parishes in Scotland; but it was just such a one as suited Mr. Wodrow: for its clerical duties being comparatively light, he was enabled to devote a portion of his time to his favourite studies in history and antiquities without neglecting the obligations which his sacred office imposed upon him; and of this circumstance he appreciated the value so highly that he could never be induced, though frequently invited, to accept any other charge. Glasgow, in 1712, made the attempt in vain to withdraw him from his obscure but beloved retreat, and to secure his pastoral services for the city; and Stirling, in 1717, and again in 1726, made similar attempts, but with similar success. The sacrifices which he made, however, by rejecting these overtures, were amply compensated by the affectionate attachment of his little flock, who rejoiced in his ministry, and were made happy by the amiableness of his manners and the kindness of his disposition. Although the charge in which he was placed was an obscure one, Mr. Wodrow's talents soon made it sufficiently conspicuous. The eloquence of his sermons, the energy and felicity of the language in which they were composed, and the solemn and impressive manner in which they were delivered, quickly spread his fame as a preacher, and placed him at the head of his brethren in the west of Scotland.

The popularity and reputation of Mr. Wodrow naturally procured for him a prominent place in the ecclesiastical courts which he attended; and in this attendance, whether on presbyteries, synods, or the General Assembly, he was remarkable for his punctuality. Of the latter he was frequently chosen a member; and on occasions of public interest was often still more intimately associated with the proceedings of the church, by being nominated to committees. In all these instances he took a lively interest in the matters under discussion, and was in the habit of keeping regular notes of all that passed; a practice which enabled him to leave a mass of manuscript records behind him, containing with other curious matter the most authentic and interesting details of the proceedings of the Scottish ecclesiastical courts of his time now in existence.

In 1707 Mr. Wodrow was appointed a member of a committee of presbytery to consult with the brethren

of the commission in Edinburgh as to the best means of averting the evils with which it was supposed the union would visit the church and people of Scotland; and on the accession of George I. he was the principal adviser of the five clergymen deputed by the Assembly to proceed to London to plead the rights of the former, and to solicit the abolition of the law of patronage, of which he was a decided enemy. In this the deputation did not succeed. The law was continued in force, and Mr. Wodrow, with that sense of propriety which pervaded all his sentiments and actions, inculcated a submission to its decisions. He did not deem it becoming the character of a Christian minister to be in any way accessory to acts of insubordination or of resistance to the laws of his country by irregular and unconstitutional means. The same feeling of propriety induced him to continue on friendly terms with those clergymen whose consciences permitted them to take the abjuration oath, although he in his own case resisted its imposition. But so far from taking offence at those who did, he exerted all his influence to reconcile the people to them, and to induce them to believe that compliance was no proof of apostasy.

Mr. Wodrow's life presents us with little more of particular interest than what is contained in the circumstances just narrated, until it becomes associated with that work which has made his name so memorable, namely, the *History of the Sufferings of the Church of Scotland from the Restoration to the Revolution*. This work, for which his integrity, candour, liberality of sentiment, and talents eminently qualified him, he contemplated from an early period of his life; but it was only in the year 1707 that he began seriously to labour on it. From this time, however, till its publication in 1721 and 1722, a period of between fourteen and fifteen years, he devoted all his leisure hours to its composition.

On the appearance of Mr. Wodrow's *History*, which was published in three large folio volumes at separate times in the years above named, its author was attacked by those whom his fidelity as a historian had offended with the vilest scurrility and abuse. Anonymous and threatening letters were sent to him, and every description of indignity was attempted to be thrown on both his person and his work. The faithful, liberal, and impartial character of the history nevertheless procured its author many and powerful friends. Its merits were by a large party appreciated and acknowledged, and every man whose love of truth was stronger than his prejudices awarded it the meed of his applause. Copies of the work were presented by Dr. Fraser to their majesties and the Prince and Princess of Wales, and were received so graciously, and so much approved of, that the presentation was almost immediately followed by a royal order on the Scottish exchequer for 100 guineas to be paid to the author, as a testimony of his majesty's favourable opinion of his merits. The warrant for the payment of this sum is dated the 26th April, 1725. In 1830 a second edition of the *History* was published in 4 volumes 8vo by Messrs. Blackie and Fullarton, of Glasgow, under the editorial care of the Rev. Dr. Burns of Paisley, afterwards of Toronto, Canada.

Mr. Wodrow's literary labours did not end with the publication of his *History*. He afterwards planned and executed the scheme of a complete history of the Church of Scotland, in a series of lives of all the eminent men who appeared from the beginning of the Reformation down to the period at which his preceding work commenced. This valuable production, which contains an accurate and comprehensive

view of some of the most important and interesting events in the history of the kingdom, has never yet been entirely published. It lies still in manuscript in the library of the university of Glasgow.

Besides these works Mr. Wodrow has left behind him six small but closely written volumes of traditionary and other memoranda regarding the lives and labours of remarkable ministers, and comprising all the occurrences of the period which he thought worth recording. These volumes are designated by the general name of *Analecta*, and the entries extend over a space of twenty-seven years, viz. from 1705 to 1732. The *Analecta* contains much curious information regarding the times of its author, and is full of anecdote and amusing and interesting notices of the remarkable persons of the day. It is preserved in the original manuscript in the Advocates' Library at Edinburgh, where it is often consulted by the curious inquirer into the times to which it relates; so often indeed, that the greater part of it has found its way to the public, though in a disguised and unacknowledged shape, through the medium of various publications in which its matter has been wrought up with other materials.

A large portion of Mr. Wodrow's time, all of which was laboriously and usefully employed in the discharge of his various duties, was occupied in an extensive epistolary correspondence with acquaintances and friends in different parts of the world, but this was no idle correspondence. He made it in all cases subservient to the purposes of improving his general knowledge, and of adding to his stores of information; and with this view he was in the habit of transmitting to his correspondents lists of queries on subjects of general and public interest, and particularly on matters connected with religion, as they stood in their several localities. With all this labour he regularly devoted two days in every week to his preparation for the pulpit, and bestowed besides the most assiduous attention on all the other duties of his parish.

In the case of Professor Simpson, of Glasgow, the successor of Mr. Wodrow's father, who was suspended from his office by the General Assembly for his Arian sentiments, Mr. Wodrow felt himself called upon, as a minister of the gospel and a friend to evangelical truth, to take an active part with his brethren against the professor. The latter, as already said, was suspended, but through a feeling of compassion the emoluments of his office were reserved to him; a kindness for which it is not improbable he may have been indebted, at least in some measure, to the benevolent and amiable disposition of the subject of this memoir. Soon after this occurrence Mr. Wodrow took occasion, when preaching on the days of the 10th and 11th June, 1727, in the Barony Church of Glasgow, to illustrate the divinity of the Saviour in opposition to the sentiments of the Arians and Socinians. These sermons had the effect of rousing the religious zeal of one of the former sect, a Mr. William Paul, a student of theology, to such a pitch as to induce him on the day following to challenge Mr. Wodrow to a public or private disputation or to a written controversy. This challenge, however, the latter did not think it prudent to accept.

In the affair of the celebrated "Marrow Controversy," which opened the way to the Secession in 1733, Mr. Wodrow decided and acted with his usual prudence, propriety, and liberality. He thought that those who approved of the sentiments and doctrines contained in the work from which the controversy took its name, viz. the *Marrow of Modern Divinity*, went too far in their attempts to vindicate them, and that the Assembly on the other hand had

been too active and too forward in their condemnation. On the great question about "subscription to articles of faith," he took a more decided part, and ever looked upon the non-subscribers as enemies to the cause of evangelical Christianity.

On this subject he corresponded largely with various intelligent and some eminent men in different parts of the three kingdoms, especially in Ireland, from whom he collected a mass of opinion and information regarding Presbyterianism in that country, which for interest and importance cannot be equalled.

The valuable and laborious life of the author of the *History of the Sufferings of the Church of Scotland* was now however drawing to a close. His constitution had been naturally good, and during the earlier part of his life he had enjoyed uninterrupted health; but the severity of his studious habits at length began to bear him down. He was first seriously affected in 1726, and from this period continued gradually to decline till 1734, an interval of pain and suffering of no less than eight years, when he expired on the 21st March, in the 55th year of his age; dying, as he had lived, in the faith of the gospel and love to all mankind. His remains were interred in the churchyard of Eastwood, where his memory has been commemorated by the erection of a monument.

Mr. Wodrow was married in the end of the year 1708 to Margaret Warner, grand-daughter of William Guthrie of Fenwick, author of the *Trial of a Saving Interest in Christ*, and daughter of the Rev. Patrick Warner of Ardeer, Ayrshire, and minister of Irvine. He left at his death four sons and five daughters. The eldest of the former succeeded his father in the parish of Eastwood, but was compelled to retire from it by an infirm state of health.

WOOD, SIR ANDREW, admiral to James III. and James IV. While the war between England and Scotland was at the fiercest, both countries seem to have been unconscious of the particular arm in which the secret of their great strength lay. Hence their vessels were entirely fitted, not for war but merchandise, and their battles at sea were nothing more than paltry skirmishes which occurred when two ships crossed each other's track, instead of the wholesale encounter of opposing fleets; while the only naval tactics of the time was for the strongest to board and the weakest to run away. But between two such nations this state of things could not always continue; and when they found that they could not only defend themselves, but annoy each other as effectually by sea as by land, ships became stronger and better manned, and the art of working and fighting them more perfect. It was full time, indeed, that it should be so, when the continental nations were immeasurably our superiors in navigation, and when an "Invincible Armada" might at any time be landed upon the shores of England or Scotland, not for the conquest of one or other of the rival countries, but the island at large. Fortunately, therefore, it happened that, coeval with the opening of India to Portugal, and the discovery of America by Spain, the Scots and English were making such improvements in nautical science as were ultimately to fit them for being the first of maritime powers. This, indeed, was a prospect as yet too remote to occur to them, and therefore the prevailing motive was a merely immediate advantage—the power of inflicting on each other the greatest amount of mischief, and having a Bannockburn or Chevy Chase on sea as well as land. Into this new contention the Scots pressed with their wonted ardour, and so successfully, that towards the end of the 15th century it seemed as if they, and not their more wealthy neigh-

bours, were to possess the ocean-flag of the island. This superiority they owed to the two Bartons, and especially to Sir Andrew Wood of Largo.

Until this brave admiral emerged into public notice, the name of Wood had acquired no place in Scottish history, so that we are unable to determine the family from which he sprung. Abercromby, in his *Martial Achievements of the Scots Nation*, supposes him to have been a cadet of the ancient family of Bonington, in Angus. Even of the early life and exploits of Sir Andrew Wood nothing can be ascertained, owing to the scantiness of our Scottish historical records of this period. It is commonly asserted that he was born about the middle of the 15th century, at the old kirk-town of Largo, in Fifeshire. He appears to have commenced life as a trader; and as he was captain, supercargo, and ship-owner in his own ventures, like many of the chief merchants of the day, he was obliged to fight his way from port to port, and combine the daring courage of a bold privateer, and the science of a skillful navigator, with the gentle craft of a trafficker and bargain-maker. His chief place of residence when on shore was Leith, at that time rising in consequence as one of the principal ports of Scotland; and there his growing wealth as a merchant, and renown as a skipper, gradually raised him to consideration among the high-born and powerful of the country. He was now the possessor of two ships, called the *Flower* and the *Yellow Caravel*, each of about 300 tons burden, but superior to most vessels of their size, in men, arms, and sailing equipments, with which he traded to the Dutch and Hanse towns, then the chief commercial marts of Scotland. As he had soon riches enough, his mind aspired to higher objects, and fortunately he served a king by whom his claims could be appreciated. James III. granted to him, as his pilot, a lease of the lands of Largo, on the tenure of keeping his ship the *Yellow Caravel* in repair, for conveying his highness and the queen to the Isle of May when they should make a pilgrimage thither; afterwards these lands and the town of Largo were granted to him hereditarily and in fee, in consideration of his public services, and especially his defence of the royal castle of Dumbarton, when it was besieged by the English navy. This grant, which was made to Wood by James III. in 1483, was afterwards confirmed by James IV. in 1488 and 1497. Soon after the first of these dates, and before 1488, he received the honour of knighthood, and married Elizabeth Lundie, a lady belonging to an ancient family of Fifeshire, by whom he had several sons. He was now a feudal baron who could ride to a national muster with a train of armed followers at his back; a redoubted admiral, whose ships had cleared the seas of every foe that had opposed them; a skillful financier and wise counsellor, in consequence of his past habits and experience; and in every way a man whom nobles would respect and kings delight to honour. From this period he abandoned trading and devoted himself to those great public interests in which his rank as well as talents required him to take a part.

Events soon occurred that conferred upon the admiral a species of distinction which he was far from coveting. A rebellion headed by some of the principal nobles of the kingdom broke out, and James III., one of the most pacific of sovereigns, found himself dragged into the field, and compelled to fight for crown and life against his own subjects. On this occasion Sir Andrew Wood received the king on board one of his vessels lying in Leith Roads, and crossed to the coast of Fife, where his ships lay at anchor. The previous destination of the fleet was

Flanders; and on hoisting sail the report was spread abroad that James was escaping to the Netherlands. Enraged at this the rebels seized his baggage and furniture, which were on their way to be shipped at the Forth, and committed great outrage upon the persons and property of the sovereign's best adherents. But no such flight was contemplated, for the king landed in Fife, and summoned a military muster of his subjects, after which he joined the northern lords who adhered to his cause, and prepared for battle. He was now at the head of such an imposing force that the rebels were daunted, and after a trifling skirmish at Blackness they proposed peace, which was granted to them on terms more favourable than they had merited. This, however, was the more necessary on the part of the king, as the insurgent lords had taken his eldest son, the Duke of Rothesay, now scarcely seventeen years old, from under the care of his guardians and placed him at their head, under the title of James IV. After this pacification the king rewarded the most trusty of his adherents with fresh grants of crown-lands, and among those whose loyal services were thus required, was Sir Andrew Wood of Largo.

But this return of tranquillity was a short and treacherous interval, for James III. had scarcely settled down to his wonted pursuits of poetry, music, and the fine arts—pursuits better fitted for a sovereign of the 19th century than one of the 15th—than the insurgent lords mustered in greater force than ever, while the royal army had dispersed to their homes. Until his troops could be assembled, James repaired to Stirling Castle for refuge, but was there denied entrance, and obliged to abide the issue with such an army as could be mustered upon a hasty summons. During the interval Wood was cruising in the Forth with the *Flower* and *Yellow Caravel*, while the contending forces were mustering near Stirling—landing occasionally with his brother and armed followers, to aid the royal party should the battle be fought in the neighbourhood, but still keeping near his shipping, to hold the command of the sea, and be ready to receive his master in the event of a reverse. The affair was soon decided by the battle of Sauchieburn, in which the forces of James were defeated, and himself foully assassinated while fleeing from the field. The deed was done so secretly, that both friends and enemies supposed he was still alive, and had taken shelter in the *Yellow Caravel*, a supposition strengthened by the fact that boats had been employed all day in conveying wounded men from the shore to the vessels. The victorious insurgents, who had now reached Leith, and were aware of Wood's fidelity to his master, resolved to remove the king from his keeping; and accordingly, in the first instance, they sent messengers to inquire if James was in his ship. He replied that he was not, and gave them leave to search it if they were still unconvinced. Not satisfied, however, with the assurance, the insurgent lords, now masters of Scotland, sent him an order to appear before their council, and there state fully how matters stood; but this he boldly refused to do, without receiving sufficient pledges for his safe return. Powerful though they were, he was upon his own element, where he could annoy them or escape from them at pleasure. Aware of this, they were obliged to give hostages in the persons of Lords Fleming and Seton, that he should come and return unharmed. The lords being safely housed in his cabin, Sir Andrew landed from his barge at Leith, and presented himself before the council. On his entrance an affecting incident occurred. Young James IV., who had seen so little of his murdered parent that he had grown up ignorant of his person, and now beheld a

stately, noble-looking man, clothed in rich armour, enter the hall, went up to him and said, "Sir, are you my father?" "Sir, I am not your father," replied the admiral, while tears fell fast from his eyes at the question; "but I was a servant to your father, and shall be to his authority till I die, and enemy to those who were the occasion of his down-putting."

The dialogue that occurred between him and the lords, after this affecting incident, was brief and stern. They asked if he knew of the king or where he was, to which he answered, that he neither knew of his highness, nor where he was at present. They then demanded who those persons were who had retired from the field, and been conveyed to his ships; to which he answered, "It was I and my brother, who were ready to have spent our lives with the king in his defence." "He is not then in your ships?" they rejoined; to which he answered boldly, "He is not in my ships, but would to God that he were in my ships in safety; I should then defend him, and keep him scathless from all the treasonable creatures who have murdered him, for I hope to see the day when they shall be hanged and drawn for their demerits." These were hard words to digest, and when we remember the names of those proud magnates of whom the council was composed, and how unscrupulous they were in dealing with their enemies or resenting an affront, we can the better appreciate the boldness of the man who, though alone, thus rebuked and denounced them. They writhed under his bitter words, but dared not resent them, for they knew that their brethren Fleming and Seton were in the *Yellow Caravel*, and that the good ship had ropes and yard-arms. They dismissed him, therefore, in safety, and it was well that they did so; for when the lords who were in pledge returned, it was in great dismay, for the sailors had become impatient at the detention of their commander, and were fully prepared to hang them if his stay on shore had been continued much longer.

In this way the brave Wood had bearded a whole troop of lions in their den, and retired with impunity; but still they were determined that he should not escape unpunished. He might be denounced as a public enemy, and assailed with the same power that had sufficed to crush the king. It was dangerous, too, that such a man should go at large, and repeat among others those threats which he had thrown in their own teeth. Accordingly, with the new sovereign James IV. at their head, they applied to the skippers of Leith, desiring them to proceed against Wood and apprehend him, offering to furnish them with sufficient ships, weapons, and artillery for the purpose; but one of their number, Captain Barton—probably one of those bold Bortons who, like Wood himself, were famed at this time for exploits of naval daring—declared that there were not ten ships in Scotland that could give battle to the admiral with the *Flower* and *Yellow Caravel* alone, so high was his skill, and so completely seconded with good artillery and practised seamen. Reluctantly, therefore, they were obliged to remit their designs of vengeance, and pass on to the subject of the young king's coronation. Wood also turned his attention to his own affairs, the chief of which was a quarrel with the good citizens of Aberdeen towards the close of 1488, concerning the forest of Suckett and the Castle Hill of Aberdeen, which, he alleged, had been granted to him by James III. On this occasion the Aberdonians denied his claim, and stood to their defence, which might have been followed by a cannonade, had not the privy-council interfered between the angry admiral and the equally incensed citizens.

It was then found that the property in question had been granted to the city in perpetuity by Robert Bruce, upon which Wood abandoned his claim.

All this was but sorry practice, however accordant with the spirit of the age, and the high talents of Wood were soon employed in a more patriotic sphere of action. James IV., one of whose earliest proceedings was to distinguish between his selfish partisans that had made him king for their own purposes and those who had generously espoused the cause of his unfortunate father, received the latter into favour; and among these was the ocean hero, with whose first appearance he had been so mournfully impressed. Having himself a high genius for naval architecture, and an earnest desire to create a national navy, he found in Wood an able teacher, and the studies both of sovereign and admiral, for the building of ships that should effectually guard the coasts of Scotland and promote its commerce, were both close and frequent. An event soon occurred to call their deliberations into action. About the commencement or earlier part of the year 1489 a fleet of five English ships entered the Clyde, where they wrought great havoc, and chased one of the king's ships, to the serious damage of its rigging and tackle. As this deed was committed during a season of truce, the actors were denounced as pirates; and James, who felt his own honour sensibly touched in the affair, commissioned Sir Andrew to pursue the culprits, after he had proposed it to the other naval captains, but in vain. The knight of Largo undertook the enterprise, and set off in his favourite vessels, the *Flower* and *Caravel*, in quest of these dangerous marauders. He fell in with the five English ships off Dunbar Castle, and a desperate conflict commenced. But though the English were so superior in force, and fought with their wonted hardihood, the greater skill, courage, and seamanship of Wood prevailed, so that all their ships, with the captains and crews, were brought into Leith and presented to the king.

This event was most unwelcome to Henry VII. of England, and all the more especially that on account of the truce he could not openly resent it. Still the flag of England had been soiled, and something must be done to purify it. He therefore caused it to be announced underhand, that nothing would please him so much as the defeat or capture of Wood, and that whoever accomplished it should have a pension of £1000 a year. This was a tempting offer, considering the value of money at that period; but such at the same time was the renown of the Scottish captain, that the boldest of the mariners of England shrunk from the enterprise. At length Stephen Bull, a venturesome merchant and gallant seaman of the port of London, offered himself for the deed, and was furnished with three tall ships for the purpose, manned with numerous crews of picked mariners, besides pikemen and cross-bows and a gallant body of knights, who threw themselves into this daring adventure as volunteers. Bull directed his course towards the Frith of Forth, and cast anchor behind the Isle of May, where he lay in wait for the Scottish admiral, who had gone as convoy of some merchant ships to Flanders, and was now on his return home; and to avoid the chances of mistake, the Englishman seized some fishing-boats and retained their owners, that they might point out to him the expected ships as soon as they came in sight. In the meantime Sir Andrew was sailing merrily homeward, little anticipating the entertainment prepared for him (for the truce with England still continued), and had already doubled St. Abb's Head. No sooner did he appear in sight than Stephen Bull

ordered his prisoners to the mast-head, to ascertain if these ships were the *Flower* and *Yellow Caravel*; and on their hesitating to answer he promised to set them free should these be the ships in question. On learning that his expected prey was within reach he prepared for battle with great glee, being confident of victory. He caused a cask of wine to be broached, and flagons handed among the crews; drank to his captains and skippers, bidding them be of good cheer for their enemy was at hand, and ordered the gunners to their posts. In this trim he weighed anchor, and bore down with hostile signal upon the Scots. It was well on this occasion that Wood possessed one of the best attributes of a good sailor—that he was not to be caught napping. Unexpected though this breach of the truce was, his ships were kept in such admirable order that a few minutes of preparation sufficed. "My merry men," he said, "be stout against these your enemies, who have sworn and avowed to make you prisoners to the King of England, but who, please God, shall fail of their purpose. Therefore set yourselves in order every man at his own station, and let your guns and cross-bows be ready. But above all, use the fire-balls well from the main-tops, keep the decks with your two-handed swords, and let every good fellow here think of the welfare of the realm and his own honour. For mine own part, with God to help, I shall show you a good example." He then distributed wine among the sailors, who blithely pledged each other and stood to their weapons prepared for immediate action.

And now commenced an engagement such as, taking the numbers of the combatants into account, the ocean had seldom as yet witnessed; it was a fearful meeting, where skill and undaunted courage, and the determination to do or die, were animated both by professional rivalry and national hatred. The battle was commenced on the part of the English by a distant cannonade, but the Scottish vessels being smaller in size, the shot passed above their decks without doing mischief. In the meantime Wood, who had got to windward of his adversary, bore down upon him under a full press of sail, closed upon him, threw out his grappling-irons, and even lashed the ships together with strong cables, that all might be settled by a hand-to-hand encounter. The battle, that commenced at sunrise, continued during the whole of a summer day with such desperate determination that nothing but the darkness of night parted them, when they separated on equal terms, and lay-to, waiting for the morning to renew the combat. The morning came, the trumpets sounded, the ships again grappled with the pertinacity of bull-dogs, and the fight became so keen that the vessels, left to their own management, drifted into the mouth of the Tay, while the crews were engaged in close struggle upon the deck. Roused also by the din, the inhabitants, men, women, and children, crowded to the shore, and cheered their countrymen by their shouts and gesticulations. "Britannia rule the waves!"—yes, when these rival flags shall be blended together, and these gallant combatants be fighting side by side! At length the superior skill of Wood and the practised seamanship of his crews prevailed over equal courage and far superior numbers; the three English vessels were compelled to strike, and were carried into the port of Dundee, while Sir Andrew brought his gallant antagonist to the king as prisoner. James IV., who was one of the last of the flowers of chivalry, received Stephen Bull and his followers with courtesy, enriched them with princely gifts, and after praising their valour set them at liberty, and sent them home in their own ships without ransom. He

also desired them to tell their royal master that he had as manly men in Scotland as there were in England, and was fully able as well as determined to defend his own coasts and merchantmen. The significant hint was added, that if they came again to Scotland in such hostile fashion, they would neither be so well entertained, nor be allowed to skip homeward so dry-shod. This at least the prisoners averred when they had reached London in safety. Henry VII., whatever might be his private feelings, expressed his gratitude for the kindness of the Scottish king. While enemies were thus rewarded, Sir Andrew was not forgot, for he was guerdoned with fresh grants of lands, and received into greater favour than ever.

Sir Andrew Wood, now incontestably the greatest naval hero of his age, had done enough for fame, and no further exploits like those off Dunbar or St. Abb's Head remained to be achieved. In 1503 he was employed against the turbulent chiefs of the isles, who were always breaking into rebellion, and was so successful that the inhabitants were reduced to submission wherever his ships appeared. Afterwards we find him captain of that enormous pageant ship the *Great Michael*, with Robert Barton as his lieutenant. This vessel, upon which not only the greater part of the timber but also of the wealth of Scotland had been expended, was found, when finished, to be as useless as Robinson Crusoe's boat, on which he had bestowed such labour, and made it so large that he could neither navigate nor even launch it. With all this expenditure upon eight or ten good ships, and these two heroes to command them, Scotland might have sent out such a fleet as no naval power in Europe could have equalled. We suspect that even Wood, in bringing such a ship into action, would have been as much encumbered as David was when he was equipped in the armour of Saul. Fortunately no opportunity occurred for such a hazardous trial, as the *Great Michael* was afterwards wrecked on the French coast, and suffered to rot in the harbour of Brest, after it had been carried off to sea under a different commander. After the disastrous battle of Flodden Sir Andrew again appears in the character of ambassador at the court of France, whither he was sent to invite the Duke of Albany, nephew of James III., to assume the regency of Scotland. In 1526 he was present at the battle of Linlithgow Bridge, one of those feudal conflicts that were so frequent during the minority of James V.; and so late as 1538 he was still alive, as appears from a deed of remission of that date. By this time he must have been a very aged man, and perhaps the perplexed witness of those striking events by which the reformation of religion in Scotland was heralded, and a new world introduced. But during his retirement from active life his affection for the sea appears to have clung to him like a first love, and he evinced it by causing a canal to be made from his castle to the kirk of Upper Largo, on which he was rowed in a barge every Sunday by his old boat's crew, when he went to the church to attend mass. The year of his death is uncertain, as no record can be found of it. He was buried in Largo kirk, where his family tomb still arrests the eye of the historian and antiquary.

WOODHOUSELEE, LORD. See TYTLER (ALEXANDER FRASER).

WYNTOWN, ANDREW, or Andrew of Wyltown, the venerable rhyming chronicler of Scotland, lived towards the end of the fourteenth century; but the dates of his birth and death are unknown. He was a canon regular of the priory of St. Andrews, the most flourishing and important religious estab-

lishment in the kingdom; and in or before the year 1395 he was elected prior of St. Serf's Inch, in Lochleven.¹ Of this he himself gives an account in his *Cronykil*:—

"Of my defeutte it is my name
Be baptisme, Andrew of Wyntowne,
Of Sanct Andrews, a chanounne
Regulare: but, noucht forði
Of thaim al the lest worthy.
Bot of thair grace and thair favoure
I wes, but² meryt, made prioure.
Of the ync within Lochlevyne."

Innes mentions "several authentic acts or public instruments of Wyntown, as prior from 1395 till 1413, in *Extracts from the Register of the Priory of St. Andrews*," which points out part of the period of his priorship; and as the death of Robert Duke of Albany is noticed in the *Cronykil*, Wyntown must have survived till beyond 1420, the year in which the duke died. Supposing, as is probable, that he brought down his narrative of events to the latest period of his life, we may conjecture his death to have occurred not long after the above date.

It was at the request of "Schyr Jhone of the Wemyss," ancestor of the Earls of Wemyss,³ that Wyntown undertook his *Chronicle*;⁴ which although the first historical record of Scotland in our own language, was suffered to lie neglected for several centuries. In 1795 Mr. David Macpherson laid before the public an admirable edition of that part of it which more particularly relates to Scotland, accompanied with a series of valuable annotations. Like most other old chroniclers, Wyntown in his history goes as far back as the creation, and takes a general view of the world before entering upon the proper business of his undertaking. He treats of angels, of the generations of Cain and Seth, of the primeval race of giants, of the confusion of tongues, of the situation of India, Egypt, Africa, and Europe, and of other equally recondite subjects, before he adventures upon the history of Scotland; so that five of the nine books into which his *Chronicle* is divided are taken up with matter which, however edifying and instructive at the time, is of no service to the modern historical inquirer. Mr. Macpherson, therefore, in his edition has suppressed all the extraneous and foreign appendages, only preserving the metrical contents of the chapters, by which the reader may know the nature of what is withheld; and taking care that nothing which relates to the British islands, whether true or fabulous, is overlooked. It is not likely that any future editor of Wyntown will adopt a different plan; so that those parts which Mr. Macpherson has omitted may be considered as having commenced the undisturbed sleep of oblivion.

Though Wyntown was contemporary with Fordun, and even survived him, it is certain that he never saw Fordun's work; so that he has an equal claim with that writer to the title of *an original historian of Scotland*; and his *Cronykil* has the advantage over Fordun's history, both in that it is brought down to a later period, and is written in the language of the country—

"Tyl ilke mannys wnderstandyng."

"In Wyntown's *Chronicle*," says Mr. Macpherson,

¹ St. Serf is the name of a small island in that beautiful loch, not far from the island which contains the castle of Lochleven, celebrated as the prison-house of the Queen of Scots.

² But, without.

³ A younger son of this family settled in the Venetian territories about 1600; and a copy of Wyntown's work is in the possession of his descendants.

⁴ Book i. Prologue, l. 54.

"the historian may find what, for want of more ancient records which have long ago perished, we must now consider as the original accounts of many transactions, and also many events related from his own knowledge or the reports of eye-witnesses. His faithful adherence to his authorities appears from comparing his accounts with unquestionable vouchers, such as the *Federa Anglie*, and the existing remains of the 'Register of the Priory of St. Andrews,' that venerable monument of ancient Scottish history and antiquities, generally coeval with the facts recorded in it, whence he has given large extracts almost literally translated." His character as a historian is in a great measure common to the other historical writers of his age, who generally admitted into their works the absurdity of tradition along with authentic narrative, and often without any mark of discrimination, esteeming it a sufficient standard of historic fidelity to narrate nothing but what they found written by others before them. Indeed, it may be considered fortunate that they adopted this method of compilation, for through it we are presented with many genuine transcripts from ancient authorities, of which their extracts are the only existing remains. In Wyntown's work, for example, we have nearly three hundred lines of Barbour in a more genuine state than in any manuscript of Barbour's own work; and we have also preserved a little elegiac song on the death of Alexander III., which must be nearly ninety years older than Barbour's work. Of Barbour and other writers Wyntown speaks in a generous and respectful manner,⁵ and the same liberality of sentiment is displayed by him regarding the enemies of his country, whose gallantry he takes frequent occasion to praise. Considering the paucity of books in Scotland at the time, Wyntown's learning and resources were by no means contemptible. He quotes, among the ancient authors, Aristotle, Galen, Palephatus, Josephus, Cicero, Livy, Justin, Solinus, and Valerius Maximus, and also mentions Homer, Virgil, Horace, Ovid, Statius, Boethius, Dionysius, Cato, Dares, Phrygius, Origen, Augustin, Jerome, &c.

Wyntown's *Chronicle* being in rhyme, he ranks among the poets of Scotland; and he is in point of time the third of the few early ones whose works we possess, Thomas the Rhymer and Barbour being his only extant predecessors. His work is entirely composed of couplets, and these generally of eight syllables, though lines even of ten and others of six syllables frequently occur. "Perhaps," says Mr. Ellis, "the noblest modern versifier who should undertake to enumerate in metre the years of our Lord in only one century, would feel some respect for the ingenuity with which Wyntown has contrived to vary his rhymes throughout such a formidable chronological series as he ventured to encounter. His genius is certainly inferior to that of his predecessor Barbour; but at least his versification is easy, his language pure, and his style often animated."

There are various manuscripts of Wyntown's work, more or less perfect, still extant. The one in the British Museum is the oldest and the best; and after it rank in antiquity and correctness the manuscripts belonging to the Cotton Library and to the Advocates' Library at Edinburgh.

⁵ He even avows his incompetency to write equal to Barbour, as in the following lines:—

"The Stewartis originale

The Archedekyne has trettyd hal

In metre fayre mare wertusly

Than I can thynk be my study," &c.

Cronykil, l. viii. c. 7, v. 143.

Y.

YOUNG, PATRICK, known also by his Latinized name of *Patricius Junius*, a distinguished scholar of the seventeenth century, was the son of Sir Peter Young, co-preceptor with Buchanan of King James VI., and was born at Seaton in Haddingtonshire, in 1584. He was educated at the university of St. Andrews—accompanied his father in the train of James VI. to England in 1603, and was for some time domesticated with Dr. Lloyd, Bishop of Chester, as his librarian or secretary. In 1605 he was incorporated at Oxford in the degree of M.A., which he had taken at St. Andrews; and entering into deacon's orders was made one of the chaplains of All-Souls' College. There he acquired considerable proficiency in ecclesiastical history and antiquities, and became profoundly skilled in the Greek language, in which he made a practice of corresponding with his father and other learned men. He afterwards repaired to London, and by the interest of Dr. Montagu, Bishop of Bath and Wells, obtained a pension of £50 a year, and was occasionally employed by the king and some persons connected with the government, in writing Latin letters. The same interest obtained for him the office of royal librarian. In 1617 Young went to Paris with recommendatory letters from Camden, which introduced him to the learned of that capital. After his return he was engaged in the translation of the works of King James into Latin. In 1620,

having recently been married, he was presented with two rectories in Denbighshire; soon after he became a prebend of St. Paul's and the treasurer of that cathedral; and in 1624 he attained, by the influence of Bishop Williams, the office of Latin secretary. Young, whose reputation was now widely extended, was one of the learned persons chosen by Selden to aid in the examination of the Arundelian Marbles. He made a careful examination of the Alexandrian manuscript of the Bible, and communicated some various readings to Grotius, Usher, and other learned men. He also published a specimen of an edition of that manuscript which he intended to execute, but was ultimately obliged to abandon; however, in 1633, he edited from the same manuscript, the *Epistles of Clemens Romanus*; and afterwards published with a Latin version, "*Catena Græcorum Patrum in Iobum*, Collectore Niceta, Heraclie Metropolitæ." In 1638 he published, "*Expositio in Canticum Canticorum Folioti Episcopi Londinensis*, una cum Alcuini in idem Canticum Compendio." Young also made preparations for editing various other manuscripts, to which his office in the king's library gave him access, when the confusions occasioned by the civil war, and the seizure of the library by the parliament, put an end to his designs. He retired during this period to the house of his son-in-law, at Broomfield, in Essex, where he died in 1652.

SUPPLEMENT.

ARNOTT. See WALKER-ARNOTT.

BREWSTER, SIR DAVID. This venerable and revered teacher of science, who, in an age distinguished for the cultivation of physics, was one of the greatest natural philosophers of his day, was born at Jedburgh on the 11th December, 1781. His father, who was rector of the grammar-school in that town, seems to have mainly devoted his sons to the service of the church, and this also with such good effect that three of them held ministerial charges in the Church of Scotland. Of these Dr. Patrick Brewster, minister of Paisley, was an eloquent and popular preacher of the Evangelical school; and although he remained in the Established Church at the Disruption, when so many like-minded with himself had left it, he continued to cherish opinions of his own, and was a democrat in politics and a keen agitator for the "People's Charter." A second of the family, Dr. George Brewster of Scoonie, was a man of much intellectual power and great moral courage, but inert; and although characterized as the most immoderate of the church party called the Moderate, both in theology and church politics, and an absolute devotee of Tory politics in secular rule, he could shake himself loose from his trammels and apathy when questions concerning religious liberty were at stake, and express himself with energy and freedom. A third brother, Dr. James Brewster of Craig, a clergyman universally beloved, belonged to the Evangelical party, and, unlike the other two, became a minister of the Free Church at the Disruption. It will thus be seen that each of the brotherhood had a distinctive character and will of his own.

Of this Levitical family of the rector of Jedburgh academy, David, the subject of this memoir, was also intended for the church, and with that view was sent to the university of Edinburgh when only twelve years old; and during several sessions distinguished himself by his respectable, and often brilliant, performances in the tasks of the classes. He also passed through the appointed courses of the theological hall, and even took license as a preacher in the Church of Scotland, and was offered a presentation by the Duke of Roxburgh. But here he stopped short in his advance to the church, and the offer of a presentation was declined. During his studies his strong scientific tendencies, which he had evinced in boyhood when only ten years old by constructing a telescope, had assumed the predominance, and claimed him exclusively for their own. His health was also so delicate as to be judged a serious disqualification for the laborious duties of a Scottish clergyman. He therefore, after long and matured thought, resolved to devote himself to a scientific life, and the world has profited by the resolution. He was also justified in his choice by the remarkable

proficiency which he had already made in his scientific studies, in which he had enjoyed the acquaintance and aid of Professors Robison, Playfair, and Dugald Stewart. He had also taken the degree of M.A. in 1800. The commencement of his public career in this new path was that series of optical researches which have since made his name so deservedly famous. He had already so greatly benefited by his past instructions, that in maturely examining the bases of Newton's theory of light he succeeded in discovering a new and important fact in optics—that of the influence of the condition of the surfaces of bodies on the "inflection" or changes of direction of the rays of light, which had been formerly accepted as a consequence of the nature of the bodies themselves. An evidence of the value of his discoveries connected with light was soon indicated by the distinguished honours which now began to shower upon him. In 1807, when he was only twenty-six years old, he was made LL.D. by the university of Aberdeen, D.C.L. by the university of Oxford, and A.M. by that of Cambridge. In the following year he was elected a member of the Royal Society of Edinburgh, of which he afterwards filled the offices of secretary, vice-president, and president, the last of which offices he held until his death. A literary appointment intrusted to him in 1808 also showed the confidence which was reposed in his talents, for it was the editorship of the *Edinburgh Encyclopedia*, to which he added many important contributions from that date until 1830.

Although such an editorship would of itself have been sufficient for the energies of most men, Dr. Brewster's working powers enabled him to wield it as lightly as if it had been little more than a feather-weight, and during the long interval his scientific achievements were carried on apparently without interruption. In 1813 he published some of the results of his optical researches during the twelve preceding years, under the title of *A Treatise on New Philosophical Instruments*, &c. Having in 1811 turned his attention to Buffon's experiments in endeavouring to discover the nature and produce the effects of the burning mirrors of Archimedes, Dr. Brewster in the course of his researches discovered the construction of what he termed "polyzonal lenses," which might be turned to important account in British commerce. At that time lighthouses were usually fitted up with plain parabolic reflectors, which were often insufficient to pierce through the darkness of the ocean and give timely warning to the ship. Instead of these imperfect reflectors, Dr. Brewster therefore proposed the use of lenses built up of zones of glass, each of which might be composed of several circular segments, arranged concentrically round a central disc, with the effect of strengthening the light, and transmitting it to a

greater distance. His discovery, and the proposal of its use, excited much talk at the time, but unfortunately nothing more, as it fell into neglect at home, while it was adopted in France. In 1815 he was interrupted by an application from the Edinburgh town-council and Professor Playfair to take the place of the latter in delivering the course of lectures on natural philosophy. He complied; but finding that such monotonous every-day occupation interrupted him in his favourite studies, he did not long continue in this intermediate change.

After he had improved upon the experiments of Buffon in his attempts to discover the burning mirrors of Archimedes, Dr. Brewster was to turn those of Malus to a similar account. That French *savant*, in a series of experiments conducted between 1808 and 1812, having improved on the original discovery of Huygens by discovering the polarization of light by reflection, Dr. Brewster commenced an extensive series of experiments to ascertain the polarizing angle of a number of transmitting substances. The authority upon which we chiefly rely thus follows up the labours of the doctor on this head:—"He pursued the subject of polarization in all its aspects, and in all the conditions that modify it, in its relations with the nature and form of reflecting or refracting bodies, in the geometrical, mathematical, and trigonometrical relations of angles and planes according to which it takes place; he established the polarizing properties of a host of new substances; he formulated general laws, completed and rectified the discoveries made in the same region of study by Fresnel, Arago, and Biot; profited by those discoveries to make himself still further advances; and by his own discoveries gave assistance to all the researches which for a long time past have been, and for a long time to come will be, made in the same domain." While he followed out this field of discovery which he made exclusively his own, Dr. Brewster communicated the most important of its results first in 1813, and afterwards in 1815, to the Royal Society of London. The last of these was a paper on the "Polarization of Light by Reflection;" and the society elected him a fellow, and voted him their Copley medal for his discoveries and researches. In the following year (1816) he was honoured by the French Institute with half of the prize of 3000 francs awarded for the two most important discoveries made in Europe in physical science during the two preceding years.

At this time also Dr. Brewster invented the kaleidoscope. During the two previous years, while employed in his researches on the polarization of light, his attention was drawn to certain effects of multiplication produced by the use of reflecting plates of glass placed at angles with each other; but being in pursuit of a different result, he allowed the observation for the present to rest. In 1816, however, while repeating the experiments of Biot on the action of fluids on light, he made use of a trough composed of plates of glass cemented at the angles, and was surprised at the remarkable regularity of the form given by reflection to some small irregular fragments of the cement which had been forced through between the plates. Struck by this phenomenon, he repeated the experiment, first by fixing pieces of glass or other small objects of irregular outline at the ends of the reflectors, and then by making those objects movable—and the result was the invention of the kaleidoscope. Convinced of its importance in scientific investigations on the subject of reflection, as well as the inexhaustible aid which it would give to the patterns of manufactures and other arts into which design largely enters, Dr. Brewster patented the

instrument, and a number of them were made, one of which was shown to the London opticians with a view to their giving orders for it. The secret thus revealed was a secret no longer; kaleidoscopes were made by the thousand, in which scientific rule was sacrificed to cheapness, and the instrument was soon to be found not only in the hands of every man and woman, but every schoolboy. In this way the patent of Dr. Brewster was violated, the kaleidoscope degraded into a mere child's toy, and the great benefits which it was to confer on science and manufactures were never realized.

In 1818 or the following year Dr. Brewster was honoured by the Royal Society of London with their Rumford gold and silver medals. It was noticed many years afterwards, that in announcing the death of Faraday to the Royal Society of Edinburgh, he mentioned that there was one person living who had, like Faraday, taken all the medals of the Royal Society of London—the Copley, Rumford, and Royal medals. That "one," whose name he left unmentioned, was himself. In 1819 he united himself with Professor Jameson in conducting the *Edinburgh Philosophical Journal*. Ten volumes of this work having been already published, it was changed in 1824 by the two editors into the *Edinburgh Journal of Science*; and in sixteen volumes Dr. Brewster published many interesting papers. During this time he had made important investigations into the mean temperature of the earth and the determination of isothermal lines, and also made various researches in the mineral kingdom, which led to the discovery of two new fluids and their properties. In 1825 he was elected a corresponding member of the French Institute. In 1827 he renewed the subject of the improvement in lighthouse illumination, on which he had suggested improvements in 1813. He now published his *Account of a New System, &c.*, for the better illumination of lighthouses, and offered his services for that purpose to the lighthouse boards of Great Britain and Ireland. Nothing was done in the matter, however, until 1833, when his method was tested by public experiment. The places for trial were the Calton Hill, Edinburgh, and Gullane Hill, having between them a distance of twelve and a half miles; and there the superiority of his "poly-zonal lenses" was proved, for one of these with an Argand burner of four concentric circles was found to give a light equal to nine parabolic reflectors, each carrying an Argand burner. The success of these experiments was so effective that better modes were introduced into the illumination of our lighthouses over the whole United Kingdom.

The reputation of Dr. Brewster was now established wherever natural science was understood and valued, and the recognition was followed by the increase of his personal influence and public honours. In 1830 the Royal Society of London again honoured him by the award of its royal medal for the researches and discoveries by which the field of optical science had been enlarged and its resources increased. In union with Davy, Herschel, and Babbage, he originated the idea of a British Association for the promotion of science by means of annual meetings, and the first of these great intellectual parliaments, held at York in 1831, was so successful that the institution was established, and its anniversaries have since been continued without interruption, and with a constantly growing popularity. In the same year the decoration of the Guelphine order of Hanover was conferred on him, and in the following year he was knighted by King William IV. In 1833 Sir David Brewster was a candidate for the chair of natural philosophy in the university of Edinburgh, but on

this occasion the town-council of Edinburgh preferred the claims of Mr. James D. Forbes, now principal of the college of St. Andrews. It was one of the last exertions of the privilege of that corporation before the reform bill came into action, and much astonishment as well as considerable resentment was felt at the time in consequence of their preference; but this feeling Professor Forbes outlived by his brilliant scientific career. Sir David, however, was not forgot in higher quarters, for in 1838 he received from the crown the appointment of principal of the united colleges of St. Salvator and St. Leonard, St. Andrews.

Events had now commenced in the Church of Scotland which partook of the enthusiasm of the old covenanting spirit; and while the nation was stirred up into all the alacrity of early youth, those events were going on which finally terminated in the Disruption. It might have been thought that as Sir David had found his mission to be elsewhere—to be that of a teacher of religion through the medium of natural science instead of the departments of languages, ethics, and metaphysics—he might have stood aloof from the din, and investigated the light that was transmitted through his own lenses and prisms. But like all decided and strong-minded men who are qualified to advance into the front rank of their species, he was of a combative spirit; he had been a preacher before he was recognized as a philosopher; and his three brothers, all of them benefited clergymen, were in the hottest of the *mêlée*, and on different sides of the controversy. In his theological opinions he had been all along on the side of the “Evangelicals” and “Non-intrusionists;” and while he sat as an elder in the very Moderate presbytery of St. Andrews, neither the length of its speeches nor the heartiness of its symposiums were calculated to convert him from his original leanings. He therefore stoutly advocated the cause of those who were contemptuously termed “the wild men;” and when they left the Established Church he went out along with them. Here was a chance for his illiberal opponents to get rid of him, and they endeavoured to deprive him of the office of principal of the university of St. Andrews by representing that he could not hold the charge because he was a dissenter. But Sir David nevertheless continued in his position until he was raised to a still higher place. This occurred in 1859, when by the curators he was unanimously elected principal of the university of Edinburgh.

In the meantime the studies of Sir David Brewster, and the distinctions that signalized it, had been steadily going on, irrespective of those theological tempests in which so many weaker minds had sunk, or been driven from their original course. In 1849, in consequence of the death of the great chemist Berzelius, the French Institute conferred upon him the highest honour which it could bestow on any one not a Frenchman, by electing him one of its eight foreign associates. In the same year he was president of the British Association, which he had so effectually helped to create. Along with the distinctions already conferred on him, and which we have mentioned, he was a corresponding member of the Royal Societies of St. Petersburg, Berlin, Vienna, Stockholm, Copenhagen, and several other continental cities. To these scientific titles the King of Prussia added in 1847 the order of Merit, and the French emperor, Napoleon III., in 1855, the cross of the Legion of Honour. At the Great Exhibition in 1851 Sir David exhibited his ingenious adaptation of the stereoscope, that instrument now so universally known, and which in point of popularity has

equalled, if it has not surpassed, the great attractions of his famed kaleidoscope.

A mind so devoted to science and possessed of such remarkable activity would not be content with the mere satisfaction of discovery; what he had discovered he must needs communicate to others, and hence, besides being a close and laborious student, Sir David was a voluminous writer. In the *Edinburgh Encyclopedia*, the *Edinburgh Philosophical Journal*, the *Edinburgh Journal of Science*, the *Philosophical Magazine*, of which he was one of the editors, the *Edinburgh and North British Reviews*, the *Transactions of the British Association*, and the *Library of Useful Knowledge*, it would be difficult to enumerate the many valuable treatises that proceeded from his pen. In the *Transactions of the Royal Societies of Edinburgh, London, and Dublin*, and other learned bodies, many of his most valuable scientific observations and discoveries are recorded. Of the rare qualities by which Sir David was especially fitted for this kind of serial and periodical work the following statement was given by Sir J. Y. Simpson at a meeting of the Royal Society of Edinburgh:—“Professor Fraser told me to-day, what I have heard before with regard to the almost mathematical exactitude and correctness of his mental work, that in the seven years during which he (Professor Fraser) was editor of the *North British Review*, Sir David Brewster contributed an article to every number; and he had been a contributor for years before to this as to other periodicals. But the certainty of his work was more wondrous than even the amount of it. For he was in the habit of stating—as Professor Fraser informs me—not only the day when his first slip of paper would arrive, and the day when his article would be finished, but his manuscripts came as they were written—day after day, and sheet after sheet—without the aid and necessity of correcting the latter by the revision of those preceding. In these literary and scientific articles he thus worked with the methodized precision and regularity of a mechanical rather than of a mental machine.”

The separate works of Sir David Brewster were, a *Treatise on New Philosophical Instruments for Various Purposes in the Arts and Sciences*, with Experiments on Light and Colours,” 1813; a *Treatise on the Kaleidoscope*, 1819; *Notes to Robison's System of Mechanical Philosophy*, 1822; *Letters and Life of Euler*, 1823; “*Letters on Natural Magic*, dedicated to Sir Walter Scott,” 1824; a *Treatise on Optics*, 1831; *Life of Sir Isaac Newton*, 1831; “*The Martyrs of Science*, or Lives of Galileo, Tycho Brahé, and Kepler,” 1841; “*More Worlds than One*, the Creed of the Philosopher and the Hope of the Christian”—an answer to Professor Whewell's *Plurality of Worlds*, 1854; and *Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton*, founded on new documents, and correcting various accepted errors regarding the character and life of the great astronomer, 1855. He also published a translation, with notes and an introduction, of Legendre's *Geometry*.

Of his work and place in the scientific world the following comprehensive statement, given anonymously by one of his admirers who evidently understood the subject, will serve instead of a more minute detail of his discoveries. “With Sir David Brewster has perished one of the last links which visibly connected us with the great philosophers of the early part of the century. When the wonderful genius of Young had thrown a new light on the fundamental phenomena of optics, a vast field was laid open to the natural philosopher; and in this field Malus

made one brilliant discovery before his early death. His place was nobly supplied, as regards the theoretical and mathematical part of the work, by Fresnel; but it is to Brewster that we owe nearly all the most important of the concomitant experimental results. With an amount of patient labour of which few can form a conception, and with a singular experimental skill which rose superior to defects of apparatus, he examined minutely every curious fragment of transparent crystallized mineral which the collections of his numerous scientific friends contained. The tables of refractive indices and dispersive powers which he thus framed would alone, and even with improved instrumental means, represent the results of no mean labour. The same may be said of his tables of the polarizing angles of various reflecting surfaces, and of innumerable other tedious investigations, apparently gone into at first with the sole object of discovering facts, and not laws." In apologizing for his scientific errors, especially on the subject of light, the writer adds, "Liebig is reported to have said, 'Show me the man who never made a mistake and I will show you one who never made a discovery.' The mistakes or misconceptions into which Brewster fell were nearly all connected with the theoretical or mathematical part of a subject; very rarely indeed with the experimental. We may wonder that he never explicitly adopted the undulatory theory of light; let us ask, what should *we* have been inclined to do now had we listened to the teaching of such masters as Laplace and Poisson, to whom the greater part of the scientific world deferred when Brewster was in the first ardour of his career. . . . But the philosopher who first discovered the existence of biaxial crystals, the connection of the polarizing angle with the refractive index, the production of double refraction by irregular heating, and numerous other grand properties of matter—each, as it were, a heaven whose influence was widely felt, and which are even now fundamental principles in science; who explained thoroughly hosts of more simple yet paradoxical phenomena, such as the colours of mother-of-pearl; and who, besides all this, wrote not merely with the earnest exactitude of the true man of science, but sometimes with the impassioned language and verbal imagery of the poet;—such a philosopher appears but rarely, and never fails to leave his mark behind him."

It would have been strange, however, if this progress, so like a triumphal procession, had been unaccompanied by the slave behind the chariot and his dispiriting whisper; and Sir David, amidst his successes, was followed by an evil influence that often marred his satisfaction by depriving him of the reputation of many of his discoveries. The source of annoyance is thus explained by the writer from whom the foregoing passages have been quoted:—"Unfortunately, Brewster's turn of mind was not mathematical, and when he sought to discover the laws of the phenomena which were deducible from his patient measurements, he often found the second task harder than the first. Sometimes, by a species of trial and error, he succeeded brilliantly, as in his discovery (from the two series of researches we have just already mentioned) that the *index of refraction of a substance is the tangent of its polarizing angle*. More often the mere mathematician stepped in, took the toilsome, elaborated facts, and from them in a few minutes deduced (sometimes taking the whole credit of it) the law he would have been utterly unable to seek experimentally. It seems to us that sufficient allowance has not been made for the natural irritation which such treatment was certain to cause,

especially in a high-souled and single-minded man incapable of treating others as he felt himself treated. His biographer will have a painful, but a necessary and salutary, task to perform in gibbeting such thankless parasites. Many a much-praised scientific article, nay, even volume, may be found, where the facts are taken mainly from Brewster, though his name is not even mentioned. He was driven by such treatment into frequent disputes about priority, and in general he was successful, though often, before the final settlement of the question, the obnoxious paper had found its way to a non-scientific public, and even to foreign journals. It is always a difficult matter to determine what the proper course of a philosopher should be under such circumstances. Few have the calmness to rely upon the almost invariably just decision of posterity; and most of those who do so go unrecognized to their graves."

After his appointment to the office of principal of the university of Edinburgh, Sir David Brewster regularly resided in our northern capital, where he was recognized both by natives and strangers as its chief living celebrity. His active person, unbroken by years, and his white, venerable head attracted the reverence of those who passed him in the streets; while in every company the unassuming style of his conversation, and the intelligence with which it overflowed, made him a welcome guest. His ardour in the prosecution of science also continued unabated, so that until within a few days—perhaps it might be even said within a few hours—of his death he was employed in his favourite investigations. To him indeed nature was a gospel on which a revelation was written by the finger of its Creator, and he regarded it as his sacred mission to decipher these written characters and proclaim them to the world. To him indeed the study of a phenomenon in science was not merely an intellectual, but a devotional act. Of this reverential appreciation of his allotted work the following incident was told a few days after his death by a relative who dwelt with him. "When we were living in his house at St. Andrews twelve years ago he was much occupied with the microscope; and as was his custom always, he used to sit up studying it after the rest of the household had gone to bed. I often crept back into the room on the pretence of having letters to write or something to finish, but just to watch him. After a little he would forget that I was there, and I have seen him suddenly throw himself back in his chair, lift up his hands, and exclaim, 'Good God! good God! how marvellous are thy works!'" Remembering these scenes of which he had been informed by the above-mentioned relative, Sir J. Y. Simpson, the medical attendant of the death-bed of Sir David, adds, "I said to him on Sunday morning (the day before he died), that it had been given to him to show forth much of God's great and marvellous works; and he answered, 'Yes, I found them to be great and marvellous, and I have felt them to be his.'"

During the later years of his long life Sir David had suffered repeated attacks of serious illness, but his death was occasioned by an attack of pneumonia and bronchitis. This occurred at his seat of Allerly, near Melrose, on Monday evening, the 10th of February, 1868, in the eighty-seventh year of his age. Even to the last his attachment to science was undiminished, and his solicitude about its progress was manifested on more than one occasion. He wrote calm and considerate farewell letters to the various scientific societies with which he was connected, and among whom his memory is still affectionately cherished. A week before his death he wrote a long letter in his own handwriting, and characterized by

his wonted mental vigour, to a brother professor, showing the liveliest interest in the affairs of their university, and in some optical discoveries upon which the pair had formerly corresponded. A few days after, while his mind was still clear, but his bodily powers exhausted, he dictated a letter to the council of the Royal Society of Edinburgh, taking an affecting leave of his old associates and of the society itself, and bequeathed to it as a valuable legacy a research which he had nearly completed. Only three days before his death he was anxious to write several farewell letters, and for this purpose to dress and go into his study; and when his anxious friends besought him to spare himself, he said, "Permit me to rise once more, for I have still a little work to do. I know," he added, "it is the last time I shall ever be in my study." On being asked, when only within a few hours of death, if he wished any particular scientific friend to take charge of his remaining scientific papers and notes, he answered, "No; I have done what every scientific man should do, viz. published almost all my observations of any value just as they occurred." Even at this moment too his scientific enthusiasm broke out like the last flash of an expiring taper, and the account of the characteristic incident is thus given by Sir J. Y. Simpson, from whom we learn most of the incidents of his death-bed:—"He then explained that he had left one paper on 'Film Forms' for the society, and went on to express an earnest regret that he had not had time to write for the society another, descriptive of the optical phenomena which he had latterly observed in his own field of vision, where there was a partial degree of increasing amaurosis, which he thought might be yet found a common form of failure in the eyes of men ageing and aged like himself. He described the appearance of this partial amaurosis minutely and energetically, telling me, for your information, that the print of the *Times* newspaper had begun for a year or two past to look at one part in his field of vision as if the white interstices between the letters 'were lightly peppered over with minute dark powder;' and this amaurotic point was, he observed, latterly extending, like the faint extending circle around a recent ink-spot on blotting-paper. The clearness and the vigour with which he detailed all this and more were amazing in one already so very weak, and near the last ebb-wave of the tide of life."

But not only was the death-bed of Sir David Brewster a scene for scientific men but Christians to contemplate, and in his last hours the devout spirit by which his researches had been pervaded broke forth in its fullest lustre. His language, while full of hope and confidence, was pervaded by a child-like simplicity such as mere science could not have inspired; and to his eldest daughter, who visited him from a great distance before he died, he exclaimed, with the remains of his departing strength, after expressing his confidence of the friends he should meet in heaven, "I shall see Jesus too—Jesus who created all things—Jesus who made the worlds—I shall see him as he is!" His daughter remarked to him, "You will understand everything then," and his fervent "Oh yes!" showed the completeness of his hopes. At another time she said, "I wish all learned men had your simple faith." After a pause he answered slowly, and with emphasis on every word, as if he wished it to be remembered, "I have had the light for many years, and oh! how bright it is! I feel so safe, so perfectly safe, so perfectly happy." And thus one of the greatest of our living sages passed away. How well it would be if those scientific men who follow him as

their guide, or adopt him for their example, could study in such a spirit, and die such a death!

Sir David Brewster was twice married. His first wife was Juliet, the younger daughter and co-heiress of James Macpherson of Belleville, better known to the world at large as the translator of *Ossian*. She died in 1850; and in 1857 Sir David was again married, to Jane, daughter of Thomas Purnell, Esq., of Scarborough, who survives him. The remains of Sir David were interred in the burial-ground at Melrose Abbey, where his first wife and a son lay buried.

BROUGHAM, LORD. Of this remarkable man, whose talents were so great and so varied, whose life was extended so long beyond the usual term, and whose public career produced so deep an impress upon Britain during half a century of one of the most important periods of its history, it is difficult in a work of this limited nature to write a biography however compendious. Even the bare enumeration of his achievements as student, reviewer, author; as lawyer, statesman, and orator; as member first of the House of Commons, and afterwards that of Lords, and chancellor of the realm, would fill many pages, and still give an indistinct impression of his likeness. This, however, is the less to be regretted, as his life is already written in the history of the nineteenth century, with all the principal actions of which he was so conspicuously and influentially connected. It is impossible also but that a biography of Lord Brougham will soon appear, characterized by an amplitude and distinctness worthy of such a subject. All that we therefore can at present pretend to do is to give a silhouette of this remarkable man, leaving it to the judgment of our readers to fill up the outline.

Henry Brougham was born on the 19th of September, 1778, and his claim to be reckoned a Scotsman was in a great measure owing to accident. His father was Henry Brougham, of Brougham in Westmoreland, and Scales Hall in Cumberland. The family of Burgham or Brougham was of great antiquity, as it occupied a high place even before the days of William the Conqueror; but like many others so circumstanced, it had faded before the Norman ascendancy, and sunk into a condition of unnoticed respectability. The Westmoreland squire being sent to Edinburgh to complete his education, was boarded in the house of the Rev. Mr. Syme, one of the ministers of Edinburgh, whose house was at the head of the Cowgate; and here, while still a student, he married Miss Eleonora Syme, daughter of the clergyman, and niece of Principal Robertson, the celebrated historian. On being married the young couple went to reside in the house No. 21 St. Andrew Square, and there the future chancellor, the eldest of a family of six, was born. We are thus particular about the locality of his birth-place, as years afterwards, when he had attained place and distinction, there was occasionally some controversy on the subject; and even in his own hearing he was claimed as a native of Cumberland without contradiction. Why he allowed this mystification to pass it would be difficult to conjecture; but he himself set the question conclusively to rest when he came to Edinburgh to be entertained at the banquet given in his honour in 1859. On that occasion he visited the dwelling No. 21 St. Andrew Square, as the place of his birth; and, as if to awaken the impressions of his early life and become "a boy again," he took a long lingering survey of every room in the house.

Besides being the place of his nativity, Edinburgh was the home of Lord Brougham's infancy, boyhood,

and youth. After the usual preliminary education he was sent to the high-school, then superintended by the learned and amiable Dr. Adams, where his immediate predecessors were Walter Scott and Francis Jeffrey. In the winter of 1795, when he was now fifteen years old, he passed from the high-school of Edinburgh to the university, which at this time was fortunate in possessing Black for professor of chemistry, Robertson for natural philosophy, Tytler for history, Playfair for mathematics, and Dugald Stewart for moral philosophy. Among these teachers and their departments the mind of young Henry Brougham ranged with that restlessness and hunger of knowledge by which his omnivorous appetite was already characterized; and however such an unsystematic course might be condemned, it enabled him to lay in that store of knowledge in every department by which his intellect was strengthened, and his eloquence enriched with illustrations. It was also by this process that he trained himself to that office of a universal instructor which he was so ambitious of becoming. But he was too impatient to await the season of maturity, and before the age of manhood arrived he had made his first attempts in authorship. In 1797, when he was not more than eighteen years old, he communicated a scientific paper to the Royal Society, which was published in its *Transactions*; and in the following year he communicated some theorems in geometry, which were published in the same repository. Feeling also the early stirrings of that volcanic eloquence which was afterwards to upheave established evils from their lowest depths, he became a member of the "Speculative Society" in Edinburgh, at that time having for members several young men who subsequently became the renowned of their day. Still, however much his anxious studies had made him conversant with the theories of oratory, he found it a very different thing to reduce them to practice. But his was to be no common eloquence, and therefore not to be easily acquired; his fiery energy, and profusion of thought and illustration, made selection difficult, and sometimes utterance impossible; and, like Demosthenes himself, whose first attempt was a failure, his earliest displays in the Speculative Society gave little promise of his subsequent success as an orator. By practice and perseverance, however, he attained the full mastery of that eloquence with which he was to delight his friends and confound his enemies; while its rich and massive character, its happy selection of thoughts, and its involution of parentheses within parentheses, which instead of obscuring his subject, as it would have done in meaner hands, only brought out his argument with clearer distinctness—these sufficiently showed the causes of his earliest failures, and the great amount of difficulties which had been successfully overcome. And, truly, to become the first orator of the day was worthy of any probation, however lengthened and severe!

As it was necessary for Henry Brougham to make his own way in the world, the profession of the law was his choice, and the bar the fittest place for his talents to have full scope. In the year 1800 he was admitted into the faculty of Scottish advocates, and two years afterwards he became a fellow of the Royal Society. In 1802 he was one of that choice band who originated the *Edinburgh Review*, and attended that memorable meeting at Jeffrey's house, which was a third-story dwelling in Buccleugh Place. There the plan of the publication was settled; and while a night of storm and tempest was raging without, the company were making themselves merry with the thought of the greater hurly-burly which

they were to let loose upon the literary world. To the *Edinburgh Review* Brougham was a frequent contributor upon a variety of topics, but his articles did not rank among the best in the collection. His authorship required the same gradual maturing as his oratory, and from the same causes. One of his productions in the *Review*, however, must be excepted from any charge of mediocrity: it was his severe but just castigation of Lord Byron's *Hours of Idleness*. Even the *Edinburgh Review*, however, was not sufficient to satisfy his craving for literary distinction, or give exercise enough for his intellectual activity; and in 1803 he published in two octavo volumes a work entitled *An Inquiry into the Colonial Policy of the European Powers*. That a political work of 1100 or 1200 pages should have been written by a young man of twenty-five was considered by some a remarkable instance of boldness, and by others of audacity; but all were obliged more or less to acknowledge the remarkable talent which it indicated, and it was translated into several European languages. But experience in the right management and government of colonies was still in its infancy, and it was therefore no wonder that "Henry Brougham, jun., Esq., F.R.S.," the author of the work, advanced theories of colonial policy which did not accord with the matured experience of the great statesman Lord Brougham. It was natural, therefore, that this *Inquiry*, however admired at the time, should gradually pass into abeyance and cease to be remembered, or that its author should make no effort to recall it to public notice. It is certain that this publication is now among those books that are difficult to be met with, and that his lordship, so far as we can learn, made no allusion to it in his other writings. He would sometimes, however, in conversation with his intimate friends, advert to it in after-years, and point to the numerous published translations of it contained in his library.

As an advocate at the Scottish bar Henry Brougham's career was not particularly profitable or successful. The merely provincial character into which Scotland dwindled at the union had not yet passed away, and the nation was only beginning to feel its resources and put forth its latent powers. Isolated by their position from contact with public opinion, our impoverished aristocracy regarded the court alone as the true source of distinction, and our judges, trained in the same sentiments, were careful to enforce submission to the powers that be. But Brougham, already distinguished by pre-eminent talents, a writer in the *Edinburgh Review*, and a Whig, was obnoxious to the rulers of the court of justice, who interposed every obstacle to his advancement. But he was not to be thus put down, and he retaliated with a fierce withering wit from which the bench of Themis was no protection. Of those judges who were his haters, one of the chief was Lord Eskgrove, of whom, and his bickerings with the impracticable young advocate, Lord Cockburn gives the following account:—"Brougham tormented him, and sat on his skirts wherever he went for above a year. The justice liked passive counsel, who let him dawdle on with culprits and juries in his own way; and consequently he hated the talent, the eloquence, the energy, and all the discomposing qualities of Brougham. At last it seemed as if a court-day was to be blessed by his absence, and the judge was delighting himself with the prospect of being allowed to deal with things as he chose; when lo! his enemy appeared—tall, cool, and resolute. 'I declare,' said the justice, 'that man Broom, or Brougham, is the torment of my life!' His revenge, as usual, consisted in sneering at Brougham's elo-

quence by calling it or him *the Harangue*. "Well, gentlemen, what did the Harangue say next? Well, it said this (misstating it); but here, gentlemen, the Harangue was most plainly wrongg, and not intelligibill."

It was either upon this judge or one of a similar character that Brougham is said to have taken the following grotesque revenge. The circuit was to be opened at Jedburgh, and the lord of session repaired to it under the comfortable assurance that Brougham was not to be there. But while the judges and magistrates in solemn pomp were marching up the long, steep, main street to the court-house, a gig was seen at the top, and in it a man wearing a cocked hat set on the wrong way; in another moment man, gig, and horse came dashing down upon the procession, upsetting every grave functionary who was not nimble enough to skip aside; and instantly after this strange intrusion disappeared before the face under the cocked hat could be recognized. The judges, highly indignant and grievously overblown, were still more incensed on reaching the court-house to find the Harangue seated composedly in his place with his papers arranged before him. Was he the author of the recent outrage? It was strongly suspected, but proof was wanting. Another similar freak, although for a different purpose, is reported of these early days of Brougham. He went to the Dumfries races on Tinwald Downs attired in a red gown, and carried in a sedan chair—an object of wonderment and perplexity to the thousands who were assembled at the race-course. This strange exhibition of the future statesman and chancellor was in consequence of a bet.

In 1804, and when he was only in his twenty-sixth year, Mr. Brougham's public career had its commencement in consequence of his removing to London; a fact bitterly recorded by Cobbet, whose political and national jealousies were equally offended by the arrival, as "an invasion of this devoted country." In England, through a certain Dr. Percival of Manchester, he was recommended to Mr. Wilberforce; and the latter, knowing that Mr. Pitt was in search of an eligible person to visit the Continent and collect information in Spain and Portugal, on the rising of a spirit of resistance in these countries to the domination of Napoleon, he thought Mr. Brougham well fitted for such a task, and accordingly recommended him to his friend the great statesman. "If in the course of any of your calls for proper men," he wrote, "to be employed in any diplomatic business, you should be at a loss for one, you perhaps could not, in the whole kingdom, find any one, in all respects, so well qualified as Mr. Brougham, whom I formerly mentioned to you. He speaks French as well as English, and several other languages. But the great thing is, that he is a man of uncommon talents and address, and for his age—twenty-six—knowledge also; and I told you of his being so long the advocate for your government in Edinburgh. [Here Mr. Wilberforce must have been ignorant of Brougham's Whiggery and his articles in the *Edinburgh Review*.] My mentioning him to you is entirely of my own head; of course he knows nothing of it—indeed he is in Edinburgh—and I only do it (most solemnly, I assure you) on public grounds, and because I know you must often want men for foreign services. He has, besides the qualities I mentioned, great resolution, strength of constitution," &c. Upon the strength of this recommendation Mr. Brougham was sent to the Continent about the end of the year 1805 under the guise of an American, and was enabled to do some service

to the question by his inquiries, more especially in Holland. His acquaintance with Mr. Wilberforce also connected him with the subject of abolition, of which he became one of the most energetic and efficient advocates. In 1806 he went again to Holland, but this time chiefly in reference to the slave-trade, and on his return he assisted the then Lord Hawick in drawing up the abolition bill of 1807.

As the Scottish bar afforded such a limited scope for his energies, Mr. Brougham while in England had qualified himself for the English bar. He had already secured for himself a high professional reputation by a visit from Scotland to London in 1807, in order to plead before the House of Lords in a case respecting the succession to the Scottish dukedom of Roxburgh. In 1808 he was called to the English bar, and commenced practice in the Court of King's Bench, and in 1809 his appearance in a case of high political importance added greatly to the fame he had already acquired. It was to plead before the House of Commons the case of the merchants of London, Liverpool, and Manchester, who complained of the injury done to British merchandise by the operation of the famous "orders in council," by which our statesmen sought to retaliate on Napoleon's Berlin decree. It was much that so young a lawyer should have been selected to plead on such a subject, and before so august a tribunal; but although the appeal in behalf of his clients was unsuccessful, the ability with which it was conducted justified their choice. He was now conspicuously a rising man, whose services government would do well to secure. He was accordingly returned to the House of Commons for Camelford by the Earl of Darlington, the patron of the borough. This entrance to parliament through a rotten borough might seem at first sight inconsistent with the public career of a patriot; but let it be remembered that it was not in those days so odious as it afterwards became—that it was in this way Burke, Fox, Pitt, Sheridan, Lansdowne, Plunket, Canning, Romilly, Palmerston, Macaulay, and many others, had been secured for the service of their country—and that in those days a free constituency also meant an enormously expensive constituency. It was not until 1831, fully more than twenty years afterwards, that Mr. Brougham was returned by a popular election, which was that for Yorkshire.

On the 5th of March, 1810, Mr. Brougham delivered his maiden speech in parliament. It was on the occasion of Mr. Whitbread's motion reprobating the conduct of the Earl of Chatham in privately transmitting to the king his narrative of the expedition to the Scheldt. The speech disappointed Mr. Brougham's admirers, who hoped that he would take the house at the first onset; but it was better as it was, for he was new to the situation, and too cautious to commit himself, so that the speech was just and appropriate, but nothing more. The same cautiousness distinguished him during the session, and it was chiefly on the slave-trade that he commanded the attention of the house. It was by a great restraint upon his natural impetuosity that he forbore to commit himself to any class of opinions, or to the persons who held them: he was prudently waiting his time, and surveying the field of action. And for this, too, there was great need, as the period was fraught with important events, under which the whole aspect of affairs was to undergo a change. Toryism was in the ascendancy and threatening to be permanent; the Perceval administration held the reins of government, and was struggling against the overwhelming power of Napoleon; while only in Spain, where Wellington had opened his cam-

paings, a reaction was appearing in our favour. The questions of home division which this foreign policy occasioned embittered the hostility of the two great parties in the state, and both Whigs and Tories exaggerated their differences with a fierceness at which themselves were afterwards astonished. But after he had ascertained the condition of things, and the nature of his position, Mr. Brougham hesitated no longer; he threw himself with his whole native ardour into the conflict, and made the house feel that they had a Titan of eloquence among them. Never, indeed, since the days of Burke, Fox, and Pitt, had there been such an orator in parliament, and of all its members Canning alone was able to confront him. It was well, too, that the style of Canning, though unmatched in its character, was so different from that of Brougham, as the passionate vehemence, unequalled fluency, and remorseless invective, would have made one such speaker sufficient in any parliament; and when the two rival orators met in full encounter, their equipments and manner were so dissimilar, yet so well matched, that the whole house looked on in breathless interest as at a new gladiatorial spectacle.

After this explanation we content ourselves with giving a brief notice of the early part of Mr. Brougham's parliamentary career. In his first session of 1810, on the 15th of June, he brought forward a resolution on the subject of the slave-trade abolition act, and the taking of measures to prevent the evasion of the provisions of the act by foreign states. The address to the crown for which he moved was carried without a division. In 1811 the practice (or rather its abuse) of flogging in the army called forth his denunciations in parliament. He delivered speeches against the "orders in council," on which he had formerly been employed by the English merchants; and through his representations these orders, as far as America was concerned, were rescinded in 1812. He advocated the Roman Catholic claims for emancipation, and for a reform in the government of India. But his principal appearance was as a champion and advocate of the press at a time when its rights were least acknowledged. The Messrs. Hunt, proprietors of the *Examiner*, having in their newspaper denounced several abuses of government, and thereby made themselves obnoxious to the ruling powers, had copied an article indignantly denouncing the practice of flogging in the army from the *Stamford News*. The Hunts being marked with the government brand, were arraigned for the publication of a libel; with Sir Vicary Gibbs, the attorney-general, and Lord Ellenborough, both of whom were keen enemies of the liberty of the press, to aid the prosecution; but in spite of this weight of authority against them, the culprits were absolved by the verdict of the jury. Not deterred by this defeat, government next prosecuted the *Stamford News*, being privately instigated, it is said, to this step by the private order of the prince-regent. This prosecution took place at the Lincoln assizes in 1811, and Mr. Brougham, in consequence of his success in the case of the Hunts, was employed by Mr. Drakard, the editor of the *Stamford News*, as his defender. Stripped of the technicalities of law the question was resolved into this: "Has the public a right to discuss a public question, and to condemn a public crime?" In the trial the whole authority of the judge was brought to bear against this right of the press, and the jury returned a verdict against Mr. Drakard. A second time Mr. Brougham was professionally employed in the defence of the Messrs. Hunt. An article was published in the *Examiner* in answer to the fulsome

eulogies bestowed upon the prince-regent, who was belauded and behymned as the noblest, handsomest, and most perfect of mortal men; and because the *Examiner* in contradiction stated what he and the whole world knew right well, their statement was declared by the ruling authorities to be a libel, and a crown prosecution was instigated against the writers and publishers in December, 1812. The tide of authority was in this case too strong to be resisted, the case was prejudged before it was brought to trial, and the eloquence and arguments of Mr. Brougham went for nothing. He was repeatedly interrupted during his pleading by Lord Ellenborough, the judge, and Sir William Garrow, the solicitor-general; and a verdict of guilty having been obtained, the Messrs. Hunt were sentenced to pay a fine of £500 each, to lie in prison for two years, and to find security for five years in £1000 to publish no more unwelcome truths against the prince-regent. Their defence during the trial so greatly offended his royal highness, who thought it even worse than the libel, that he ever after hated Mr. Brougham as one of his worst enemies.

During this last advocacy in behalf of the Hunts Mr. Brougham had no seat in parliament, and thus he continued from 1812 to 1816. In October, 1812, when the administration of Mr. Perceval was succeeded by that of Lord Liverpool and Lord Castlereagh, Mr. Brougham was induced to contest the Liverpool election against Mr. Canning, and such a competition between the two most eloquent of parliamentary orators was regarded with keen public interest. On this occasion Canning was successful. Mr. Brougham then tried for the Stirling boroughs, but was again unsuccessful. It was in this year that the differences between the prince-regent and the Princess Caroline began to attract public attention, and in the beginning of 1813 Mr. Brougham was appointed the princess' counsel. Although the feud between the prince-regent and Mr. Brougham had thus assumed a distinct character, the latter was not thereby secluded from the other members of the royal family; on the contrary, his connection with the princess, whom they regarded as an injured wife, made his friendly intercourse with them more intimate. One important occasion in which he acted as her legal adviser will not soon be forgotten. Alarmed by the fear of being driven by her father into a matrimonial union with the Prince of Orange, the young Princess Charlotte, in a summer evening of 1814, escaped from Warwick House and fled for protection to her mother. Such an arrival of one with whom she had been prohibited to hold intercourse was perplexing to the Princess Caroline, who drove to the House of Commons to ask the advice of her friends; and the chiefs of her party, with those of the regent, including the royal dukes, assembled in Connaught House for the settlement of this vexatious affair. Their chief difficulty lay in the persistence of Charlotte herself, who refused to return to her father; and the hours of the night were wasted in fruitless remonstrances and appeals. In this manner the morning arrived, but it was the morning of the day in the hot month of July in which the excited friends of Lord Cochrane were to assemble for his restoration to parliament. Two such events occurring at the same time in London would be like the meeting of fire and gunpowder. Availing himself of this circumstance, Mr. Brougham led the royal recusant aside to a window when the dawn was breaking, and after informing her of the approaching tumultuary meeting, he assured her that a word or two would be sufficient to turn the fury of the mob against her father's palace. "It will be

levelled to the ground," he added, "blood will be shed, and the people of England will never forgive you." Subdued by this alarming view of the case, the princess yielded, and consented to return on condition that she should be allowed to write a document expressing her resolution never to marry a prince of Orange, that all present should attest it, and that the custody of the document should be assigned to Mr. Brougham. On the 9th of August the Princess Caroline left England for the Continent. It was an ill-advised step, as royal personages of the female sex cannot thus travel at large, especially without the permission of their husbands, with impunity. It would lay her open to foreign espionage and foreign scandal, which it would not be easy to refute at home; and by this act she seemed to abandon her rights as the wife of the prince-regent, and the future Queen of England. For this her imprudent proceeding her counsellor Mr. Brougham was greatly blamed; but succeeding events showed how little his opposition would have availed with one so accustomed to act upon her own impulses.

In 1816 Mr. Brougham was returned to parliament for the borough of Winchelsea, and this time also it was through the influence of the Earl of Darlington. Although he continued to represent that borough until 1830, during the interval on three several occasions—at the general elections of 1818, 1820, and 1826—he contested the county of Westmoreland against the Tory and family influence which then predominated there, but without effect. This interval between 1816 and 1830 was the period of Brougham's highest political celebrity. On his re-entering parliament the great continental war had ended, the fever of the public mind occasioned by the triumph of success had cooled down, and the nation was bethinking itself of what all these wars and victories had cost. A legislative reform was also necessary for the old abuses which had been left untouched, and a new crop had sprung up. The session demanded a powerful eloquent tribune, and such it found in Mr. Brougham. The series of parliamentary speeches which he delivered during this period were scarcely below the number of 300, and with these he thundered and lightened over that august assembly during fourteen years. While he was thus upon the whole the most frequent, he was also the most eloquent speaker in the house, while his eloquence assumed every variety of character and shade, from the sublime to the comic—from the merciless, trenchant, sarcastic, to that of gentle playfulness. His chief misfortune as an orator was, that while certain peculiarities of his youth were abandoned, others were too strong to be relinquished, while his personal appearance and manner were such as somewhat to detract from the effect of his eloquence, especially when he had recourse to impassioned pleading. While the ear was enthralled, the eye could not be blind to the long ungainly form, grotesque countenance, flexible nose or trunk, and fierce ungraceful gesticulations of the speaker, which formed equally the subjects of political lampoon and poetical caricature; and in one of the former he was described as having

"A meagre form, a face so wondrous thin
That it resembles Milton's Death and Sin;
Long arms that saw the air like windmill sails,
And tongue whose force and fury never fails."

The history of Mr. Brougham's parliamentary career during this period may be best indicated by an enumeration of the principal topics in which he bore an influential part, and this has been given in the following brief list by one of his biographers: "In 1816 (the year of his readmission

to parliament) he took a leading part in the debates on the reduction of the army estimates, the repeal of the property-tax, the distresses of the agricultural interest, and other topics natural at a time of sudden transition from war to peace; and in the same session he commenced his long labours in the cause of popular education, by moving and obtaining the appointment of a committee to inquire into the education of the poor in the metropolis. In 1817 he made a speech on the distresses of the manufacturing classes, recurring to the question of the education of the poor in the metropolis, and attacking the foreign policy of the ministry. In 1818 he spoke on the tithe-laws and parliamentary reform, recurring again to the subject of metropolitan education, and succeeded in obtaining the appointment of a commission, since so famous, for inquiring into the abuses of the public charitable foundations of the kingdom connected with education. He was not himself nominated on this commission, but he continued to watch its proceedings with the greatest interest, and to keep public attention fixed on it. Thus, in 1818 he published a *Letter to Sir Samuel Romilly upon the Abuse of Public Charities*, which was so popular that it ran through ten editions in a few months. In 1819, besides his other appearances in parliament, he defended the education committee against certain charges of Sir Robert Peel. During the years 1820, 1821, his time was chiefly occupied in proceedings connected with the case of Queen Caroline. . . . Here, whilst burdened with business as the queen's attorney-general, he had not ceased to take part in debates on education, admiralty reforms, the state of Ireland, and other topics. In the session of 1823, when Canning's foreign ministry was beginning a new era in our relations with foreign powers, Mr. Brougham, who had in 1816 stood almost alone in the house in denouncing the holy alliance, and calling on the British government to pursue another policy in foreign affairs than that of the alliance, was able to return to the topic under much more favourable auspices, in a speech attacking the alliance for their armed interference through France with the liberties of the Spanish nation. Canning, though not going so far, may be supposed on this occasion to have sympathized to some extent with his parliamentary rival; but on another occasion, during the same session, the two orators came to a personal quarrel. It was on a debate on Catholic emancipation, and the scene was one of the most memorable that ever occurred in the house. Mr. Brougham, charging Canning with faithlessness to his previous declarations in behalf of emancipation, pressed the charge in a speech of extraordinary invective, which he wound up by pointing to Canning as having been guilty 'of the most monstrous truckling for office that the whole history of political tergiversation could present.' Canning, goaded out of all power of self-control, started up and cried, 'It is false!' and the speaker had to interpose and arrange the matter in parliamentary form by enforcing mutual explanations. In the same session Mr. Brougham spoke on colonial slavery and on delays in chancery. In 1824 his greatest effort was a speech on a motion censuring the Demerara authorities for their proceedings in the case of the Rev. John Smith, an Independent missionary, who, on suspicion of having incited the slaves to revolt, was tried in a very illegal manner, and while under sentence of death expired in prison. In 1825 the expulsion of a missionary from Barbadoes furnished a text of the same kind; and in that and the following session colonial slavery, the Catholic claims, chancery reform, and the corn-laws were the chief topics of Mr. Brougham's

oratory. On the accession of the Canning ministry in 1827, he signaled his independence in the house by defending the chief measures of that ministry, declaring that 'since Mr. Canning had established a system of liberal and manly foreign policy, he should have his support.' On this occasion he even sat on the ministerial benches, though declaring that he had bound himself not to take office under Mr. Canning. In this peculiar position of independence he continued his parliamentary activity under the administrations of Lord Goderich and the Duke of Wellington, after Canning's death; taking part in the debates which led to the famous passing of the Catholic relief bill by Wellington's ministry (April, 1829), but at the same time pressing questions of his own. Among these was law reform, on which, on February 7, 1828, he delivered a speech of six hours' length, containing the germs of many improvements in this important department of administration which have since been carried into effect. In 1829 he had the satisfaction of explaining to the house the proceedings of the great Charities Commission, the appointment of which he had procured eleven years before, and which during that interval had investigated into the condition and history of no fewer than 19,000 of the charitable foundations of Great Britain."

During this period of a most active public life, Mr. Brougham in 1819, and when he was in the fortieth year of his age, found time to marry, and his choice on this occasion was Mrs. Spalding, the widow of Mr. John Spalding of Holm, New Galloway, and daughter of Mr. Thomas Eden. By this marriage Mr. Brougham had two daughters, both of whom died young. It is said that at an earlier period he had been the suitor of Lady Vane Tempest, distinguished both by her beauty and ample fortune, and that his application for her hand was favoured by her guardian, Michael Angelo Taylor. The lady however married Sir Charles Stewart, afterwards the Marquis of Londonderry, and brother of Lord Castlereagh. It was said too that the bitterness of this disappointment was the cause of Mr. Brougham's keen attacks on the public appearances of the fortunate suitor who had supplanted him, but for this there was no better ground than vague suspicion.

The following year, which was fraught with such important public events, had also an important connection with the career of Mr. Brougham. At the beginning of 1820 George III., who for long had been a political nullity, died, and George IV. became king in title as well as reality. But what was to be done in reference to the queen, who had now been six years absent from England, and against whose foreign life, during this long interval, the most scandalous rumours had been propagated. On the accession of the new sovereign, her name was ordered to be struck out in the usual prayer uttered in the services of the church for the members of the royal family, and as George IV. was now head of the Church of England, the order, however unpalatable it might be to personal and private feelings, was implicitly obeyed. But the same order was announced to the Church of Scotland, which recognized no such earthly headships, and this blunder or oversight of the English statesmen was met, as it merited, with universal disobedience: it was an invasion of the sacred and guaranteed rights of their national church, so that many clergymen who would have omitted the queen in their public prayers, brought forward her name with peculiarly distinct emphasis, to show that such orders emanating from the court could not extend beyond the Tweed. But even in the south this change in the liturgy occasioned much angry disputation, and the question was put to Lord Castlereagh in the

House of Commons by Mr. Hume, Mr. Tierney, and Mr. Brougham, why the queen's name had been omitted in the *Book of Common Prayer*, and what provision had been made for her as queen. As often as these questions were propounded they were evaded, and thus the subject was unsatisfactorily drifted through the session. When it had closed, Mr. Brougham once more contested the representation of Westmoreland; but although the votes in his favour were more numerous than before, he was again defeated. This rejection showed how little the test of a parliamentary election can be taken as a reward of genuine desert, when it thus vetoed the most eloquent and able champion of the public rights which parliament at that time possessed. Thus defeated, Mr. Brougham for the third time was obliged to betake himself to Lord Darlington's close borough of Winchelsea.

Events necessarily connected with Queen Caroline now drove onward at full speed. Parliament met on the 21st of April, and she arrived in England on the 5th of June. All who truly loved the peace of their country deprecated the immoral details which her prosecution would produce, regretted her arrival, and blamed Mr. Brougham as its cause; but although her legal adviser, it would appear that he had no voice in the case: the same recklessness and self-will that had carried her abroad induced her to return, and she was anxious to brave a trial which she ought not originally to have provoked. There was also the luxury of excitement to her feverish mind in the popular huzzas with which she was welcomed and followed, and the indignation which her appearance excited against her unworthy husband. On the 6th of June, the day after her arrival, Lord Liverpool brought down to the House of Lords a message from the king, calling their attention to her behaviour while absent from the country; and at the same time a similar request was laid on the table of the House of Commons by Lord Castlereagh. On each of these occasions a green bag was introduced, crammed to the brim with the most odious and revolting accusations. On the 8th of June a secret committee was proposed for the examination of these papers; but by a message to the commons the queen protested against a secret inquest, and demanded an open inquiry into her conduct. After several adjourned debates on the question, the queen presented a petition to the House of Lords on the 26th of June praying to be heard by counsel at their bar, and this being unanimously agreed to, Mr. Brougham, Mr. Denman, and Mr. Williams appeared as her counsel. Into the particulars of the trial we have no wish to enter; it is sufficient to say that the aims of the ruling party were frustrated, so that Lord Liverpool's bill proposing that Caroline should be deprived of her title, rights, prerogatives, and immunities as Queen of Great Britain, was carried by only a small majority of nine, which compelled its abandonment. It is sufficient to say that throughout the trial the great orator of the case not only triumphed over all opposition, but over himself also. "It was a case," says a writer in the *Times*, "in which even latent powers might have struggled into utterance; but a review of Brougham's conduct of the case would show him rather the subdued, and calm, and elaborate, than the hot and reckless advocate he appears here; and it was rather his art than his anxiety that made him so appear like a man suppressing by effort those impulses which made him ordinarily launch into violent declamation, and give too much license both to temper and to tongue. His allusions to the prosecutor behind the scenes were couched in the most guarded language, as of one who divined his audience. . . . He displayed the shrewdest saga-

city alike in the examination and in the summary of the evidence, by implying more than he said. In his closing harangue the most remarkable feature is the significant pause, the studied omission, the veiled compliment to the acumen of the judges, the negative force gained by hinting at an indefinite argument beyond. This was a kind of skill as admissible in its kind as it was wonderful and unequalled in its degree—it was the triumph of a psychologist." The same writer thus describes the effect his eloquence produced not only on the fate of the queen, but his own celebrity. "Some portion at least of Brougham's permanent reputation will rest upon a piece of oratory which, rendered historical as it is by the nature of the trial and the rank of the accused, will be read and remembered far beyond the circumference of his more useful and uncontested fame; but it made for his instant popularity as much as for his ultimate renown; it established him not only as a man of genius, but as a man whose judgment was not always erratic, or angry, or self-willed. With the masses, to whom the queen, as the object of her husband's hatred, was the object of a compensating enthusiasm, her chief defender became a hero. He knew, but did not encourage, the idolatry; it was, indeed, as the sequel proved, a favour to be lost and won more than once before the distance which settles the perspective of actions should enable men to decide his definite place among orators and statesmen." It may be added, however, that although his reputation was advanced, his professional rise was retarded, by this celebrated advocacy. As attorney-general to the queen he had sat within the bar of the Court of King's Bench, and by the etiquette of the profession a patent of precedence ought to have followed. But this was withheld, so that the silk gown was not conferred on him until just before the Trinity term of 1827. Such a man this distinction could scarcely ennoble, and he accepted it with indifference. During this career of such intellectual and political distinction, Scotland was justly proud of Mr. Brougham, and especially Edinburgh, that could number him among her sons. On this account he was appropriately elected in the spring of 1825 lord-rector of the university of Glasgow. It was a free election of the students themselves divided into nations, according to the old fashion derived from the continental colleges—and the circumstance was the more honourable to Mr. Brougham, inasmuch as the rival candidate was Sir Walter Scott, then at the height of his fame. The votes having been equal between both competitors, the decision rested with Sir James Macintosh, who gave his casting vote in favour of Brougham. On this occasion the new rector's address to the students was regarded as a model of classical and academical eloquence, and would have imparted universal satisfaction, but for one heterodox sentiment, which, like a dead fly, marred the perfume of the whole pot of ointment. It was the allegation that man was not more accountable for his religious belief than for the colour of his skin or the height of his stature. This speech, which was so greatly admired that it was afterwards often printed, was prepared amidst the fatigues of the northern circuit. On the 5th of April, the day preceding his installation as rector, he was entertained at a public dinner, given in his honour in the Edinburgh Assembly Rooms, where 800 gentlemen were present, and on this occasion Mr. (afterwards Lord) Cockburn, who occupied the chair, reviewed the whole career of their honoured guest, from the time when, a young man, he had left Edinburgh for the English capital. Such consecutive labour on the part of Mr. Brougham is only one of many

proofs of his unwearied energy. Whatever might be the amount and variety of labour, he was ready for each as if it had been the sole object of his thoughts, and thus he accomplished all in a brevity of time that appeared miraculous. Thus, some five years afterwards, amidst the bustle of a great political crisis, and while canvassing for Yorkshire, he on one day of the canvass addressed eight several electoral meetings, travelled 120 miles to accomplish this feat, before railways existed, and on the next morning was in the assize court of York at the usual hour, as fresh and vigorous as ever. It is needless to observe, that, as in the case of Napoleon, this inexhaustible power of action was one great secret of his success. In this canvass of Yorkshire he did not fail, for he was returned for that county free of expense, along with Lord Morpeth, the Hon. William Duncombe, and Mr. Bethell. But the prize was worthy of the trial. Hitherto only the aristocracy connected with the county had been elected, but now the suffrage had been won by a commoner and a stranger, and with such a constituency he had far more consideration in parliament than an ordinary member.

This election of Mr. Brougham under such circumstances seemed a fitting prelude to the important measures he contemplated. The chief of these was the great subject of reform, for the introduction of which the death of George IV. and the prevalence of the popular wish had prepared the way. On the 2d of November, 1830, when the new parliament of William IV. was opened, Lord Grey in the Upper House, and Mr. Brougham in the Lower, were confident in the approaching triumph of the cause; and on the 13th Mr. Brougham announced to his friends and supporters his own scheme of reform, the main provision of which was household suffrage. But the ministers elected to take the sense of the house upon the civil list, and in the debate upon it on the 15th, the opposition carried their amendment upon it by a majority of twenty-nine. In consequence of this defeat the administration resigned office, but still Mr. Brougham expressed his determination that this change should produce no impediment to the bill. "As no change in the administration," he said, "can by possibility affect me, I beg it to be understood that in putting off the motion I will put it off till the 25th, and no longer. I will then, and at no more distant day, bring forward the question of parliamentary reform, whatever may be the condition of circumstances, and whosoever may be his majesty's ministers." Until the 19th he continued to express the same resolution, but on the 22d an astounding change shook the parliament and the political world as with an earthquake. On that day, and even before the patent of his peerage had been made out, he passed from the House of Commons into that of the Lords, and took his seat on the woolsack as Lord High-chancellor of England, under the title of Lord Brougham and Vaux. Had the inflexible Gracchus forsworn his principles? Had the incorruptible tribune yielded to the allurements of rank and title? But time soon demonstrated the change to be more apparent than real. He was still a reformer, and would give his whole energies to the cause of his reform—and he had taken office under a Whig ministry that could not carry out the measure without his co-operation. The following apology offered in his behalf is perhaps essentially the true one: "The whole private history of the transaction, and indeed of the formation of the ministry, is yet but obscurely known; but Mr. Roebuck, in his *History of the Whigs*, gives the various rumours of the day, and adopts as the true conclusion,

the supposition that Mr. Brougham was offered the lord-chancellorship simply because Earl Grey found it utterly impossible to construct a government leaving him out, and that Mr. Brougham accepted it simply because to have refused it would have paralyzed the Whig party at the moment of their first return to power, made an eternal separation between him and the Whigs, and ruined his own chances of further usefulness. As the lord-chancellor of a Whig ministry, he had a new career opened up to him, not so congenial, perhaps, as that of a great popular chief in the Lower House, untrammelled by party, but still promising opportunities of great public service.¹

A different, and on the whole a more extensive, plan of reform having been brought forward in consequence of the succession of the Whig ministry, the second reading of the bill was supported by Lord Brougham in the House of Lords upon the 7th of October. On this memorable occasion his speech, while it was considered to surpass all his former displays of eloquence, was also supposed to outdo all his oratorical extravagances. Among these last the climax was what may be called the supplicating scene. After having adduced every argument in favour of the bill, he exclaimed, "I pray and exhort you not to reject this measure. By all you hold most dear—by all the ties that bind every one of us to our common order and our common country—I solemnly adjure you, I warn you, I implore you, yea, on my bended knees [here he knelt on the woosack] I supplicate you, reject not this bill!" This significant pantomime, however it might have suited the Roman forum or French convention, was most uncongenial to the tastes of a staid methodical British parliament, and could only be paralleled by the rhetorical illustration of Burke, when he threw down a rusty dagger upon the floor of the House of Commons. In the second as well as the first instance the speaker was supposed to have suddenly lost his wits—or at least to have been guilty of a violation of order for which no oratorical transport could be considered an apology. The bill, as is well known, after five days' debate was thrown out by a majority of forty-one—the numbers being 199 against 158. In consequence of this rejection of the bill by the lords, while it was favoured by the House of Commons and not opposed by the king, the peers were supposed to be influenced not so much by political opinion as the influence of class, and it was proposed to counteract this influence by the introduction of a new set of peers among them, expressly created for the purpose. This proposal, chiefly attributed to Lord Brougham, perplexed the king and dismayed the aristocracy; but it was a *coup d'état* that was effectual. In the following year, when the reform bill was again introduced, and threatened with a similar discomfiture, the king yielded to Lord Brougham's solicitations, and gave him the following authority in writing: "The king grants permission to Earl Grey and to his chancellor Lord Brougham, to create such a number of peers as will be sufficient to insure the passing of the reform bill, first calling up peers' eldest sons.—William R." The opposition of the lords was overcome, and the bill was passed through their house without a vote on the 7th of June, 1832.

After the reform bill had become law, Lord Brougham and his coadjutors were set free to attend to its practical effects, and the measures which were carried in the first reform parliament, from 1832 to 1834, in the passing of which he had an ample share, were neither few nor unimportant.

These, upon which he made speeches in the House of Lords that occupy the greater part of his public collection, are enumerated by himself as the following:—

1. The abolition of slavery in all our colonies.
2. The opening of the East India trade, and the destruction of the Company's monopoly.
3. The amendment of the criminal laws.
4. Vast improvements in the whole municipal jurisprudence, both as regards law and equity.
5. The settlement of the bank charter.
6. The total reform of the Scotch municipal corporations.
7. The entire alteration of the poor-laws.
8. An ample commencement made in reforming the Irish church by the abolition of ten bishoprics.

In the meantime the elevation of Lord Brougham to a seat in the House of Peers had been otherwise than welcome to those among whom he was introduced. A man essentially of the people, he had unexpectedly and at once been promoted to the highest seat in their select conclave; and from his talents, his political opinions, and his temper, it was judged that he would not there rest and be still. Their utmost fears in this respect were more than realized, and bickerings broke out between him and his new associates which arrested public attention, and often provoked the popular mirth. Regarding him as not one of their privileged order, but a mere intruder, and his entrance as the first instalment of that new reforming spirit under which all distinctions of rank and class would gradually be levelled, he was accounted an enemy in the camp whom every one might assail at pleasure. But he quickly taught them that this was no safe experiment, and compelled them to temper their valour with circumspection. Of these assailants, it happened unfortunately that the Marquis of Londonderry, his early successful rival, was the most frequent, and upon him the blows of Lord Brougham could fall with personal as well as political rancour. In a debate on the policy of England towards Belgium, the marquis accused the chancellor of vituperation. "The noble lord," replied the other, "says that I am particularly fond of vituperation. I am not prone to a vituperative style of argument. The noble lord is a person of that sort, that if you were to bray him in a mortar you could not bray the prejudices out of him." On a later occasion, when the two were in controversy, Lord Brougham used such contemptuous terms against his adversary, that the latter expressed himself in language that seemed to tempt the settlement of their quarrels by the decision of the pistol. What an invitation to the guardian of the laws of the realm! Another opponent was Lord Eldon, the ex-chancellor, whose ideas of professional etiquette were most precise, and whose feelings were scandalized by the rough, careless contrast exhibited in those of Lord Brougham. "My lords," said he on one occasion, "you have the commons of England coming up to present bills with the usual forms at your bar, and you have a person proceeding from the woosack in boots, and with his top-coat on, to receive the commons of England in a manner in which, consistently with all former usage, they should not be received."

During this busy period of his political life, when his proceedings and speeches might have seemed more than enough for the energies of most men, Lord Brougham was also discharging the weighty duties of his office as chancellor with a promptitude which few of his predecessors had equalled. But here also his *modus operandi* gave dissatisfaction to the martinets of the legal profession. Like Sir

¹ *Knicht's Cyclopædia*, Biography, article "Brougham."

Walter Scott in the inferior situation of clerk of the Court of Session in Edinburgh, he was in the habit of answering notes of invitation, or correcting proofs for the press, while a case was argued before him. On one of these occasions, Sir Edward Sugden made a pause as often as the lord-chancellor put pen to paper. Lord Brougham at last becoming angry, exclaimed, "I have heard every word you have said. Do you suppose that the mechanical action of placing my signature to papers can distract my attention from your arguments? You might just as well complain when I blow my nose, or take a pinch of snuff." On another occasion he displayed his contempt of the refined quiddibets of the law when they were militant to the plain rules of justice and common sense. After a word of no particular import upon which a long wrangling had been maintained, Lord Brougham gave his decision, and added, "I shall not assign my reasons, nor can I ever do so when counsel are so long as they have been in this case." If Lord Brougham was thus independent and even arbitrary in his decisions as lord-chancellor, it must be remembered that his contemptuous treatment of the heads of the legal profession had been provoked by every device of relentless ingenuity. As one instance of this, Sir Edward Sugden was arguing before him an appeal case arising out of an Irish trusteeship, when the opposing counsel having urged that the fact of Lord Lifford's being one of the trustees might serve as a guarantee, Sir Edward rejoined, "I do not conceive that argument will weigh with your lordship, for your lordship must be fully aware that though a person may be a pretty good *nisi prius* pleader, it does not at all follow that he will be competent as an equity judge." Men had pretended to sneer at him for being no lawyer according to the strictest acceptation of the term, and when he was elevated to the woolsack the charge was repeated with double bitterness. And it was true, so far as he possessed the philosophy of law and the powers of the advocate rather than the special qualities which are adapted to the most unwieldy, intricate, and unsystematized division of the law. But for those defects his clear, accurate judgment, immense perseverance, and incredible activity, more than compensated. So dilatory had been the method of Lord Eldon, his predecessor, that unsettled cases had greatly accumulated, so that nothing less than a legal Hercules was needed to carry off these obstructions, and leave a free course for the ever-flowing tide. And such a Hercules was Lord Brougham in his capacity of chancellor. In the first year of his chancellorship he sat two days longer than Lord Eldon had done, and "by devoting more hours each day to the business of the court, he was enabled in the course of a few months to decide no less than 120 appeals; and instead of leaving, as his predecessor had done, a large arrear of causes, he had the gratification of saying that he had not left a single appeal unheard nor one letter unanswered." While this despatch made his tenure of office a memorable one in the annals of chancery, his judgments also were so carefully and accurately prepared as to refute the charge that he was no lawyer. His manner in the meantime of exercising the patronage of his office, both in church and state, was the subject of general commendation.

After the continuance of the Whig ministry in office from 1830 to 1834, its popularity and influence were in the wane. Great as were the changes it effected, especially during the first two years of its occupation, it was complained of as not going fast enough and far enough; and while Whiggism was striving to effect its appointed work in parlia-

ment, its slowness was blamed by the impatient Radicalism from without, which could see no obstacles and brook no delay. Such is invariably the fate of a political revolution: the original masters of the movement are succeeded or driven out by a more impatient party, who are apt to sacrifice everything to the awakened desire of greater and yet greater progress. At the close of 1834 the ministry was changed, and a Conservative one succeeded; but this lasted only till 1835, when a second Whig ministry was formed, with Lord Melbourne for its premier. In this government Lord Brougham had a place, not however as lord-chancellor, but as lord-keeper of the great seal and chairman of the House of Lords, and without a seat in the cabinet. At this exclusion by his old friends, the public was amazed and his admirers indignant; and while some thought that the exclusion was owing to the overruling wish of the king, others supposed that the milky temperament of Melbourne instinctively rejected an alliance with such a fiery and restless coadjutor as Lord Brougham. The latter, however, has plainly declared that the fault did not lie with the king, and that the cause of his exclusion had never been announced to him. At all events, it was evident that his colleagues were impatient to get rid of him. Accordingly, on the 15th of January, 1836, the *Gazette* announced the appointment of Sir Charles Pepys as lord-chancellor, under the title of Baron Cottenham, and on the 4th of February following Lord Brougham's connection with the ministry terminated.

Although no longer in office, his lordship's political life had not ended; he was still a peer of the realm, with a retiring pension of £5000 a year, and in his place in the House of Lords, or through the press, he still continued to identify himself with the principal events of the period. During the first two years of the Melbourne administration he generously continued to support it, although at wide intervals, his chief appearance on such occasions being a speech in the House of Lords in May, 1835, proposing a series of comprehensive resolutions on the subject of national education. Two years after, when William IV. was succeeded by Queen Victoria, he blazed out into his former activity; and in February, 1837, he introduced two bills, one for the establishment of local courts, and the other for the abolition of pluralities. Two months after, he spoke fully on the subject of Irish emigration, and land-improvement in Ireland; in May, he assailed the government policy regarding Canada; and in June, he moved for a select committee to inquire into "the state of business" in the House of Peers. These were done before the death of William IV., but in the latter part of the same year he was active in the measures then before parliament for amending the laws, supporting the forgery bill, and other alterations in the criminal code (in which he hinted at the desirableness of abolishing the punishment of death entirely), and supporting a bill for abolishing imprisonment for debt, except under peculiar circumstances. In December, 1837, he once more brought into parliament a formal bill on the subject of national education. Then succeeded, in 1838, his violent attacks upon the Melbourne administration in reference to the government of Canada; and his three speeches on the subject, which he republished under the title of *Speeches on the Maltreatment of the North American Colonies*, produced an immense sensation, and led to the remarkable return of Lord Durham from Canada. In 1839, besides his share in other parliamentary matters, were published his *Speech moving a Committee of the Whole House on the*

Corn-laws; A Letter on National Education to the Duke of Bedford; and A Reply to Lord John Russell's Letter to the Electors of Stroud on the Principles of the Reform Act. For a few years afterwards his public appearances were chiefly in reference to the great anti-corn law agitation with which the whole country was engrossed. On this occasion his conduct was so independent, and so exclusively his own, as to be characteristic of the man and no other; for while his declarations and votes contributed to the final repeal of the corn-laws in 1846, he denounced the league itself as unconstitutional. But among the various public measures which during these years he either supported or condemned, the chief subject that interested him was the improvement of our legislation; and in 1843 he published *Letters on Law-reform, addressed to the Right Hon. Sir James Graham*; in 1844 he delivered in parliament, and afterwards published, a *Speech on the Criminal Code*; and in May, 1845, he delivered another great speech on law-reform. Notwithstanding this continued activity, a very inadequate idea would be formed of the amount of work performed by Lord Brougham were we to limit our views of it to the foregoing statement. Hitherto we have contented ourselves with a consecutive account of his public appearances, and his publications in connection with them which they originated. But during the whole course of his public career his pen had never been idle, and newspapers, reviews, magazines, and encyclopedias abounded with his productions, some published anonymously, and others with his name, but all of them stamped with the impress of his own remarkable genius, by which, during such a long course of years, had there been nothing else, he would have been constantly kept before the public gaze and the public wonder. Even had he done nothing else, the chief surprise would have been that one man could write so much. After his early production on *Colonial Policy*, in two volumes, in 1803, a long interval succeeded in which his productions were chiefly the fruits of temporary occasions, and appeared in the form of *Letters, Speeches, Essays, and Dissertations*. But in 1835 he resumed the work of authorship in its volume form by publishing a new edition of Paley's *Natural Theology*, to which he appended a preliminary discourse and notes. This work, on which it was said Lord Brougham had been employed for five years, went speedily through three editions—a public favour which was owing to the celebrity of his lordship's name, and to the fact that the "Discourse" was reckoned one of the most eloquent of his writings. A few years later he added two supplementary volumes to the work, under the title of *Dissertations on Subjects of Science connected with Natural Theology*. In 1838 he published the *Collected Edition of his Speeches*, in four volumes, including his principal orations up to that date, with historical notes and introductions, and a "Discourse on the Eloquence of the Ancients." In 1839-43 appeared the first series of his *Historic Sketches of Statesmen who Flourished in the Time of George III.*, and in 1845 his *Lives of Men of Arts and Science who Flourished in the Time of George III.* In 1842 he published his *Political Philosophy*, and in January, 1845, he brought out in French, *Lives of Voltaire and Rousseau*, with some unedited letters of Hume and Voltaire. In 1837 he published his *Dialogue on Instinct* and his translation of the *De Coronâ* of Demosthenes. In 1849 he published a *Letter to the Marquis of Lansdowne on the Late Revolution in France*, which went through five or six editions. In 1855 he published, conjointly with E. J. Routh, an *Analytical View of Sir Isaac Newton's Principia*,

which is now used in the university of Cambridge. In 1857 he collected and published his contributions to the *Edinburgh Review*, in three volumes 8vo. An edition of Lord Brougham's works, entitled *The Critical, Historical, and Miscellaneous Works of Henry Lord Brougham, F.R.S., Member of the National Institute of France, and of the Royal Academy of Naples*, has been published in ten volumes, 1855-58; and so recently as the 17th and 31st of May, 1858, Lord Brougham read to the Academy of Science a very interesting paper on the structure of the cells of bees, in a zoological and mathematical point of view. It is published in the *Comptes Rendus*, &c., 31st May, tom. 46, p. 1024, under the title of "Recherches Analytiques et Experimentales sur les Alveoles des Abeilles." To this long list, which only comprises the chief of his productions, popular rumour attributed to him the authorship of more than one novel. It sounds like a joke upon the grave and earnest statesman, or at least a satire upon his ambition of universal literary distinction. The rumour was chiefly founded upon a novel published in the established three-volume form in 1844, under the title of *Albert Limel, or the Chateau of Languedoc*. But no sooner was it printed than it was withdrawn, so that only five copies are known to exist, while the suppressed work was stated to be the production not of Lord Brougham but of a lady.

Having purchased a property in the neighbourhood of Cannes, his lordship was in the practice, during the latter period of his life, of there spending the summer. This residence naturally brought him into contact with the stirring political events which were going on in France, and especially with the great revolution in the beginning of 1848. Infected by the general fever, or ambitious to take a share in the new but short-lived government of liberty, equality, and fraternity, he announced his intention to the mayor of Cannes of standing as a candidate for the department of the Var, and then wrote to M. Cremieux, the minister of justice, requesting the necessary certificates to be forwarded, and expressing his wish that he should be naturalized as a French citizen without delay. The French minister was amazed at such an application, and warned him of the consequences of its success. "If you become a French citizen," Cremieux wrote in reply, "you cease to be Lord Brougham. You lose in an instant all your noble titles, all the privileges, all the advantages, of whatever nature they may be, which you hold either from your quality of Englishman or from the rights which the laws and customs of your country have conferred upon you, and which cannot be reconciled with our laws of equality amongst all citizens." Becoming sarcastic, the minister added, "I certainly imagine that the late lord-chancellor of England knows the necessary consequences of so important a step; but it is the duty of the minister of justice of the French republic to warn him of it officially. When you shall have made a demand including these declarations it will be immediately examined." The merriment both of France and England was raised at this application, and the rebuff with which it was encountered; and as if to protract the mirth of the two countries, Lord Brougham repeated his appeal. "I never could have supposed," he said in a second letter to M. Cremieux, "that in getting myself naturalized as a French citizen, I should lose all my rights as an English peer, and an English subject in France. I shall only retain all my privileges in England; in France I should be all that the laws of France accord to the citizens of the republic." To this strange reason for urging his claim he added a still stranger

as its cause: "As above all things I desire the happiness of the two countries and their mutual peace, I thought it my duty to give a proof of my confidence in the institutions of France in order to encourage my English *compatriotes* to trust in them as I do." The reply to this which Cremieux returned was final. "In order to become French it is necessary that you should cease to be English. You cannot be an Englishman in England, and a Frenchman in France. In the present state of the case, then, and as long as you wish to remain an Englishman in England—that is to say, as long as you do not choose to abdicate completely and everywhere your quality as an English subject, and to exchange it for that of a French citizen, it is impossible for me to grant your request." Here the matter ended, and the French journals pointed to it as a choice example of English eccentricity. As for Lord Brougham, he immediately and formally renounced his French citizenship, which, by the way, he had never obtained. Here, however, his resentment did not terminate. Irritated at the refusal and the merriment which the whole case had created, he wrote an indignant condemnation of the French republic, which he published under the title of *Letter to the Marquis of Lansdowne, K.G., Lord-president of the Council, on the Late Revolution in France*—a goodly pamphlet of 165 pages 8vo, although it was scarcely large enough to contain the overflow of his anger. This production, however, did not impair his popularity, as the work ran through five or six editions. He also spoke on the revolution, its principles and its consequences, on several occasions in the House of Lords, in 1848 and 1849, especially in his "Speech on Italian and French Affairs" on April 11, 1848, and his "Speech on Foreign Affairs" on July 20, 1849.

As Lord Brougham had now exceeded the usual term of human existence, decay began to tell upon his iron frame, making more frequent retirement from action necessary. But he had nobly worked during his day, and could well claim the evening's repose. New political events also had succeeded, and new agents to carry them forward, so that his presence could be better spared. Still, however, he could not wholly rest, and the world was reminded of him by his occasional appearances, in which he acquitted himself with much of his former power. Among the most remarkable of these was his address delivered at Grantham in the end of September, 1858, on the occasion of inaugurating the statue of Sir Isaac Newton. From 1857 to the end, most of his public appearances and his longest addresses were made in connection with the meetings of the Social Science Association, of which body he was preses, and in whose proceedings he took a deep and active interest. In 1859 he was elected chancellor of the university of Edinburgh by a great majority over the Duke of Buccleuch, and in the autumn of the same year he was entertained at a banquet in the Edinburgh Music Hall, the choicest of his countrymen of all ranks and professions being present on the occasion. In 1863 he again visited his native city as president of the Social Science Association, and in the several speeches which he made at their meetings, "the old man eloquent" showed that his former fire was by no means utterly extinguished. We may add, also, that to the last Lord Brougham was devoted to the study of the exact sciences and to natural philosophy. He resumed in 1850 his optical researches, and communicated to the Royal Society "Experiments and Observations upon the Properties of Light;" in 1852 he sent "Further Experiments," and in 1853 a third paper of the same title. Their

argument, based on elaborate experiments, shows the principle on which Sir Isaac Newton established his theory of light to be inconclusive. Later still (1855), as we have already mentioned, he published, in conjunction with E. J. Routh, Esq., his *Analytical View of Sir Isaac Newton's Principia*. Among his honourable titles, Lord Brougham was a Foreign Associate of the Institute of France, to which he had been elected in 1833; he was afterwards a Member of the Royal Academy of Sciences at Naples.

While the last years of Lord Brougham's life were thus chiefly spent at Cannes amidst the peaceful and tranquillizing pursuits of science, his occasional re-visiting among us, which gradually were becoming fewer, were always noted as important public events; and as he passed along our streets the crowds regarded him with reverence as the patriarch of the age, the living chronicle of what the days of their fathers and grandfathers had been. At last he was wholly confined to his foreign residence by infirmity and decay, but even then he showed that his heart was with his country, and that his interest in its public proceedings had not ceased, so that in 1867 he addressed a short letter to the people of England, which he termed his "death-bed legacy," and in which he warned them against the consequences of political corruption. In the important subject of religion it had been usually suspected that amidst the whirl of public business he had lost sight of it—that amidst his universal studies he had omitted the one thing needful—and that the place which it should have held was occupied by a general scepticism, which, among men of large and active minds, is too often adopted as an apology for indifference. But in the latter years of his life a more healthful spirit seemed to predominate, and the cares of the present world to be superseded by his growing interest in a higher and a better. His mind also in this happy return had reverted to the days and character of his early training, and his favourite hymn, which was the 42d Paraphrase used in the Church of Scotland, was adopted into the service of the Protestant church at Cannes, which he attended, under the title of Lord Brougham's hymn, and was always sung the first Sabbath after his arrival and the last before his departure. It was also sung over his funeral. His death, although it occurred at such an extreme old age, was sudden and unexpected. On Thursday night the 7th of May, 1868, he retired to rest in his usual health, and was found dead in bed an hour or two afterwards, having died, it was supposed, in his sleep. At his death he was in his ninetieth year.

It is difficult at present, and perhaps will always be difficult, fully to estimate the character of this extraordinary man. In intellectual power and variety of talent Lord Brougham stood alone not only in his own day, but in the preceding history of his country; and among the most eminent of the records of Great Britain, while none equalled him, only a few have approached him. Better lawyers, more sagacious statesmen, more finished orators, and profound philosophers might indeed be quoted, but when were they all so comprised in one as in the instance of Lord Brougham? But still more remarkable than such capacities was his power of using them, so that while he could make each pre-eminent for the occasion, not one of them was allowed to maintain an exclusive ascendancy, and all were equally subservient to his control. Hence the wideness of their application and variety of action, and the deep permanent impress they have left upon everything that came under their range. To time therefore his memory

may be safely consigned, and as generations pass away the worth of his actions will be better understood and more permanently established.

BURNS, REV. WILLIAM CHALMERS. This devoted, active, and enterprising religious missionary was of a class whose deeds are too seldom recognized by the world, or recorded in the pages of our literature. He was the son of the Rev. Dr. W. Burns, who was first the minister of the parish of Dun, and afterwards of Kilsyth, and member of a race more prolific of clergymen than perhaps any Scottish family of the present age. W. C. Burns was born in the manse of Dun, Forfarshire, on the 1st of April, 1815. In consequence of the translation of his father from Dun to Kilsyth, William was removed to the latter place in 1821. Although he showed in after-life that he possessed original talents of no ordinary kind, the influences of the parish school of Kilsyth, though at that time taught by a very able master, were not altogether of a kind fitted to rouse and develop those latent powers. The effect of this apathetic indifference was shown in the early choice of an occupation made by young Burns, which was that of a farmer; but in consequence of being sent to Aberdeen, and his attendance at the grammar-school there, a new life seemed to have entered into him that was too active and ambitious for agricultural pursuits; and as he lived with his maternal uncle, who was an Aberdeen advocate, the profession of the law naturally suggested itself to him as a more eligible profession. To this accordingly he turned his studies, and after having attended two years at the classes of Aberdeen College, he was, at his own earnest desire, sent to Edinburgh, that he might commence the study of law under one of his uncles, Mr. Alexander Burns, Writer to the Signet. He however completed his literary course at the university of Aberdeen, where he acquired distinction in all the classes, and won a bursary both in classical languages and mathematics. In the meantime a third change had occurred in his choice of a profession. Having been impressed while prosecuting his law studies in Edinburgh with a deep sense of the importance of religion, he resolved to devote himself to the church; and with the purpose of studying for the ministry he entered the divinity hall of the university of Glasgow in 1835. After a theological course of four years, in which he signalized himself by his diligence and proficiency, he was licensed as a preacher in March, 1839.

On becoming a licentiate, the same divine agency which had directed William C. Burns in the final choice of his profession, had prepared a fit school for its training. The apostolic Robert Murray M'Cheyne had laboured in Dundee until his health was exhausted; and as its recovery would depend upon change of air, scene, and occupation, he was sent with a deputation from the Church of Scotland early in 1839 to Palestine, on a mission of inquiry to the Jews, while during his absence Mr. Burns was appointed to supply his place. It was to no ordinary man that such a charge would have been intrusted, but Burns had already approved himself as one of more than common mark. This was evinced by the letter to him from Mr. M'Cheyne, announcing the choice made by the congregation and himself, in which he wrote: "You are given in answer to prayer, and these gifts are, I believe always without exception, blessed. I hope you may be a thousand times more blessed among them than ever I was. Perhaps there are many souls that would never have been saved by my ministry who may be touched under yours; and God has taken this method of bringing you into my place."

While Mr. W. C. Burns was earnestly labouring in Dundee, remarkable events were going on in his father's parish of Kilsyth. A century previous, that town, under the ministry of Mr. Robe, had been remarkable for that religious revival which, commencing at Cambuslang, had burst out in several localities in quick succession, and in none more remarkably than in Kilsyth, where it had wonderfully changed the vicious into upright characters, and persuaded men who had only thought of to-day to be up and doing for eternity. But after that generation had passed away, the former apathy and irreligion had returned, and during the early period of the present century its condition was more hopeless than ever. Such was the condition of Kilsyth when Dr. Burns was inducted into the spiritual charge of it, and his sensitive spirit was grieved by the contrast of the past to the present condition of the parish. At length, on the anniversary of Mr. Robe's death, he took his station on the grave of that good man, and preached upon the words which Robe had caused to be inscribed in Hebrew over the dust of his wife: "Thy dead men shall live, together with my dead body shall they arise. Awake and sing, ye that dwell in dust: for thy dew is as the dew of herbs, and the earth shall cast out the dead." The sermon preached on such a text, and upon such a rostrum, seemed like the rising of the old revivalist from the grave: a sudden shock and arrest was visible upon his people, manifested by an abandonment of their evil courses, and a more serious attention to the ordinances of religion; and this continued until the following year (1839), when the funeral of a near relative required the presence of Mr. W. C. Burns at Kilsyth. He preached there, and the work for which his father had made the preparation broke out, the imprisoned tide burst asunder its feeble barriers, and the old deceased revival became a new living reality. He continued to preach during his short stay, chiefly in the open air, and to congregations which a church could not have contained, being generally from 3000 to 4000 auditors, who were pervaded with the cry of Pentecost, "What shall I do to be saved?" Describing these scenes at Kilsyth, the Rev. A. Bonar writes: "While pressing on the audience immediate acceptance of Christ with deep solemnity, the whole of the vast assembly were overpowered. The Holy Spirit seemed to come down as a rushing mighty wind, and to fill the place. Very many were that day struck to the heart; the sanctuary was filled with distressed and inquiring souls. All Scotland heard the glad news that the sky was no longer as brass, that the rain had begun to fall. The Spirit in mighty power began to work from that day forward in many places of the land."

After about a fortnight of such labours in Kilsyth, where he was every day employed in preaching, or in comforting and counselling anxious inquirers, Mr. Burns returned to his appointed duties in Dundee; but he had only been two days there when the same indications began to manifest themselves that had occurred at Kilsyth, and before the year had closed similar results followed in Dundee, Perth, Collace, Blairgowrie, Strathbogie, Ross-shire, Breadalbane, Kelso, Jedburgh, and Ancrum. And of this immense amount of exciting and exhausting toil he bore the principal part, preaching everywhere, and preaching constantly in-doors or in the open air, while nothing but a frame of iron, supported by an invincible patience, could have borne the burden. And well was it that for such a task as this he was no mere enthusiast or reckless inconsiderate fanatic, as so many might have been apt to imagine, but a man of a strong, considerate, well-poised mind, which all

who came in contact with it were compelled to respect. Nor was his oratory of the kind that is called sensational. "His preaching," we are told, "was as unlike what is usually known as revival preaching as anything well could be; but he was thoroughly in earnest. He believed every word he spoke. You could hardly fail to feel that. It came straight from the heart—from the abundance of the heart—and it went as straight to the heart. . . . The present writer has heard Mr. Burns preach, when every word he spoke seemed as a sharp arrow in the hand of the mighty. The word pierced right and left, and was answered by literal outcries on all sides. Strong men bowed their heads and wept, as if their very heart were literally broken." And yet, without a preparation, independent either of speaker or hearer, even such preaching could at other times pass by unheeded, or be listened to without emotion. "He has heard," the writer adds, "the same man preach equally clearly, equally powerfully, perhaps the very self-same discourse substantially, and yet no visible effects of any kind followed, beyond those which ordinarily follow the full and faithful preaching of the word." With so much preaching also he was never without careful preparation, while his self-possession and command of language enabled him to adapt his extemporaneous utterance to every change or emergency however sudden. One of these, the most disconcerting to an orator, occurred on a fine summer Sunday evening, when Mr. Burns was preaching to a very large crowd at the approach to a railway-station. In the midst of his discourse a tall man somewhat intoxicated stood at the edge of the crowd interrupting the speaker, and by his ludicrous remarks exciting the laughter of those who were near him. At last Mr. Burns paused for a moment, and turning his eyes on the man, said calmly but impressively: "You are tall and strong; but you are not too tall for a coffin, nor too strong for the worms. You are tall and strong; but not too tall for the grave, nor too strong for death. You are tall and strong; but you will soon have to stand forth, one of the crowd, before the great white throne; and how will you face the Judge of the whole earth? Tall and strong as you are, you cannot be hid from God: the rocks and mountains will not cover you: His all-seeing eye is on you now." This awful rebuke slowly and deliberately uttered sobered the reveller; he crouched beneath the level of the crowd, and stole away.

The career of laborious open-air preaching over Scotland, which was also extended into England as far as Newcastle, and into the north of Ireland, was continued until 1844, when Mr. Burns began to feel that his mission in his native country was fulfilled. He had made trial of his ministry, and discovered the work for which he was best fitted; and instead of subsiding into the comfortable life of a parish incumbent, he resolved to devote his energies to evangelistic and missionary labour. He saw that the command was still imperative to preach the gospel to all nations; and provided his proper field could be found, he was indifferent to its remoteness, or the trials with which it might abound. Independently also of the success of his past endeavours which encouraged his choice, his physical frame possessed great power and endurance of nerve, while his aptitude in the acquirement of languages, in which he excelled most of his class-fellows, had made him distinguished at the university. Canada was the first outlying station to which he turned; and having speedily mastered the French tongue, he traversed the greater part of the vast region of Canada, preaching in the open air, in barracks, and in prisons,

wherever his services were judged needful, gratified with many conversions among the mixed population of French and British colonists, and obtaining a proportionable amount of hatred and opposition from the Popish clergy, whose ascendancy his coming had so greatly disconcerted. After having aroused the careless, alarmed the depraved, and occasioned by his preaching an unwonted solicitude about their spiritual and eternal interests, he felt that there too his mission was fulfilled; to rouse to such inquiry was the work for which he was best qualified, and having accomplished this he thought that such a people might be safely intrusted to that gospel ministry with which the colony was provided. He therefore returned home, and awaited the first call to missionary labour that might offer. Nor had he long to wait. The English Presbyterian Church had adopted China as their field of operation, but such obstacles had occurred that they were resolving to change it for India, when Mr. Burns presented himself before the Presbyterian synod at Sunderland while they were holding their sittings there, and offered to go out as their missionary to China. Such an offer from one already so well known, and made in so disinterested a manner, struck the whole meeting with glad surprise, and on asking him when he could be ready to set sail, he pointed to his carpet-bag lying at the bottom of his seat, and replied, "To-morrow." He was accordingly ordained, but instead of being sent off at once, he was detained a few months in England to visit several of the congregations. At length he set sail, and arrived in Hong-Kong in November, 1847, and there he resided about a year, studying the Chinese language, and preaching to a small congregation of British residents. In 1850 he tried to establish himself in Canton, but failing to effect this he repaired to Amoy, acquired a new dialect of the Chinese language, fitted up at his own expense a little chapel, and itinerated as a missionary among the numerous towns and villages of the island of Amoy. But this was not all, for he gave a whole year's salary to the mission for furnishing another missionary to China. In fact, his own expenditure scarcely amounted to a tenth part of his salary; all the rest was devoted to the support of the mission.

In these missionary tours among the villages inland, where Mr. Burns was often a week or more from home, the people collected in great numbers to hear his addresses, which were sometimes as numerous as six in a day, delivered at as many different villages. He usually sent forward his native assistants to distribute copies of the ten commandments, and this was followed up by an earnest address pointing out the only way in which the breaker of that law could obtain pardon and eternal life. In a country where strangers are so hated and despised, and Christianity has been persecuted as a state crime, it required no small amount of courage for Mr. Burns to go into districts where he was wholly unknown, and attempt to convince such a self-sufficient people of the uselessness of the religion of Fo or the philosophy of Confucius to procure their acceptance with God. But he adopted the simplest of all methods, that of the primitive teachers of Christianity, and found it, in spite of the prudence of the nineteenth century, to be the safest and most effectual. Giving an account of his tours among the Chinese he told a friend in England that "he went forth in the morning trusting to the guidance of the Master. So soon as he reached a village he commenced to read his Bible aloud, say, under the shade of a tree. Soon the villagers began to gather, and he explained to them the nature and object of the gospel. Usually some one would ask him about meal-time where he

was to eat? And he as usually partook of what was set before him by some hospitable villager. As evening approached some one would offer him a night's shelter; and thus he often went on from week to week, preaching the word as he went, and lacking nothing."

In 1854 Mr. Burns returned home, but after a stay of only three or four months in his native land, he went back to China. That he now considered as his home and country, the place in which he was to labour, and live, and die; and so prevalent was this feeling, that he adopted the dress of the people, and became not only in language, but in manners and appearance, a Chinese. His constituents and friends in Britain thought that this was carrying his accommodation too far; but he was of opinion that in this way he could more effectually conciliate the arrogant inhabitants of the "Flowery Land," and win a more favourable hearing for his message. In this style he travelled about the country, preaching, teaching, and exhorting, with a Chinese Bible under his arm; and when the "Man of the Book" thus appeared at a town or village, he was generally received by the people with love and reverence. Besides the Decalogue in Chinese which he plentifully distributed, he translated the *Pilgrim's Progress* into Chinese, which he was able to print at a small expense of fourpence or sixpence a copy; and this wonderful production of the Bedford tinker, suited for all time and for every country, found its way into a land of which its author probably knew nothing but the name. But Mr. Burns could not always thus travel and teach at large in a country where the government was so suspicious of strangers without interruption, and on one occasion while pursuing his wonted course, towards the end of 1856, he fell within the grasp of Commissioner Yeh, whose name was afterwards of such portentous distinction in his dealings with the English. As the native accounts of the missionary's proceedings are interesting, we give them as they are embodied in the official report of the high imperial commissioner to the British consul at Canton: "He, Yeh, has before him an official report of the district magistrate of Chaon-chow, in which he finds the following. Inspecting the defences of the place they found three persons seated in a boat on the river, whose appearance had in it something unusual. We, the magistrates of Chian-chow, found in their boat, and took possession of, seven volumes of foreign books and three sheet-tracts; but these were the only things they had with them. On examining the men themselves, we observed that they all of them had shaven heads, and wore their hair plaited in a queue, and were dressed in Chinese costume. The face of one of them had, however, rather a strange look; his speech in regard to tone and mode of expression being not very similar to that of the Chinese. We therefore interrogated him carefully, whereupon he stated to us that his true name was Pin-wei-lin (William Burns), and as a teacher of the religion of Jesus he had been for some time past engaged in exhorting his fellow-men to do good deeds. (After a statement of dates and facts they thus continue:) Wherever he went he made himself acquainted with the language of the Chinese, and by this means he delivered his exhortations to the people, and explained to them the books of Jesus, but without receiving from any one the least remuneration." "Such," adds Yeh, "is the account given by the missionary, William Burns, who, together with his seven volumes of foreign books and his three sheet-tracts, was given over to the charge of an officer, and brought by him in custody to this office." The commissioner was evidently puzzled by such a capture; his cruelty

and avarice could derive no gratification from it; for the missionary, as a British priest, was too important a subject to be executed or put to the torture, and too poor to be *squeezed* according to the usual fashion of Chinese justice; and accordingly Yeh thus ends his statement: "I have directed Hen, the assistant Nanh-hae magistrate, to hand him, Mr. Burns, over to the consul of the said nation, in order that he may ascertain the truth respecting him, and keep him under restraint; and I hereby, by means of this declaration, make known to the consul the above particulars."

Such is a very brief sketch of the missionary labours of Burns in China from 1847, when he first landed there, until his death. They can only be understood however by a full detail of them, which has been given in the *History of the Chinese Missions of the English Presbyterian Church*. In prosecuting his task he mastered five dialects of the Chinese, each so different from the other, that it was almost equal to the acquirement of five languages. His incessant toiling in the good work, so like that of a primitive apostle, was crowned with apostolic success. And so full was his self-denial and his unrestrained benevolence to the close of his career, that scrip or purse would to him have been superfluities, for he gave as fast as he received. After a life of such active religious usefulness in Britain and Ireland, in Canada and in China, it could scarcely be otherwise than that he should be prematurely worn out, and a severe shock which his health sustained from the privations he endured in a native vessel while sailing to Nieu-chwang, and afterwards at that place while prosecuting his missionary duties, brought on his last illness. He soon saw that there was no prospect of recovery, so that while announcing the tidings to his mother he wrote: "Unless it should please God to rebuke the disease, it is quite evident what the end must be; and I write these lines beforehand to say that I am happy and ready, through the abounding grace of God, either to live or to die. May the God of all consolation comfort you, when the tidings of my decease shall reach you; and through the redeeming blood of Jesus, may we meet before the throne of God!" His death was in entire harmony with his life. About six or seven days before it occurred, a few of his English friends residing at Nieu-chwang were collected at his bedside, and a very interesting religious conversation was going on. "Finding a decided change for the worse, and great distress in breathing, the gentleman read and repeated several portions of Scripture, among others Psalm xxiii. Hesitating at the verse, 'Yea, though I walk through the valley of the shadow of death,' Mr. Burns took it up, and in a deep, strong voice continued and finished the psalm. He also greatly relished John xiv., 'Let not your hearts be troubled,' and on closing the exercise with the Lord's prayer, Mr. Burns suddenly became emphatic, and repeated the latter portion and doxology, '*For thine is the kingdom, and the power, and the glory,*' with extraordinary strength and decision. This was the last time he manifested any power of mind. Afterwards he only evinced recognition, and at last hardly spoke, or even opened his eyes. Thus he passed away." He died on the 4th of April, 1868, when he had just entered his fifty-fourth year.

CAMPBELL, JOHN, D.D. As a Dissenting minister and a journalist he occupied an influential position, which he attained by his unaided energy and talents. He was the son of Alexander Campbell, surgeon in Kirriemuir, near Dundee, and was born October 5th, 1795. A short time after his birth his father died, and the helpless infant was thrown wholly upon the charge of his mother, who

however fulfilled her task to the best of her ability; and after being taught to read, which he learned with remarkable facility, he was sent to the parish school, where his gentleness and good behaviour made him the favourite of the schoolmaster. Along with a desire for general knowledge which he gratified by miscellaneous reading, he was very partial to mechanical operations that required dexterity and inventiveness, and in this way became a Jack-of-all-trades without excelling in any one in particular. His wayward and impulsive spirit was at last enthralled by the perusal of *Dampier's Voyages*, so that he resolved to become a sailor and see the world, and with that view went secretly to Sunderland, bound himself to a shipowner in that port, and made several voyages. Soon finding, however, that the romance of the sea was a very different thing from its severe realities, he resolved to quit the occupation of a sailor, and this he did in defiance of his indentures by stealing one night from the deck to the ship's boat while it was anchored in a bay off the coast of Norfolk. It was nearly a mile to the shore, and on descending into the boat he found that there was no oar in it! In this dilemma he suspended himself by the stern of the boat, using his feet in the water as paddles, and by this irregular kind of rowing at length managed with great labour to reach the landing-place in the bay. Having then made fast the boat to another ship's cable, that its owners might find it in the morning, he returned home cured of every sea propensity, and resolved that all his future endeavours should be confined to dry land.

The first occupation of John Campbell after settling at home was as a blacksmith in the shop of a relative in Dundee, where he distinguished himself as a first-rate hand in shoeing horses; and afterwards he was employed in a foundry of the same town. In none of these occupations, however, had he found his proper vocation, and from his talents it was evident that he was fitted for something higher and better. At length the power of religion, under which he now came, consolidated his wishes and directed his choice: he would be a preacher, the office for which he was best qualified; and as he had joined the community of Methodists, among whom a learned education was not essential for a religious teacher, he preached among them, and afterwards among the Independents, a body which he had thought fit to join, supporting himself meanwhile by teaching a school. His sense of deficiencies, and his aspirations for still higher excellence, having grown by the practice of preaching, he was anxious to qualify himself for his sacred duties, to which he had resolved that his whole life should be devoted. Accordingly he turned his attention to a university education; and to fit himself for entrance into the college he studied Latin under private tuition. He repaired to the university of St. Andrews in October, 1817. How diligently he had qualified himself for the work of a student may be surmised from the fact that on entering college he won one of the Latin bursaries by competition, although he had previously no purpose for such a bold trial, and was only incited to it by the urgency of a fellow-lodger. As he found it easy to prepare the lessons for the class, Campbell had abundance of leisure to gratify his love for general knowledge, and this he pursued so voraciously that he was one of the most frequent applicants at the university library. But besides this, he also gratified his ardent love for discussing and haranguing. Of this instinct, which he manifested when a child, the following instance is given by his biographer. "When about five years of age, seeing a troop of soldiers proceeding along the highway,

the boy ascended the stump of a tree, and began to make a speech to the men of the red coat, loud and vehement, to their great amusement. One of the soldiers stepped aside, and laughing in the child's face, gave him a piece of roll, saying, 'Go on, my little fellow; you will be a preacher some day.'" Campbell became a member of the university Forum, where he soon obtained a foremost place; and not satisfied with this, he established another weekly society for debate which became very popular in St. Andrews. But while distinguishing himself by eloquence and readiness in discussion, and gathering by reading an immense amount of knowledge on every variety of subject, John Campbell was still under the necessity of teaching to support himself at college; but on this occasion it was a higher kind of instruction than that which he had formerly attempted. Having obtained a public room in St. Andrews, he established an elocution class to correct the barbarous manner in which his fellow-students pronounced their native language; and the endeavour was so respectable that the French professor and several gentlemen became his private pupils.

After having studied two sessions at St. Andrews, Mr. Campbell resolved to complete his curriculum at the university of Glasgow. Here he entered the gown classes, and at the same time became an auditor of the lectures of Dr. M'Gill, professor of theology. But while advancing in scholarship, he still made his sacred duties his chief concern, and preached not only in buildings but the open air, especially at Partick, in the neighbourhood of Glasgow, with increasing popularity. In 1824, however, this acceptance was the cause of involving him in a whole world of difficulty. There was no Congregational church in the town of Kilmarnock, while there were only three poor weavers in it who belonged to that persuasion; but being abundant in zeal, and perhaps in ambition, they resolved to found a church of their own in the locality, and to that effect sent a requisition to the Congregational head-quarters at Glasgow. It was favourably received, and in consequence of their expressed preference for Mr. Campbell, he was sent to Kilmarnock by Dr. Wardlaw to collect and establish there a congregation of Independents. Confident of success, these poor weavers had rented the Music-hall, although they were unable to pay for it; and as the speculation turned out a failure, in consequence of the Presbyterian tendencies of the town-folks, Mr. Campbell had not only to become responsible for the rent of the hall, but to support himself into the bargain. Finding that he could not collect a congregation from the other churches, he went out into the lanes and highways of Kilmarnock and the neighbouring towns, preaching in the open air to those who did not enter a place of worship, and the result was, that after a short time the Music-hall was filled to overflowing, so that he was obliged to transfer the meetings to the Masonic Lodge, which was more commodious for the purpose. There he established four services on the Sundays, until at last he was obliged to meet his numerous auditory in the town-green. Notwithstanding this great increase of his duties in Kilmarnock, he continued his favourite practice of open-air preaching, and the popularity he acquired by this kind of ministerial labour was testified in the increase of his own particular flock.

Encouraged by these promising symptoms, Mr. Campbell now resolved to convert his precarious preaching station into a regular church, according to the Independent model, and this resolution involved him deeply in the mortar-tub. He planned the building of a church and manse, for the cost of

which he guaranteed his own responsibility, and when they were erected he set out upon a preaching tour to collect funds for the purpose. This was the more necessary, as, notwithstanding the number of his audience, it had collected from liking to himself rather than the sect to which he belonged, which they knew nothing about, or regarded with Presbyterian aversion, so that the only Independents of his flock still continued to be nothing more than the original three poor weavers. He therefore had recourse to a preaching tour through some of the principal cities and towns of Scotland for the collection of funds, and was so successful that he was enabled to clear the expenses both of church and manse. Having thus surmounted the difficulty, he settled down in this locality as a permanent charge, and married a young lady, Miss Agnes Crichton, a school-mistress in Irvine, whose tastes and character corresponded with his own, and whose affections he had engaged soon after his arrival in Kilmarnock.

During the five years of his residence and ministry in that town, Mr. Campbell had no fewer than five tempting calls for removal to other pastoral charges, one of these being from Edinburgh, and another from Dublin. His fame as an eloquent and effective preacher had been widely diffused by his preaching tour for the collection of building funds, in which he had visited not only many parts in Scotland, but also of Ireland and England. The whole five invitations were rejected, but another which followed could not be so briefly disposed of. While in England collecting money for his manse and chapel, he was invited to supply the pulpit of Hoxton Chapel for six weeks during June and July, 1828. He gladly accepted the call, and preached in that large church to overflowing audiences with an acceptability seldom accorded by English congregations to pulpit orators from the north; and this difference is sufficiently explained by the intellectual tendencies of the two nations. It is distinctly shown by Campbell in the following words of a letter written at the period. "A great preacher in Scotland might utterly fail here. Excitement, excitement, effect, effect, these are everything. Profound exposition and accurate views of the gospel are nothing, or next to nothing, with many. They care not to be taught, but to be touched and moved." During his stay in London he was almost overwhelmed with preaching invitations, and had now become one of the pulpit lions of metropolitan Dissenterism. On his engagement with Hoxton Chapel having expired, he returned to his flock at Kilmarnock: but his admirers in London had not lost sight of him, and soon after he received a formal invitation to supply the services at the Tabernacle and Tottenham Court Road Chapels, commencing his labours in the month of October, and officiating during eleven Sundays—an invitation with which he closed. Circumstances had now occurred which in course of time were to settle him permanently in London. The minister of Tottenham Court Chapel, a man in his eighty-third year, and one of the most popular preachers and influential leaders of his communion, was the well-known and justly celebrated Mr. Wilks. Feeling that his end was approaching, and anxious that his place should be adequately filled, he silently studied the character of Mr. Campbell, and conceived him everyway qualified for the succession. One trial of this kind, among several, seemed to indicate such a conclusion. Being in the pulpit, and too unwell to continue the service, and learning that Campbell was among his hearers, he sent to him a request that he should preach, with which the other immediately complied. When he stepped into the

vestry previous to ascending the pulpit, Mr. Wilks joined him, and taking off his gown and bands in silence, he put them on Mr. Campbell. The Puritanism of the latter, which had never submitted to such insignia, was somewhat startled; but controlled by the fatherly and authoritative manner of Mr. Wilks, he uttered no objection, but went thus draped to the clerical duty of the day. The sermon which he delivered on the spur of such an occasion to an audience that filled the whole of that vast building, was of such remarkable power that the venerable Wilks had no cause to regret the investiture which he had symbolized with his robes of office. On returning to the vestry the old man, pointing to a chair which had belonged to the celebrated Whitfield, said to Campbell, "That is Moses' seat, sir; sit down." "If so," replied the young man, "it is not for me, sir, but for yourself." "Do what you are bid, sir," rejoined Mr. Wilks. The result of all this was, that the minister and managers were in favour of Campbell's succession to Mr. Wilks; and as a touch of Presbyterianism still lurked in the Scottish bones of Mr. Campbell, he also obtained what he valued most of all—the expressed wish or call of the congregation that he should be their minister. Almost immediately after, Mr. Wilks died, and Mr. Campbell entered into the vacant charge.

On succeeding Mr. Wilks, it was as minister of the Tabernacle, as Tottenham Court Road Chapel, in consequence of a change in the disposal of the property, was no longer an Independent place of worship. At the Tabernacle, however, Mr. Campbell, at his entrance, found several established usages with which he could not conscientiously comply, and these he set himself to remove with his wonted firmness and decision. One of these was the practice of kneeling at receiving the communion, which had prevailed among a part of the congregation since the days of Whitfield. Another was a frequent communion service held as early as six o'clock in the morning, to the great discomposure of family order and comfort. A third was a prohibition by the managers of the chapel for the minister to read any portion of Scripture in the public religious services of the chapel, under the plea that the people could read the Bible for themselves at home. To these and other obstacles which had been obstinately kept up from the time of Whitfield, without any regard to change of time or progress of improvement, Mr. Campbell systematically opposed himself until he had procured their abrogation. Still self-educating, and making advances in various departments of intellect, Mr. Campbell in 1831 combined authorship with preaching by becoming a contributor of articles to the *Patriot* newspaper and the *Eclectic Review*; and by this step he brought himself into contact with several eminent literary characters, in whose society and conversation he found the best cure for that clerical exclusiveness which so often mars the efficiency of our public teachers of religion.

It was in 1834 that the keenest and most important of Mr. Campbell's controversies commenced; and it was not with opponents outside the Tabernacle, but a party composed of his own flock. Dissatisfied with his reforms which he had introduced into the church-service, and perceiving that he was too well established in the affections of the people to be removed, the managers abdicated, and made over the lease of the chapel to certain men who formed themselves into an oligarchy for its future government. And sufficiently despotic it was, for they arrogated to themselves the power not only to choose a minister for the congregation, but to

remove him at their own pleasure, without regard to character, doctrine, or pastoral efficiency. It was a natural result into which *Independency*, whether religious or political, is so often seen to fall. To find time to establish their illegal authority, they endeavoured to keep the change a secret from their pastor, but he was soon apprised of it. He was at this time supplying a vacant pulpit in Edinburgh, and preaching to a congregation that wished to have him for their minister; and from this vantage-ground he sent a letter to his London managers of which the following is an extract:—"If I must submit to the domination of men whom I never saw, whose authority I never recognized, and hold to be usurpation; men who can have no scriptural or reasonable connection with my charges or with myself;—if such men are to control my procedure, decide my merits, and regulate my subsistence; if such men are to rob my people of their rights to manage their entire affairs, to choose and depose pastors, either as a body, or as represented, and having their authority concentrated in their own managers, who are of themselves—if such men shall have the privilege, as often as they please, to convene the managers at Tabernacle House, and in their presence to criticize all the doings of a pastor, misrepresenting and maligning him; to rob him of his character, and ruin his usefulness, while to him is denied all means even of explanation or defence;—if these things, and as much more as the principle, or rather want of principle, renders possible and practicable, are to exist any longer, and if by a legal instrument they are to be rendered perpetual, then I must, my dear Christian friends, with all the esteem which I bear you, be permitted to intimate, with the utmost decision, with all solemnity, and much sorrow, that our connection is at an end."

In consequence of this express alternative it was necessary that Mr. Campbell should ascertain by actual experiment whether he could reduce the managers to reason, or must himself yield to the storm, and be minister of the charge no longer. He accordingly at the close of the week returned to London, and on Sunday presented himself in the Tabernacle for the usual discharge of his public duties. But there an opposition had been organized against the attempt, which would have been simply ludicrous but for its profane indecency. The pulpit had been secured with a lock, and turned into a sentry-box in which a man had remained all night upon watch and ward. The door at the foot of the pulpit stairs was also secured with a lock, and a guard of policemen and church-managers drawn up before it to confront and hinder the first advance of the minister. These were the military arrangements of a Sunday morning in a Christian church, and all to try conclusions with the pastor, and prevent him from the performance of his sacred public duties. Nor here did the painful farce terminate; for a gentleman—a professed friend of Mr. Campbell, but who had lately become a member of the oligarchic clique—first gave out a hymn to the congregation, thanking God for their minister's safe arrival, then prayed with great fervour for his welfare—and finally took his stand with his back to the pulpit-door to keep him out. Not for one day also, but for six months, was this strange display of recusancy maintained unbroken.

During this warfare, although Mr. Campbell presented himself every Sunday at the appointed hour for the performance of his duties, there was no relenting on the part of the conspirators, so that he withdrew in silence as he came, and preached to nine-tenths of his congregation in a large hall, the

use of which had been secured for these services. Not content also with this annoying opposition, which shocked the feelings of the serious in London and furnished food for the merriment of the profane, the enemies of Mr. Campbell attempted to blacken his character both as a minister and a man. He was not only, they asserted, heterodox in doctrine, but too practical in his preaching to be evangelical—that he was Arminian rather than Calvinistic, and an Arian rather than a Trinitarian—that he was loose in the admission of members into the flock, so that the church at the Tabernacle was no better than an open communion—that his Bible-classes were mere debating clubs—that in public and private he was addicted to insincerity and falsehood; and that, in short, there was scarcely anything too mean and worthless at which he would stop short for compassing his ends. There are limits in the endurance of injuries beyond which patience ceases to be a virtue, and on the 18th of December, 1834, this vexatious case was brought for adjudication into the vice-chancellor's court. Thus reduced to a question of legal right, its merits were intelligible, and a conclusion made simple and express. It was against the arrogant claimants, and in favour of Mr. Campbell and his congregation, who were left in quiet possession, while the oligarchy was so utterly scattered that it could not afterwards be found. In reviewing this case many years afterwards, Mr. Campbell writes in a grateful spirit, "I have reason to reflect, with no small degree of satisfaction, on the general course adopted by my friends and myself. Even at this day I see very little on their part, or my own, to cause regret. Never did churches more lovingly, generously, and faithfully uphold a pastor, or more boldly, steadily, or perseveringly stand by a cause—the cause of truth and righteousness, justice and liberty. I count it an honour to have served such a people in the gospel of Christ, and to have shared with them in so noble and virtuous a struggle."

While Mr. Campbell was watching his case through the court, and studying the characters of the choice ornaments of the bar, all this was not enough for his active mind, and during these hours of waiting and suspense he occupied himself in planning one of his best literary works. It was a prize-essay offered for competition by a benevolent Christian gentleman, who wished that members of the Congregational denomination, although not educated for the ministry, should be more extensively employed than hitherto in the work of Christian teaching among the community at large, and who announced a prize of one hundred guineas for the best essay on this employment of a lay agency. It was a subject according to Campbell's own heart, upon which he also had large experience; and during the progress of the trial he had sketched out and prepared a large portion of the work, which finally appeared at the close of 1839 under the title of *Jehro, a System of Lay Agency in connection with Congregational Churches*. We are not informed of the number of competitors, but the judges had little hesitation in awarding the palm of superiority to *Jehro*, and on being published its popularity was almost universal. It is, on the whole, the most intellectual and elaborate, and perhaps the best, of all its author's writings.

Having now been borne into tranquil waters, he was enabled to resume his pastoral cares which had been so rudely disturbed; and as Tottenham Court Chapel, which by the late decision had been returned to his charge along with the Tabernacle, was dwarfed into a mere preaching station, he was

earnest in restoring it to more than its former amplitude. He accordingly established for it day and Sunday schools, a body of deacons for the care of the poor of his flock, prayer-meetings for the congregation, monthly meetings for supplying them with missionary intelligence, school and congregational libraries, which he extensively supplemented from his own collection, and district-meetings for Christian fellowship among the members of the church. The same course he pursued at the Tabernacle. He was also careful to obtain the best preachers from every evangelical nonconformist communion to assist him in supplying the pulpit of his two chapels. While his preparations for the pulpit were most carefully studied and prepared, and his public appearances as a preacher frequent, he had also had recourse to the press for the purpose of teaching his flock. He commenced by publishing a small volume reviewing the condition both of the churches and congregations, and setting forth what he deemed necessary to restore their efficiency. He published three catechisms for families and schools, with a text-book for Bible-classes. He added a series of letters on the subject of district-meetings, pastoral visitation, and other matters; and he published a hymn-book for the congregation and another for his schools. To facilitate the religious instruction of his Bible-classes and helpers' meetings, he published in 1836 the "*Youth's Guide to Sacred History*," a Catechism on the Facts of the New Testament Scriptures; and in 1854 another catechism on the *Facts of the Old Testament Scriptures*, both of these works distinguished by their simplicity as well as careful study and research. In 1836 he published his *Theology for Youth*, on the doctrines, experience, and duties of the Christian system—a work much needed, and which is highly valued by all who are engaged in Bible-class instruction. To complete the series of works on religious instruction and church discipline he also published his valuable treatise on *Church Fellowship*, with an *Essay on Marriage*. But his greatest work at this period of his authorship was, *Maritime Discovery and Christian Missions considered in their Mutual Relations*. The merit of these numerous publications, and the high place which their author held in the religious world, were not lost sight of in our northern seats of learning, and the diploma of D.D. was conferred upon him by the senatus of the university of St. Andrews.

The next important enterprise in which Dr. Campbell was engaged was the emancipation of the Bible from the fetters of monopoly, a deliverance which already had been achieved in Scotland. Against the monopoly of the royal printer for Scotland the Rev. Dr. Adam Thomson of Coldstream had entered his public protest in 1834, and had persevered in it so strenuously that in 1839, when the printer's patent expired, it was not renewed. The ordinary competition established in the printing of other books was now obtained for the Scriptures, and cheap Bibles of excellent type and paper were in circulation over Scotland at a price which would formerly have appeared fabulous. This example inspired Dr. Campbell. Could not the monopoly be also broken in England, where there was still greater need for its overthrow? He commenced the warfare by a series of letters in the columns of the *Patriot* newspaper, and afterwards, in conjunction with Dr. Thomson, made a tour over the principal towns and cities of the kingdom, explaining the enormity of the evil and suggesting the remedy. The conversations and public speeches of such an agitator did not fall unheeded, and the cry for cheap Bibles became one of the popular demands of the day. It

was not indeed the monopoly itself as the cost of the Scriptures which Dr. Campbell denounced as the head and front of the evil; and he suggested the four following remedies, with any one of which he would have been satisfied:—

"1. Let the Queen's printer's patent be forthwith abolished.

"2. Allow the importation of cheap Bibles for schools and the poor.

"3. Permit the British and Foreign Bible Society to print its own books.

"4. Let the patentees supply the Bible and Testament which the Bible Society was lately selling to schools at the prices for which the Society sold them—that is, at cost price."

Any of these measures, Dr. Campbell added, "would go far to meet our views of the exigency of the case. If you abolish the patent, and if you think that justice requires it, by all means compensate its holder, unless he be satisfied with the enormous gains already realized from the hard-earned pence of the poor peasantry, and the penniless children of our Sunday-schools. If these most reasonable overtures be rejected, then there remains only one course—England must force it. The voice of her millions will prevail." When the battle terminated the monopoly was not destroyed, but rendered almost innocuous, and copies of the Scriptures became so cheap that the Bible could be purchased for sixpence, and the New Testament for twopence. Some of Dr. Campbell's best friends, among whom was his efficient coadjutor, Dr. Thomson of Coldstream, were indignant that he should content himself with such a partial surrender. These cheap issues, they maintained, would only be temporary, and that when all was lulled into peace and forgetfulness, the monopoly would resume its ascendancy. But by the many his successful labours were applauded, and the general satisfaction was expressed by several gratifying testimonials.

In 1830 was formed the Congregational Union of England and Wales. Its object was to unite into closer union and co-operation the many Independent congregations, which, in consequence of their ecclesiastical organization, acted as separate bodies, and were too apt to lose sight of each other by the separation. One plan by which cohesiveness was to be given to this union was the establishment of a denominational literature in the form of a monthly magazine; and in drawing up the plan of it, the experience and sagacity of Dr. Campbell pointed him out for the task. He set himself as editor of the future work to plan its character, departments, and mode of operation; and in 1844 he commenced his editorial duties upon the magazine, termed the *Christian Witness*. Only two years after, he originated the plan of the *Christian's Penny Magazine*, of which also he was appointed editor. The success of these periodicals justified alike his planning and his superintendence. At first they had a large and almost unprecedented sale compared with other religious magazines. During the year 1846 no less than 1,600,000 copies were issued from the press, being an average monthly sale of 31,000 of the *Witness*, and 100,000 monthly of the *Penny*. At the end of twenty years the total numbers printed were more than 14,000,000, represented by a profit of £11,655, 14s. 6d., the larger part of which was devoted to the securing of deferred annuities to many of the Congregationalist pastors, and annual distributions to distressed brethren—the rest was invested in government securities as a permanent fund for the benefit of aged and afflicted Congregational ministers. After continuing editor of both periodicals during twenty-one years, Dr. Camp-

bell resigned his editorship, and the trustees and managers indicated their sense of the value of his services by a gratuity of £500, which they voted to him on his retirement from the charge.

In the formation of the London City Mission by Mr. Nasmith, Dr. Campbell took great interest, although at first he viewed it with distrust, feeling that one of the evils of the day was the endless multiplication of new societies, through which the old were neglected. When Nasmith died five years afterward exhausted by his heroic labours, Dr. Campbell, who had been acquainted with him in Glasgow when a youth, was thought the fittest person to write his biography. And well and affectionately he fulfilled this duty in the *Memoir of David Nasmith*, which he published in 1844. But however home and city missions might interest him, it was to foreign missions that his enthusiasm was chiefly devoted; and when the news arrived of the untimely death of John Williams, who fell a martyr to his missionary zeal, being murdered by the natives of one of the South Sea Islands, the writing of his life also was devolved upon Dr. Campbell. This choice was appropriate, as Williams had received his first spiritual impressions and religious education in the Tabernacle; and well did the minister of the Tabernacle satisfy the general expectation, by *The Martyr of Erromanga*, in which the character, labours, and death of the devoted missionary, as well as the philosophy of Christian missions, are so eloquently portrayed.

In 1846-7 Dr. Campbell was involved in a personal controversy in consequence of having written a series of articles in the *Christian Witness* upon Wesleyan Methodism. The reply of the party was characterized by such bitterness and calumny that the Doctor could not do otherwise than refute it; but while doing this both ably and satisfactorily, he caught the infection from his opponents, and returned their asperity in no stinted measure. It was in no such contests that he was best qualified to shine. A more congenial occupation in which he employed himself at this time was the preparation of a volume of *Sermons on Self*, delivered to his congregation, for the press, "to promote the present gratification and the future welfare of an affectionate flock." The chief topics of these discourses, ten in number, will give by their titles a general idea of the work, and are as follows:—"Self-examination," "Self-approval," "Self-condemnation," "Self-denial," "Self-indulgence," "Self-distrust," "Self-confidence," "Self-preservation," and "Self-destruction."

For some time past Dr. Campbell had been impressed with regret at the immense numerical superiority of the pernicious immoral newspapers as compared with the counteracting works of the Bible and Tract Societies, and although already the editor of two magazines, he also wished to have a newspaper of his own in which he could maintain a daily and hourly opposition to the preponderating evil. While his thoughts were in this direction, he received a letter from the committee of the *Patriot* newspaper intimating the means by which his wishes might be gratified. His observations in the *Christian Witness* had suggested the project, and they were anxious to establish a new weekly periodical, devoted to the interests of benevolence and religion, and connected with those of nonconformity—and of this they earnestly desired him to undertake the editorship, otherwise the attempt must be abandoned. To insure its success, they also offered to relieve him of his pulpit duties for twelve months by procuring substitutes for their performance, while future arrangements might be made according to contingencies.

After several weeks of deliberation he decided on accepting the offer, moved by these words of Mordecai: "If thou altogether hold thy peace at this time, then shall enlargement and deliverance arise from another quarter; but thou and thy father's house shall be destroyed; and *who knoweth whether thou art come to the kingdom for such a time as this?*" He undertook the management upon the express condition that beyond having his pulpit supplied he was to receive no emolument whatever; he drew up the plan, and announced the principles upon which this periodical, to be called the *British Banner*, would be conducted. "We will never cease to insist," he thus announced, "that national can only be the effect of individual regeneration. On these grounds, not simply rejecting, but resenting the idea that the ignorant, the idle, the improvident, the vicious can be raised to happiness and respectability by mere legislation, the conductors of the *British Banner* will strain every nerve to elevate the moral character of the people, as the only path which will infallibly place them within the pale of the constitution. Politics, in their columns, will occupy much the same proportion as, in their judgment, they should in the mind of a superior Christian citizen. As to social economics, while they contend for the rights of labour, they will boldly assert the claims of capital, not forgetting, however, the duties of the capitalist. They will take the moderate common-sense practical view of all subjects, to the exclusion of crotchets; and they will in no case waste their breath in the pursuit of the airy, to the rejection of the substantial; but notwithstanding this, their motto will be—PROGRESS IN EVERYTHING."

The new journal first appeared at the commencement of 1848, and its early success was unparalleled: no religious newspaper had hitherto commenced under such promising auspices. Year after year it continued to display the force of its public influence and the choice character of its editorship. Dr. Campbell was also enabled to commit himself more exclusively to the work, as at the commencement of his labours on the *British Banner* his voice broke down, and from this and other causes he was unfitted for his ministerial work, which he was obliged to resign into other hands. His literary energy and perseverance were remarkable. When his newspaper was started he had four amanuenses established in his office at Bolt Court, who were successively summoned to his room, each of whom received from him almost a quarter of an hour's dictation either written in short-hand or dictated extemporaneously; for his habits of extemporaneous preaching had given him great quickness of thought, and remarkable facility in language. While thus so closely occupied, he was impatient of interruption, especially by frivolous callers; and when any of these appeared, he would look at his watch, which was always placed in front of him, and say, "Now, sir, two minutes is all I can give you. What do you want? Come to the point." But his busiest day was Thursday, in which none, under whatever pretence, was to enter his room; and when this rule was transgressed, the Doctor invariably said to the intruder, "I cannot see anybody, I cannot see even angels to-day." On one occasion, when a visitor strongly recommended, and coming on urgent business, came upon him thus occupied, he only heard him for a few moments, and added by way of apology, "If the angel Gabriel was to call, I should ask him to retire and walk up-stairs." The management of his *Penny Magazine*, *Witness*, and *Banner*, independently of the pastoral duties of Tottenham Court Road Chapel and the Tabernacle, which he still retained—each of which would have

been occupation sufficient for one mind—will not only explain his solicitude about freedom from interruption, but apologize for his bluntness when his privacy was invaded. So early, however, was his work commenced in the morning, so effectual his method of saving time, and so much thereby accomplished in a single day, that he could find leisure to write *Popery and Puseyism Illustrated*, which was published in 1851. The work consists of four essays, in which the unscriptural claims of the Papists and Puseyites are exposed and refuted, and the superiority of genuine Protestantism vindicated. In 1853 Dr. Campbell published a little work, entitled *Counsels on the Choice of Pastors*. In 1856 he published six letters on the moral and spiritual condition of the metropolis, pointing out their diseased condition, and suggesting the best means of cure.

Great as were the merits and wide the popularity of the *British Banner*, it was unfortunate that Dr. Campbell should have undertaken its management. Highly talented though he was, it was not the kind of work in which he was best fitted to excel, and the cause of this is so well explained in Campbell's obituary, written in the *English Independent* of March 28th, 1867, that we cannot refrain from quoting its statement. "The truth is, that the mind of Dr. Campbell was not well adapted for the work which, in the newspaper line, he had undertaken. It embraced a large variety of subjects, some of which he had but little studied. It required more various and more special information than he had collected. It exacted a readiness which he never possessed, and for which no amount of mere labour could suffice as a substitute. It involved an art only to be acquired by much practice, of which he had none. Above all, it called for a power of dividing attention among a dozen subjects at once; whereas the power in which he excelled, both by nature and by habit, was that of concentrating attention exclusively upon one. It is therefore no disparagement of Dr. Campbell's just reputation to say that he never proved equal to himself as editor of a newspaper. That he worked hard and rendered useful service in the two journals which he originated, is not denied even by those who sometimes thought his efforts misdirected, and were compelled to take exception to the methods which he used; but to his warmest admirers, no less than to observers who watched him with a critical reserve, it cannot but have been apparent that nearly every effort which gave a character of energy, not to speak of success, to the labours of Dr. Campbell as a newspaper editor, consisted in a series of epistolary compositions addressed to real or imaginary correspondents, and strictly limited to one subject or class of subjects." It was not, however, owing to this deficiency that his connection with the *Banner* was dissolved, but his uncompromising earnestness for what he conceived to be the cause of truth, and the unsparing manner in which he advanced its claims, be its obstacles or opponents what they might. This involved him in controversies which he did not always conduct in the best of tempers, and the *Banner* which he carried so boldly into these affrays was apt to sustain damages which its proprietors did not care to hazard. After some bickering with them on this account, his editorship of the newspaper terminated at the close of 1856, and the *Banner* itself became extinct.

But although the Doctor thus threw down the *British Banner*, it was only to take up the *British Standard* in its stead—a newspaper as like the former in character and spirit as the one name was like the other, but free from the incumbrance of managers or

proprietors; and he triumphed in the thought that by the absence of such restrictions he would be able to express his sentiments without check or limit. Very soon after it was established an important occasion presented itself, and he rushed into the field of controversy. In a republication of Horne's *Introduction to the Critical Study of the Scriptures*, Dr. Davidson, one of the professors of Lancashire Independent College, had produced an additional volume which was considered as having a tendency to unsettle the faith of inquirers regarding the authenticity and inspiration of parts of the Old Testament. Shocked that a teacher of the future teachers of religion, and one belonging to his own particular church, should have been guilty of so extreme an inconsistency, Dr. Campbell proclaimed his opposition. His desire was to keep the colleges untainted by heresy; and the letters which he published on the occasion were thought to have had a large influence in producing that important result.

On the death of his old friend, the Rev. J. A. James of Birmingham, Dr. Campbell published the work entitled "*A Review of his History, Character, Eloquence, and Literary Labours*, with Dissertations on the Pulpit and the Press, Academic Preaching, College Reform," &c. &c.

The solicitude of Dr. Campbell for the welfare of British Protestantism, and his alarm at the progress of Popery in our island, was manifested by the publication of his work, *The Conquest of England: in a series of Letters to the Prince Consort*. Desirous also that its influence might extend in head-quarters, he sent a copy of these *Letters* to the Earl of Shaftesbury, to each member of the Episcopal bench, and to many of the leading clergymen of all denominations.

In 1862, in consequence of the opening up of China to British commerce, and partly to British rule, Dr. Campbell, who had made the Christian development of that vast empire an important subject of his studies, now wrote a series of articles in the *British Standard* on the conversion of China, which he represented as being, in connection with India, the great field of enterprise for modern missions. The letters also reappeared in the *British Ensign*, and produced such an impression that it was proposed to publish 100,000 extra copies of the *Ensign* for general circulation. The proposal was acceptable, and the paper was subscribed for by individuals not for a few copies but a thousand. This success excited the ire or envy of the *Saturday Review*, and in a bitter article upon the subject they characterized Dr. Campbell's zeal in behalf of missions to China as a device "to make a losing paper go." They also asserted that the subscription lists were not authenticated, that the subscribers themselves were mere myths, that the letters from correspondents all bore the mark of one hand, and that the whole plan was a deception contrived for purposes of gain. These were serious moral charges, for which Dr. Campbell demanded a public recantation and apology; and when these were refused he brought an action against the printer of the *Review*, and the case was tried in the Court of Queen's Bench in April, 1863. The result of the trial was that a verdict was found in favour of Dr. Campbell, and the opposite party sentenced to a fine of £50.

In 1865 the Doctor published his work on "*Popery, Ancient and Modern*;"—its Spirit, Principles, Character, Objects, Prospects, Checks, and Extirpation; with Warnings and Counsels to the People of England." This work he intended to be the last he should ever write, and he considered it as a bequest to his countrymen. It was characterized not only

by all his wonted power in controversy, but also a double portion of his controversial bitterness—and for this he justified himself by the example of Luther and the early reformers. But he forgot that in the simple manners of those early ages an explicitness of language was used which could not now be tolerated; and that words which in those days were simply expressive of dislike, are now denounced by the common consent of society, and punishable by law as subversive of the public peace. In that war at outrance which must be waged against Popery, the cause of truth will scarcely be benefited by using in the nineteenth century the spirit and phraseology which characterized the sixteenth.

In the same year Dr. Campbell published his *Essays on Baptismal Regeneration*. In these essays, fifteen in number, he discusses the different views entertained by different churches of the nature and efficacy of baptism, and denounces the views of it as held by the Church of England. "The subject," he declares, "is vital not only to her real usefulness, but to her very existence as a Protestant institution. The universality of the doctrine of baptismal regeneration will be the sure prelude to her overthrow, and the re-establishment of the Church of Rome, with all her darkness and bondage, misery and wickedness. . . . The doctrine of salvation by sacraments is a deadly delusion, the overthrow of the gospel, the destruction of souls, and the path to perdition."

So early as about the year 1834 Dr. Campbell had contemplated writing a life of Dr. Whitfield, whom he justly regarded as the chief of modern preachers and reformers; but the magnitude and importance of the subject were such that it could not be lightly commenced, while the throng of occupations which succeeded left him no leisure for sitting down to it in earnest; and when in old age he would have renewed the attempt he found his decayed strength incompetent to such a task. Another enterprise which he also meditated was to write his own autobiography, but in this he proceeded no farther than the outline of certain chapters coming down to the time of his appointment as successor to Mr. Wilks.

Having outlived most of his distinguished contemporaries, Dr. Campbell resolved that when he had reached the age of seventy years he would retire from the editorship of his magazines, the *Christian Witness* and the *Christian's Penny Magazine*. So many were now the religious periodicals in the field that he thought denominational serials unnecessary, and that it was in vain to contend with the cheap press in its varied and manifold resources. He therefore announced his resignation to the trustees and managers in March, 1864, who received it with regretful acquiescence, and voted to him a gratuity of £500 as a testimonial of the value of his editorial services during twenty-one years. But while this token was confined to two of his periodicals, a movement, commenced in Glasgow, had been going on among his friends at large to make his old age comfortable, and the result was the subscription of a testimonial to him of £3000. In 1865 he resigned the pastorate of the church and congregation of the Tabernacle. On doing this he wrote: "Our last load is now being packed, and in an hour or two we shall turn our backs for ever on our old house. I shall do so with emotion, but not with sorrow. I feel I have done right in giving up the Tabernacle. I have had quite enough of it, and I feel that my mission there is ended. I have done much and suffered much for its good, and a generation is risen which 'knows not Joseph.' There is a time to go as well as a time to come. The former is my case, and I go with cheerfulness."

Being thus freed from the greater part of his incumbrances, Dr. Campbell retired, but not to solitude or a sick chamber; he had been a widower for eight years, his private disposition was domestic, companionable, and affectionate, while his health promised that years of tranquil enjoyment were still in store for him. He therefore entered a second time into marriage, his choice on this occasion being Mrs. Fontaine, a lady of large fortune, and they were married on the 13th of January, 1866. Except the management of the *British Standard*, and the preparation of his own autobiography, Dr. Campbell had got free of his intellectual labours and public duties, and was anticipating the comfortable rest of old age after a life of active toil and trouble, when it was unexpectedly changed into the rest that is enduring, for he died on March 26th, 1867, in the seventy-second year of his age—and he died as he had lived, rejoicing in the faith which he had been so earnest to teach to others.

From the foregoing sketch, necessarily a very summary one, of a long and very active life, it will at once be seen that Dr. Campbell was no ordinary character. Born in a humble rank of life, and surrounded by many impediments, he set himself in earnest to become an intellectual leader of men of thought, and never rested until his high aim was accomplished, for in the department he had chosen, which was that of a nonconformist minister, he became an authority by which a large portion of society was directed in its opinions. And truly not without toil was such pre-eminence won! As a preacher he was more abundant in labour, as well as more painstaking, than most of his clerical brethren. As a literary workman, besides his monthly and weekly oversight of his journals, and his constant communications to their columns, he was the author of separate published works that would fill at least twenty octavo volumes. And as a controversialist he dealt such tremendous blows as few were able to resist. In fine, we extract the following just description of him from his funeral sermon: "His endowments and attainments were multifarious and marvellous. He was a man of iron will, of untiring energy, of unflinching courage, and of vast information. Few men that ever lived have been able to work so hard—speak and write so much. He might not be in the highest poetical sense of the word, a man of genius, yet he had a fine imagination, though he dealt largely with matters of fact. He might not be in the highest sense a deep philosophical thinker, or an acute and accurate scholar, yet he was in himself an encyclopedia of knowledge. He was unacquainted with science, but was a well-read divine, had all but exhausted religious literature, and had a power of expression and utterance vivid, striking, forcible, overwhelming."

"In the pulpit he was always interesting; on the platform he was sometimes matchless; in private he was a child with children, tender as a woman, firm when required, ever cheerful, and always grateful. To sum up his whole character, he was 'a faithful man.' He is gone: gone gently as goes down the summer sun in a cloudless sky."

CLARK, THOMAS, M.D. This able chemist and professor of chemistry was born in Ayr, on the 31st March, 1801. His father, who was captain of a merchantman, was distinguished by singular energy, integrity, and circumspection, and during a long professional career had sailed in every sea without sustaining any serious disaster; while his wife, a woman of strong and reflective mind, originated the well-known Ayrshire needlework. Their children showed

themselves worthy of such a parentage, those of them who grew up to maturity evincing strength of character in various ways, and this was especially the case with the subject of the present memoir. Thomas was educated at the Ayr academy, attended at that time by upwards of 400 scholars, many of whom afterwards won distinction by their talents and attainments; and the course of education pursued in it was of a most liberal character, comprising French, classics, and mathematics; while the rector, Mr. Jackson, afterwards professor of natural philosophy in the university of St. Andrews, gave occasional lectures in experimental science. At this school, however, young Clark at first made little perceptible progress, so that he was considered a heavy, dull boy until about his thirteenth year, when he began the study of mathematics, and became one of the most distinguished boys of the institution. It was then, too, that the original inquiring spirit by which he was to be distinguished through life broke out, and the strange schoolboy theories and schemes which he propounded obtained for him the nickname of "Philosopher Tom." Among his contemporaries at the academy who were afterwards to attain distinction were Lord Cowan; Mr. Weir, editor of the *Daily News*, and talented miscellaneous writer; and Mr. McClelland, accountant in Glasgow.

In 1816 Thomas Clark, accompanied by Mr. McClelland, went to Glasgow, and entered the counting-house of Charles Macintosh and Co., the inventors of the waterproof cloth, as book-keeper and cashier. At that time the principal business of the firm was the preparation of the material known as "cudbear," which was used as a scarlet dye, more especially in the manufacture of cloth for the army; and before Clark left their employment they had commenced the manufacture of the india-rubber cloth. Mr. Macintosh also, from a mineral found in the margin of the coal formation, had created an extensive alum manufacture. It was in these, rather than in book-keeping, that Clark discovered where his strength lay; his mind was exclusively directed to mineralogy and chemistry, and their application to the arts; and on discovering the bent of his mind, the Macintoshes, through their recommendation, obtained for him the situation of chemist in Tennant's chemical works at St. Rollox.

It was in 1826, after he had left St. Rollox, and when as yet he was only in his twenty-fifth year, that Clark commenced his public life in consequence of his appointment as lecturer in chemistry to the Glasgow Mechanics' Institution. He had already followed up his original investigations, and in the programme of his lectures for the above-mentioned year he gave his table of chemical elements and formulæ, from which the advancement of his views on the atomic theory, and the theory of salts, may be inferred. Of this the following statement read before the Royal Chemical Society is worthy of notice:—"That theory of the constitution of salts in which they are represented as uniformly consisting of a metal or hydrogen united with a radical, simple or compound, no doubt originated in Davy's discovery of the composition of chloride of sodium; and the credit of the generalization is generally ascribed to that philosopher. But it does not appear that Davy ever expressed the view in precise terms. In objecting to the rival view—of the presence of acids and oxides in salts like the sulphate of potash, and in illustrating his binary theory of certain other salts—he looked upon the former class as triple compounds of metalloids, metals, and oxygen. He admits, though with inaccurate numbers, that the atomic weight of hydrogen is 1, of oxygen 16, of

carbon 12, and of sulphur 16; water being composed of two atoms of hydrogen and one of oxygen. But the new theory, particularly in its relation to the function of hydrogen in the hydrated acids, appears to have been first properly appreciated and fully developed by Dr. Clark in his early chemical lectures of 1826. It was sagaciously applied by him to explain the proportion of acids in salts of peroxides, like sulphate of alumina, and was a manifest advance upon the canon of Barzelius, that the oxygen of the acid is always a multiple of the oxygen in the base. Dr. Clark also interpreted the atomic theory less rigidly than most of his English contemporaries, and more in accordance with modern views. He allowed portions of an equivalent to be represented, as $\frac{2}{3}$ Fe, the quantity of iron united with one equivalent of oxygen in the peroxide, which he could thus assimilate to a protoxide in constitution. He exercised also a free judgment in fixing the atomic weights of elements, and we find in his table of 1826 carbon made 12 and oxygen 16, in reference to hydrogen as 1."

It was in this memorable year 1826, when he surprised the scientific world by new and startling theories, that Dr. Clark published his papers, the first on the *Pyrophosphate of Soda*; the second on the *Arcaniate of Soda*; and the third on a *New Phosphate of Soda*. It was on the first of these that his chemical reputation was the most permanently established—to wit, his discovery of the pyrophosphate of soda, in consequence of the effectual support it gave to the doctrine of isomerism then struggling for existence, and to the important influence of the phosphoric acids in opening up the more recent ideas of polyatomicity. Sir John Herschel, in his *Introduction to the Study of Natural Philosophy*, declared Clark's research, by which he discovered the existence and the use of pyrophosphate of soda in chemical history, to be "one of the most felicitous examples of a successful induction."

In 1827 he entered the university of Glasgow as a medical student, and took the degree of M.D. in 1831. It was not however with a view to practise as a physician, but to teach chemistry in a medical school. In 1829 he became apothecary to the Glasgow Infirmary; and while holding that appointment, he contributed to the *Glasgow Medical Journal* the three following articles:—1. "On the Pharmaceutical Preparation of the Precipitated Carbonate of Iron." 2. "A Chemical Examination of Singleton's Golden Ointment, with an Improved Formula for Preparing the Red Precipitate Ointment." 3. "On a New Process for preparing Medicinal Prussic Acid."¹

In 1832 Dr. Clark published in the *Westminster Review* a very elaborate inquiry into the whole system of existing weights and measures—an article which attracted great attention at the time, and the interest of which has not yet wholly subsided. Another article on the patent laws was contributed by him to the same magazine. In 1834 he took an active part in the matter of patents. The use of the hot-blast in furnaces for the expeditious smelting of iron having been patented by Mr. Neilson of Glasgow, in whom the discovery originated, a long litigation followed to defend his right from invasion, in which Dr. Clark acted as scientific adviser to Mr. Rutherford, afterwards lord-advocate, the counsel for the patentee. He also published a paper on the working of the process, which led some unreflective people into the idea that Dr. C. was not merely the expositor, but the inventor of the hot-blast.

In 1833 an important change for the better oc-

¹ *Glasgow Medical Journal*, Nos. 11, 12, 14.

curred in his scientific position. The chair of chemistry in Marischal College, Aberdeen, having become vacant, Dr. Clark became a candidate for the professorship, which was to be filled by a competitive examination. It was a keen competition, and in spite of his high reputation, obstructions were interposed to his election. It was declared, for instance, by four members of the *senatus*, that he had not an academical education, as was required by the rules of election for the chair; that under these his diploma of M.D. was not sufficient, and that he ought also to be Master of Arts. A different view, however, was taken by the rest of the professors, and the election of Dr. Clark as professor was decided by the casting vote of the principal, Dr. Dewar. As usual in such cases, his appointment occasioned considerable umbrage in the *senatus*, against which he was obliged to make way as he best could; but he soon showed that as professor of chemistry he was the right man in the right place. His mode of lecturing is thus described in the article of the *Journal of the Chemical Society* from which we have already quoted:—

"As a chemical lecturer, he had strongly marked peculiarities. Applying his thoroughly original and independent mind to chemistry, as to everything else, he took nothing on trust himself; and it was his aim to bring before the students whatever doubts and difficulties attended the subject, and to exhibit the evidence, experimental or theoretical, for each position. He also paid great attention to the manner of stating and expounding his science. Instead of commencing with the generalities of the atomic theory, he described in detail a few of the leading elements—as oxygen, hydrogen, carbon, sulphur—stating, as matters of fact, the proportions of each in the several compounds, water, carbonic acid, &c., without making any references to the theory of combination. He next took up the atomic theory, and expounded it minutely, showing how far it was hypothetical, and how far an expression of experimental truth. Then followed the usual detail of the elements and their compounds, interspersed with discussions of leading points, as the constitution of the salts and acids, the theory of muriatic acid, the theory of the prussiates, &c. He devoted occasional lectures to leading processes in the arts, as the manufacture of coal-gas. His method of describing these was carefully studied, but was chiefly resolvable into the practice of starting from known and familiar elements, and showing how they became transformed in the course of the operation to the more recondite products. Many of his students probably remember to this hour the manufacture of sulphuric acid, as depicted by him from his acquaintance with the works at St. Rollox." Of the method and arrangement of the subjects on which he lectured, the same writer thus informs us:—"There was what many parties considered a want of order in his course. He did not proceed by following out a systematic and exhaustive classification of the elements, as in an ordinary chemical text-book. He rather selected important and typical bodies, making them the representatives of general classes and doctrines. This was especially his way with organic chemistry, under which he merely adverted to a few important substances. Neither was he systematic in dealing with the chemistry of drugs; a few substances that he had thoroughly mastered being all that he took notice of. Indeed, system was never his strong point; he disliked the empty vagueness often disguised under a systematic array, and preferred the minute and thorough investigation of single and isolated facts. The accurate determination of any

fact, however limited its place in a system, or even its utility, was always to him an intense satisfaction."

Although the election of Dr. Clark to a university professorship gave him a high as well as definite position in science, it could not offer him the substantial profits he might have obtained as a commercial chemist. In this capacity his practical turn of mind and his experience in chemical manufactures would have been certain to lead him into extensive practice, from which his exclusive position, and distance from the seats of our great commercial manufactures, had now removed him. Only one tenure of this kind he held, and occupied for several years: it was that of adviser to a chemical company in Staffordshire; but owing to disputes among the proprietors, the business was interrupted, and his connection with it dissolved. When he went to his chair in Aberdeen, two subjects had chiefly employed his investigations, one of which was the theory of hydrometry and the practice of hydrometer-making. In this he succeeded so well, that he constructed an instrument which gave at once by its own readings the true specific gravity of liquids, instead of requiring a calculation by a formula. The other subject was the detection of arsenic, which he had chiefly studied in connection with the soda and mineral acid manufactures, and he discovered methods of detecting the slightest quantity of arsenic in every one of these manufacturing products. So satisfied was he with the success of these discoveries, that although his account of them would have been very profitable, he never prepared any paper on the subject. He was content with their results in the improved methods employed in his own laboratory for purifying the sulphuric and hydrochloric acids, and for testing arsenics in poisons.

In 1835 Dr. Clark published his paper *On the Application of the Hot-blast in the Manufacture of Cast-iron*, in consequence of his connection with the defence of Mr. Neilson's patent, and in this he gave the true explanation of the great benefits arising from the process. In 1836 he published his letter to Mitscherlich on a *Difficulty in Isomorphism, and on the Revised Constitution of the Oxygen Salts*.

But of all his chemical discoveries, Dr. Clark is best known by those which he made in connection with water. To soften the hard waters of chalk districts was the public desideratum, and about the year 1840 he had thought of effecting it by the application of a fact already known—to wit, that lime-water, poured into a water containing lime in solution, as chalk, threw down the old hardening matter with the new, and softened the water on the whole. Hitherto the knowledge of this fact had been only held as a vague theory; but convinced that there was truth in it, he set his whole mind to ascertain its precise mode of operation, and the best means of accurately and easily testing the hardness of water. For this he devised what is called the soap-test, which was found so accurate, that for more than twenty years it has been universally employed in testing waters, and has decided in the choice of that element for several of our towns. Having advanced thus far, he proposed by its agency to soften chalk waters by lime in the exact measure of the requirement. Many of our large provincial towns being supplied by water from the chalk, and having London for the chief sufferer in the evil, Dr. Clark naturally hoped that his process would be favourably received by the water companies in the metropolis, and therefore took out a patent for his invention in 1841. But the London companies rejected his remedy, and have continued to reject it to the present hour. And yet it has been well tested, for

it was first applied at Plumstead, Woolwich; next at Castle Howard, the seat of the Earl of Carlisle; then at Catherane, Surrey; and recently at the Chiltern Hills—and in all of these cases with perfect success. It is possible that the plan may come into more extensive or even general use, but like many such cases of tardy conviction, the change will come too late to benefit the inventor. In 1845 his patent expired, but after a hearing before the judicial committee of the privy-council, it obtained the rare privilege of being renewed for seven more years; no benefit, however, was derived by Dr. Clark, but rather trouble and expense, although he had reasonably hoped that his invention, being a great national boon, would have secured him an ample fortune as well as fame. Upon it he had spent a large portion of his life, his water-tests were everywhere employed, and their correctness universally acknowledged—and he was still left what he was before—a poor professor of Aberdeen.

At the beginning of the session 1843-4 the question of the abolition of university tests was taken up by the senatus of Marischal College in a series of resolutions moved by Dr. Clark. In the preparation and correction of these he spent, as was usual with him on great occasions, an enormous amount of labour, and was greatly excited by the subject. This told upon him in the course of the session, as he became seriously ill of disease in the brain, by which his lecturing was interrupted, and he never afterwards was competent for the work of his class. He was obliged to leave Aberdeen; and for several years he resided, first in his mother's house at Glasgow, and afterwards at Rothesay, while his malady continued to be so severe as constantly to torment him with headaches, and often confine him to bed. After four years of such suffering, he was induced in 1848 to try the hydropathic cure, then only coming into practice; and derived from it such benefit, that although he was not entirely cured, he was renewed for much of the business of active life. In 1849 he married, and in the same year he resumed his residence in Aberdeen, with the hope of being able to prosecute his college duties; but he found that his strength, although improved, was still unequal to the task. He made himself useful however to the college in the struggles that ended in the union of the Aberdeen universities, which led in 1860 to his being superannuated. But he had already laid the university under a debt of gratitude, not merely by his excellence as one of its teachers, but by his active labours in its behalf. In all the discussions connected with medical education he always took a leading part. He was the chief promoter of the scheme of examinations pursued at Marischal College, and an improver of their strictness and severity. He was also deputed by the senatus to watch over the medical bills introduced into parliament in 1844 and 1845, and spent many weeks in London for that purpose.

Although the brain disease by which Dr. Clark was attacked in 1844 compelled him to quit his regular occupations, it could not extinguish his mental activity, or prevent him from intellectual exertion. When he was obliged to abandon his laboratory, it was only to betake himself to a new field of inquiry, which was the transition of the Anglo-Saxon into the English language. Had it indeed been a transition from one dialect to another? Hallam and others have maintained that such was the case, and that less than a century sufficed for the change. This hasty conclusion, however, was too much for Dr. Clark, and he proceeded to a laborious examination of the Anglo-Saxon chronicles of Eng-

land in connection with the early English of the thirteenth century, within which space the assumed transition period was comprised; and he came to the conclusion that our modern English was a dialect coexisting with the Anglo-Saxon, instead of having been derived from it. Leaving nothing upon this subject of difficult inquiry but notes, which may aid the investigations of some future philologist upon the question, the Doctor's next study was the reformation of our English spelling—a subject which excited much interest about twenty years ago, and still awaits a settlement. After a long series of experiments upon various forms of a phonetic alphabet, he at length settled upon a scheme of vowel pronunciation, which was thought by others as well as himself sufficient for the difficulties of the case. He also tried new forms of alphabetic characters for some of our consonants, and even went so far as to study the reformation of the whole, for the purpose of making them more distinct. This philological enthusiasm was one of his original characteristics he had never lost sight of, and the manner in which it was exercised is thus described by his biographer:—"From early years he gave great attention to English style, and made the idioms of the language a matter of special research. He investigated a number of authors of different ages, and made many interesting notes of their peculiarities. He made a careful inquiry as to the English relatives, and pointed out the characteristic effect of 'that' as compared with 'who' and 'which,' showing by decisive instances the benefit that would accrue by keeping up this distinction as it had been generally observed in our older writers, and is still attended to in good conversation.¹ He also showed privately many illustrations of the placing of adverbial words, as 'not' and 'only,' on which the ordinary grammars were either silent or confused. He applied a severe criticism to all vagueness and indistinct reference in the pronouns generally, and especially censured the indiscriminate use of 'it,' and pointed out peculiarities in the pronoun never adverted to by any English grammarian or critic. He took pains to correct the phraseology of the students' written exercises, and often gave invaluable aid to authors, young and old. Although he freely communicated the results of these various grammatical inquiries, his note-books are probably still unexhausted of their interest. It was only to be expected that his own compositions should afford traces of these studies. His style could not be characterized in a few words: it is strongly marked with his individuality; and a good service will be rendered to students by the collected publication of his scattered writings. Many a volume has been composed with far less care and thought than he bestowed upon a pamphlet."

Among the many questions that occupied his active mind was the historical evidences of Christianity, which he thought still in an imperfect state, and he was of opinion that much could be done for that important subject by careful investigation. Accordingly, in 1848 he turned his attention to the historical origin of the Gospels with more than his wonted application, and having prepared a series of comparisons of the four Evangelists, he pasted them in columns side by side, the parallel passages making four sets of comparisons, one in the order of each Gospel. Certain conclusions as to the verbal dependence of the Gospels on each other were suggested to him by a minute study of these parallelisms. But

¹ The result of these inquiries has been published in Professor Bain's *English Grammar*.

a question as to verbal agreement or discrepancy must ultimately be referred to the Greek original, and he felt the necessity of qualifying himself to examine it from this point of view. Here, however, he was met with the uncertainty arising from the recent introduction of numerous and various readings into the Greek text, which he was obliged to study also, and many years were employed in this anxious and difficult research before the question could be determined. Seldom, indeed, if ever, was such elaborateness of inquiry manifested by the most patient and painstaking of theologians. The result, however, was satisfactory, as he thought that the determination of nine out of ten of the various readings were in favour of the established version of the Greek Testament—a discovery which he announced with peculiar pleasure. Thus far he had advanced in his tabulation of the readings of the first three Gospels, and it was hoped that his assistants would be able to complete the work on the plan he had established. He also appointed a scholar of the highest competence to superintend the publication of the work in the event of his dying before it was completed.

The other writings of Dr. Clark were chiefly connected with university reform, of which he was a strong advocate from the beginning. So early as 1833 he published a pamphlet entitled *Reform in the University of Glasgow*, in which he drew out a plan of a complete university constitution, with a new governing body, approaching in resemblance to the recently constituted university courts in the Scottish universities. The pamphlet also contains a minute examination of Mr. Oswald's bill for the university of Glasgow. Soon after his appointment to the chair in Marischal College, the question of the union of the two Aberdeen universities into one, which had occasionally been agitated, was brought up by Mr. Bannerman's bill, and again by the royal commission of 1836. On this occasion Dr. Clark, who had carefully studied the subject, produced a letter to the commission, which, says his biographer, "may one day be looked back to with interest." In January, 1850, a pamphlet having appeared challenging the right of the Marischal College to grant degrees in divinity, law, or medicine, Dr. Clark wrote an answer to it, arguing the question from a decision of the House of Lords, under Lord-chancellor Hardwicke, in 1745. This pamphlet of Dr. Clark was remarkable for its style, elaborate statements, and forcible conclusive arguments, in which he ably vindicated the rights of his university in granting degrees. The question of the union of colleges in consequence of the introduction of the Scotch universities' bill, and its clauses for uniting King's College and Marischal College into one university, again called Dr. Clark into the field of controversy, and he opposed such union by many published statements and memorials. As they at present existed, he thought the Aberdeen colleges, from the manageable dimensions of their classes, were well adapted for effective teaching; but this advantage he apprehended would be lost if the colleges should be fused together, and every class have its numbers doubled. Besides these intellectual labours connected with university reform, Dr. Clark was a frequent contributor of leading articles in the journals upon the important public events of the day. Being an ardent politician of the liberal school, he was animated by the march of progress, and his articles, which were distinguished by pungency and pertinacity, generally appeared in the editorial column, and thus took the front rank in the contest. Such was his career to the close—the action of an intellect

that knew not how to rest, and with which every subject in turn was of the highest importance. The various qualities of his character are thus comprised in the article read before the Royal Chemical Society on the 30th March, 1868:—

"A much more extended notice would be necessary to give an adequate impression of Clark's various labours and many-sidedness. His industry between the ages of twenty and forty must have been enormous. His intellectual faculties belonged to the highest class. His strongest feature may be expressed by sagacity, and his delight was to attain his ends by the simplest and often the seemingly most unlikely means. He had essentially a practical mind; his originality and his sagacity took the direction of practical suggestions. His love of minute accuracy, so valuable in itself, was carried to a pitch of extravagance, which was perhaps his chief foible as an investigator. He never knew when to have done refining and improving; hence the unfinished state of so many of his inquiries. His attention to style was an additional source of embarrassment and delay when he had any work to publish.

"The energy and vehemence of all his determinations made him urgent and imperious; and while increasing his sway over others, often excited no small hostility and dislike. He was furious in his onslaught when roused by opposition, yet he could also control himself and employ all the resources of his cultivated expression in suavity, courtesy, and conciliation. His loves and his hates were alike on a large scale, but his amiable side greatly preponderated. His generosity and sympathy were manifested both in public spirit and private benefits. He was looked up to and beloved by the whole circle of his intimate friends."

For two or three months before his death Dr. Clark had been ailing, but not so much as to alarm his friends. On the morning, however, of the 27th of November, 1867, he was unable to rise as usual; he soon became insensible, and expired at two o'clock in the afternoon. He left a widow, but no children, his only child, an amiable and gifted boy, having died a few years previous to his own decease, by which bereavement the close of his own career was sensibly affected.

CRAWFURD, JOHN, F.R.S. In this distinguished individual were comprised the characters of a great traveller, an accomplished Oriental scholar, an able administrator, a sound geographer and ethnologist, and an accurate statist. His father, Mr. Samuel Crawford, a man of sense and prudence, and brought up to the medical profession, having visited Islay, married Margaret Campbell, daughter of James Campbell, of Ballinaley, the proprietor of a small estate which had been for several generations in the family, and there their son John was born on the 13th August, 1783. He received his early education in the village school of Bowmore, and from the instructions of its teacher, Daniel Taylor, Mr. Crawford used afterwards to say, that he was chiefly indebted for his advancement in life. The medical profession being chosen for him, although he had no particular liking for it, and never excelled in it, he went to the university of Edinburgh; and after studying three years in its classes, he obtained in 1803 a medical appointment in the Indian service. He embarked for India in April of the same year, landed in September, and was almost immediately immersed in the active duties of an assistant-surgeon in the Company's military service. Thus he served under Lord Lake, when that general invaded the dominions of Scindiah, and was also present at the siege of Delhi. In the

following year he accompanied Colonel Monson's troops in the advance to Ougain, and in their retreat before the army of Holkar. In 1805 he was so fully employed that twelve companies of Sepoys were under his medical charge in the fortress of Rampoor.

After five years of service in the North-western Provinces of India, Mr. Crawford was transferred in 1808 to Penang; and there he commenced those studies of the Malay languages and people which ultimately enabled him to compose that remarkable work, the *Malay Grammar and Dictionary*. His knowledge of the Malay tongue having recommended him to the notice of Lord Minto, at that time governor-general of India, he accompanied the latter, in 1811, in the important expedition which effected the conquest of Java. It was in consequence of his acquaintance with the Malay languages that Mr. Crawford was also left in that island as a representative of the British government at the court of one of the native princes, and for nearly six years he filled some of the principal diplomatic offices of Java. During this time, also, he made extensive journeys and voyages, and collected those copious and diversified materials in ethnology, natural history, and geography, which, after his return to England in 1817, he published in 1820, under the title of *History of the Indian Archipelago*.

After a residence of four years at home, Mr. Crawford went back to India in 1821, and was appointed by the Marquis of Hastings, then governor-general of India, to the diplomatic mission sent to Siam and Cochin-china. His difficult duties in this important station were so ably discharged as to obtain for him the highest credit from the Indian government. Indeed, his general services in India induced the public men employed in its government to betake themselves to his counsel and advice, and the most eminent among them—Colebrooke, Mountstuart Elphinstone, and many others—were his intimate friends and correspondents. In 1823 Mr. John Adams, *ad interim* governor-general, appointed Mr. Crawford governor of the new settlement of Singapore, on the resignation of its founder, Sir Stamford Raffles; and in that position, which he held during three years, he concluded with the native chiefs to whom the district belonged, that convention by which we hold its sovereignty. By this and his wise management and negotiations, through which that place attained such an important position, he has been justly regarded as the second founder of Singapore. In 1826 Mr. Crawford returned to Bengal, and was immediately appointed commissioner in Pegu by Lord Amherst, the governor-general, and afterwards, on the conclusion of peace, he was appointed envoy to the Burmese court. But amidst this political life, in which he was so well qualified to rise to high station and distinction, he retained his love of scientific pursuits; "and thus it was," says his friend Sir R. Murchison, "that in his voyage up the Irawadi to the capital of Ava, in 1826, he collected those fossil bones of mastodon, large tortoises, and crocodilia, &c., which were described by Dr. Buckland and Mr. Clift, and which gave to the former the opportunity of generalizing on the important fact, that there existed in the Indian regions formations analogous to the tertiary and superficial deposits of Europe." Sir R. Murchison adds: "It was when these remarkable collections were the admiration of geologists that I became better acquainted with Mr. Crawford; and from that day, now forty-two years ago, our intimacy strengthened with each succeeding year."

Mr. Crawford's personal connection with India terminated in 1827, when he permanently returned VOL. III.

to England; and in the following year he published an account of his mission to Siam and Cochin-china, and in 1829 another of his mission to Burmah. For some time, also, after his return he endeavoured to connect himself with political occupation—a tendency which he had perhaps acquired from the nature of his life in India. Having large and liberal views on the subject of free-trade, he took an active and influential part in the support of his friend, Mr. Joseph Hume, in breaking up the old commercial monopoly of the East India Company, in consequence of which the price of tea was so much reduced that this commodity was placed within the reach of the poorest. He also ably seconded Mr. Cobden in favour of free-trade, who highly estimated his aid, as is shown in the *Westminster Review* of 1832. The ambition of Mr. Crawford was also to obtain a seat in the House of Commons, where he could have better served the Liberal cause, and with this view he presented himself as a candidate both for Glasgow and the Stirling burghs; but both applications were unsuccessful, so that he was left to those literary and scientific pursuits in which he was best qualified to excel. "I have often rejoiced at these political failures," Sir R. Murchison says with no little professional triumph; "for from that moment the strong mind and untiring energy of the man were devoted almost exclusively to his favourite topics of philology, ethnology, geography, and statistics; the fruits of his laborious studies first appearing in the *Malay Grammar and Dictionary*, the preliminary dissertation to which is a remarkable work in itself. Tracing the affinities of a vast number of the languages of the Indian Archipelago, and even in parts of the Pacific, to the Malay root, he ascribed this wide diffusion to the insular character of this vast region. His first-rate merits as a philologist have indeed been canonized in the writings of William von Humboldt, in his great work *Über die Kawi-Sprache auf der Inseln Java*. In it the illustrious Prussian expressly stated, that without the valuable contributions of Mr. Crawford he could never have succeeded in mastering the Javanese and Kawi languages; and he expresses the very great obligations of his brother Alexander von Humboldt and himself for the highly valuable contributions of our deceased associate."

The *Malay Grammar and Dictionary* was published in 1825, and in 1826 its author published his *Descriptive Dictionary of the Indian Islands and Adjacent Countries*, which was a completion and extension of his original work of 1820, entitled the *History of the Indian Archipelago*. The *Descriptive Dictionary*, illustrated with an interesting map of the Asiatic Archipelago, and limited to 459 pages 8vo, contains within that compass a surprising amount of accurate geographical, ethnological, and statistical knowledge.

In 1861 Mr. Crawford was elected president of the Ethnological Society, and until the day of his death his spirit continued to animate and pervade it with a fresh existence. This will be understood when the number and excellence of his papers contributed to the society are taken into account. These, which were produced between his seventy-eighth and eighty-fifth year, thirty-eight in all, give a wonderful idea, not only of the energetic industry of the old man, but the unabated vigour of his intellect, and remarkable variety of his knowledge and attainments. Of this the following list of some of these, published in the *Journal of the Ethnological Society*, may help to furnish some conception:—"On the Connection

¹ Address of Sir R. Murchison to the Royal Geological Society, May 25th, 1868.

between Ethnology and Physical Geography.”—“On Numerals as Evidences of the Progress of Civilization.”—“On the Antiquity of Man from the Evidence of Language.”—“On the Commixture of the Races of Man as affecting the Progress of Civilization.”—“On Colour as the Test of the Races of Man.”—“On the Relation of the Domesticated Animals to Civilization.”—“On Language as a Test of the Races of Man.”—“On Lyell's *Antiquity of Man*, and Huxley's *Evidence on Man's Place in Nature*.”—“On the Sources of Tin for Bronze Tools and Weapons of Antiquity.”—“On the supposed Infecundity of Human Hybrids or Crosses.”—“On the supposed Stone, Bronze, and Iron Ages of Society.”—“On the so-called Celtic Languages in reference to the question of Races.”—“On Cannibalism in relation to Ethnology.”—“On the Physical and Mental Characteristics of the Negro.”—“On the Origin and History of Written Language.”—“On the Ancient Hindu Sacrificial Bell found in the Northern Island of New Zealand.”—“On the Invention of Writing Materials in reference to Ethnology.”—“On Cæsar's Account of Britain and its Inhabitants.”—“On the History and Migration of Cultivated Plants.”—“On the Dissemination of the Arabian Race and Language.”—“On the Migration and Cultivation of Sacchariferous Plants.”—“On the Plurality of the Races of Man.”—“On the Animal and Vegetable Food of the Nations of Australia in reference to their Social Position.”—“On the Classification of the Races of Man according to the Form of the Skull.”—“On the History and Migration of Cultivated Plants, and on Condiments.”—“On the Antiquity of Man” (second memoir).—“On the Ethnology of Abyssinia and Adjacent Countries.”

The last article was read before the Ethnological Society, Nov. 12, 1867. After that contribution Mr. Crawford continued to read certain papers to the society, including one on his objections to the Darwinian theory, and another on “Coffee and Other Plants.” He left also behind him sixteen papers which had never been published. In summing up his literary achievements, his friend Murchison thus affectionately speaks of him:—“Including his frequent contributions to reviews and weekly newspapers, particularly the *Examiner*, Mr. Crawford has perhaps written more than it has been given to any one author of this century to accomplish. I may here also observe, as a striking illustration of the logical accuracy of his thoughts, and the strength of his memory, that his writings on the statistics of commerce, geography, philology, and ethnology, scarcely ever required a correction; for they exhibit fewer *pentimenti*, or alterations, than are to be seen in the original manuscripts of Walter Scott, or any other author of works of fiction. . . . Yet, with all this incessant literary labour, he found time to read extensively, and store up in his surprising memory all the knowledge that he had ever acquired. He also found leisure to hold much social converse with his many friends, both young and old; and few of the members of the Athenæum Club will now enter its great vestibule, in which he was generally to be seen in the afternoon, without mournfully regretting the absence of the cheerful countenance and friendly grasp of the hand of dear John Crawford. Let me add that he was equally popular with the gentler sex, who could not fail to be attracted to him by his genial address, and his happy and simple manner of conveying information. Well has it been said by an able writer in the *Times* who commemorated his deeds, that ‘all the members of the Geographical and Ethnological Societies will miss the tall form of

the evergreen veteran, who scarcely ever failed to take part in their discussions, and who, while stoutly maintaining his own views, showed a forbearance and courtesy which might well be imitated by all members of learned societies.’”

Mr. Crawford died at his residence in Elvaston Place, South Kensington, on the evening of 11th May, 1868. He was twice married. His first wife, having lost her health in India, was returning home with her child, when the ship was lost and all on board perished. In 1820 he secondly married Miss Horatia Perry, who died in 1855, leaving one son, Oswald, now British consul at Oporto; and two daughters, both of whom are married.

GRAHAM, THOMAS, D.C.L., F.R.S., an eminent chemist and master of the mint, was born at Glasgow on the 21st December, 1805. He was the eldest of a family of seven, and his father, who was a prosperous manufacturer, gave him a good education. He was sent to the school of Dr. Angus from 1811 to 1814, and afterwards to the grammar-school, where he acquired the classical languages under the well-known Dr. Dymock, and the rector Dr. Chrystal. On finishing the five years' grammar-school course he entered the University in 1819, where, having passed through the curriculum of arts, he graduated M.A., April 28, 1824. Thus far he seems to have studied with a view to the Church, in which the influence of friends would have obtained him preferment. His attention, however, was probably diverted to physical science by finding himself more and more interested in the work of the mathematical and natural philosophy classes, and in the lectures on chemistry of Dr. Thomas Thomson, of whose class he seems to have been a member during the last sessions of his arts curriculum. He was at the same time engaged at home in experiments by which he was acquiring the indispensable art of manipulation. Instead, therefore, of entering the theological faculty according to the wish of his friends, he gave himself up wholly to chemistry, and retired to Edinburgh to pursue his studies privately. He worked in Dr. Hope's laboratory, and while there made his first appearance as an author at the age of twenty-one, by the publication in the *Scotts Mechanics' Magazine* of a paper “On the Absorption of Gases by Liquids,” reprinted afterwards in Thomson's *Annals of Philosophy*, xii. pp. 69-74, 1826. In it he tries to show that, when absorbed by a liquid, a gas is first of all condensed to the liquid form, and that the two liquids then mix together. In this way he reduces the absorption of gases to the same class of phenomena as the miscibility of liquids. This paper is followed in the same volume of the *Annals* by another “On the Heat of Friction,” and a third “On Alcohol from Bread,” while the *Philosophical Magazine* for 1827 (i. pp. 107-109) contains an article “On the Finite Extent of the Atmosphere,” in which he tries to explain how the lowness of the temperature in the upper regions of the atmosphere may counteract its continuous expansion. These, which were written in 1826, were all his contributions to the journals during his residence in Edinburgh. The following year he returned to Glasgow, where, to avoid proving burdensome to his family, he opened private classes for mathematics, under the patronage of Dr. Meikleham, professor of natural philosophy. Either he gave up these classes very soon (at furthest he may have conducted them for a year), or he must have continued his investigations independently, for during 1827 he wrote on “Longchamp's Theory of Nitrication” (a paper which has escaped the notice of

Cloëz in his recent lecture on the subject) and other topics, and communicated his first paper to the Royal Society of Edinburgh. It appeared in the *Transactions* for 1831, and contained a description of a class of bodies which he called alcoates, and which he formed by dissolving certain deliquescent salts in alcohol and crystallizing. By this process bodies were obtained, which, instead of water, contained "alcohol of crystallization." At the same time he read some papers to the Society for the Promotion of the Useful Arts in Scotland, of which he became a member in January, 1828. A few months later he described to the Royal Society of Edinburgh (*Edinburgh Journal of Science*, vol. viii.) the results of experiments on the absorption of vapours by liquids, by which he showed that solutions of salts inhale as readily as exhale vapour, according to the atmosphere in which they are, and that a measure of this power, which Graham styled "power of invaporation," is to be found in the temperature at which the solution boils. He was shortly after elected a fellow of the society, and he then sent another communication upon supersaturation.

This year he gave up the teaching of mathematics, but during the winter session of 1828-29 he attended the classes of anatomy and chemistry in the University, and besides conducted the business of a laboratory which he opened in connection with the Portland Street medical school. He remained here until, in 1829, he succeeded to the lectureship of chemistry in the Mechanics' Institute, in room of Dr. Thomas Clark, who had been appointed professor of chemistry in Aberdeen. The following session, 1829-30, he gave a formal attendance upon the remainder of the medical classes; but although already enrolled in six, he took the chemistry lectures over again. In 1830 he resigned his lectureship, on being appointed to the same post in Anderson's Institution, where he replaced Dr. Ure, the technologist and author of the *Chemical Dictionary*, who had removed to London. Graham had now attained a definite position, and his success had reconciled his friends to his choice of a profession to which he was strenuously devoting himself. For one or two years he published only a few notes, but he was working hard upon subjects, one of which, the function of water in salts, occupied much of his attention at this period; the other, the diffusion of gases, was never long absent from his thoughts to the very close of his life. His shorter papers appeared in the *Quarterly Journal of Science* for 1829, and were on "The Oxidation of Phosphorus," in which he shows the effect of traces of the vapour of turpentine, ether, naphtha, and many other gases, in preventing the action; "The Diffusion of Gases," in which the relation between their specific gravity and diffusibility is first pointed out; and one or two other notes. In the *Glasgow Medical Journal* (1831) he published, along with W. B. Lorraine, an analysis of the Rothesay sulphuretted water.

In December, 1831, he laid before the Royal Society of Edinburgh the fruits of his labour during the preceding year, in the form of an experimental verification of the law according to which gases diffuse into one another (*Edinburgh Roy. Soc. Trans.* 1834, vol. xii.) As the result of a long series of experiments on ten different gases, Graham arrived at the conclusion, that when gases diffuse, they do so inversely as the square root of their specific gravity. The numbers he got agree so closely with theory—in the case of oxygen they agree absolutely—that his proposal to employ the diffusion of a gas as a means of ascertaining its specific gravity seems fully warranted, and the law has been accepted as

the true expression of the phenomena. For this paper he received sometime later (May, 1833) the Keith medal—the highest prize in the gift of the Royal Society of Edinburgh.

It was in 1833 that his first paper was read to the Royal Society of London (*Phil. Trans.* 1833). It contained his beautiful investigation into the constitution of the phosphates and arseniates, and while it cleared away confusion which had existed respecting these bodies, it revealed water performing such unexpected functions, that Graham's conclusions, backed though they were by most satisfactory experiments, were not at once accepted universally. On the Continent, however, they were published in the principal chemical journals, as leaving no doubt on the subject, and they have long since become the recognized views in this country.

The year following he was elected a member and chosen vice-president of the Glasgow Philosophical Society, and about the same time, or perhaps some months earlier, was made member of the Faculty of Physicians and Surgeons. He was busily engaged with researches on the remarkable spontaneously inflammable and non-spontaneously inflammable states of phosphoretted hydrogen, by which he proved that the difference was due to some body analogous to an oxide of nitrogen present in the spontaneously inflammable gas in minute quantities, and it is noteworthy how in this paper Graham has anticipated several of the analogies which have since led to the classification of nitrogen and phosphorus in the same group of elements. The explanation of the difference between the two phosphoretted hydrogens based upon isomerism, which had been advanced by Rose, was objected to by Graham, who, from his discovering that the two states could be changed into one another by various substances, and from his observing that other cases of so-called isomerism were due to certain differences of composition produced by differences in preparation, seems to have rejected isomerism altogether. Full of these subjects he attended the British Association meeting at Edinburgh in 1834. He there summed up his views in a paper upon the function of water in different kinds of salts, and showed that many anomalies classed under isomerism could easily be explained by taking water into account (*B. A. Rep.* 1834). The complete paper on phosphoretted hydrogen was afterwards read to the Royal Society of Edinburgh (*Trans.* xiii. 1836).

Graham's reputation as an unwearied and accurate investigator was gradually widening, and he was beginning to receive those honours which flow in upon success. He was chosen one of the committee of the chemical section of the British Association for 1835; in the same year he became a corresponding member of the Berlin Academy; and in 1836 was elected a fellow of the Royal Society. At this time he was still engaged with the constitution of hydrated salts, on which he published various papers (*Edin. Trans.* xiii., and elsewhere).

In 1837 his connection with the Andersonian came to an end by his removal to London. He applied for the chair of chemistry in University College, which had become vacant by the death of Professor Turner. The testimonials he got from foreign chemists were most laudatory, and he had the goodwill of such men as Faraday. The election, however, was so close that it is doubtful how it may have gone, had not the decision been referred to Lord Brougham, who happened to come late into the room. He gave his vote for Graham; and the way in which the latter held the professorship for eighteen years shows, as has been remarked, how good the decision was.

For a few years after settling in London, the course of his investigations was interrupted, partly doubtless from the calls made upon his time by the work incidental to a new office, and partly from his being engaged in writing his *Elements of Chemistry*. A paper which he read to the British Association at Birmingham in 1839, upon "The Theory of the Voltaic Circle," appears to have been suggested by his having to consider the chemistry of the battery in the physical part of his treatise.

Two years later, in 1841, the Chemical Society was founded, and Graham was chosen the first president. He attended the meetings of this society with great regularity, and communicated several notes and papers to it, which are published in the early volumes of its *Memoirs*—in particular an elaborate investigation into "The Heat disengaged in Combination," carried out in 1842. It referred solely to the heat evolved when fluids are mixed together, and when salts in various degrees of hydration are dissolved in water. The data obtained afford a means of discovering salts belonging to the same natural class, in the same way as in a previous investigation he discovered the relations existing among certain hydrated salts, by their loss of water on heating and the substitution of part of it by other salts.

By the death of his father in this year, Graham fell heir to an estate in Stirlingshire, and to some other property. The income he received from his chair and as assayer to the mint, an office which he obtained after he went to London, seems to have been amply sufficient for a man who from his earliest days had never been very anxious to accumulate money. Accordingly, with a generosity towards his family which at the very beginning of his career manifested itself upon the first opportunity, he resigned to his sisters a considerable part of the fortune he had just acquired. This year also saw the publication of his *Elements of Chemistry* in one large volume, which was very favourably received at the time. It was at once translated into German by Professor Otto, and both the original and translation have enjoyed a wide reputation. The latter has passed through several editions, and though now (1870) it has swollen to great proportions, and has become in every part an original work, it still retains Graham's name on the title-page, thus showing the value originally attached to it.

About 1843 Graham began to be employed on a kind of work which would have proved more remunerative than investigation, but of which he never undertook much. This was to draw up reports on various topics of public or commercial interest, where the special knowledge and skill of the chemist cannot be dispensed with. One of the earliest of these was upon the question of removing the duty upon alcohol for use in the arts, by mixing it with some cheap substance which would render it quite unfit for domestic use, and while leaving its solvent and inflammable properties unchanged, would be practically not separable from it. The substance proposed by Graham, wood spirit, or methylic alcohol, the lowest member of the series of which ordinary spirit of wine is the best known, was adopted, and the introduction of the cheap methylated spirit has been one of the greatest boons both to the scientific and manufacturing chemist. The other reports on which Graham was engaged were carried out in company with Drs. Miller, Stenhouse, and Hofmann, some years later. These were, on the "Supply of Water to London;" another upon "Original Gravities," addressed to the Board of Inland Revenue, and published in 1853 (*Quarterly Journal of Chemical Soc.* vol. v.); and a third which was undertaken at the urgent request of

the Messrs. Allsopp, in consequence of the belief that had taken possession of the public mind that strychnine was used instead of hops to impart the bitter flavour to their beer. Graham at first was unwilling to comply, and asked a fee which he thought would be sufficient to deter the company from prosecuting their request. But on receiving a cheque for double what he had asked, he could no longer refuse, but associated Dr. Hofmann in the inquiry. The report showed in the first place that the quantity of strychnine which would be required to adulterate the pale ale annually made at Burton, would amount to about sixteen times the quantity of that alkaloid manufactured all over the world; it showed further, from actual chemical tests, delicate enough to detect the 1-1000th of a grain of strychnine, that the pale ale was devoid of even that minute trace; and, finally, that the quantity required to make the ale bitter becomes a poisonous dose in half a gallon. It was concluded, therefore, that strychnine was not only absent from the ale, but was one of the substances least adapted for such adulteration. But though this settled the scientific aspect of the question, it was some time before the sale of the article recovered from the shock which the alleged impurity had given it. The only other reports which Graham published were one upon "The Adulteration of Coffee," more especially with chicory (*Chem. Soc. Quart. Journ.* ix. 1857), and one addressed to a committee of the Privy Council for Trade (*Edin. New Phil. Journ.* liii. 1852) upon "The Cause of Fire in the Ship *Amazon*." In the latter he explained that it was due to the spontaneous ignition of a quantity of cotton waste saturated with oil. The methods of detection pursued in the former were chiefly indirect, and consisted in mixing the coffee with certain proportions of other vegetable products, and subjecting the mixture to various tests.

To the close of the year 1848, Graham's chief investigations referred to the motions of gases. In 1845 he read a short note on the subject at the British Association meeting in Cambridge, and published the complete paper the following year in the *Philosophical Transactions*. The origin of the inquiry was his discovery of the fact that gases which diffuse through a porous septum or an aperture in a plate into each other, or into a vacuum, with velocities inversely as the square root of their densities, exhibit quite a different series of motions when the septum becomes a tube of sensible length. To the first of these, the motion of a gas through an aperture into a vacuum, Graham gave the name "effusion," and showed by experiments conducted under varying conditions of mixture and pressure that the rate was a function of the density. The other he termed "transpiration," and by an equally elaborate series of experiments proved that the rate of motion of a gas through a long capillary tube does not depend upon its density.

The difference between diffusion or effusion and transpiration is sufficiently indicated by the fact, that while the motions in the former case are not influenced by mechanical pressure, in the latter they depend to a very great extent upon the force pressing the gases through the capillary tubes. Moreover while gases of the same specific gravity have equi-diffusive volumes, the gases of equal transpirability are as diverse as possible in their specific gravities. In fact the motions of transpiration have not been brought into any relation with the specific gravity of the gases or the other motions depending upon that.

In addition to this investigation, Graham, in 1845,

made a fresh analysis of the explosive gas of the Newcastle coal-mines, which he found to consist mainly of marsh gas, and published one or two notes besides. During the years 1846-48, a good deal of time must have been taken up with instituting the Cavendish Society, of which he remained president to the last. The first volume of *Reports and Memoirs* was translated by Dr. Day, but Graham's name appears on the title-page as the editor. Besides this presidency, he was elected in 1847 vice-president of the Royal Society; the year following he attained to one of the highest honours within reach of a scientific man, election as a corresponding member of the Academy of Sciences; and not long afterwards he received for the second time the Royal medal. The first award was made in the year 1838, and was an acknowledgment of the value of the first two papers he had published in the *Philosophical Transactions*, namely that upon the arseniates, and the other upon the constitution of salts, nitrates, oxalates, &c. The second was made in 1850, for the investigation into the motions of gases which has just been mentioned.

While working upon this he must have been carrying on at the same time a different series of experiments, which he laid before the Royal Society in the Bakerian lecture for 1849. The subject was the "Diffusion of Liquids," and the papers appeared in the *Philosophical Transactions* for 1850. Upon this and the preceding research into the motion of gases, as the earliest of his great investigations, Graham's fame in his later life rests. He was now forty-five years old; he was familiar with the whole field of chemistry; he was a consummate experimenter, a keen speculator, but cautious theorizer; his name was familiar to the physicists and chemists of Europe, and his ability had been acknowledged in various ways by the principal societies. What has been found true of the greatest men in all spheres of mental labour is fully applicable to Graham. After a preliminary training of twenty or five-and-twenty years, replete with activity of thought and work, the student of natural phenomena is only at the threshold of his highest discoveries. Fertility or rapidity of production may diminish, but concentration, insight, and power become intenser. Graham's papers were fewer in number during his later years, but their importance increased. Possibly his health and bodily strength were to some extent impaired, for at no time had he been very robust, and his labours may have been thus interfered with; but the nature of the investigations themselves also caused a diminution of their frequency. They were devoted chiefly to liquid and gaseous diffusion, and involved a prolonged set of observations and experiments under very different circumstances, in order to arrive at the laws for which they had been instituted.

The phenomena of the diffusion of different saline solutions into pure water, and into other saline solutions, he compared aptly to the volatilization of a liquid into a liquid atmosphere. An interesting deduction from the very numerous experiments made, relates to the salts of equal diffusibility. As a general rule they are isomorphous substances, that is, they have similar chemical composition and assume the same crystalline form. With regard also to the times of equal diffusion, a certain analogy with those of gases was indicated. For as in the latter the squares of the times are in the ratio of their specific gravities; so in the former it is not unlikely that the solution molecules have specific gravities in the ratio of the squares of the times of equal diffusion. But the exact law is realized in practice only under special conditions of concentration.

The substances which were employed in these experiments were crystalline, and exhibited a ready enough tendency to diffusion. Certain other bodies, however, of which gum-arabic and egg-albumen were the most notable, were besides mentioned, of which the diffusion was very much less. Upon this marked difference in diffusibility Graham afterwards founded a classification of substances, and applied it to their separation.

The interval between this and 1854, when he was again appointed to read the Bakerian lecture, was occupied chiefly with the preparation of the reports already alluded to. An examination of Liebig's theory of etherification also belongs to this period.

The subject of the Bakerian lecture for 1854 was "Osmose," a term which means "impulse," and which is used to denote the effect produced by allowing two saline solutions or other fluids to mix with each other through a porous septum. Under these circumstances it frequently happens—just as in the case of gaseous diffusion—that there is an accumulation of fluid on one side or the other of the septum. Graham reviewed the different explanations given of the phenomena, showed that the motion was due to chemical action upon the septum, that the highest amount of osmose is produced when opposite chemical states exist on the different sides of the septum, and pointed out the important function osmose may discharge in producing the flow of the sap in plants.

The year following, 1855, the degree of D.C.L. was conferred upon him by the University of Oxford, and in April, upon the retirement of Sir John Herschel from the mastership of the mint, he was appointed to that post. In one sense Graham's career culminated in this appointment, and it was a not unsuitable reward for the laborious investigations he had conducted. At the same time he reflected equal honour upon the office, so that, however much the abolition of it since Graham's death may be regretted, it is matter for congratulation that the now extinct title will be always radiant with the lustre it derived from one of the greatest scientific luminaries of the century.

During the five years following his acceptance of this charge we hear comparatively little of Graham. His report on coffee adulterations came out in 1857; in 1858 appeared the second edition of his *Elements*, which was revised by Mr. Watts, the laborious translator of Gmelin's *Handbook* and editor of the *Dictionary of Chemistry* and other works; and in 1860 he was again chosen vice-president of the Royal Society.

In 1861 however he described to the Royal Society the continuation of his experiments upon liquid diffusion (*Philosophical Transactions*, 1861, *Philosophical Magazine* [4], vol. xxiii. 1862). He first recapitulates the difference between the diffusive and non-diffusive substances. The former he calls *crystalloids*, the latter *colloids*, from their general analogy to gelatine.

While in the colloidal state bodies are possessed of certain relations to diffusion which are not exhibited by crystalloids. In particular, while they are quite pervious to crystalloids, they present an almost impassable barrier to other colloids. This was exemplified in the power of a sheet of unsized paper to separate a mixed solution of sugar and gum. In twenty-four hours the crystalloidal sugar had passed through, while the colloidal gum was retained. To this separation of substances by colloidal septa the name *dialysis* was given, and the apparatus finally adopted was called a *dialyser*. Having found that by this process the separation of crystalloids from

colloids was easy to effect, Graham took advantage of the method for two purposes. One of these was to get colloids in the soluble condition, the other was to separate, in medico-legal cases, crystalloids, such as arsenic and antimony compounds, or the vegeto-alkaloids, from the colloidal matter with which they are usually mixed.

Simultaneously with this paper Graham published (*Philosophical Transactions*, 1861) another upon liquid transpiration, that is, the flow of liquids through tubes of very fine bore. His starting-point was the fact incidentally mentioned by Poiseuille, fifteen years earlier, that the degree of dilution at which a mixture of alcohol and water exhibits the greatest amount of condensation is also that at which it offers the greatest resistance to transpiration. Graham extended this observation to other fluids, and showed that ordinary alcohol is not by any means a peculiar substance in this respect, while among homologous bodies the increase in the weight of the molecule is indicated as surely by diminished rate of flow as by decreased volatility. For these splendid papers the Royal Society, during the following year, conferred upon the author the Copley medal, their highest honour.

For some time subsequent to this Graham's labours were devoted to following up the topics upon which he had been recently engaged. He gave a description of silicic acid and other colloids (*Chem. Soc. Journ.* 1864), adding some new examples to his previous lists, and he made a further investigation of the phenomena of the diffusion of gases, particularly when they are under pressure and have to pass through a porous diaphragm (*Ibid.* 1864). It was in these experiments that he made use of Brockedon's graphite, instead of the plug of stucco which he had used twenty years before, but the results corresponded with those he had previously obtained. It was observed, however, besides, that in diffusion under pressure through a porous plate, a mixed gas passed not only in a shorter time than it would do if the motion was one either of effusion or of transpiration, but that after diffusion the gas was also different in composition. This separation of gases by diffusion Graham called *atmolysis*, and comparing it with the dialytic separation of fluids by colloids, Graham next attempted to find if colloids could be also employed for gases, and the results of his trials he described to the Royal Society (*Philosophical Transactions*, 1866). At the outset he showed that the action of a colloidal septum on a gas is not strictly dialytic, but is really due to condensation of the gas to the liquid state. The liquified gas is absorbed by the septum, diffuses and dialyses as a liquid through the septum, and then on the other side resumes its gaseous form by evaporation. In this way though a thin caoutchouc balloon has no pores penetrable by a gas, yet by the action just described gases can pass through it with more or less readiness.

In the second part of this paper Graham brings forward a striking discovery of Deville and Troost respecting the passage of gases through a plate of platinum or of iron at a red-heat, and asks if there is not an analogy between the passage through colloidal india-rubber and through the metallic plates which at a high temperature may be to some extent colloidal? To answering this question, this and his remaining investigations were devoted.

A large number of gases were made to pass through plates of different metals, and it was found that while by some gases the plates were to a certain extent permeable, and by others not at all, to hydrogen they exhibited most singular relations, allowing it to pass in very large proportions, and even decom-

posing compound gases containing it. Still influenced by the view that the metals are colloidal, and considering that according to theory the gas is condensed and dissolved in the septum before it passes through, Graham next examined the metals as to whether they retained any of the gas which was permeating them. He found as a matter of fact that platinum at a red-heat absorbed a quantity of hydrogen, which it retained for an indefinite period at temperatures below redness. This new property of platinum he designated a "power to occlude hydrogen, and the result the occlusion of hydrogen by platinum." Repeating the experiments with palladium instead of platinum he found that while the latter metal at a red-heat occluded from three to five times its volume of hydrogen, the former occluded from 500 to 600 volumes of hydrogen. Next in interest to the relation of hydrogen to platinum and palladium, is its relation to iron. Deville and Troost had showed that a steel tube was quite permeable by hydrogen gas; in carrying out his experiments Graham confirmed this, and found besides that "pure iron takes up at a low red-heat, and retains when cold, 4.15 volumes of carbonic oxide gas." When it takes up and occludes hydrogen, which it does to a small extent, it becomes white; but the occlusion of carbonic oxide does not appear to modify either its physical or chemical properties. Its occlusion, however, is probably of importance in the conversion of iron into steel, which may take place not at the surface of the iron merely, but through the whole mass by its being previously permeated by carbonic oxide.

A year later Graham read a short paper to the Royal Society (*Proceedings*, xv.; 1867: *Philosophical Magazine* [4], vol. xxiv.), "On the Occlusion of Gas by Meteoric Iron." A piece of the meteoric iron of Lenarto on heating yielded a quantity of gas, consisting chiefly of hydrogen. The conclusion arrived at from the analysis was, that this iron had come from or passed through a hydrogen atmosphere, and had brought to us some of that hydrogen, which has been recognized by the spectroscopy in the stellar world, occluded within it, and that the atmosphere from which it had been extruded was very dense, since it contained three times the amount of hydrogen with which malleable iron can be impregnated under our atmosphere. If this discovery, which flows so naturally from the whole course of Graham's investigations, surprised the public, who were ignorant of the steps, and interested them by its unexpected confirmation of the spectrum analysis of solar and stellar light, not less interested were chemists by Graham's final discoveries in this department, and the still more striking confirmation of ideas long entertained theoretically, but never so closely realized in fact. He now submitted the compound of palladium and hydrogen to a more minute examination, and communicated a paper on the subject to the Royal Society in 1868 (*Proceedings*, xvii.) He showed that palladium could absorb hydrogen not only when heated in the gas, but also under other circumstances. At ordinary temperatures, even in a vacuum, the hydrogen evinced no tendency to escape, and it was not till the temperature was raised that an evolution of gas took place. From the very great absorption of the gas by palladium, and the peculiarities of the compound formed, Graham regarded it as a definite chemical substance, and styled it accordingly hydride of palladium.

During the autumn of 1868 he still continued the investigation. He had been elected an honorary member of the German Chemical Society at Berlin, and in a letter to the president, Dr. Hofmann, his

friend and former coadjutor, he acknowledges the compliment, and then surprises him by the question, "What do you think of hydrogenium, a white magnetic metal, of specific gravity 2?" The paper containing the grounds for this statement was read to the Royal Society on the 15th January, 1869. It begins by a reference to the belief that hydrogen is the vapour of a very volatile metal, and then proceeds to give the proofs in support of the view that palladium with occluded hydrogen is an alloy with this volatile metal. He then closes: "The general conclusions which appear to flow from this inquiry are, that in palladium fully charged with hydrogen (as in the portion of palladium wire now submitted to the Royal Society) there exists a compound of palladium and hydrogen in a proportion which may approach to equal equivalents; that both substances are solid, metallic, and of a white aspect; that the alloy contains about twenty volumes of palladium, united with one volume of hydrogenium, and that the density of the latter is about 2, a little higher than magnesium, to which hydrogenium may be supposed to bear some analogy; that hydrogenium has a certain amount of tenacity, and possesses the electrical conductivity of a metal; and, finally, that hydrogenium takes its place among magnetic metals. The latter fact may have its bearing upon the appearance of hydrogenium in meteoric iron in association with certain other magnetic elements."

In a subsequent note, read 17th June, 1869, Graham mentioned that palladium-alloys with gold, silver, and platinum could also absorb hydrogen. As the result of these experiments, a considerably smaller specific gravity was calculated for hydrogenium, and as the mean of all his experiments he finally accepted 0.733 as the specific gravity of hydrogenium, and from a consideration of its chemical properties suggested that in the palladium-alloy we have probably the active form of hydrogen, analogous to ozone the active oxygen.

This was Graham's last paper. Tired by the exertion he had gone through, he went down to Malvern in September for rest. Coming in heated after a long walk he lay down on a couch near an open window and fell asleep. A chill was the result, and this occasioned inflammation of one of his lungs. Hurrying back to London he got medical advice, the inflammation was subdued, and after a short but severe illness he was pronounced out of danger. But the sharp treatment to which he had been subjected proved too great a strain for his exhausted frame. He became gradually weaker, and expired at his house, 4 Gordon Square, London, at nine o'clock in the evening of Thursday, September 16th, 1869. Seven days later his remains were borne to their last resting-place in the High Church burying-ground, Glasgow.

His death has caused a blank among chemists, which it will be found difficult, if possible at all, to fill up. It is not merely that he was distinguished as a successful and energetic discoverer, but the field in which he laboured, and which he was the first to open up, he tillied by himself alone.

In every respect Graham's work bears the stamp of genius. Original in his choice of subjects, he was equally original in his method of working, in his reasoning, and in his results. His labours are dominated by one or two great ideas of which he tried to prove the objective existence in outer nature.

The vividness with which he perceived these ideas in his own mind enabled him to dispense with complicated experiments. There were never results of such great general application obtained by such

direct and simple means. At the same time they guided him in his choice of details, so that one investigation grew gradually out of another. From his first inquiry "into the absorption of gases by liquids," when he shows that there is no line of demarcation between these two states of matter, to his last, the absorption of hydrogen gas, the lightest of all bodies, by a colloidal metal, and its probable condensation to the solid state, there is a consecution, a logical development of thought, which if paralleled, is not surpassed, in the writings or discoveries of any other chemist.

The external circumstances of Graham's life hardly differ from those of any student. It is in the inner life that the interest lies, the inner life revealed in his papers. In these one contemplates a buoyancy and an unflinching perseverance, a keenness of vision, and a sureness of aim, which while it is useless to try to imitate or acquire, are in the highest degree stimulating.

At present Graham's eminence is known to but few; as his discoveries become more widely studied, and as their applications become more generally perceived, his reputation will widen—it can hardly rise higher. So long, however, as his papers are scattered through sixty or seventy volumes, few will take the trouble to read them. No more appropriate monument to Graham's memory could be erected than a complete edition of his works.

JERDAN, WILLIAM, born at Kelso, 16th April, 1782; died at Bushey Heath near London, 11th July, 1869. He was the third son and seventh child of John Jerdan and Agnes Stuart. His father was the descendant of a long line of small landowners in Roxburghshire. The fortune of the family, however, only sufficed to provide for the sons a good education, and to start them in life. William Jerdan first attended the grammar-school of his native town; and subsequently he was sent to Edinburgh, where he studied law for more than two years in the office of Mr. James Hume, writer and distributor of stamps for Berwickshire. But his bent was for literature, not law, and this he attributes chiefly to the influence of Dr. Rutherford, author of *A View of Ancient History*, &c., who had removed from Uxbridge, Middlesex, to settle at Maxwellleugh. With that gentleman he became a favourite, and from him learned much. On his birth-day in 1801 he sailed from Berwick in a smack, and reached London in nine days. For some time he was occupied as a clerk in the city, and in his leisure hours busied himself with composition in prose and verse.

He gradually formed acquaintances in literary circles, and at length he became a reporter. His diligence and fidelity in this capacity obtained for him the favour of men of high position, and opened the way to that extensive intimacy with the leaders of politics and literature which he afterwards enjoyed. On the afternoon of the 11th May, 1812, he was proceeding to his duties in the House of Commons, when he was passed in the lobby by Mr. Spencer Perceval, who was, almost the next moment, shot by Bellingham, the bankrupt merchant. Jerdan seized the assassin and handed him over to the officers who were presently in attendance. That was one of the events which brought him into notice, and by which he will be remembered. In his profession he displayed considerable fertility and activity. One particular circumstance marks his character: when editor of the *Sun*, in 1818, he was the first to introduce reviews of new books as a regular feature of newspaper journalism. He afterwards started the *Literary Gazette*, which during its first year circulated weekly

nearly 1000 copies stamped, and 250 unstamped. In its second year the circulation increased, and its influence grew until it became one of the most important organs of literature. The promoter of it lived to see the *Gazette* wane and die about six years ago.

He wrought himself into a good position, and his personal acquaintance with nearly all the most celebrated men and women of his time rendered his conversation welcome everywhere; but he appears to have laboured under difficulties even in the midst of his success. Writing in 1852, he says, "My life has been one of much vicissitude, of infinite struggle, and latterly of very grave misfortune." The precise nature of his misfortune is not stated. In his autobiography (four volumes, 1852-53), a work which contains many anecdotes and sketches of the notable personages of the previous thirty years, he urgently warns young men not to adopt literature as a profession. He was, however, always a kindly adviser of literary aspirants, and in that way assisted many who have since won for themselves distinction in letters and art. Amongst his protégés was L. E. L. (Miss Landon), whom he first introduced to the public, and with whom he remained on terms of intimate friendship till the period of her sad death.

He was a prolific miscellaneous writer, and besides his London work, continued for a long time to contribute leaders to provincial journals. He was a zealous advocate of the Royal Literary Fund, and in support of it produced his work *Illustrations of the Plan of a National Association for the Encouragement and Protection of Authors and Men of Talent and Genius* (1839). Of his other works the principal are: *The National Portrait Gallery of Illustrious and Eminent Personages of the 19th Century, with Memoirs* (1830-34); *A Voyage to the Isle of Elba; The Rutland Papers; The Perth Papers; The Paris Spectator*; "*The Works of the Rev. G. Herbert, with Remarks on his Writings, and a Sketch of his Life*" (1853); "*Men I have Known*," illustrated with Facsimile Autographs" (1866). He continued to contribute to the metropolitan magazines till within a few weeks of his death; and the number of the *Gentleman's Magazine* issued at the beginning of the month in which he died contains the second portion of one of his sketches. During his latter years a pension of £100 per annum was paid to him by government, in acknowledgment of his services to literature.

LAING, ALEXANDER. This minstrel of rural scenery and lowly social life, and who worthily won the local distinction of being entitled "The Brechin poet," was born at the town of that name, on the 14th of May, 1787. His father, James Laing, was only a day labourer, with a family of two sons, of whom Alexander was the second, and a daughter. As Alexander was only two winters at school, while his summer occupation was to herd cattle, his education was both limited and desultory; but his mother, whose name was Isabel Thomson, supplied these deficiencies by teaching him reading at stated hours, while she was employed at her spinning-wheel, while his day's progress was regularly examined and catechised in the evenings by his father. In this way the whole expense of his education amounted to nothing more than five shillings. In tending cattle, to which he was sent when he was only eight years old, he was wont to carry his books, chiefly consisting of poetry and songs, to the fields, that no intervals of leisure should be lost; while every penny he could get was expended in enlarging his little library. In this way his early youth was familiarized with the works of

Fergusson, Tannahill, and Burns, and the best of our Scottish poets both old and new.

When Alexander Laing had reached the age of sixteen, he was apprenticed to the occupation of flax-dressing for fourteen years, and during this period his poetical inspiration found vent in some of his best songs, which he sent to the Montrose and Dundee newspapers; and having obtained slip copies of these from the printers, he afterwards stitched them together, and distributed them among his friends. The occupation, however, of a flax-dresser he was obliged to exchange for that of a travelling merchant or packman, in consequence of being disabled by a plank of wood falling upon his shoulder, while engaged in repairing the dam dyke. The change, if not a more lucrative, was certainly a more poetical one, as it was full of variety and excitement, and brought him more in contact with those persons and scenes that constitute the chief element of poetry. He was cautious, however, in committing himself to authorship, and his first important appearance in that capacity was as editor of a neat and correct edition of Burns' poems, published at Montrose in 2 vols. 32mo. The same caution or timidity prevailed in the publication of his first original work, which did not appear until 1827, when he had reached the ripe age of forty years. The production was the poetical tale of *Archie Allan*, which was printed at Forfar—a slim pamphlet in paper boards, price fourpence. It is enough to say that seldom has such excellent poetry been committed to so humble a vehicle. The language in which *Archie Allan* is written, the Scottish dialect, besides being characterized by poetical harmony, is true to nature and pictorial power, but without coarseness or vulgarity; while the simple tale itself delineates the consequences of an old man's marriage with a young reckless wife, in consequence of which he is reduced to poverty, beggary, and a premature death in a wretched barn where he was grudgingly sheltered:—

"O sirs, it was sair;
Had he no hae'n a wife, he had never been there!
Cauld, cauld at their backs thro' the evenin' he sat,
An' cauld was the bed an' the beddin' he gat,
The floor on the roof-tree was a' they could spare,
An' he lay down, alas! but to rise never mair."

The author of the poem, speaking in the third person, records of it with honest pride the following simple incident: "Soon after its first appearance he happened, on his way to a friend, to fall in with a little boy who had it in his hand. Being somewhat doubtful, from his extreme youth, whether he could read it, the boy promptly replied to his inquiry, 'I can read it very weel: I ha'e it maistly a' by heart.' This gave him more pleasure, he confesses, than what he chooses to express."

The rest of Mr. Laing's literary appearances were chiefly in an editorial character. A second time he edited the poems of Burns, when they were published by Scott and Webster, London, and supplied most of the foot-note glossary. This edition had an extensive sale, but Laing would receive no remuneration for his labours except a gift of books from the publishers. He supplied Allan Cunningham with notes for his edition of the *Scottish Ballads*. In 1833, when the *Angus Album* was published, he was a considerable contributor to the poetry, and compiler of biographical notices of the Angus poets. He supplied some drolling incidents to the *Laird of Logan*, a publication so called, and edited the works of his favourite author, Robert Tannahill. He contributed some happy imitations of Irish songs to R. A. Smith's *Irish Minstrel*, and had now become so distinguished as a song-writer, that several of his lays were not only introduced into some of our best

collections of Scottish song, but translated into German. While thus employed, no department of editorial labour by which the lowest and youngest of society might be improved was beneath his notice, and the new edition of the chap-books or "ballants," which might be purified, as they could not be extinguished, owing to their wide popularity, were revised and pruned by him for the Brechin editions, with short historical or biographical notices appended. He also collected and revised the annual series of hymns and prayers for the Sabbath evening scholars of the Relief church in Brechin, to which communion he belonged.

As it had been a subject of regret to the friends of Mr. Laing, that his poems, so well entitled to distinction, had not yet appeared in a collective form, he yielded in 1846 to their solicitations, and published them in a single volume, under the title of *Wayside Flowers*, by subscription, at the price of three shillings a copy. The first impression of 700 copies was speedily sold, and four years afterwards a second was published at the price of one shilling, which went off with equal rapidity. The work being soon out of print, a third edition of *Wayside Flowers*, the copyright of which had been purchased by Blackie and Son, Glasgow, was published by that firm in 1857, and Laing, who had revised the work and supplied illustrative notes and additions, survived until this impression was ready for issue, several copies of which were sent to him a few days before his death, which occurred on the 14th of October, 1857. He was survived by his widow, who was also a cousin of his own, to whom he had been married in August, 1827; and upon his grave was afterwards placed a handsome marble tablet, bearing the following inscription:—

"In memory

of

ALEXANDER LAING,

Author of *Wayside Flowers*, &c.

Born at Brechin, 14th May, 1787, and died 14th October, 1857.

This Tablet is erected over

His remains, by the United Presbyterian Congregation of High Street, Brechin, in commemoration of his Christian worth;

And in grateful remembrance of his untiring labours amongst them, both as Elder, and Superintendent of the Sabbath-school, From the formation of the Congregation in 1837, Till the time of his Death.

"The footstep of time hastens on in its power;
And soon we must fall like the 'wayside flower';
But again we shall blossom in beauty and power,
Where the foot never falls on the 'wayside flower.'"

In the simple record of the life of Alexander Laing we see much to admire. Although a poet and genius of no mean degree, and sorely tried by the poverty and uncertainty of his lot, he was neither led astray by the eccentricities of a lively fancy, nor allured into the vicious habits of a wandering and precarious life; and having bravely undergone his probation, he settles down quietly in his native town, and secures the esteem of all classes, not only by his literary fame, but his social and domestic worth, and his consistent upright conduct as a Christian. Of few poets indeed, born to poverty and toil, can so much be said, so that his example in this respect stands out with marked distinctness. Of his poems the following sketch of Adam Glen, an old piper who married eight wives successively, and fell in the battle of Sheriffmuir at the age of ninety, is a strongly drawn and happy specimen of caricature.

"Pawkie Adam Glen,
Piper o' the clachan,
When he stouter ben,
Sairly was he pechan;

Spak a wee, but tint his win',
Hurkit down, an' hostit syne,
B ew his beik, an' dicitit' een,
An' 'whaisl't a' forfoughten.

"But, his coughin' dunc,
Cheerie kyth't the bodie,
Crackit like a gun,
An' lengh to Auntie Madie;
Cried, 'My callans, name a spring,
'Jinglin' John,' or anything,
For weel I'd like to see the fling
O' ilka lass an' laddie.

"Blythe the dancers flew,
Usquebae was plenty,
Blythe the piper blew,
'Tho' shakin' han's wi' ninety.
Seven times his bridal vow
Ruthless fate had broken thro':
Wha wad thocht his comin' now
Was for our maiden auntie!

"She had ne'er been sought,
Cheerie hope was fadin';
Dowie is the thocht
To live and dee a maiden.
How it comes we canna ken,
Wanders aye maun wait their ain,
Madge is hecht to Adam Glen,
An' sune we'll ha'e a weddin'."

M'KENZIE, WILLIAM, M.D. This skilful oculist and excellent teacher in his department of medical science, was born in Glasgow in 1791, and was educated first at the high-school, and afterwards at the university of his native city. There he became a student of theology, but gave up this subject for that of medicine. Like most medical students who have the time and means at their disposal, M'Kenzie resolved to complete what he had learned at the university of Glasgow by continuing his studies in the foreign universities; and accordingly he studied at Paris, Vienna, and other distinguished medical schools of the Continent, where the healing art was in highest account. After completing his course at the continental colleges, he returned to this country, and in 1817 commenced practice as an oculist in London. When two years had been spent in the metropolis, he settled in Glasgow, and there pursued his profession to the close of his long and well-spent life. When in London he published a little book on the lachrymal organs; and about 1823, when he was in Glasgow, a description of the human muscles.

The life of a medical practitioner thus permanently settled can offer few points of interest to the unprofessional reader. It is enough, therefore, to state in general terms that the superior talents of Dr. M'Kenzie were recognized, that his practice grew in reputation and extent, and that as an oculist, patients repaired to him, not only from every part of the island, but also from abroad. To his practice, also, he added the office of lecturer, and delivered courses of lectures on anatomy, materia medica, and medical jurisprudence in the Andersonian University and other institutions. In 1824, in conjunction with Dr. Monteith, he established the Glasgow Eye Infirmary, an important institution the prosperity of which he greatly advanced, and in which he discharged the office of consulting surgeon till the period of his decease. For more than forty years, also, Dr. M'Kenzie was lecturer on the eye in connection with the university of Glasgow—an important addition to its course of medical training—and the funds of the Waltonian lectureship were appropriated for his remuneration.

While thus diffusing scientific knowledge by his lectures, Dr. M'Kenzie was also careful to disseminate it by the press, and in 1830 he published his great work on *Diseases of the Eye*, a work which was so greatly valued by the medical world, that it went through four editions in Britain, and was trans-

lated into French and German. Of this publication, a supplement, containing annotations by the author and others, was published in France in 1865, by which the knowledge of the subject which had been accumulating since the work first appeared, was brought up to the progress of the period. In 1841 he published a book on the *Physiology of Vision*. Besides these important publications, Dr. M'Kenzie for two years edited the *Glasgow Medical Journal*, and was a frequent contributor to that and other medical periodicals. One of the most important of his minor writings was an article "On the Vision of Objects on and in the Eye," which appeared in the *Edinburgh Medical Journal* for July, 1845. The celebrity which he had acquired in his particular department of science obtained for him the appointment of surgeon-oculist to her majesty in Scotland, and he was also elected a member of various scientific societies on the Continent. So wedded also was Dr. M'Kenzie to his constant round of active usefulness, that it had become a necessity of life, so that as years advanced and the frailty of age increased, he still continued at his post. This was the case until almost the very day of his death. When his last short illness came, it found him at his consulting rooms. He seemed better in the evening, but the following morning his malady returned, and he died in the course of the same day, July 30, 1868.

Dr. Mackenzie's professional learning was immense, and was not confined to his favourite department. He was a good classical scholar, and had a knowledge of general literature such as is rarely met with among men actively engaged in professional pursuits. He methodically carried out the practice of taking notes of everything that struck him as valuable in the course of his professional reading. As a writer and lecturer he was remarkable for the clearness and elegance of his style. As an operator he was distinguished for deliberation, adroitness, coolness, and resource. In private life he was genial and humorous; and he was singularly free from pretension.

THOMSON, REV. THOMAS NAPIER, was born at Glasgow on the 25th February, 1798, and was the fifth son of Mr. Hugh Thomson, a West India merchant, but the lineal descendant of John Thomson, who after the death of Edward Bruce in Ireland, led the remains of his army back to Scotland. While receiving his education at the schools of his native town, he early manifested an extraordinary love of reading, and as the somewhat rigid principles of his father rather discouraged the pursuit of light literature, he was necessitated to search for it away from home. As cheap editions and circulating libraries were as yet unknown in Glasgow, his pocket-money was spent at a neighbouring book-stall in the purchase of works of fiction, which, when read, he exchanged for others of the same character. These he enjoyed seated in an old cradle in a garret that served as a lumber-room, whence his bursts of laughter resounded through the house as he relished the humour of Smollett or Cervantes, and where he was sure to be found when missed by the family circle, absorbed in the higher delights of poetry and romance. In this manner, before he had reached his fourteenth year, he had stored his mind with the works of Shakespeare, Milton, and the best of English poets and dramatists, besides the earlier novelists; which were thus so indelibly imprinted on his memory, that he could recollect every character and event, and quote long passages from them, to the latest period of his life, often applying, with the happiest effect, their quaint remarks and antiquated phraseology to the topics of the passing hour.

About the year 1812 Mr. Thomson removed with his family to London, where he held a government appointment connected with the distribution of prize-money. The associations thus formed, with the warlike enthusiasm then prevalent, naturally led to a boyish fancy for the naval service, for which, however, Thomas was disqualified by an accidental injury to his right hand during infancy, and he was placed at a boarding-school near Barnet to continue his studies preparatory to entering the university. But, unfortunately, the school was conducted in a manner formerly but too common, and neither bodily nor intellectual vigour could be sustained upon the miserable allowance of food doled out to the famishing pupils. Upon being removed, it was found that the boy's health had become seriously impaired: a bronchial affection which never entirely left him, caused great alarm to his parents, and he was sent into Ayrshire on a visit to an uncle, where country air and exercise, with an unlimited supply of milk and eggs, had so beneficial an effect upon his constitution, that he was soon enabled to resume his studies with renewed ardour. He entered the college of Glasgow in October, 1813, by the name of Thomas Thomson, having dropped his second appellation in consequence of some disagreement with the Napier family.

A period of Mr. Thomson's life now commenced upon which he always looked back with feelings of pleasure. Distinguishing himself in every class, he attracted around him a number of students of similar tastes and habits, who thus formed a group as remarkable for their intellectual culture as for their moral excellence. Of many of these it was Mr. Thomson's painful task to write the biography, as one by one they dropped away, and the few who now survive will cherish the remembrance of the gifted companion of a well-spent youth. Bringing the treasures of his already well-stored memory to enliven the severer studies in which he was now engaged, he illumined the whole by the fervid glow of an exuberant fancy, while his refined taste and strict principle rejected everything that was coarse or trivial, and preserved him from many dangers that beset the path of inexperienced and high-spirited young men. Indeed, the plain style of living of the Glasgow students fifty years ago, and the simple pleasures in which they found delight, seem almost incredible at the present day; and it would be found as impossible to reproduce them now as to restore the respectability of those dwellings which surround the ancient college, in which the young men of that time could find lodgings, which, though economical, in no way detracted from their position in society, or lowered them in their own estimation.

It was at this time that Mr. Thomson made his first attempt as an author, and this, as might have been expected from his early predilections, took the form of poetry. In 1818 he published a small volume, entitled the *Immortality of the Soul*, and other Poems, his only publication in verse; for though he occasionally wrote poetry for his own amusement, and sometimes contributed a short piece to periodicals, he had too modest an opinion of his own compositions to repeat the experiment of publishing them.

Having completed his preliminary studies, Mr. Thomson resolved to devote himself to the ministry, and entered the divinity hall. But scarcely had he done so when he received a communication from his father, announcing that in consequence of heavy losses in his mercantile speculations, he was unable to continue to maintain him at college. Undeterred, however, by this disappointment, the young student

determined to persevere, and to turn his already acquired knowledge to account for the means of continuing his curriculum. For one who bore so high a character, not only among his fellow-students, but with all the professors under whom he had studied, it was not difficult to procure employment as a private tutor, and in that capacity he was received into several families, where his amiable disposition procured him many faithful friends. But desirous of higher distinction, and emboldened by the commencement he had already made, he resolved to try authorship, and published a tale called *Richard Gordon*, which, being favourably received, was soon followed by another, under the title of the *Christian Martyr, a Tale of the First Century*. This, unquestionably the best of his early works, was published in 1823—a year in which he obtained the two highest prizes in the university of Glasgow.

Having thus completed his college curriculum with the highest honours in the power of the university to bestow on a student, Mr. Thomson now obtained license as a preacher, and it might naturally have been expected that his superior talents, combined with his high character for morality and piety, would have speedily obtained him a presentation. But, unfortunately, inferior qualifications are sometimes essential to success in life. Singularly unmindful of his own interests, he never took any pains to secure the favour of either patrons or congregations when a vacancy occurred; and though he preached with great acceptance in many parts of Scotland, and in the Presbyterian congregations of Newcastle and Birmingham, years passed away without his obtaining a settlement in any parish. Meanwhile he published two other small works, *A Visit to Dalgarnock*, and the *City of the Sun*, besides contributing occasionally to the *Christian Instructor*, then conducted by his esteemed friend, Dr. Andrew Thomson, of St. George's, Edinburgh.

It was during this period, also, that Mr. Thomson, taking advantage of the newly awakened interest in literary pursuits commenced by the labours and examples of Hannah More, Maria Edgeworth, and other female writers, delivered in Glasgow a course of lectures on the "Philosophy of History," addressed exclusively to ladies. These having become deservedly popular, he was induced to repeat them in Edinburgh the following year, where they were attended by many ladies, some of whom subsequently attained high literary celebrity, and upon which all who now survive will look back with pleasing remembrances. It was after this commencement that Professor Leslie followed his example by delivering a course of lectures on chemistry, which have been recently mentioned as having been the first lectures addressed exclusively to ladies in Scotland.

In the year 1827 Mr. Thomson obtained the appointment of assistant to the Rev. Laurence Adamson, minister of Cupar-Fife; and it was hoped that in this capacity his talents would naturally secure him high distinction as a preacher. But his physical powers now proved inadequate to the demands made upon them. Mr. Thomson's voice was naturally weak, and his endeavours to make it audible to the congregation of a large church brought on a recurrence of the bronchial affection which had attacked him in his early youth. Dangerous symptoms began to appear, and a cessation from public speaking, with a removal to a milder climate, were recommended as the only means of averting consumption—a disease which had already proved fatal to two of his brothers.

Under these circumstances it was natural that Mr. Thomson should be induced to look with favour upon

a proposal to emigrate to Australia. The Rev. Dr. Lang, a well-known minister of the Scotch Church at Sydney, had arrived in Scotland with the view of carrying out emigrants to New South Wales. As he had chartered a vessel, and was to reap a pecuniary advantage from every passenger she carried, he held out inducements suitable to various classes of persons. He was erecting a college in Sydney, in the building of which not only architects, surveyors, and mechanics of all kinds were to find employment, but professors of all kinds were to be engaged to teach the various classes. He also represented that there were numerous congregations of Scottish Presbyterians in different parts of the colony, all desirous of the settlement of a regular minister among them. These considerations, combined with the well-known salubrity of the climate, prevailed with Mr. Thomson; and having been ordained by the presbytery of Glasgow to the pastoral charge of the "Scotch Church in the district of Maitland, Lower Hunter's River, in New South Wales," on the 11th of May, 1831, he set sail, accompanied by his youngest brother and sister, bearing the highest testimonials in his favour, and the warmest wishes for his success, from the ablest professors and the most distinguished ministers of the Church of Scotland.

On arriving in the colony, his health being already considerably improved, Mr. Thomson at once repaired to Maitland, ready to enter upon the duties of the office to which he had been ordained. But he found matters very different from the expectations he had been led to form. There was neither church, manse, nor congregation, while by the few Scotsmen scattered at considerable distances over the surrounding country, the settlement of a minister among them was neither expected nor desired. There was no choice but to retrace his steps, and make the attempt in a different locality. He therefore visited Bathurst, then a township containing only four houses, but surrounded by the extensive farms of thriving settlers, many of whom were of Scottish origin. By these he was hospitably and kindly received, and forming themselves into a congregation, they invited Mr. Thomson to the pastoral office on the 13th July, 1832.

Being now, as he thought, permanently settled for life, Mr. Thomson's next step was to marry, naturally hoping that the ordinary comforts of a minister's home would fall to his lot. But as the novelty of his position wore off, many disadvantages began to appear. Perhaps, indeed, no man was ever less fitted for a colonial life than Mr. Thomson. Disqualified for manual labour, and ignorant of the common processes of agriculture, he could take no interest in the pursuits of the people by whom he was surrounded, and interpreted but too literally the command to take no thought for the morrow, while his amiable and unsuspicious disposition rendered him an easy prey to the depredations of his convict servants and their confederates. Besides these discomforts, it is well known that an important part of the duties of a colonial minister consists in visiting his scattered congregation, preaching to a few families who assemble at different stations, at perhaps from twenty to forty miles from his own residence. To a man accustomed to a sedentary life, these journeys, performed on horseback under the scorching sun, were productive of so much exhaustion and dizziness as to incapacitate him in a great measure for his duties, besides which, being an unskilful rider, he suffered frequent falls from the spirited horses he rode. He also felt keenly the want of the literary and intellectual society to which he had been accustomed, and began to dread the idea of bringing up

a family who must necessarily come in contact with convict servants. For these reasons, after the birth of his second child, Mr. Thomson determined to resign his charge and to return to England, there to devote himself to the profession of literature.

During the tedious voyage home, the ill-managed ship in which Mr. Thomson sailed being obliged to put in at Bahia for a supply of provisions and water, the British residents in that town earnestly requested him to remain and settle among them as their minister; but declining the generous offers they made him, he adhered to his purpose, and arrived in London in September, 1835. It was some time, however, before his literary talents met with the encouragement they merited. The years he had spent and the connections he had formed while devoting himself to clerical duties availed but little in the new line of life he now pursued; the works that had been so successful but a few years previous were already out of date, while his modest and retiring disposition forbade him from thrusting himself into public notice. But one friend of his early days, Mr. George Lillie Craik, was now settled in London, a popular and successful author, as well as a man of the most amiable and benevolent disposition, and by him Mr. Thomson was introduced to the eminent publisher, Mr. Charles Knight, of Ludgate Street. Mr. Knight engaged him to edit and remodel Henry's *History of England*, but as Mr. Thomson proceeded in the work, so many alterations were found necessary that it was at length resolved to abandon Henry altogether, and to commence a new work upon a similar plan, allotting, however, the different chapters to different contributors, which finally resulted in the well-known *Pictorial History of England*. To this work, which appeared in 1838, Mr. Thomson contributed the first four chapters on religion, and the whole of those on manners and customs. But as the work was published in a serial form, and as considerable intervals sometimes elapsed between these chapters, they did not afford sufficient employment for Mr. Thomson's active mind, and he therefore contributed articles to various periodicals, some of which are of great merit. It was at this time that Mr. Thomson formed those habits of punctual and systematic study to which he always adhered. Rising and breakfasting at a moderately early hour, at nine o'clock every morning he seated himself at his desk, either in his own house or in the reading-room of the British Museum, where the late Sir Henry Ellis gave him the name of "the Indefatigable," by which he became known to the subordinate officials and frequenters of the library. Thus pursuing his literary labours, with a proper interval for exercise and refreshment, during the day, he avoided all study by night—a practice which he considered injurious to bodily and mental vigour. These regular habits not only enabled him to perform a great amount of work, but to calculate the time it would employ him, so that publisher and printer could always depend upon his manuscript being ready at the time appointed, written in a neat and legible hand, without errors or erasures.

In the year 1839 Mr. Thomson published his *British Naval Biography*, a work which soon became so deservedly popular that it was immediately followed by its companion, the *British Military Biography*. These two volumes were highly commended by the most distinguished officers of both services, not only for the correctness of the information they contain, but for the concise and interesting manner in which it is conveyed. He was also engaged in writing biographical and critical notices not only for the *Book of the Poets*, but of numerous other authors

in various branches of literature, prefixed to new editions of their works, prepared by him for publication.

In the year 1840 Mr. Thomson renewed his connection with his native land, to which his reputation as an antiquary had now extended. He was commissioned by the Wodrow Society to edit Calderwood's *Historie of the Kirk of Scotland*, a work which occupied him nearly five years, having to be copied *literatim* from the original MS. in the British Museum, written in a small and antiquated hand, in some places dim with age, though generally well preserved. But before the completion of this work, events occurred which changed the position of Mr. Thomson as well as that of many of his early friends. Though the movement which resulted in the Disruption has been so well depicted by himself that further description is unnecessary, it may be mentioned that among the ministers deputed to advocate their views in London were some who had known him in former years, and were eager to secure his talents for their cause. Immediately after the organization of the Free Church, a society was formed for the publication of the works of the early reformers and divines, and Mr. Thomson was invited to become the editor. He therefore left London in July, 1844, and removed with his family to Edinburgh, where he resided for the remainder of his life. The first work published by this society was the *Select Writings of Knox*, some of which were printed for the first time, and were preceded by a biographical notice. The works of Rutherford, Traill, Henderson, Guthrie, Veitch, Hog, and Fleming quickly followed, and others were in preparation when the society was dissolved, and Mr. Thomson was again thrown upon his own resources. He severely felt the failure of this scheme, which had promised him a permanent appointment for life, the prospect of which had induced him to remove from London, abandoning the literary connections he had succeeded in forming; but again applying himself to periodical literature, he contributed several articles to *Lowe's Magazine*, and wrote a tale called "Hermann" in *Chambers's Miscellany*. He also for some time wrote the leading articles in the *Inverness Advertiser*, the *Scottish Guardian*, and other journals. It was at this period that he wrote his "*History of Scotland, for the Use of Schools*," a work which though originally intended for general readers, became favourably known and extensively used in the principal educational establishments in Scotland.

It was towards the close of the year 1851 that Mr. Thomson first became connected with Messrs. Blackie & Son of Glasgow; a connection which was destined to continue to the close of his life with feelings of mutual satisfaction and esteem. He then undertook to write a continuation to Aikman's *History of Scotland* up to that time, which was followed by a supplemental volume to the *Biographical Dictionary of Eminent Scotsmen*. His next undertaking was the *Comprehensive History of England*, adapted in a great measure from the *Pictorial History*, in which he had been engaged more than twenty years previously. Besides carefully revising the "Civil and Military" sections, Mr. Thomson supplied the "Social and Domestic History" of each period, and continued it up to the present time, thus forming the most complete history of the country which has ever been published.

He then undertook to revise and edit the *Works of the Ettrick Shepherd*, prefixing a biography and critical notices of all his writings, which was published in 1863. The edition of the *Biographical Dictionary of Eminent Scotsmen*, published in 1851,

being now exhausted, and many other distinguished men having since deceased, a new edition was prepared by Mr. Thomson, in which not only the lives in the previous Supplement were included in alphabetical order, but many other men of eminence in every department who had been accidentally omitted in the former edition, as well as those who had died during the interval, were introduced in regular order; thus forming the most complete record of illustrious men of which any country can boast.

Still as the work progressed, another and another of his distinguished countrymen dropped away; and it was with a melancholy pride, in his declining years, that he continued to record the achievements of his contemporaries, with many of whom he had been on terms of intimacy, while with the others who had attained a wider reputation he could sympathize, as he always did with everything that was virtuous and noble. It was this sympathy with excellence of every kind that so peculiarly fitted Mr. Thomson for the task of a biographer. Strict in his own conduct and firm in his own principles, he was ever indulgent in estimating those of others, and he has therefore been sometimes accused of having represented his characters as too perfect. But if occasionally some envious or censorious voice would point out some defects in the subjects of his biographies, he was ever ready to find some excuse or palliation, either in the deficiencies of their early training or in the circumstances surrounding them in their maturer years, and often he would express his conviction that they had afterwards repented of their faults or follies, to perpetuate the memory of which he regarded as neither edifying to the living nor charitable to the dead. And studying each life in this amiable and truly Christian spirit, sympathizing with his trials and sufferings, as well as with his virtues, and rejoicing in the success of his meritorious efforts, he came to regard every one in turn as a valued friend in whose reputation he felt a personal interest; and it was with perfect truth that he was enabled to say, at the close of his life, "I have never written a line that could give pain to any living being."

But this was not the only work that occupied Mr. Thomson during the latter years of his life. For a long time previous, even while he was residing in London, he had been desirous of writing a complete history of Scotland; and during every interval of leisure he had been collecting materials for that purpose, and revolving in his mind the conflicting evidences on every obscure or disputed point, so as to form a correct judgment upon the most intricate events of past times. And if sincerity, disinterestedness, and impartiality are the qualifications of a historian, no man was ever better fitted for the task. Though assured of the truth of his own religious convictions, he not only tolerated but respected those of others: connected with no political party either by family ties or by ambitious hopes, he was free from many prejudices; and thoroughly acquainted with the manners of each successive period, he entered into their habits of thought and modes of action, and was able to appreciate all that was great and heroic in each character and event, mixed though it might be with the errors of an imperfect civilization; while everything that was insincere, base, or treacherous, met with his unqualified disapproval. The *History of Scotland* published in 1848 was but a compendium of the materials he had already prepared, and it was not till the year 1859 that he commenced to write a work upon the plan that had proved so successful in the *Comprehensive History of England*. This work, upon which he always considered that his

literary reputation would mainly depend, he earnestly desired to see completed and published; and this desire was partially fulfilled, for shortly before his death the whole MS. was completed and placed in the hands of his publishers. But with the completion of this work and that of the last edition of the *Biography of Eminent Scotsmen*, his own work on earth was finished. Two years before, he had been attacked with pleurisy, accompanied by a severe recurrence of his early complaint bronchitis, from which he never perfectly recovered. In the hope of restoring his failing strength, he removed to the pleasant suburban village of Trinity, but though still vigorous in mind, his bodily health never returned. On the 3d December, 1868, he ruptured a blood-vessel, and was carried to his bed, from which he was never more to rise; for though the more alarming symptoms were soon abated, his constitution was too feeble to allow a complete recovery. His last illness was an epitome of his life—a life of purity, of universal benevolence, and of unostentatious piety. With the holy calmness of a Christian he awaited the approach of death, which removed him to a better world on the 1st February, 1869, having nearly completed his seventy-first year. Among all the eminent Scotsmen whose memory he has embalmed, many have been more distinguished: none have been more blameless or more beloved.

WALKER-ARNOTT, GEORGE A., LL.D. This earnest student and distinguished teacher of botanical science, was born in Edinburgh on the 6th of February, 1799. The early years of his life were chiefly spent at Edenshead, on the borders of Fifeshire and Kinross, until he entered as a pupil the high-school of Edinburgh; and there, while he studied the classics, he formed those schoolboy friendships which, unlike such transitory attachments, he continued to hold to the end of his days. From the high-school of Edinburgh he passed, in 1813, to the university, and won distinction as a student in the classical languages and mathematics, in the latter of which departments his progress attracted the favourable notice of Sir John Leslie. While still a student, also, he wrote two papers on mathematical subjects, which were published in Tilloch's *Philosophical Magazine* for 1817 and 1818, in the last of which years he also took his degree of Master of Arts.

As the law was selected for his future profession, Walker-Arnott, after the necessary legal studies, was admitted a member of the faculty of Advocates in 1821. But he found the study of the law both dry and irksome, and the practice of pleading a weary task, so that he never appeared in more than three cases; and he was content to let his title of advocate be an indication of his rank and position in society, rather than the means of professional distinction. Other pursuits than those of the bar had already preoccupied his regards, and determined his future career. While attending college, the lectures of Professor Jameson in natural science had turned his tastes towards its departments, and especially to mineralogy, but botany finally secured his preference, and became his predominant study. He attended the lectures of Mr. Stewart, an extra-academical lecturer in Edinburgh, and his awakened likings for botany were confirmed into a life-long and exclusive pursuit by visits which he made to France in 1822 and 1825, and by his intercourse with the great French botanists whose herbaria he studied, and in whose botanical excursions he took a part.

Being now wholly given up to botany, Mr. Walker-Arnott spared no pains either of travel or study to

advance his beloved science. One of his earliest botanical papers, "On some Mosses from Rio Janeiro," written in the French language, was published in a Paris journal in 1823. In 1825 he made a tour to the south of France and the Pyrenees, in company with Mr. Benthams (now the president of the Linnean society), and the result of this tour was a valuable narrative of its investigations published in the *Edinburgh New Philosophical Journal* in 1826-7. For a considerable time he resided at Montpellier, and in the notes of this visit he gave an interesting comparison between the botanical gardens of England and the Continent. He afterwards proceeded to Geneva, where he devoted much time to the study of the great herbarium of De Candolle. At a later period he visited Russia, and remained there until he had acquired a considerable knowledge of the Russian language. But in every transition, botanical research was the main occupation of his life; and during twenty years, from 1825 to 1845, the fruits of his investigations appeared in upwards of forty papers published among the *Transactions* of learned societies, besides innumerable epistolary communications to his scientific friends in England, on the Continent, and in America. Of his larger writings, we may mention the *Prodromus Floræ Indiæ Orientalis*, prepared in conjunction with Dr. Wight; his monograph of the *Indian Cyperaceæ*; his *Botany of Beechey's Voyage*; and his *Contributions to the Flora of South America and the Islands of the Pacific*, along with Sir William Hooker; his article "Botany," in the seventh edition of the *Encyclopædia Britannica*; and the well-known *British Flora of Hooker and Arnott*, which has passed through nine editions. It will thus be seen that most of the larger publications of Dr. Arnott were written in partnership with some eminent man of science; but the advancement of the study to which he was so earnestly devoted was more to him than even the love of individual fame, and thus he was content to sink his own individuality if the study of botany could thereby be the better promoted. The same disinterestedness made him cordially co-operate with men of different nations, such as Sir William Hooker, Drs. Greville and Wight, Roper and Nees von Esenbeck. But besides this spirit of generous co-operation, Mr. Walker-Arnott was affectionately devoted to the progress of young

rising botanists, who soon learned to regard him as a father, and whose researches he aided both by counsel and encouragement. Often also after the studies of the day were ended, he was employed during the hours of night in elaborating the collections of foreign botanists purely from the love of science. Several years before he died, he especially devoted himself to the study of *marine diatoms*, for which his habits of minute investigation peculiarly fitted him, and his discoveries in this department were published in his communications to the *Microscopic Journal*.

In spite of his modest reticence, the worth of Walker-Arnott could not be hid; and in 1837 the degree of L.L.D. was conferred upon him by King's College, Aberdeen. In 1845 a still higher honour was awarded to him by the university of Glasgow, in which he was appointed professor of botany. It was an office for which he showed himself admirably qualified, and his young students who had any zeal for the science caught fresh inspiration from the instructions of such a teacher. And with all his enthusiasm for study he did not seclude himself from the outer world, of which one proof was his love of free-masonry, of which he was an earnest and genial member. In this way the useful and honoured life of Professor Walker-Arnott passed on, until a considerable period before his death, when he suffered under a painful and protracted illness; but as the summer of 1868 advanced, he endeavoured to rally and resume the labours of his summer session class, with a zeal that alarmed his friends and aggravated the disease. In this difficulty he was consoled by his old associate, Dr. Cleghorn, also an accomplished botanist, who undertook the charge of his class, and knowing that it could not be intrusted to better hands, Professor Arnott gladly assented. His work on earth was now ended: his malady gathered to a head, and he died on Wednesday morning, the 17th of June, 1868, in the seventieth year of his age.

As a botanist Dr. Walker-Arnott's careful habits of observation and minute accuracy of description wonderfully fitted him for his favourite science, and in this department his reputation is as well-known over the Continent as in Britain. It is only necessary to add, that he was Deputy-lieutenant of the county of Kinross, where his estate of Arley was situated.

CHRONOLOGICAL INDEX.

. The first date indicates the Birth, the latter the Death, of the individual.—When the dates are doubtful, they are put in parentheses.—The names followed by an italic (*s*) are in the Supplement.

(1575)	Walter Donaldson, classical writer.	1610 — 1681	Donald Cargill, Covenant-ter.	(1650)	Sir Robert Sibbald, physician.
(1575) — 1639	Rev. Alexander Ross.	1610 — 1684	Robert Baillie of Jerviswood.	1650 — 1722	Charles Leslie, bishop of Clogher.
(1578) — (1651)	David Calderwood, ecclesiastical historian.	(1610) — 1689	Sir George Lockhart, lawyer.	1650 — 1678	Henry Scougal, theologian.
1578 — 1628	Gilbert Jack or Jachæus, metaphysician.	1611 — 1684	Robert Leighton, archbishop of Glasgow.	(1650) — 1689	John Graham of Claverhouse, viscount Dundee.
1578 — 1627	Robert Boyd of Trochrig.	1612 — 1650	James Graham, marquis of Montrose.	1650 — 1693	Henry Erskine, third lord Cardross.
(1579) — 1625	John Cameron, theologian.	1613 — 1646	Rev. George Gillespie.	1652 — 1711	Rev. John Sage.
(1580) — 1640	Wm. Alexander, statesman and poet.	1613 — 1679	James Sharp, archbishop of St. Andrews.	1652 — 1713	Dr. Archibald Pitcairne, physician.
1580 — 1661	Robert Gordon, geographer.	1615 — 1685	Rev. John Blackadder.	1652 — 1722	Alex. Pennecuik, M.D., poet, &c.
(1580) — 1625	Thomas Dempster, miscellaneous writer.	1619 — 1695	James Dalrymple, viscount Stair.	1653 — 1716	Andrew Fletcher of Salton, politician.
(1580) — 1645	Rev. Walter Balcanquell, D.D.	1620 — 1665	Rev. William Guthrie.	1655 — (1706)	William Paterson, financier.
1582 — 1621	John Barclay, miscellaneous writer.	1620 — 1680	Robert Morison, botanist.	1656 — (1716)	Patrick Abercromby, historian.
1583 — (1630)	Wm. Lithgow, traveller.	(1620) — 1696	George Sinclair, mathematician, &c.	1657 — 1713	James, fourth duke of Hamilton.
1583 — 1646	Alexander Henderson, ecclesiastical leader and reformer.	(1620)	William Gordon of Earlstoun.	(1660) — 1726	Sir Francis Grant, forensic lord Cullen.
1583 — 1663	David Dickson, minister at Irvine, afterwards professor of divinity.	1620 — 1682	David Leslie, lord Newark.	(1660) — 1735	John Arbuthnot, M.D.
1584 — 1654	Rev. John Strang, D.D.	(1620) — 1680	David Hackston of Rathillet.	(1660) — 1743	Rev. James Blair, president of Williamsburgh College.
1585 — 1649	William Drummond of Hawthornden.	(1620) — 1680	Richard Cameron, Covenant-ter.	1661 — 1689	William Cleland, colonel.
1586 — 1657	Rev. William Guild.	(1620) — 1685	Archibald Campbell, ninth earl of Argyle.	1661 — 1701	David Gregory, astronomer.
1587 — 1641	Dr. Arthur Johnston, poet and physician.	1621 — 1675	Sir William Lockhart of Lee.	1662 — 1728	James Anderson, antiquary.
(1587) — 1644	Geo. Jamesone, painter.	1622 — 1699	Lady Anne Halket, religious writer.	1662 — 1688	Rev. James Renwick.
(1588) — 1653, 4	Rev. Zachary Boyd.	1622 — 1653	Rev. James Durham.	1665 — 1726	David Crawford, historiographer.
(1590)	Alexander Anderson, mathematician.	(1626) — 1687	George Dalgarno.	1667 — 1747	Simon Fraser, twelfth lord Lovat.
(1590) — 1661	Alex. Leslie, general.	1627 — 1653	Hugh Binning, professor of philosophy.	(1670) — 1749	Alexander Robertson of Strowan.
1590 — 1654	Alexander Ross, miscellaneous writer.	1629 — 1719	Sir Ewen Cameron of Lochiel.	(1670) — 1716	Robert Fleming, theologian.
1593 — 1666	Rev. Robert Blair.	(1630)	James Kirkwood, grammarian.	(1670) — (1723)	Rev. John Anderson.
(1593) — 1657	Sir James Balfour, annalist.	1630 — 1694	Sir Andrew Balfour, M.D.	1671 — 1743	George Cheyne, physician.
1593 — 1648	John Forbes, professor of divinity.	1630 — 1714	George Mackenzie, first earl of Cromarty.	1671 — 1721	John Keill, mathematician.
(1594) — 1657	Sir William Mure, poet.	1635 — 1699	General Patrick Gordon.	1671 — 1729	John Law, financier.
1596 — 1646	Sir Robert Spotswood, lawyer.	1636 — 1691	Sir George Mackenzie, lawyer.	1673 — 1731	George Lockhart, political writer.
1598 — 1661	Archd. Campbell, marquis of Argyll.	1638 — 1675	James Gregory, natural philosopher.	1673 — 1747	John Dalrymple, second earl of Stair.
1599 — 1685	Thomas Dalryell, general.	1640 — 1666	Rev. Hugh M'Kail, martyr.	1673 — 1719	James Keill, physician.
1599 — 1662	Rev. Robert Baillie.	1641 — 1724	Patrick Hume, first earl of Marchmont.	1674 — 1712	Rev. Thos. Halyburton.
(1599) — (1600)	Colonel Edmonds.	1642 — 1716	Rev. Robert Traill.	(1674) — 1754	James Gibbs, architect.
(1600)	Christopher Irvine, antiquary, &c.	1643 — 1715	Gilbert Burnet, bishop of Salisbury.	1674 — 1757	Thomas Ruddiman, philologist.
(1600)	Robert Douglas, state-preacher.	(1645) — 1700	William Dunlop, principal of Glasgow College.	1675 — 1742	James Douglas, M.D.
(1600) — 1639	Henry Adamson, poet.	(1646) — 1720	Count Anthony Hamilton, miscel. writer.	1675 — 1740	Alexander Hume, second earl of Marchmont.
1600 — 1649	Charles I.				
(1600) — 1661	James Guthrie, minister at Stirling.				
(1600) — 1664	Andrew Cant, a leader of the Covenanters.				
1600 — 1661	Rev. Samuel Rutherford.				

- A.D.
1676 — 1732 Thomas Boston, doctrinal writer.
1678 — 1762 Alexander Forbes, lord Pitsligo.
1678 — 1755 Rev. George Logan, controversialist.
1678 — 1743 John Campbell, second duke of Argyle.
1679 — 1734 Rev. Robert Wodrow, church historian.
(1680) — 1728 Patrick Blair, M.D., botanist.
1680 — 1756 Rev. Ebenezer Erskine, Secession church.
(1680) — 1727 Robert Dundas of Arniston, lawyer.
1681 — 1757 Robert Keith, bishop Keith.
1682 — 1731 William Aikman, painter.
1682 — 1744 Rev. James Craig, M.A.
1683 — 1760 Charles Alston, M.D., botanist.
(1684) — 1751 John Smibert, artist.
1685 — 1747 Duncan Forbes of Cul-loden.
1685 — 1752 Rev. Ralph Erskine, Secession church.
1685 — 1753 Robert Dundas of Arniston, F.R.S.E., lawyer.
1685 — 1732 John Horsley, antiquary, &c.
1686 — 1766 Archibald Bower, littérateur.
(1686) — 1750 Andrew Baxter, moral philosopher.
1686 — 1743 Andrew Michael Ramsay, miscellaneous writer.
1686 — 1757 Allan Ramsay, poet.
1687 — 1766 George Drummond, provost of Edinburgh.
1687 — 1771 Sir Andrew Agnew of Lochnaw, Bart., lieutenant-general.
1687 — 1768 Dr. Robert Simson, mathematician.
1688 — 1745 Colonel James Gardiner.
(1690) — 1750 Thomas Gordon, party-writer.
(1690) — 1712 Robert Hepburn, miscellaneous writer.
1691 — 1780 John Bell of Antermony, traveller.
(1692) — 1765 Adam Anderson, commercial historian.
1692 — 1766 Andrew Fletcher, forensic lord Milton.
(1693) — 1757 William Maitland, antiquary.
1695 — 1750 John Love, controversial critic.
1695 — 1773 Rev. John Glass, founder of the Glassites.
1695 — 1768 John Erskine of Carnock, lawyer.
1695 — 1779 John Rutherford, physician.
1696 — 1782 Henry Home, forensic lord Kames.
1696 — 1753 James Keith, marshal Keith.
1697 — 1771 Rev. Robert Wallace, D.D.
1697 — 1767 Dr. Monro, *primus*, physician.
1698 — 1746 Colin Maclaurin, mathematician.
1699 — (1746) Rev. Robert Blair, poet.
1699 — 1784 Alexander Ross, poet.
(16—) — (16—) Rev. John Dury, ecclesiastical writer.
(16—) — (17—) Alexander Cunningham, historian.
(1700) John Douglas, surgeon.
- A.D.
(1700) James Anderson, D.D., genealogist.
(1700) Thomas Innes, historian and antiquary.
(1700) — 1747 Alexander Blackwell, printer, &c.
(1700) Elizabeth Blackwell, engraver and colourer.
1700 — 1770 Alexander Cruden, author of *Concordance*.
(1700) — 1750 Alexander Gordon, antiquary.
1700 — 1748 James Thomson, poet.
(1700) — 1749 William Ged, inventor of stereotyping.
(1700) — 1765 David Mallet, poet, &c.
(1700) — 1753 John Cockburn, agriculturist.
(17—) — 1743 Donald Cameron of Lochiel.
1701 — 1757 Thomas Blackwell, professor of Greek.
1702 — 1749 John Lindsay, eighteenth earl of Crawford.
1703 — 1778 Patrick Murray, fifth lord Elibank.
1704 — 1793 William Murray, earl of Mansfield, lord chief-justice.
1704 — 1754 William Hamilton of Bangour, poet.
1706 — 1766 Walter Goodall, antiquary.
1707 — 1732 Sir John Pringle, physician.
1707 — 1776 Robert Foulis, printer.
(1707) — 1734 Rev. Alexander Webster, D.D., statish.
1708 — 1770 William Guthrie, political writer, &c.
1708 — 1774 Rev. Thomas Gillespie, Relief church.
1708 — 1794 Hugh Campbell Hume, third earl of Marchmont.
1708 — 1775 John Campbell, LL.D., miscellaneous writer.
1708 — 1771 Sir Andrew Mitchell, K.B., politician.
1709 — 1788 James Brown, traveller.
(1709) — 1789 John Callander of Craighforth, antiquary.
(1709) — 1779 John Armstrong, M.D.
1710 — 1796 Dr. Thomas Reid, metaphysician.
(1710) — 1768 Dugald Buchanan, Highland poet.
(1710) — 1771 William Lauder, critic.
1710 — 1790 Rev. James Bayne or Baine, M.A.
(1710) — 1794 Mrs. Alice Cockburn, poetess.
1710 — 1790 William Cullen, M.D.
1710 — 1768 James Short, optician.
(1710) — 1789 Rear-admiral Sir Charles Douglas.
(1710) — 1779 James Moor, LL.D., Greek professor.
1710 — 1776 James Ferguson, experimental philosopher, &c.
(1710) — 1749 James Geddes, advocate.
(1710) Rev. John Anderson, M.A., controversialist.
1711 — 1792 William Tytler of Woodhouselee, antiquarian writer.
1711 — 1776 David Hume, metaphysician, historian, &c.
1711 — 1751 David Fordyce, professor of philosophy.
1712 — 1775 Andrew Foulis, printer.
1713 — 1787 Robert Dundas of Arniston, lawyer.
- A.D.
1713 — 1734 Allan Ramsay, portrait painter.
1713 — 1792 John Stuart, third earl of Bute, prime minister.
1713 — 1788 Rev. Adam Gib, Anti-burgher.
